" 'Its proportions are designed from the standard rail with which it is used as companion. The head is narrower and deeper than that of the standard rail; the web and base are preferably the same as those of the standard rail. Frictionless rail is laid to the customary gage for curves in accordance with standard practice. The specifications of composition and quality are the same as those of ordinary rails of the railroad company.

" 'By decreasing the impinging action of the outer wheel flanges of a locomotive or car against the high rail of a curve, the truck receives far less strains and accommodates itself to the curves more easily, and rail and track wear is reduced.

" 'The action from the frictionless rail we believe to be due to the shorter line contact of inside wheels and frictionless rail as compared with the outside wheels and standard rail. This shorter line contact allows the necessary slip to occur at the inside rail rather than the outside one, and allows the trucks to right themselves more readily. Such slip must occur somewhere on the curve because of the greater distance the outer wheel travels as compared with the inner wheel with both attached to the axle. Allowing slip on the inner rail permits lateral movement across the rail, and thereby releases the pressure against the outer rail by the outer wheel flanges.'

"Cross sections of frictionless rails as companion rails for standard sections of 85 lb., 90 lb. and 100 lb. weight are uniformly made with 7/16-in. radii of corners of head, width of head at top 1¾ in., and slope of sides 16 to 1. It is asserted that less tractive power is required to take trains around curves with this type of rail as the inside rail of the track than with standard sections, and also that less flange wear occurs on the outer rail.

"Features in the designs of rails first to attract attention are naturally those which give promise of strengthening the rails against their most common types of failure. This would lead, among other details, to a consideration of the depth of the metal of the base and to the radius of the fillet connecting the web and base. To strengthen the rail against split bases is one of the first modifications to consider. In the proposed 125-lb. section for the Pennsylvania Railroad, the radius at the base has been established at ¾ in. Dr. P. H. Dudley is recommending a fillet of about 15/16 in. radius in a new 105-lb. section for the New York Central & Hudson River Railroad. The use of a large fillet puts metal in a place advantageous to resist crosswise bending stresses in the flanges. Such a change in design appears to be beneficial, without being attended with disadvantages in other directions."

Following a discussion of car wheel and axle troubles, the report concluded with a strong recommendation for the steel car. Quoting Bulletin No. 60 of the special committee on relations of railway operation to legislation, it states that there were but fifteen wooden cars under construction on Jan. 1, 1914, only two of which were intended for the use of passengers. Of the 3144 cars under construction on the date named, 86.9 per cent were of steel, 12.6 per cent of steel underframe type and 0.5 per cent of wood. The percentage for cars with steel underframe included wooden cars under reconstruction. On the same date there were 9492 steel, 4608 steel underframe and 44,560 wooden cars in service.

STATISTICS AND ACCOUNTS OF ELECTRIC RAILWAYS

The committee on statistics and accounts of electric railways was composed of A. F. Weber, chairman; C. S. Cunningham, John H. Hale, M. F. Sheppard, John E. Benton, U. G. Powell and W. F. Ham. In its report this committee states that the developments of the last year as regards new regulatory laws in Pennsylvania, Ohio, Indiana, Illinois and Missouri have made more apparent than ever before the need for uniform and comparable statistics of electric railways. In order that the committee might be able to render to new commissions the assistance that many have sought, it seemed best to obtain first hand information concerning the powers of commissions over accounting procedure with particular reference to depreciation. On July 12 a circular letter was sent to all existing commissions, with the result that more precise information has been obtained than heretofore available.

SUMMARY OF INVESTIGATION

The committee's summary of its investigation is shown in tabular form and is made to include the three states (Delaware, Utah and Wyoming) that have not yet provided for public utility regulation, and also two territorial districts (Alaska and the District of Columbia) that possess public utility commissions. New York State, with its two commissions, is treated as a single unit. Of the forty-seven commissions, thirty-seven furnished information to the committee, and sufficient information was at hand to permit the classification of the remaining ten with the exception of Mississippi, North Carolina, South Carolina and Alaska. Most of these commissions seem without jurisdiction over the accounts of electric railways, which is definitely reported to be the situation in the following eight states: Arkansas, Florida, Kentucky, Louisiana, North Dakota, South Dakota, Tennessee and Texas.

The remaining thirty-five commissions have power to require reports if not to prescribe the accounting procedure of electric railways. In nine states the commission's power seems to be limited to determining the form of report, but in twenty-six states the commission may also prescribe rules of accounting. To this last group ten states were added during the year as follows: Colorado, Idaho, Illinois, Indiana, Missouri, Montana, Nevada, Oklahoma, Pennsylvania and Virginia. Texas was eliminated from the list because the Railroad Commission states that its jurisdiction does not extend to street and electric railways and no branch of the Texas state government is charged with the regulation of such utilities.

Nearly one-half of the thirty-five states use forms of reports provided by the Interstate Commerce Commission, presumably based on the 1908 classifications. Several of the New England states still use the earlier classifications endorsed by the National Association of Railway Commissioners in 1903, while Massachusetts and Illinois have adopted the new uniform system of accounts of the Interstate Commerce Commission effective July 1, 1914. The committee states that the form used by Nebraska contains certain variations in the classification of operating expenses that have much to commend them.

Comparatively few of the state commissions have prescribed complete systems of accounting procedure for electric railways. Many adopted the classifications of the Interstate Commerce Commission or took no action when satisfied that the companies were using these classifications. The following five states have their own systems: Maryland, New Jersey, New York, Montana and Wisconsin. The three Eastern systems on the one hand and two Western systems on the other show a general similarity.

DIFFERENCES IN EXISTING CLASSIFICATIONS

While many differences existed in present classifications, the committee feels that these are not so fundamental as to prevent ultimate uniformity of proper efforts are made in the right direction. It feels that a notable opportunity to promote uniformity was lost this year when the Interstate Commerce Commission prescribed its uniform system without co-operating with the National Association of Railway Commissioners as in 1908. This association has followed the former classifications and annually pointed out inconsistencies, certain of which criticisms have borne fruit in the new classifications. For example, the committee mentions the new Interstate Commerce Commission segregation of power costs, which was favored by a vote in the association last year.

The committee believes that maintenance charges are still incomparable as between companies that own and those that hire cars and other facilities. Rent or compensation paid for the use of cars and other equipment consists of a maintenance element and an interest element which should be separated as is done in the steam railroad classification. The experience of the New York Commissions in classifying rents paid as income deductions instead of operating expenses demonstrates that such a separation is practicable. Payments for trackage rights over other carriers' lines are more difficult to deal with. In so far, however, as the tracks used in common by several companies belong to the same system, a separation of the maintenance element from the interest element may reasonably be insisted upon. But where the interest element is minute, as is said to be the case with the majority of trackage rents paid by interurban companies for rights over city tracks, the entire amount might perhaps be included in the maintenance of way accounts. The committee quotes a letter from the Interstate Commerce Commission to the effect that the proportion of rental representing interest on investment charged to operating expenses does not exceed one-half of 1 per cent of the total operating expenses, and that this amount does not appear to justify the refinement of accounting attending the distribution of rents into the maintenance, operation, power, taxes and interest sections usually included in electric railway rentals.

DEPRECIATION ACCOUNT

The committee characterizes the Interstate Commerce Commission revision of the renewal and depreciation accounts as an important advance, but the rules adopted are now six years old and do not embody the results of recent progress. Nearly all state laws of the last three years have contained specific grants of authority to the regulatory body to require the reservation of sufficient income to provide for depreciation and many have often defined the uses to which the depreciation fund may be put. References are made to the Wisconsin public utility law, which is similar to the laws in Indiana, New Hampshire, New Jersey, the District of Columbia, Ohio, Oregon, etc., and to the California law, which is the basis for the Colorado, Idaho, Illinois and other state laws. The committee concludes that the people have learned that they cannot expect to obtain adequate service from a utility that pays out its entire surplus in dividends and reserves nothing for ultimate replacements, and also that there is an evident determination to make sure that moneys collected for depreciation, if used temporarily for new construction, shall not be deemed to constitute a part of the investment upon which consumers must pay a return.

The committee reports that comparatively little progress has been made in the determining of proper rates for depreciation. More accurate records of the term of service of physical units are needed, and an effort should be made to define more clearly the minor renewals and replacements that are properly treated as repairs and the larger replacements that are cleared through the property accounts and paid off out of the depreciation fund. The first step to be taken, however, is the expansion or multiplication of the two or three depreciation accounts now provided, as has been done by the Interstate Commerce Commission in its last steam railroad classification.

SEGREGATION OF EXPENSES BETWEEN CITY AND INTERURBAN OPERATION

The committee finds that in several commonwealths the state commissions control only interurban electric railways, while urban lines are subject to municipal control. Yet many of such interurban companies perform city service and commissions find it necessary to make some segregation of the two classes of service, which raises a problem more difficult than that of separating intrastate and interstate traffic of steam railroads. To emphasize the need of increased study of such points, the committee submits a brief by George Eberle, electric railway statistician of the Wisconsin Railroad Commission. Mr. Eberle says that there is no complete classification of accounts for electric railways in the country to-day and makes a plea for such a classification to cover all accounting divisions. He mentions investment enterprises in land, joint utility operation and joint services as points that are much in need of accounting unification, and decries the common practice of throwing urban, suburban and interurban accounts together on one system without any attempt at segregation. The necessity of separating such accounts is particularly mentioned because of the question of increased city fares or increased urban fares, which depend for their proper solution upon unimpeachable financial statements instead of spasmodic allocations. Mr. Eberle adds, however, that complete accuracy cannot be obtained unless a thorough system of segregation has been carried on over a period of years with improvements added annually as a result of consistent detailed study. Similar questions requiring segregation of accounts confront regulative bodies, and the time is now ripe for adoption of thorough cost accounting methods in the electric railway business.

The Clark interests in Tennessee, which include the utilities in Chattanooga and Nashville and the power plants on the Ocoee and Tennessee Rivers, will show at the Panama-Pacific Exposition 2000 ft. of motion picture films, for which the pictures have just been taken.

Meeting of American Railway Association

The fall session of the American Railway Association was held at the Blackstone Hotel, Chicago, on Nov. 18. There were 210 company-members present, represented by 180 delegates.

The report of principal interest to electric railway companies was that of the committee on electrical working which recommended clearances for third-rail and overhead working conductors with specifications for electric light and power transmission lines and overhead crossings for telegraph and telephone lines. The specifications for light and power transmission lines were similar to those adopted by the American Electric Railway Engineering Association in 1913. In regard to the telegraph and telephone lines, the committee reports that it recommends the adoption of the specifications prepared by the Association of Railway Telegraph Superintendents with the exception of one paragraph relating to the minimum clearance of poles over railway tracks. It points out that the specifications contained in its report has not been definitely acted upon by the engineering associations interested but is included so as to place the essentials of the matter on record.

At the meeting the Illinois Central Railroad and the Long Island Railroad were added as members to the committee on electrical working. The sub-committees appointed by the committee for further investigation of continued subjects are as follows: On third-rail working conductors and on overhead working conductor clearances—A. S. Baldwin, chief engineer Illinois Central Railroad; J. H. Davis, electrical engineer Baltimore & Ohio Railroad; E. B. Katté, chief engineer electric traction New York Central & Hudson River Railroad. As representatives of the committee on the national joint committee on specifications for wire and cable crossings—E. B. Katté and J. H. Davis.

The association decided to hold its next session in Atlantic City on May 19, 1915.

Interurban Electric Railways of Austria in 1912

The official statistics of the Austrian Railways Ministry for the calendar year 1912 contain the following data on the so-called "Kleinbahnen" or cross-country lines, about one-third of which are narrow gage. These figures do not include the Kingdom of Hungary.

The total operating route length of these lines was 406 miles (1180 miles of single track) or 87.3 per cent of all cross-country mileage, and represented an increase of 28.1 miles over the year 1911. Of this mileage, 48 per cent was double track. A total of 41 miles was devoted to freight business exclusively.

The rolling stock comprised ten locomotives, 204 snow plows, 2321 motor cars, 2013 trailers and seventy-six freight cars. The combined capacity of the passenger cars was 167,229 seats and 76,094 standing places. The lines carried 484,295,628 passengers and 232,164 metric tons of freight. The gross earnings from the passenger service were approximately $15,889,323 and from the freight business $82,193. The operating expenses averaged 61 per cent of the gross earnings, but despite this the average surplus of $5,806,090 was equal to 9.55 per cent of the capitalization. The total number of employees was 17,724 and the total annual wage $5,977,366, or about $320 per person. The railways insure the employees in sick benefits, accident and pension funds. Only sixteen persons were killed and for all traffic the splendid record of 1.03 accidents per 1,000,000 passengers was attained.

The Mayors' Conference

The Meetings in Philadelphia Last Week Were Devoted to Papers and Discussions Upon Public Utilities and Their Regulation—Resolutions Were Adopted Indorsing the Establishment of a Public Utilities Bureau for the Exchange of Information

The conference of mayors held in Philadelphia last week was attended by the mayors of forty-nine cities. There were also present a number of other officials of cities, representatives of civic clubs and associations, representatives of several of the state public service commissions and members of the Uniform Electric Rate Association. According to the list given out, mayors of the following cities were registered: New York, Philadelphia, Chicago, Boston, Mass.; Cleveland, Ohio; Detroit, Mich.; Cincinnati, Ohio; Newark, N. J.; Minneapolis, Minn.; Providence, R. I.; Rochester, N. Y.; Denver, Col.; Toledo, Ohio; Scranton, Pa.; Fall River, Mass.; Grand Rapids, Mich.; Cambridge, Mass.; Trenton, N. J.; Reading, Pa.; Wilmington, Del.; Chattanooga, Tenn.; Yonkers, N. Y.; Elizabeth, N. J.; Fort Worth, Tex.; Fort Wayne, Ind.; Holyoke, Mass.; Hoboken, N. J.; Evansville, Ind.; Akron, Ohio; Norfolk, Va.; Erie, Pa.; Harrisburg, Pa.; Passaic, N. J.; Allentown, Pa.; Canton, Ohio; South Bend, Ind.; Middletown, N. Y.; Sea Isle City, N. J.; Kalamazoo, Mich.; Camden, N. J.; Mount Vernon, N. Y.; Perth Amboy, N. J.; Montclair, N. J.; Ocean City, N. J.; Toronto, Ont.; Lebanon, Pa.; Easton, Pa.; Chester, Pa., and Poughkeepsie, N. Y.

Starting with a reception at the Bellevue-Stratford Hotel on the evening of Nov. 12, the time of the delegates was kept fully occupied until the end of the concluding session on Nov. 14. On the general reception committee were the names of many prominent Philadelphians, including officials of the local public utility companies. The reception at which the mayors were welcomed by Ex-Governor Stuart of Pennsylvania and Mayor Blankenburg of Philadelphia, was attended by many men prominent in the banking, civic and industrial life of the city.

In the business sessions, which began on the morning of Nov. 13 and were concluded on the evening of the following day, the formal papers presented were grouped in accordance with subjects prearranged in the program and there was little departure from the arrangement announced in advance. Time was allotted arbitrarily to the different speakers, and there was little opportunity for general discussion. Mayor Blankenburg was the first presiding officer, and when he was called away Dr. Ernest S. Nichols, president of Dartmouth College, presided during the remainder of the first business session. It was at this session that the chairman was directed to appoint a committee on recommendations which did the definite work of the convention. It was at this session also that Louis D. Brandeis appeared instead of taking part in the discussion of "Holding Companies and the Public Welfare" which was arranged for the evening of Nov. 14. The real subject of the discussion of Mr. Brandeis was the new Utilities Bureau, of which he is one of the trustees. This session did not bring out any strong, dominant note to characterize the drift of the entire proceedings.

It was at the afternoon session on Nov. 13, devoted to "The Regulation of Utilities," that the discussion began to get warmer in the direction of closer regulation, home rule and public ownership and operation. The tendency in this direction was strengthened by the remarks of Mayor Harrison of Chicago, who presided. Outside of the city and state officials, regulators and public ownership advocates who talked at the discussion, a distinct point of view was presented by Charles Day, of Day & Zimmermann, whose constructive policy for public service corporations rests largely on the adoption of the principles of scientific management in internal organization, operation and rate-making.

At this session the members of the committee on recommendations was announced by Mayor Blankenburg, as follows: Newton D. Baker, Mayor of Cleveland, chairman; Richard D. O'Brien, Director of Utilities, Seattle; Theodore Theime, Citizens' League of Indiana, Fort Wayne, Ind.; Frederic W. Donnelly, Mayor of Trenton, N. J.; John P. Mitchel, Mayor of New York; Charles E. Merriam, alderman, Chicago; Milo R. Maltbie, Public Service Commission, First District, New York; John M. Eshleman, Railroad Commission of California; H. S. Hocken, Mayor of Toronto; F. C. Thomson, Mayor of Chattanooga.

During the latter part of this session there was a short discussion on rates for electric light and power in which Mr. Day and the mayors of Toledo, Toronto and Poughkeepsie participated.

The evening session on Nov. 13 was held at the Central High School under the auspices of the American Academy of Political and Social Science and was devoted to "Local and State Regulation of Municipal Utilities." The presiding officer was Mayor Mitchel, of New York, and of the four speakers, Mr. Erickson, of the Wisconsin Commission, stood most strongly for state regulation in preference to local regulation.

The discussion on the morning of Nov. 14, was on "Municipal Ownership and Operation." Clarke M. Rosecrantz, of general counsel of the Milwaukee Electric Railway & Light Company, made the principal talk against public ownership and operation. Mayor Baker of Cleveland, and afterward Mayor Curley of Boston, presided at this session.

After the lunch tendered by business men of Philadelphia at the Wanamaker store, brief talks were made at a somewhat informal meeting, over which Charles A. Prouty, director of the division of valuation of the Interstate Commerce Commission, presided. Among those who spoke briefly were M. N. Baker, of the *Engineering News;* Felix Frankfurter, professor of law of Harvard University; F. C. Henderschott, of the New York Edison Company; Mayor Seger of Passaic, N. J., and Mayor Nevin of Easton, Pa. The last-named speaker said that it should not be forgotten that public service corporations made cities what they are to-day. During this meeting Mayor Baker of Cleveland, chairman of the committee on recommendations, presented the report which is published elsewhere in this issue. It was adopted without discussion.

The final session, devoted to "Holding Companies and the Public Welfare," was held at Witherspoon Hall under the auspices of the American Academy of Political Science. It lost some of its impressiveness, so far as the mayors were concerned, by reason of its unfortunate position in the program on Saturday evening at the conclusion of all the proceedings. Secretary of the Interior Lane, who was expected to preside, was not present, and Dr. Carl Kelsey, acting president of the

American Academy of Political and Social Science, opened the meeting. A strong presentation of the case of the public utility holding company was made. Brief abstracts of the different papers and addresses in the order of their presentation follow:

PRACTICAL UTILITY PROBLEMS

"FUNDAMENTAL PLANKS," BY DR. D. F. WILCOX

Speaking on "Fundamental Planks in a Public Utility Program," Dr. Delos F. Wilcox, of New York, declared that public utility investments should be placed upon a non-speculative basis and their security should approximate that of municipal bonds. In the establishment of the non-speculative character of these investments cities should not undertake to make good past losses. So far as future investments in standard utilities are concerned, the cities should assume the risk of loss due to unforeseen causes and should substantially guarantee the integrity of all investments made at the request or with the approval of public authority. The elimination of the speculator and the stockjobber from the utility field and the establishment of utility investments upon a safe, conservative, non-speculative basis is the fundamental condition precedent to good service, permanently low rates and adequate public control. If capital is made secure and is guaranteed a steady return, it demands nothing more than the ordinary interest rate. Cities ought not to make good past losses on investments that were frankly on a speculative basis when they were made. If the cities are to assume the risks of the future in order to give stability to capital and thereby to secure low rates and dependable service, the control of the investment by public authority must be much more minute and far-reaching than in the past.

Dr. Wilcox said that public utilities should not be regarded as a legitimate source of profit to be used for the relief of general taxation. Public utility services should be rendered as nearly at cost as practicable, except that the rates should include a sufficient contribution to retire the investment within a definite period of time. Public utilities should receive credit for all the service rendered by them to the city and its various departments, but only under unusual conditions should the city assume to subsidize a public utility service out of the proceeds of taxation or otherwise. Dr. Wilcox would be willing to exempt from ordinary as well as special taxation all property actually devoted to public use in the rendering of utility service under adequate control, but he hesitates to advocate at the present time so radical a proposal.

Rates and charges should include enough to maintain a sinking fund for the retirement of the investment. Under public ownership, or under private ownership as a means of ultimate public ownership, consumers should be required to pay for the plant and give it to the city. While a number of utilities at the present time seem very well established, all of them have been largely transformed within a generation, and there is no absolute assurance that the investment in any of them will not become obsolete within a single generation. If the public is to assume the risk of obsolescence, obsolescence should be met in advance.

Dr. Wilcox said that cities should assume that all the well-established utilities will be publicly owned sooner or later, private capital being entirely excluded from the public streets, except that it is loaned to the city. While the development of interurban utilities, the extension of utility service to rural regions and the grouping of a number of cities in relation to a single source of supply often present serious obstacles in the way of separate operation by or for each distinct political unit, Dr. Wilcox assumes that the most appropriate governmental agencies for the operation of these utilities will be developed as the need arises. The problem that the cities must meet ultimately, and that they should begin to meet definitely now, is that of paying for the public utilities so that the actual transfer of the properties from private ownership to public ownership may be made ultimately. It is a mistake to assume that the reduction of rates will bring public ownership any nearer except as it may squeeze the illegitimate values out of franchises and render the public utility field uncongenial for speculators.

"REGULATION," BY N. T. GUERNSEY

N. T. Guernsey, general counsel of the American Telephone & Telegraph Company, New York, in talking of "Regulation of Municipal Utilities," said that what the public wants and demands is, first, good service; second, the widest possible extension of this service, and, finally, a fair price. If the utility is to fulfil these public requirements two things are necessary. The first is that there be a return from its operation sufficient to attract constantly the new capital which is continually necessary. To-day and in the near future, public utilities, for the money which they require, must compete not only with all normal demands, but with the enormous abnormal requirements due to the war. The second essential is that freedom in the transaction of business which is necessary to progress and to efficient, economical operation, and that this freedom be not unduly restricted by attempts at so-called regulation, which are not in fact regulation, but are efforts to control the details of management and operation.

Regulation, Mr. Guernsey added, costs money. It is not an overstatement to say that millions of dollars are being spent every year for this purpose in the United States. In the ultimate analysis this burden inevitably falls upon the public. To make regulation a benefit to the community and to justify the enormous expense which it imposes upon the public several things are necessary: (1) The regulatory body must be composed of men of unquestioned integrity and force of character. (2) The men composing the regulatory body must have not only the capacity but also the business and special training necessary to the proper determination of the important and intricate questions which are presented to it. (3) The regulatory body should be composed of men who are free from other interests and engagements which would tend to prevent their giving the requisite time to the performance of their duties.

If these considerations are sound, the regulation of municipal utilities should be not local but in the hands of the state commissions. No man should sit as a judge in his own case. Members of city councils cannot in the very nature of things acquire the special knowledge and experience necessary to the correct determination of the many varied, intricate and important questions which arise out of the regulation of public utilities. The public interest does not require the local authorities to do things which may be better done by others.

The idea seems to be more or less prevalent, Mr. Guernsey added, that the function of regulation is to decrease prices and impose burdens upon the public utilities. Every burden upon a public utility is a burden upon the public, which in the final analysis must pay the bills. If the burden brings with it a benefit that is worth to the public what it pays for it, the public can afford it. Otherwise it cannot. Rates cannot be indefinitely reduced by regulation. The downward tendency in rates that has been constant in recent years has been partially met by economies that have been brought about through efficiency in management and operation; but there is a limit to what may be accomplished by such economies, and if this limit has not already been reached it will be soon. Neither by regulation nor by anything else can the public buy service for less than it is worth. To attempt to do this is to invite bankruptcy. The matter of the regulation of municipal utilities is still in the development stage in this country. If this development is to result in successful regulation, something that will contribute substantially to the welfare of the public as a whole, this must be accomplished through the co-operation of the public and the public utilities with a frank recognition of the principles which have been discussed.

"TRANSIT PROBLEMS IN PHILADELPHIA," BY A. M. TAYLOR

Under this title A. Merritt Taylor, director of the department of city transit of Philadelphia, described the program providing for the construction of subway and elevated railway lines by the city at a cost of $46,000,000, and the equipment and operation thereof by the Philadelphia Rapid Transit Company in common with its existing systems.

"We recognize," said Mr. Taylor, "the importance of co-operation between the city and the company in establishing these new facilities in a manner calculated to best serve the public. We also recognize the importance of protecting against destructive competition capital which has been invested in the existing system. Philadelphians stand for a 'square deal' between the city and vested interests. We recognize the vital importance of honestly protecting capital invested in Philadelphia to the extent that it shall produce an attractive return for reasonable service rendered to the public. In the case of our local railway system a contract was entered into in 1907 between the city and the company. With the terms of this contract in force as a basis, it is the policy of the department of city transit in establishing the high-speed lines under the terms of the co-operative program to protect the company to the extent of its annual net earnings gained prior to the operation of the municipally owned lines regardless of the amount of capital which is actually invested in the property.

"We want Philadelphia to stand out as a safe place for the investment of capital for public service. We recognize the great part which the railroad and other public service corporations can take in the development of this city and its industries, but to so take this part they must have credit upon which to raise large sums of money and they must be assured of an adequate and attractive return thereon and immunity from unwarranted competition or political and public attacks. The capitalists of this country are going to invest their money in communities where capital is justly treated and permitted to earn attractive returns and are not going to invest capital in communities where its security is impaired and its productiveness is unduly curtailed by unreasonable legislation, regulation or competition."

Mr. Taylor said that he believes that the time is past when corporations, through political, financial or other influence, can retard the development of the resources of our great cities, make unfair bargains for franchises or refuse to co-operate upon just terms in carrying out great municipal developments and undertakings which are dependent upon their co-operation. On the other hand, he believes that the time is at hand when cowardly public officials will not be permitted by the thinking public to be led by blackmailers and demagogues into imposing unreasonable and onerous terms and conditions upon corporations and invested interests. They will no longer be able to make political capital by pursuing any such course in an enlightened community.

"MUNICIPAL LIGHTING RATES," BY RAY PALMER

In his paper Ray Palmer, commissioner of gas and electricity, Chicago, Ill., said that the two principal factors discouraging municipal ownership of public utilities in our cities to-day are bad politics and the relatively high union scales paid municipal labor compared with that of the low scale paid utility corporation labor for the same class of work. When the results of bad politics are eliminated by non-partisanship elections and a fair living scale of wages is established and regulated in all classes of labor the municipality will be placed on the same operating cost basis of utility service as the corporations with the advantage of low interest charges on the investment. Until such time as this is accomplished municipal ownership will seldom be economical or practical for the public taxpayer. He then quoted some figures on cost in Chicago of 450-watt municipal arc lamps and 300-watt nitrogen tungsten lamps.

"NATIONAL UTILITIES BUREAU," BY L. D. BRANDEIS

Louis D. Brandeis, of Boston, in an address, said that for a long time there has been co-operation among the public utility interests through associations which have advanced in great degree the efficiency of operation. The cities, on the other hand, had no plan of co-operation and the proposed Utilities Bureau is not only a plan but an instrument of co-operation. The mayors must see that it has not only the machinery of operation but also an opportunity of operation.

The objection to stock watering, Mr. Brandeis said, is not at all that men who engage in these enterprises get a large return. Those who in public utility risks hold that a proper return is a fair return compared with other lines of business are right. The objection is that stock watering hides the facts as to the investment. Men have resorted to it many times because they have believed that the public would not regard the actual investment and risk. Mistrust rather than a desire to mislead underlies stock watering. When there is machinery to give the facts the occasion for stock-watering utilities is largely removed.

Mr. Brandeis also said that interlocking directorates tend to obscure facts. Where a man deals with himself as railway manager, banker and manufacturer, the public has not the ordinary assurance that the best trade is made. Mr. Brandeis also thought that no man had the time or the necessary varied knowledge of facts to be a real director in many enterprises.

REGULATION OF UTILITIES

The meeting on Friday afternoon was devoted to the "Regulation of Utilities." Mayor C. H. Harrison, of Chicago, presided. In opening the meeting he said that state control was better than no control, but not so good as local control. The latter brings results. In the early days when the infant utility was taking a chance of possible failure the investor was entitled to extra return for the hazard. To-day these utilities are entitled to a fair profit and no more. Mayor Harrison spoke of early days when the method of control of cities by public utilities could be traced through their expense accounts and doubted whether these practices had been entirely abandoned.

Personal responsibility, he thought, will weigh more heavily on a mayor than upon a governor, who is responsible to a larger constituency, all of whom are not interested in each decision. Mayor Harrison declared that the personnel of the Public Utilities Commission of Illinois is satisfactory and that all regulation must be reasonable. The most valuable commodity the utility possesses is the right to use the streets. Great good would come from public ownership. Let a municipality operate all its utilities and self-interest will induce each citizen to take a more active part in the affairs of local government. The first requisite of public ownership is a rigid civil service that appoints, holds and promotes absolutely on merit. Without it public ownership would be a public disaster; with it public ownership would be made a tremendous blessing to every community.

"COMMISSION REGULATION," BY E. W. BEMIS

Prof. Edward W. Bemis, member of the Board of Supervising Engineers, Chicago Traction, and the valuation bureau of the Public Utilities Commission of the District of Columbia, spoke on "Some Present Issues in Regulation." He told of the increase in the number of state commissions and said that efforts are being made everywhere by utilities to secure regulative acts. Home rule seems to have been checked. On the other hand, the California commission has been organized and manned so magnificently that cities are surrendering all their power to it. State commissions are existent in most states, and, said Professor Bemis, "we accept it even though seeking, as in Chicago, to secure separate regulation. We accept it as something that the country will try out for some years to come." Cities must learn that in order to win cases before state commissions they must prepare their evidence as well as the companies. It is difficult, Professor Bemis said, to get or keep strong commissioners. Criticism was expressed of the action of many of the new commissions in giving perfunctory approval to securities aggregating hundreds of millions of dollars. It is necessary to have trained experts of unimpeachable character on commissions.

"CITIES WITHOUT STATE REGULATION," BY S. P. JONES

S. P. Jones, secretary of the Voters' League, Minneapolis, Minn., made an address on "What Certain Cities Have Accomplished Without State Regulation." While admitting that state regulating commissions have been of substantial service to communities struggling with public utility problems, he said that the bald fact yet persists that it is in cities that have worked out their own salvation that the largest degree of success in rates and service has been achieved. Success in this field, however, cannot be wholly expressed in terms of rates and service. These are emphasized first, for they are the things in utility regulation that appeal most strongly to the public. The greater results are seen in the educational effect upon the community and the preparation it furnishes for the time when public utilities must and will be taken over for community operation. Disinterested students of the public utility problem should see by this time that there is but one logical and one correct solution of this problem, that public utilities must become public utilities, publicly owned and operated. Municipal ownership will not come to cities through the route of state regulation, no matter how efficient in the public interest that regulation may be. In fact, the greater the efficiency the more distant the final day of public ownership.

"A CONSTRUCTIVE POLICY," BY CHARLES DAY

"A Constructive Policy for Public Service Corporations" was the title of the next paper, which was presented by Charles Day, of Messrs. Day & Zimmerman, Philadelphia. Mr. Day advocated the application of scientific principles to rate making and management while continuing governmental regulation. The soundness of the principle of regulation must not be questioned on account of the existence of faults in its application, although, of course, we shall lose the benefits which it should afford if a constructive policy is not established which will eliminate these serious effects.

While there has been a tendency to look to the public for a remedy through the correction of faulty laws and to the commissioners through a modification of their points of view, Mr. Day believes that the responsibility rests squarely upon the corporations themselves. They alone can furnish those facts and statistics without which all argument is futile. The contributions of the engineer-manager are second in importance only to those of the engineer. These men must harvest the full benefits of which the modern steam power plant is capable.

Mr. Day said that the establishment of regulation in many states is so recent that the corporations have not yet been able to adopt new rate schedules based on cost. Rapid strides have been recently made toward the solution of this pressing need, particularly in those states where regulation has been established for some time. The work of the Wisconsin commission has been notable in this regard, Mr. Erickson's contributions especially having paved the way for a system of rate-making that promises to meet almost every requirement. A thorough knowledge of cost and operating conditions is imperative. If correct principles are applied to rate-making, the subject of rates should eventually pass from the jurisdiction of what is now largely individual opinion and debate to that of unvarying scientific law.

"REGULATION," BY J. M. ESHLEMAN

John M. Eshleman, president, Railroad Commission of California, in his paper on "What Regulation Must Accomplish if It Is to Be Permanent," said that a public utility is essentially a monopoly, but as an individual is powerless to protect himself against the abuses to which a monopoly might subject him, there must be state regulation for his protection. Otherwise the utility would be both judge and jury in every case which came before it and so would usurp the right of sovereignty. The only alternative to a monopoly in the operation of public utilities is competition, but competition involves the economic waste of duplication. Properly regulated monopolies mean better service and cheaper rates than competitive public utilities, but competition between utilities will produce better results than monopolies without regulation.

The natural tendency of everyone is to be selfish. Hence the natural inclination of the utility is to give as poor service as possible and to charge the highest price for it. On the other hand, the natural tendency of the public is to demand the best service possible and the lowest price. The wise public utility will not impose conditions on the public more burdensome than the municipality would impose if it tried to perform the same service. On the other hand, the public should realize that it cannot permanently secure any service at less than cost. The maximum service at the least cost is the desideratum. The object of public service regulation should be to produce the same frame of mind in the owner of the private utility property as he would have if he were supplying a competitive service. Those in charge of regulation should bear in mind that there is one form of competition from which a public service monopoly is not free, and that is the competition for money. The utility must always compete for funds to extend and improve its service with the unregulated industries.

Mr. Eshleman said that there were two conditions which inspired action on the part of a utility; one was the fear of loss, the other the hope of gain. If possible the public utility owner should be encouraged by the latter sentiment, but sight should not be lost of the effect of the first. If a utility feels that it is absolutely secure from competition, it may take its ease, but the only justification of monopoly is service rendered. In California no public utility can commence business until it has received from the Railroad Commission a certificate of public convenience and necessity, and the policy of the commission has been not to grant such a certificate where the existing public utility was doing its duty. Nevertheless, certificates have been granted by the board permitting competition where there seemed to be justification in doing so, and in one case as a result the existing utility not only reduced its rates in the competitive territory, but made a reduction as large as 30 per cent in non-competitive districts. Now the company realizes that it must reduce its rates where it can.

In looking toward the future, Mr. Eshleman believed that the government would go into the public utility field when the advantages of so doing were not overbalanced by the disadvantages. He was not convinced that the private owner had clearly proved that private ownership was always better than public ownership. Mr. Eshleman believed that regulation should cover the supervision of capitalization and that unless rates were made on the basis of investment, the theory of private ownership would fall because with public ownership the investment would be the basis upon which the rates would be established. Whether public ownership was desirable when private ownership was doing its best is entirely another thing. Mr. Eshleman said that he believed that if the railroads should be valued on the terms of the La Follette bill railroad rates would have to be raised. This was because of the increase in the value of the lands owned by them, especially terminals. Mr. Eshleman said that if the public utilities will not stand behind intelligent regulation they will lose.

The final question, according to Mr. Eshleman, is whether a private plant can go as far as a public plant can go. Private ownership is always under the handicap that private owners have to pay more for their money. Unless private ownership can overcome this handicap by greater efficiency in operation and in other ways it will lose.

LOCAL AND STATE REGULATION OF PUBLIC UTILITIES

This was the general subject of the meeting Friday evening. The presiding officer was Mayor John Purroy Mitchel, of New York, who spoke of the new Utilities Bureau as a clearing house of information. He said that New York had felt the necessity for some agency through which information of the kind that will be furnished by the bureau could be obtained. In dealing with electric-lighting companies the city lacked the essential facts. Regulation has been established in the United States much more quickly than seemed to be possible a few years ago. Besides the state commissions in forty-five of the forty-eight states, there are local commissions. Non-regulated public utilities are almost as foreign to the thought of managers of public utility companies as to the public.

The old hostility toward the companies has very largely waned, and this has been helped by the decided change in the managerial policy of the corporations. The companies have sought to give good service rather than otherwise. People are no longer willing to accept poor service. In every great city public opinion expects very high-grade service and clean, efficient and straightforward management. In case such service is not forthcoming the public is prepared to provide it through public ownership. Public ownership is a reserve power of which the companies are conscious.

What the cities want, Mayor Mitchel continued, is a high quality of service at just rates providing a fair return and providing for the upkeep of the property. The public cannot mulct the public service corporation of just profits and expect efficient management. It cannot demand low rates at the expense of funds for depreciation and obsolescence and of fair wages. There must be fair wages, good service and wholesome management. After that rate reductions and revenues for the benefit of the city treasury can be considered. Mayor Mitchel said that New York is not advocating a change from private to public ownership, but is advocating the policy of rigorous control of management which it has had for the last seven years. New York has benefited from the work of the Public Service Commission, as much indirectly as directly. The presence of the commission and the temper of the public that it represents have brought about a great change in the attitude of public service corporations. The city now looks forward confidently to the time when the subway and new elevated lines will revert to it.

"Some of us," said Mayor Mitchel, "have thought that the Public Service Commission has lacked aggressiveness. We do not feel that it is a part of us, that it is in close enough touch with what we are doing. I felt this so much that I organized a department of public utilities in the city's law department which is intended to represent the people of New York City in their regulative cases and hearings before the commission." Mayor Mitchel said that he also had thought of a plan to establish a local commission which should voice the interests of the people in the locality.

"STATE AND LOCAL CONTROL," BY HALFORD ERICKSON

Halford Erickson, member of the Railroad Commission of Wisconsin, said that if he should seem to favor state regulation it is because the facts as he has found them point in this direction.

It is the fact that adequate regulation of public utilities requires so much work of a technical and administrative nature that has caused so many states to abandon all efforts so to regulate directly through legislation alone and to adopt in place thereof a public utility law with a state commission. The problems with which regulation has to deal are, in fact, so persistent in their tendencies, so far-reaching in their effect and so complex in their nature that in order to cope with them properly a separate regulating body is required that is intrusted with wide powers, backed by a strong government, has the broadest and best sources of information, and is fully equipped in every other way to deal promptly with the enormous amount of work that is constantly coming before it.

While state regulation, as it is known to-day, has its shortcomings, it has on the whole been fairly successful. It has led to general improvements in the service and to more equitable and on the whole lower rates. Investigations which have resulted from it have also thrown much needed light upon the many important problems that are involved in the operation and regulation of public utilities. In the rates there have been both decreases and increases, but the former are by far the most important. State regulation has afforded an easy, inexpensive and fair means for an informal settlement of any disputes. If economic history teaches anything, it is that institutions like state regulation are simply the outcome of existing economic conditions and that they, as a rule, do not long survive these conditions. The conditions and tendencies in the public utility field, however, which have brought about state regulation are still present and bid fair to remain for some time. The public utility field, for instance, is still a legitimate field for private initiative and investments. There is also a marked tendency therein toward centralization in ownership and operation. Electrical and other utilities, while in a sense firmly established, are still subject to upheavals which flow from inventions and from the competition of new sources of supply and the risks involved therein are considerable. The forces are state-wide and they greatly affect the conditions of regulation. As long as they exist it would seem important that the regulating power also should be state-wide or as broad as the forces with which it has to deal.

There are, no doubt, instances of successful local regulation, Mr. Erickson said. It is also probable that those instances will increase in number as time goes on. At the same time local regulation is beset with many obstacles that are inherent in the situation and are difficult to overcome. To many who have given close attention to the matter it is far from clear that local regulation alone is adequate and in line with the best policy. Of the franchises which were in effect in the State of Wisconsin at the time the public utility law was enacted hardly one has been found which contained adequate provision for the regulation of service and rates. That the necessity for regulation is not obviated when the utilities are owned and operated by the municipalities is quite clear from such experience as the Wisconsin commission has had in the matter. Such utilities furnish no better service than privately-owned or operated utilities. In fact, it is often a great deal worse. Municipalities are, as a rule, slow in responding to new discoveries and improved methods, and they often fail to list and supervise their meters and other equipment properly. While some municipalities furnish good service, the service in the great proportion of them is, on the whole, on a lower level than is the case for privately operated plants.

When it comes to rates the situation from municipally operated utilities is no better. When the commission first entered upon its duties, it found the State literally streaked with unjust discriminations of all kinds, and these discriminations were as flagrant in municipally operated as in privately operated plants. While the rates charged by the municipally operated plants are often relatively low, this is not often due to low cost production of the service, but largely because in one way or another upkeep and other costs are shifted from the consumer as such to the taxpayer as such. In 1912 about 161 out of the 177 municipally owned waterworks and electric plants in the State failed to keep their accounts in such a way that they could be made to disclose the results of their operations. In passing upon public utility controversies a city administration would often have to be both prosecutor and judge. Such relations do not always lead to equitable conclusions and should be avoided as far as possible.

Replies received to a circular letter sent to all utilities in the State operating electric, gas or water departments indicate that a great many operate beyond the boundaries of a single city, and many cover many cities and towns. Thus the Central Illinois Public Service Company has properties in more than 100 cities and villages. Suppose that each of these cities and villages started out to regulate this company or so much of it as was within its limit. Local control would be running riot. The Milwaukee Electric Railway & Light Company embraces the Milwaukee city railways, eleven suburban lines, four interurban lines with 175 miles of track, four city lines in Racine, two lighting systems and one heating system. Seven of the eighteen city lines extend beyond the city limits; nine of the suburban lines have in addition to their regular city run a second fare zone beyond the city. No system of local control could have jurisdiction to link the urban and suburban lines to secure good transpartation facilities.

"STATE OR LOCAL CONTROL," BY MILO R. MALTBIE

In his address, Dr. Milo R. Maltbie, member of the New York Public Service Commission, First District, began with the following postulates: (1) Every generation is apt to have its own ideas of the scope and distribution of governmental powers. (2) Economic and social conditions are shifting constantly. (3) There has been a steady expansion in the field of operation of a single utility. (4) Effective regulation of such large utilities is difficult and expensive. Continuing, he said that, overestimating the importance of these facts, there are those who urge that all control should be transferred from local authorities to the state board; that our great cities, which have a larger population than some states, should be ousted from all supervision over their utilities, and that even the franchise-granting function be taken from them. Between this extreme and complete local regulation there is a middle ground, for certain functions can be exercised more effectively by a state board and others by local authorities. Would it not be as unjust and improper for a state board to fix the terms and conditions upon which a private corporation should use city property without municipal consent as it would be for a municipality to use private property without the consent of the owner? If municipal authorities have been corrupt and if the power to grant or withhold franchises has been abused, the remedy is not state centralization but reform of local conditions, and we have progressed too far in this direction to take a backward step.

Control over the issuance of securities by public service corporations, Dr. Maltbie said, should be lodged in the state. Supervision of accounts and the filing of reports are also matters which should be under state supervision. He also thought that if it is not now it soon will be necessary in most instances for the state authorities to control rate regulation, although, while state commissions are perfecting their methods and organization, it is not advisable to deprive every local authority, and particularly the large cities, of all control over rates. On the other hand, the granting of franchises should be reserved for the cities. Dr. Maltbie criticised the theory that state commissions should determine the rates charged by municipalities operating their own utilities. This, he thought, was another radical infringement of the home-rule principle and would virtually prevent a municipality from dealing with its utilities upon a public-health or common-good basis and require it to raise funds as prescribed by a state board. Dr. Maltbie said that the most practical plan which has occurred to him relative to service matters is for local authorities to continue to exercise the control now vested in them by statutes and city charters but to provide that in case of conflict between different local regulations or between local and state regulations the action of the state body should be controlling.

"LOCAL REGULATION," BY PROFESSOR MERRIAM

Prof. Charles E. Merriam, professor of political science of the University of Chicago, in speaking of the passage of the Illinois Public Utility Commission act by the Legislature of 1913, said that through that act the city of Chicago became the victim of as daring a raid as was ever made by a pirate crew. The bill was passed, he declared, in the interest of the public service corporations. Cities should possess the power to regulate public service corporations which are largely local. They should have the option of whether they shall retain the control over all utilities operating within their borders. There is nothing to prevent cities from securing the best advice to guide them in their regulation of local utilities. The city of Chicago has ample funds for the proper regulation of public service corporations, and it would be entirely feasible for it to have a staff of experts. The contention that city regulation will be more political than state regulation is entirely misleading. The real reason why the corporations prefer state regulation is that the indirect protest of the state electorate is less powerful than the direct protest of the local electorate. The public service corporations of Chicago will never be as effectively regulated by the State as they would be by Chicago. In conclusion, Professor Merriam said that cities deprived of the power to regulate may be forced to own and operate public utilities.

"LOCAL REGULATION," BY THE MAYOR OF READING

Mayor Ira W. Stratton, of Reading, Pa., said that while the aim of commission government is to centralize and to concentrate power and authority, the pendulum can be made to swing too far in that direction and the matter be overdone. That has been the case in Pennsylvania. Mayor Stratton said that he had no grievance against the individual members of the commission, their character, integrity and honesty of purpose. He does not believe that the commission would intentionally use the vast power at its command to the detriment of the municipalities of the State, but no necessity exists for conferring it upon them, and the act should be modified very materially. The most striking feature resulting from state regulation of public utilities, outside of its inefficiency, is its frightful cost. Mayor Stratton said that he was informed that there had been spent by the public service commissions of the several states during the last year the amazing sum of $40,000,000. "Do you marvel," he asked, "that the public is awakened and demanding that laws of regulation that do not regulate but only result in great cost, inefficiency, delay and inconvenience be corrected?"

MUNICIPAL OWNERSHIP AND OPERATION

Mayor Newton D. Baker, of Cleveland, was the presiding officer of the meeting on Saturday morning. Speaking on "Municipal Ownership and Operation," he said that the movement for municipal ownership is the direct effect of the misconduct of public service corporations. Some years ago, he said, practically every state legislature and practically every city council had been either corrupted or was under very grave suspicion, but in large part these conditions have disappeared.

Municipal ownership, Mayor Baker said, is a question of social organization and economic policy. The question of whether there shall be public ownership must be determined by consideration of all the elements that enter into the problem at any one place. To make public ownership successful the people must be willing to understand and maintain the conflict. Public utility corporations are now banded together to maintain the status quo. They have abandoned the idea of obtaining exorbitant franchises, and in the main are trying now to hold what they have secured.

"MUNICIPAL OWNERSHIP ABROAD," BY F. C. HOWE

Frederick C. Howe, Commissioner of Immigration, New York, said that the zone system of fares in English municipalities does not seem to arouse any protest and that it stimulates short-haul business. There is a constant pressure on the municipally owned lines from laboring classes to secure reduction in fares, but councils in most cases prefer to retire debts and keep up the plants. Electrical plants are municipalized to a greater extent than gas plants in England. This, he believes, is because very few electrical franchises were granted by England until electrical central stations had been established firmly in America and Germany and then, when the tramways were taken over, the English people wanted to co-ordinate the services.

ADDRESSES BY MANAGERS OF MUNICIPAL PLANTS

Mr. Howe's address was followed by a talk by Albert E. Winchester, manager and superintendent of the municipal electric lighting plant at South Norwalk, Conn., and he was followed by C. W. Koiner, manager of the municipal electric lighting plant of Pasadena, Cal. Mr. Winchester said that the South Norwalk plant had been kept out of politics by agreement between the political parties. Mr. Koiner quoted some rates charged in Pasadena and said that if the municipality had the entire field to itself it could reduce rates still further.

"MUNICIPAL OWNERSHIP," BY CLARKE M. ROSECRANTZ

Clarke M. Rosecrantz, a member of the firm of Sullivan & Cromwell, New York, general counsel for the Milwaukee Electric Railway & Light Company, was the next and last speaker of the morning. He said that he had yet to find any instance where an examination of the accounts of municipal utilities will show that their rates have been less than those of privately operated utilities without showing a deficit when proper charges incident to the cost of service were made. If insufficient rates are charged, Mr. Rosecrantz declared, "the non-users must make up the deficit, and their proportion of that deficit will be included in their tax bills. If the public operation of utility companies is likely to be successful, we ought to be able to find without any difficulty that those which have for many years been owned and operated by municipalities have been economically and efficiently operated. The history of our city management shows that the contrary is the fact."

"Many cities have been investigated by bureaus of public efficiency," he said, and "we do not find that in those matters which are properly within the province of municipal operation there has been efficient and economical management." He cited criticisms of municipal affairs in New York, Cleveland, Chicago, Milwaukee, Pittsburgh and Cincinnati. As to the claim that municipalities can raise money for public utilities at a less rate than private corporations, Mr. Rosecrantz declared: "That this cannot be done where the plant alone is pledged, is clear. It can only be done, if at all, where the city has a wide margin between the existing indebtedness and its bond limit, and it will guarantee the bonds so that it will be obliged to make any deficit occasioned by any losses in operation by resorting to taxation." Among the reasons against municipal ownership given by Mr. Rosecrantz may be stated the following:

"Public officials in charge will not have had the necessary experience and training. Extensions of service will be made for political reasons often into territory where the business would not afford a return upon even a fair proportion of the cost of the extension.

"Corruption will not be decreased, but will be increased. Public service will be less even. The policy and plan of operation and extension of the utility will be changed with change of administration. Politics will enter into every branch of the service and to the detriment of the service.

"Taxes will have to be increased to make up the deficit caused by operation and to pay for costly mistakes. The individual employee will not have a reason for giving the best there is in him. He can gain nothing by increased effort or showing ingenuity. The public will gain nothing in service or rates and will lose as to both. If a municipality once assumes such an undertaking it must assume others. The history of other countries shows that it cannot stop."

CONSTRUCTIVE UTILITY PROGRAM

At the afternoon session the resolutions of the special committee were presented by Mayor Baker as follows:

"We congratulate the cities and people of America upon the candor and fearlessness with which their representatives have in this conference faced the problem of the relation of the public to public utilities. The conference has been helpful in its interchange of opinion and experience, and especially in its development of the idea of the community of interest among the cities. With that made plain, we can now proceed to a program of inter-city helpfulness which must be the permanent outcome for good from the conference.

"We recommend: That no general conclusion be formulated upon the abstract question of municipal ownership, but, rather, we express our judgment to be that municipalities should be given in all instances the power to municipalize public utilities, the expediency of its exercise being at any time and place, and with regard to any particular utility, a matter for local determination.

"That we make no general determination as between state board and local or home-rule regulation of public service corporations. That we do, however, declare that the franchise-making power should in all cases be local, that municipally owned utilities should be subject to local control only, that in large cities local regulation is plainly to be preferred, and that in all cases the principles of home rule should be preserved by at least leaving it to the people of a city of whatever size to determine whether they desire to act for themselves or to call in a state board, if one exists, either to regulate or to aid the local authorities in regulating privately owned local utilities.

"That we indorse the idea of the establishment of the Utilities Bureau, as a nation-wide inter-city agency for bringing the combined ability and experience of all our cities to the service of each city which may face a public utility problem. Through it we meet the combination of private interests with a combination of public interests, and to the specialized experts which private interests thus mass in defence of one another we oppose the skill, experience and resources of the united cities of the country.

"We recommend that the trustees of the Utilities Bureau proceed to its further organization, outlining a plan by which its support may be assured and its services made available. In this connection we suggest for the consideration of the trustees that an office be provided, records kept, experts be employed, and that cities which can legally do so contribute on some equitable basis to the expense of the bureau, in excess of its earning, when in the service of cities actually using its facilities in the solutions of particular problems.

"We vote our hearty recognition of the high public service performed by Mayor Blankenburg in calling this conference; to Mayors Mitchel, Harrison, Shroyer and Baker, for their sympathetic assistance to him; our appreciation of the gracious hospitality of the city of Philadelphia, and our thanks to the American Academy of Political and Social Science."

During the afternoon also brief addresses were made by Messrs. Crosser and Frankfurter. Abstracts follow:

"MUNICIPAL OWNERSHIP," BY CONGRESSMAN CROSSER

Congressman Robert Crosser of Ohio said that in every other kind of business than public utilities there is competition. No matter how good or how bad managers of private companies are, they are human, and if they have the right to control service they will regulate it in the interest of profits. The policy of regulation is not new, although the form of regulation now common may be new. Instead of having regulation by a city council or a board of aldermen, there is now regulation by a commission. Congressman Crosser declared that employees of public utilities privately owned are in politics now, and that it would be desirable to have one set of officials in control of general city operations and public utilities, so that the people could hold them responsible. Public ownership will purify politics by freeing the public from control by corporations. The speaker said he wants cheaper and better service, but above all he wants to have the cities purified.

"CONCERTED ACTION," BY PROFESSOR FRANKFURTER

Prof. Felix Frankfurter, professor of law of Harvard University, said that in the decision of public utility questions there should be a balanced representation. Up to date, the opposing interests have not been well balanced. Concerted ability on the part of the corporations must be met by concerted ability on the part of the public. In the telephone rate case now pending in New York the company has the facts as to the value of its property, but the city lacks them and cannot get them without an expenditure out of all proportion to the importance of the matter. The same condition exists in the controversy over street lighting rates in Boston. The fact should be demonstrable without difficulty.

HOLDING COMPANIES AND THE PUBLIC WELFARE

Abstracts of the addresses made at the Saturday evening session follow:

"HOLDING COMPANIES," BY F. T. HOMER

Francis T. Homer, of Bertron, Griscom & Company, New York, said that the most serious charge brought against holding companies generally, and therefore public utility holding companies, is that they afford a most convenient means for overcapitalization. That all holding companies are susceptible to this abuse cannot be denied. But public utility holding companies do not offer the same opportunity for overcapitalization as those in the industrial field because the history of public utility investment has been one of almost uniform growth in the volume and security of earnings and not one of large fluctuations. Overcapitalization of the operating company in itself is not facilitated in any manner by the instrumentality of the holding company. Public utility holding companies do not result in the centralization of large power for their officers and directors, for the reason that they are usually so financed as to provide only such an amount of working capital as can be profitably employed in temporarily financing the subsidiaries, so that in adverse times the bonds and preferred stock of the subsidiaries need not be sacrificed, and so that even in good times the disposition of the securities of the subsidiaries can be postponed until the investment made therein is demonstrative of the increasing earning power of the subsidiaries and the higher grade of credits which its underlying securities should command.

Operating companies included in a holding company are under the stimulus of competition in their different departments with similar departments in other companies, and the average of operating economy and efficiency is materially greater in the public utilities which are subsidiaries of large holding companies than in the isolated, unaffiliated companies locally owned and controlled. The advantages arising from uniformity of accounting from the purchase of material and supplies in volume and the lower prices from the use of the greater credit of the holding company are self-evident.

The conference of mayors, Mr. Homer added, is welcomed by the public utility people. There is nothing so harmful to the public service corporations as a lack of public understanding and comprehension of their functions, their duties and their rights. In the face of an increase in the costs of materials, supplies and labor used for the public service corporations proportionate to the increased cost of such commodities and labor in other business channels, public service corporations have nevertheless steadily and uniformly reduced the actual costs of the service which they furnish the public.

Of approximately $4,000,000,000 of securities invested in street railways, 81.4 per cent are organized into or affiliated with holding companies. Of the $2,100,000,000 of securities outstanding in the electric light and power business, 82.5 per cent are organized into or affiliated with holding companies. Of the $1,300,000,000 of securities outstanding of gas companies, over 66 per cent are organized into or affiliated with holding companies, so that out of approximately $7,500,000,000 of gas, electric and traction capital 78.5 per cent is now organized into or affiliated with about 140 independent holding companies whose securities are known and bought throughout this country and Europe. The last annual report of the comptroller shows that for the year 1913 the investment holdings of the national banks in public utility issues had increased nearly 20 per cent over their previous holdings, while their investments in railroad securities decreased over 6 per cent.

"HOLDING COMPANIES," BY C. F. MATHEWSON

Charles F. Mathewson, of Krauthoff, Harmon & Mathewson, counsel for the Consolidated Gas Company of New York, said that the great majority of public utility holding companies exist to meet a real need. They add immensely to the development and the efficiency of the service of public utilities and inure enormously to the benefit, not only of their immediate customers, but also of the entire communities in which such utilities are established. If, through the medium of a company holding scattered plants, the hazard of the investor is rendered less than it would be if his eggs were all placed in a single basket, he would be willing and could be compelled to accept a lower rate of return upon his capital.

Mr. Mathewson expressed the belief that the centralization of financing and management which is made possible by the holding company, or which is made possible by a centralized holding by any other method, is of vast and growing importance to the development of the company in the line of public utilities and the activities of the community which are dependent thereon or connected therewith. The element of destruction of competition which is said to lead to monopoly is not present; for scattered public utilities at different points never, or only in rare instances, could be competitors with each other. Moreover, being subject to state regulation, their charges to and treatment of consumers may be controlled for the public good, and in certain public utilities, at least, a regulated monopoly is more conducive to the convenience and good service of the public than any amount of competition.

The holding company, Mr. Mathewson concluded, has come to stay because it ought to stay, because it is an instrument of progress and efficiency and development and its elimination would be a misfortune whose consequences would be difficult to calculate, but certainly immense.

"HOLDING COMPANIES," BY J. P. GOODRICH

James P. Goodrich, director of the National City Bank, of Indianapolis, Ind., said that so far as the existence of public utility holding companies is concerned, no possible objection can be urged. Competition in public utilities is never desirable from the standpoint of either the investor or the public. Public utility holding companies enjoy wider banking facilities, and it will be conceded that in operating, managing and legal directions such companies possess certain advantages. By the policy of checking one plant against another the properties are keyed to the highest point of efficiency.

No holding company, Mr. Goodrich declared, ought to be permitted to acquire only a controlling interest in operating property and manage the whole company in the interest of that controlling share. Holding companies should be required to acquire the entire stock interest in the property. The speaker had no sympathy with the cry against big business. Public opinion, however, must require the regulation of holding companies as well as operating companies.

Changes in Railway Section of A. I. E. E. Standardization Rules

The standards committee of the American Institute of Electrical Engineers held two sessions on Nov. 14 and approved the revision of the standardization rules which has been in process for a year past. The revised code will be effective on Dec. 1. The board of directors on July 10 approved the rules in preliminary form subject to revision by the committee so that no further action by the board is necessary. The revision of the electric railway standards was in charge of a sub-committee consisting of W. A. Del Mar, New York Central Railroad, chairman; F. W. Carter, British Thomson-Houston Company; Hugh Hazleton, consulting engineer, New York; E. R. Hill, Gibbs & Hill; H. M. Hobart, General Electric Company; William McClellan, consulting engineer, New York; Harold Pender, professor University of Pennsylvania; Martin Schreiber, Public Service Railway, and N. W. Storer, Westinghouse Electric & Manufacturing Company.

The important revisions in this section include the following: The rating of substation machinery was changed to differentiate between overload capacity of machines for ordinary and for extreme fluctuations of load and for specification of input power-factor other than 100 per cent. The section (No. 418) on maximum motor output was stricken out and a statement made to the effect that the subject of overloads is under investigation. The table of permissible operating temperatures was altered so as to clarify the intent of the phrase "short period." The revised rule states that 'for infrequent occasions, due to extreme ambient temperatures, it is permissable to operate at 15 deg. higher temperature" (see Section 419). An inconsistency in the sections on efficiency tests was eliminated by inserting a new table of core losses based upon a larger number of experimental results than had been originally available. The appendix, Section 437, was changed insofar as it relates to core losses to correspond with Sections 427 and 428. Allowances for axle-bearing and gearing losses (Section 430) were considerably decreased on the basis of extensive data and the range of the table was extended to double load. The statement was appended that further investigation may indicate the desirability of giving separate values of the losses for full and tapped fields, or slow and high-speed motors.

The Chicago, Milwaukee & St. Paul Electrification

The Final Plans Have Been Made and the Contracts Placed for the Electrification of 113 Miles of Trunk Line —Locomotives Weighing 260 Tons and Using Regenerative Control Will Be Used—Four Substations Will Supply 3000-Volt Direct Current to a Double Overhead Trolley Wire

With the placing, last week, of the contract for the electrical equipment for the Chicago, Milwaukee & St. Paul electrification there has been taken one of the most important steps in the history of the supersession of steam by electricity. In this instance electrical operation has been adopted, not because of the smoke nuisance, the high cost of terminals, the congestion of traffic, or any of the dozen other impelling but peculiarly local causes that have necessitated past installations, but rather because of the accumulated evidence as to the normal operating economies that may be expected from the use of the more modern form of motive power with low-priced hydroelectric energy. labor and material necessary to complete the first 113-mile division will cost approximately $3,000,000. It is also estimated that the complete electrification, comprising 440 miles, will cost approximately $12,000,000, but the change in motive power is expected to result in a saving of 25 per cent over the costs involved by the present system of operation.

With regard to route mileage, this electrification is the first step in a scheme which, when completed, will very greatly exceed anything that has heretofore been attempted. The immediate program calls for the electrification of 113 miles of line between Three Forks and Deer Lodge, Mont., as shown in the accompanying map.

C., M. & ST. P. ELECTRIFICATION—MAP NORTHWESTERN SECTION OF THE UNITED STATES SHOWING ELECTRIFIED DIVISION

In authorizing the statement that the final contract for the work had been closed, C. A. Goodnow, assistant to the president in charge of construction, Chicago, Milwaukee & St. Paul Railway, said that field work on the overhead line would be started as soon as forces could be organized. Practically all of the poles are on the ground at the present time, and the overhead line material will be available as rapidly as it is required. The contract calls for the delivery of the first substation equipment on May 1, 1915, and the first locomotive on Oct. 1, 1915. Upon receipt of the first locomotive it is planned to run an operating test, and, if this is satisfactory, the electrified division will be in full operation by Jan. 1, 1916.

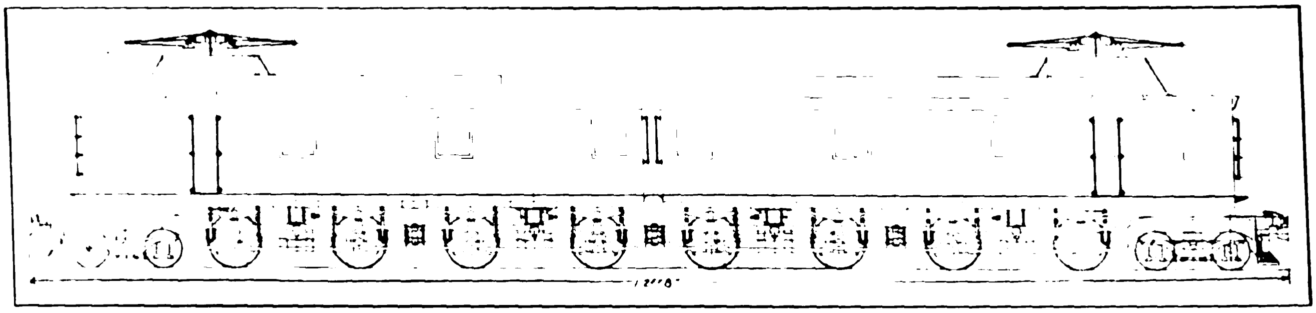
The contract for electrical apparatus, which was placed with the General Electric Company, covers the equipment for four substations, the overhead line materials and twelve locomotives. It is estimated that the This, with sidings, makes a total single-track mileage of 168. The plans for the near future, however, include the extension of the electrified zone to cover 440 route-miles between Harlowtown, Mont., on the east, and Avery, Idaho, on the west, the whole foreshadowing the ultimate electrification of the main line to the Pacific Coast, a distance of 865 miles.

OVERHEAD CONSTRUCTION

Power for propulsion will be furnished at 3000 volts, d.c., and it is obvious that the remarkable success of the 2400-volt electrification of the Butte, Anaconda & Pacific Railroad, which, as shown by the map, is in the same general locality as the proposed electrified division, contributed largely to this choice of system. In fact, the overhead construction is to be exactly similar to that used on the Butte, Anaconda & Pacific Railroad, except that a double trolley wire of No. 0000 copper will be used in order to provide greater collection area for the pantograph shoes. The contact wires will be supported by a flexible catenary construction that will be hung from mast arms on wooden poles, the single-pole bracket construction having been adopted because it affords a minimum obstruction to the view and also is less expensive than the use of span wires. Double poles with span wire, however, will be employed where there are two or more tracks as well as at the sharper curves.

A limited amount of feeder copper will be placed on the poles at the present time to minimize the voltage drop between substations. A high-tension transmission line will also be installed along the right-of-way, tying the substations together. This line will be erected and maintained by the railroad company, independently of the transmission lines from the hydroelectric company which is to supply the power, and it will form a ring system to protect against shut-downs through line failures.

The prime power will be purchased from various hydroelectric plants of the Montana Power Company, and it will be transmitted to the railway company's substations at 110,000 volts, three phase, sixty cycles. The price at which it will be furnished approximates ½ cent per kilowatt-hour, the power factor being limited to a variation of 20 per cent from unity and the monthly load factor being the equivalent of 60 per cent when based on the contract load. As planned at present, the load factor will easily be maintained by requiring the dispatcher to adjust train movements so as not to exceed the maximum amount of power covered by the power contract.



C., M. & ST. P. ELECTRIFICATION—LOCOMOTIVE DIAGRAM SHOWING ARRANGEMENT OF DRIVING WHEELS AND MOTORS

SUBSTATIONS

Contrary to previous reports the high-tension alternating current will be transformed to 3000 volts d.c. in four permanent substations. These will be built of brick and will have concrete roofs that will provide a support for overhead high-tension busbars. Indoor transformers, of the self oil-cooled type, will step down the high-tension current to 2300 volts a.c. for use in motor-generator sets, each of the latter being composed of a synchronous motor mounted on the same shaft with two 1500-volt d.c. generators that are connected in series to supply 3000 volts to the line. Each unit will have two separate exciters for the synchronous motor and for the generator fields, and, with the control switchboard and transformers, will make a complete, independent set.

Two of the four substations that will be installed for the 113-mile division will contain equipments consisting of three 1500-kw motor-generator sets, and each of the other two substations will be equipped with two 2000-kw motor-generator sets. The total substation capacity will thus be 17,000 kw, or about 50 per cent of the input of all of the locomotives, the reason for this relatively high percentage being the high requirements for starting trains which reach momentary peaks of more than 5000 kw. These momentary loads will be easily carried, however, by the five-minute overload capacity of the motor-generator sets, which will be of the order of 200 per cent. The substations will be erected and placed in operation by the railway company, the General Electric Company furnishing all of the electrical machinery.

LOCOMOTIVES

The locomotives, of which twelve are to be included in the initial installation, are truly remarkable for their size and power. Each will consist of two half-units permanently coupled together to make an engine 112 ft. 8 in. long that weighs 260 tons and that has 200 tons on drivers. The prominent feature of the design is the use of a separate motor twin-geared to each of the eight pairs of driving wheels. In the design may be seen the principle of "stretching out" the locomotive and thus minimizing the localization of vertical and horizontal blows on the track. The same principle was followed, although on a much smaller scale, in the case of the latest type of high-speed electric locomotive built by the General Electric Company for the New York Central Railroad, these engines having made a remarkably successful record for the past year in hauling the extremely heavy through passenger trains on that road.

The eight pairs of drivers for each complete locomotive are equally spaced at about 10-ft. intervals. Each half-unit has two articulated trucks with frames outside of the driving wheels, and this arrangement, together with the connection between the half-units themselves provides a chassis composed of four trucks linked together by three permanent couplings. The driving-wheel trucks at the extreme ends of the complete unit have their frames extended to provide center-pin castings for four-wheeled bogie trucks, the extended framing carrying also the bumper beams and coupler at each end of the locomotive.

A summary follows of the general dimensions and weights of the locomotive:

Length face to face of couplers	112 ft. 8 in.
Total wheelbase	103 ft. 4 in.
Wheelbase each half unit	46 ft. 7 in.
Minimum driving wheelbase	5 ft. 0 in
Total weight	260 tons
Weight on drivers	200 tons
Weight on each pair of driving wheels	25 tons
Weight on each bogie truck	30 tons
Diameter of driving wheels	52 in.
Capacity of locomotive—continuous rating	3000 hp
Capacity of locomotive—one-hour rating	3440 hp

The drivers are 52 in. in diameter and they are equalized in pairs on each side, so that each one of the four driving-wheel trucks is independent. The drivers on the end trucks are not excepted so that there is no cross equalization anywhere in the structure. Naturally each driving-wheel truck also has its own brake-rigging system. The bogie trucks at the ends of the complete unit are of the standard locomotive type with 36-in.

wheels on 6-ft. centers. Each one will transmit a 30-ton load to the truck wheels for guiding purposes, the truck center pin being 13 ft. 5 in. ahead of the nearest driving axle.

The cab extends practically the full length of the locomotive, the space between the two half-units being minimized to provide easy passageway from one end of the locomotive to the other. The height of the cab roof is only 13 ft. 10 in. above the rail exclusive of the housings for the ventilators, but the pantograph bases extend about 5 ft. above this owing to the great height of the trolley wire, which will be maintained at an elevation of about 24 ft. above the rail. The cab for each half-unit will be supported at two points, one permitting rotation and the other a sliding movement so that the chassis can weave about in accordance with the requirements of the track but without affecting the cab.

MOTORS AND CONTROL

The eight motors for the complete locomotive will be of the General Electric No. 253-A type, and each will have a continuous rating of 375 hp and a one-hour rating of 430 hp. This will give the locomotive a continuous rating of 3000 hp and an hourly rating of 3440 hp. The drawbar pull effective for starting trains will approximate 80,000 lb. As previously mentioned the motors will be twin-geared to the driving axles, that is to say, each armature shaft will carry a pinion on each end, and it is only in the matter of gear ratio that the passenger locomotives will differ from those used for hauling freight.

The motors will be insulated for 3000 volts, but they will be permanently connected in pairs in series so that the voltage across each one will be 1500 when the locomotive is operating in full parallel on the 3000-volt trolley. The control will provide three running positions with the four pairs of motors connected in series, series-parallel or full-parallel, but the control system will include the novelty (for this country) of using regenerative braking control for holding trains on down grades. This will provide also for regenerative return of energy to the trolley wire on long down grades so that the presence of a train going down a mountain grade will be of assistance to another train coming up. This obviously will improve the load factor of the electrified division to a marked degree.

The motor equipment will enable locomotives in freight service to pull 2500-ton trains up 1 per cent grades at a speed of 16 m.p.h., or, when two locomotives are used on a train, will provide power enough to pull 2500 tons up a 2-per cent grade. However, the plan of operation includes the general use of a locomotive at each end of trains on ascending grades, there being one 2 per cent grade 20 miles long and two 1 per cent grades approximately 35 miles long on the electrified section. On descending grades only the locomotive at the head end will do the regenerative braking. The locomotives in passenger service will be called upon to haul trailing loads of 800 tons at a speed of 60 m.p.h. on the level.

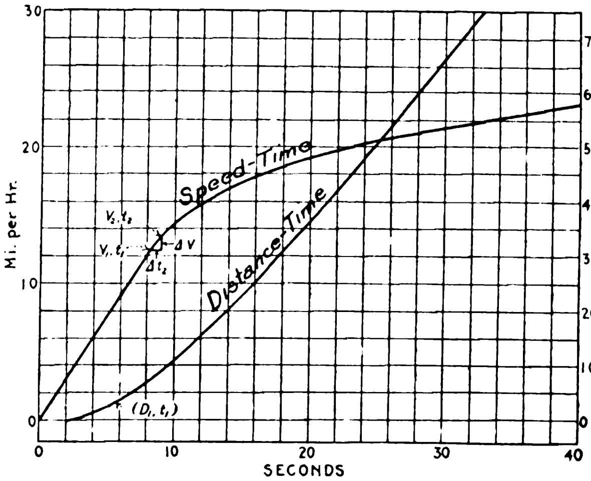
Collection of the large drafts of current (ranging from 1500 amp to 2000 amp at 3000 volts) that will be required for the service at times will be effected through the use of two pantographs of the "pan" type on each complete locomotive. As a provision against the possibility of injurious arcing, however, and to supply an ample factor of surplus capacity the previously mentioned use of a double trolley wire was considered desirable. This secures flexibility and gives a greater area of collection, the maximum draft of current per pantograph contact being thus reduced to the order of 500 amp.

All of the plans for the electrification project have been in charge of C. A. Goodnow, assistant to the president, Chicago, Milwaukee & St. Paul Railroad, and R. Beeuwkes, electrical engineer, and the work of construction that is soon to commence will be under their direction. In general, all of the erection will be done by the railroad company including the installation of the overhead lines, the construction of the substations, and the preliminary operation during the future period of transition from the use of steam to that of electricity.

Electric Railway Graphics at A. I. E. E. Meeting

Graphical Methods of Plotting Velocity-Time and Distance-Time Curves Were Considered at Last Week's Meeting

At the regular monthly meeting of the American Institute of Electrical Engineers, held in New York on Nov. 13, part of the time was devoted to the presentation and discussion of a brief paper on "A Graphic Method for Speed-Time and Distance-Time Curves," by E. C. Woodruff, of the electrical engineering faculty, Pennsylvania State College. This paper appears in the November issue of the A. I. E. E. *Proceedings*. The paper was discussed by C. O. Mailloux, N. W. Storer, Max von Recklinghausen, F. Castiglioni, and others. The general trend of the discussion indicated that the method outlined by the author was ingenious but that it had been used before substantially in the same form. The speakers emphasized the importance of graphical methods when many calculations are to be made. Mr. Mailloux described the methods which he had developed for applying the integraph, a special form of planimeter which traces an integral curve, to electric railway problem solution. The limitations of graphical methods in regard to accuracy were referred to in the discussion, especially in methods involving an accumulation of errors as the one just presented does.



RAILWAY GRAPHICS—FIG. 1

Professor Woodruff's method of plotting time-speed, or as Mr. Mailloux prefers "velocity-time," curves is explained and illustrated briefly below:

In Fig. 1 are shown the curves which are desired; that is velocity-time and distance-time curves.

The velocity-time curve consists of two parts; a straight line from $V = o$, $t = o$ to $V_1 t_1$ where starting resistance has all been cut out, and a curved line from $V_1 t_1$ onward as current is cut down by increasing counter-emf.

The straight-line part of the curve is calculated by assuming starting current per motor and reading from the traction-current curve furnished by the motor manufacturer or experimentally determined, the traction corresponding to the gear ratio and wheel diameter used. The acceleration is calculated by means of the formula,

$$\text{acceleration} = \frac{\text{force}}{\text{mass}}.$$

where acceleration is in feet per second per second, mass is weight in pounds divided by acceleration due to gravity, 32.2 ft. per second per second, and force is in pounds. Extra allowance must be made for the mass of rotating parts, roughly about 10 per cent of the total.

For example, assume that the starting current in the case illustrated in Figs. 1 and 2 is to be 70 amp per motor. The car weight is assumed at 7½ tons per motor and the speed-current and traction-current curves in Fig. 2 are plotted for a certain motor geared 69:17 with wheels 33 in. in diameter.

At 70 amp the traction is 1190 lb. per motor and the resistance, as determined from Armstrong's formula, and plotted in Fig. 2 (see speed-resistance curve) is about 85 lb. per motor.

Armstrong's formula is

$$f = W'\left(\frac{50}{\sqrt{W}} + 0.03V + 0.002V^2a(1 + 0.1[N - 1])\right)$$

Where

f = resistance in pounds (2000 lb.),
W' = weight of train in tons,
W = weight of load in tons per motor,
V = speed in miles per hour,
a = cross-sectional area of train in square feet, and
N = number of cars in train.

The net traction on level tangent track is then 1190 — 85 = 1105 lb. per motor.

The corresponding acceleration is, in miles per hour per second,

$$a = \frac{1105}{7.5} \times \frac{3600 \times 32.2}{5280 \times 2000} \times 0.9, \text{ or approximately}$$

$$a = \frac{1105}{7.5} \times \frac{1}{100} = 1.53 \text{ m.p.h.p.s.}$$

The speed, by Fig. 2, for 70 amp is 12.5 m.p.h. To reach this speed at a = 1.53, requires 8.15 seconds. Thus V = 12.5, and t_1 = 8.15, Fig. 1, and this is connected with the origin by a straight line, as the current per motor, and therefore the acceleration, is assumed constant up to this point.

From V_1t_1 up it is necessary to assume intervals of time or speed and to calculate the corresponding speed or time. These increments are represented by ΔV and Δt in Fig. 1. It proves to be easier to assume increments of speed. Then the average speed while the speed is increasing from V_1 to V_2 is $(V_1 + V_2) \div 2 = (2V_1 + \Delta V) \div 2$.

From this average speed and the curves in Fig. 2 the traction, current and time can be calculated by the method already outlined.

Professor Woodruff simplifies the calculations by means of certain "service curves" plotted between net traction and time, of which one is shown as a hyperbola in the upper right-hand corner of Fig. 2. These simply show the times in which a certain increase in speed will be produced by different applied net traction forces. The one shown is for $\Delta V = 1$. The data for these curves are calculated by means of the fundamental law already mentioned. One will need as many of these curves as he proposes to use values of ΔV, the use of smaller values of ΔV being necessary on the upper flat part of the velocity-time curve to insure accuracy.

To show the application of the curves assume ΔV = 1 in Fig. 1. The average V between V_1 and V_2 is 13 m.p.h. In Fig. 2 a horizontal line is drawn at 13 m.p.h. intersecting the current curve at 65 amp. A vertical line through this point intersects the traction line at A and the gross traction is AD. The net traction available for acceleration is AB, which is laid off with dividers on the service curve, which is intersected at 0.58 seconds. This is Δt and it determines the point V_2t_2. This procedure is followed until the desired length of curve is obtained. (Fig. 2 is reproduced here simply for illustrative purposes. It was reproduced from the advance copy of the paper, but appears to the abstracter to have been inaccurately reproduced from the author's original chart.)

The distance-time curve is obtained thus. Up to time t_1 the distance is most readily calculated point by point from

$$D = Vt$$

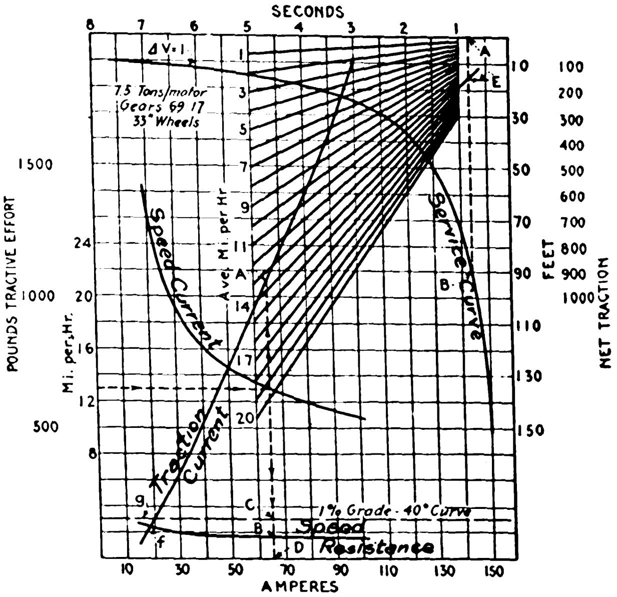
$$D \text{ (in feet)} = \frac{\text{m.p.h.} \times 5280}{3600} \times \text{sec.}$$

when V is the average velocity up to the time t.

From t_1 on the distance can be obtained from the area under the velocity curve by counting the squares or using a planimeter, the value of each white square being

D' = 2 (m.p.h.) × 2 (sec.) = 4 m.p.h. — sec. = 5.87 ft.

This calculation is greatly simplified by means of a series of radial distance-time lines drawn from the upper right-hand corner of the diagram for different speeds. The point in which the service curve intercept intersects the distance-time line corresponding to the appropriate speed is the increment of distance corresponding to the assumed speed increment. (See point E, Fig. 2.)



RAILWAY GRAPHICS—FIG. 2

It remains only to explain the correction for grade and curve resistances. Horizontal lines are drawn in Fig. 2 corresponding to these resistances. Grade resistance is 20 lb. per ton per per cent and curve resistance is assumed at 1 lb. per ton per 2 deg. curvature. In stepping off the net traction the intercept is simply reduced by the curve resistance and reduced or increased (on down grade) by the grade resistance.

The British Columbia Electric Railway, Vancouver, B. C., has arranged to look after the families of all of its employees who have volunteered for active service during the war. A special officer has been appointed to take charge of the work, and the employees are contributing 1 per cent of their monthly wages to the fund. The company has made a contribution of $1,000 to the general relief fund in Vancouver.

Central Electric Railway Association Meeting

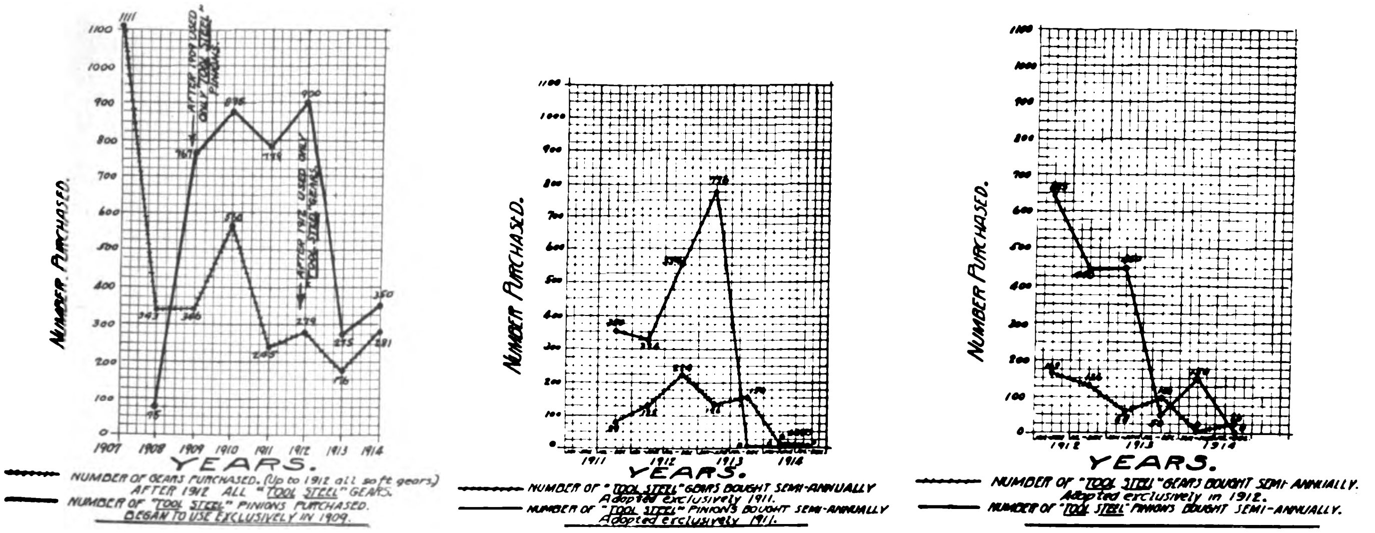
Among the Subjects Discussed at This Meeting, Which Was Held in Fort Wayne on Nov. 19-20, Were Those of Intermating Hard Pinions with Soft Gears, Timber Preservation, Selection of Railway Equipment, and a New Standard Flange Contour—Abstracts of the Papers Are Published, Together with a Telegraphic Report of the First Day's Proceedings

The autumn meeting of the Central Electric Railway Association was held in Fort Wayne, Ind., on Nov. 19-20. At this meeting five papers were presented and three of these are published in abstract below. An important report of the C. E. R. A. committee on standards was also presented at the meeting in which a new standard wheel-flange contour, differing from the A. E. R. A. standard, was recommended for adoption by the association, and an outline of this committee's recommendations follows, together with a report of the proceedings on Thursday, Nov. 19.

RUNNING TOOL-STEEL PINIONS WITH SOFT GEARS

BY E. S. SAWTELLE, ASSISTANT GENERAL MANAGER TOOL STEEL GEAR & PINION COMPANY

With regard to the results that have been secured by running tool-steel pinions with low-carbon untreated gears we have found that the three following general laws may be formulated: (1) Where an untreated gear has a carbon content of less than 0.30 per cent a tool-steel pinion will be injurious to it. (2) Where the untreated gear has a carbon content of 0.30 per cent or over, the tool-steel pinion will not decrease its life, and if the carbon content runs reasonably high, the tool-steel pinion will prolong its life. (3) In either case where the tool-steel pinion is mated with an untreated gear the life of the pinion will usually be lessened and frequently will be reduced from one-half to one-third as much as would be obtained if it were mated with a tool-steel gear.



FIGS. 1, 2 AND 3—GEARS AND PINIONS—DIAGRAMS SHOWING EFFECT OF USE OF HARD PINIONS

The startling significance of the importance of carbon content has been demonstrated by a test on a machine which absorbed a continuous input of 10 hp. On this a new tool-steel gear was installed and was first operated with a tool-steel pinion long enough to polish up the teeth on the gear. An untreated pinion made from 0.17 per cent carbon steel was next installed, and this pinion was completely worn out in fifty-six hours. An untreated pinion of 0.31 per cent carbon was next installed and it was worn out in 354 hours. Finally a tool-steel pinion was installed and it continued in service for more than 3000 hours, and the pinion was not then completely worn out. This test demonstrated that by increasing its carbon content from 0.17 per cent to 0.31 per cent, five times as long a life could be obtained from an untreated pinion that was mated with a tool-steel gear.

Substantiating this conclusion we have had check analyses taken in four cases where customers reported that they were obtaining low life from soft gears on account of mating them with tool-steel pinions. In all four cases the analyses of drillings from the soft gears showed that their carbon content was between 0.18 per cent and 0.25 per cent.

I have very carefully watched several test cars that were equipped to demonstrate the effect of inter-mating hard and soft gearing. With untreated material that showed a carbon content of 0.42 per cent the net result would indicate that the inter-mating with tool steel was a trifle beneficial to soft gearing and a trifle detrimental to the tool-steel gearing. In another case it was found that a soft gear wore 25 per cent faster where mated with a tool-steel pinion than where mated with a soft pinion, also that the tool-steel pinion wore very much faster than normal. In this case the soft gear was made of a comparatively low carbon steel. In fact, in every case that I have been able thoroughly to investigate, where the soft gears have given unsatisfactory results when mated with hard pinions, it has appeared that the condition came primarily from the fact that some manufacturer was using a case-hardening grade of steel for an untreated gear.

To go at the matter from another viewpoint, if the mating of the hard pinion with the soft gear is detrimental to the soft gear, it would be apparent that, after the installation of a considerable number of hard pinions in excess of hard gears, it would be necessary for a railway company to purchase, during the next few years, a greater number of gears per annum than had been bought previously, these gears being needed to replace gears which were wearing abnormally fast on account of the injurious effect of mating them with hard pinions. Conversely, if the hard pinions were beneficial to the soft gears, the buying of gears would be decreased numerically after the installation of a quantity of hard pinions.

In Fig. 1 is shown the number of gears purchased by a large city railway line. These were all untreated gears up until 1912, after which nearly all were tool-steel. On the same chart is shown the total number of tool-steel pinions purchased, and it is evident that there were installed approximately 2000 tool-steel pinions which had been in use for a year or two before the use of the hard gears had begun. It is noticeable that, despite this fact, the purchases of gears were numerically less in 1911, 1912, 1913 and 1914 than in the four years preceding. The extremely heavy purchases in 1907 were occasioned by an attractive proposition, and the company bought a number of soft gears for general stock, but these were used up within the next couple of years.

Fig. 2 shows results on a line which began to equip with the hard gears and pinions in the latter part of 1911 and whose purchases of pinions ran exceedingly high as compared with gears. During 1911 and 1912 the road installed about 800 tool-steel pinions to run with soft gears, yet for 1914 the gear purchases have been virtually nil.

Fig. 3 shows results on a large city line which began, early in 1912, to use tool-steel gears and pinions exclusively. It will be noted that during 1912 and 1913 more than 1000 tool-steel pinions were installed in excess of the tool-steel gears. In addition to this there were undoubtedly many cases where the hard gears and pinions were not mated together. The replacements for 1913 and 1914 were considerably less than in the preceding years.

A fourth calculation may be based on the total purchases of four smaller city and interurban roads. During the first two years they bought 283 more tool-steel pinions than gears, while during this period their total annual purchase averaged eighty-nine gears. During the third year and the fourth year their annual gear purchases dropped to fifty-four and forty respectively.

All of these companies have been purchasing under exclusive contracts, and we have positive assurance that they have not purchased any gears from other sources so as to interfere with the accuracy of the calculations we are making. It might be pointed out that many of these companies had installed a considerable number of tool-steel gears and that this might affect the purchases in the latter part of our calculations. I believe that all of these companies, however, have been able to get at least two or three years' life from the soft gears, and, this being the case, they would not feel the benefits of the use of the hard gear directly until a period later than that which we have used in compiling the charts.

It would seem to me from the data which we have been able to collect from the experience under special tests and under actual service conditions in test cars, and from the general effect that the use of the tool-steel pinion has on the diminution in the numerical purchases of gears in subsequent years, that with the exception of certain isolated cases it is good practice from the standpoint of the gear to mate it with a hard pinion, though we believe it is not good practice from the standpoint of the pinion.

However, it would be my recommendation that wherever for any reason untreated gears or pinions are purchased, a minimum carbon content of 35 per cent should be specified and the manufacturer held strictly to this as a minimum allowance. It would also be my recommendation that, as far as possible, railway companies keep their hard gears and hard pinions intermated, rather than allow their hard gears to be mated with soft pinions, and vice versa.

TIMBER PRESERVATION

BY WILLIAM F. GOLTRA, PRESIDENT THE W. F. GOLTRA TIE COMPANY, CLEVELAND, OHIO

There are two general methods of impregnating woods with antiseptic, namely: (1) Impregnation by immersion in open tanks or boilers, involving an absorption rather than an injection of the preservative fluid, so that the depth of penetration obtained is very shallow except with particularly open or porous woods such as sap pine. (2) Impregnation by pneumatic pressure in air-tight cylinders. In this method, which is the one in general use, the timber is placed in closed cylinders, and the preservative is injected into the wood under pressure from force pumps. There are some variations in the details of operation, and these may be classed into five groups and described as follows:

Process A—The wood that is to be treated is first "air seasoned," or piled in open air for a period of from three months to twenty months, to dry out. When sufficiently seasoned, it is loaded on small tram cars and run into cylinders 6 ft. or 7 ft. in diameter and from 100 ft. to 150 ft. long. The wood is then submerged in the preserving fluid, which has been heated to a temperature between 170 deg. and 190 deg. Fahr. A pressure pump then forces more fluid into the cylinder until the desired degree of absorption is obtained. The pressure is then released, the surplus fluid drained from the cylinder and a vacuum applied. This last operation is for the purpose of hastening the drying of the material and to prevent subsequent dripping when taken out of the cylinders.

Process B—In this the green or partially seasoned wood is run into the cylinders. Live steam is admitted at such rate as to secure 20-lb. steam pressure in from thirty minutes to fifty minutes. The pressure is maintained for a period varying from one hour to five hours, depending upon the character of the timber and its condition. A vacuum is then applied and maintained for at least thirty minutes, at the expiration of which time the hot preservative is admitted into the cylinder without otherwise breaking the vacuum. The remainder of the operation is similar to Process "A."

Process C—The material, in a green or partially seasoned condition, is run into a cylinder and the wood is submerged in a preservative, usually creosote oil, the temperature being raised to 215 deg. or 225 deg. Fahr. Boiling is maintained for periods ranging from four hours to eight hours, depending upon the character of the timber and its condition. A vacuum is sometimes applied to assist liberation of saps in the wood. Pressure pumps are then put into action, the remainder of the operation being substantially the same as Process "A."

Process D—Under this process the material must first be "air seasoned" as in Process "A." It is then run into a cylinder and an initial air pressure of varying intensity is applied. Without lowering this air pressure the cylinder is then filled with a preservative, usually creosote oil, having a temperature of from 170 deg. to 190 deg. Fahr. The pressure is then raised still higher, the remainder of the operation being substantially the same as in Process "A." The patentees call this an "empty-cell" process.

Process E—As creosote oil and water solutions of zinc chloride have different specific gravities and tend to separate from each other it is necessary to keep such preservatives in agitation in the treating cylinder, and a device for this purpose has been patented. This consists of a centrifugal pump that keeps churning the emulsion in the impregnating cylinder while under pressure.

Practically all plants in America are equipped to treat by Process "A," the earliest and simplest method of treating timber by the application of pressure. Thirty-one plants are completely equipped to treat also by Process "B," while thirteen plants are equipped to treat with Process "C," that is, boiling in creosote oil. Of the other fifty treating plants about two-thirds are equipped in some fashion for steaming material whenever occasion requires. Seventeen plants are equipped for treating by Process "D" and nine by Process "E."

The selection of the preservative that is used for the treatment, although important, is secondary to other factors which influence the durability or life of treated material. The chief impregnating fluids in use in this country to-day are chloride of zinc, creosote oil and heavy crude oil. Up to 1900 approximately 15,000,000 ties had been treated in the United States, of which about 14,500,000 were treated with chloride of zinc and 500,000 with creosote oil. However, for various reasons (some legitimate and some otherwise) the consumption of creosote oil has greatly increased of late and has surpassed that of zinc chloride.

Chloride of zinc is an efficient and cheap preservative. It has been used longer than any other preservative, and the service records both in Europe and America attest to its merits as an excellent wood preservative. Ordinarily ties and timbers, when treated with chloride of zinc, are treated to "refusal," that is to say, the chemical solution is forced into the wood until it refuses to imbibe any more. The solution is usually made 2 per cent strong. The average absorption is 1½ lb. of salt per tie, which at 3½ cents per pound costs between 5 cents and 6 cents per tie.

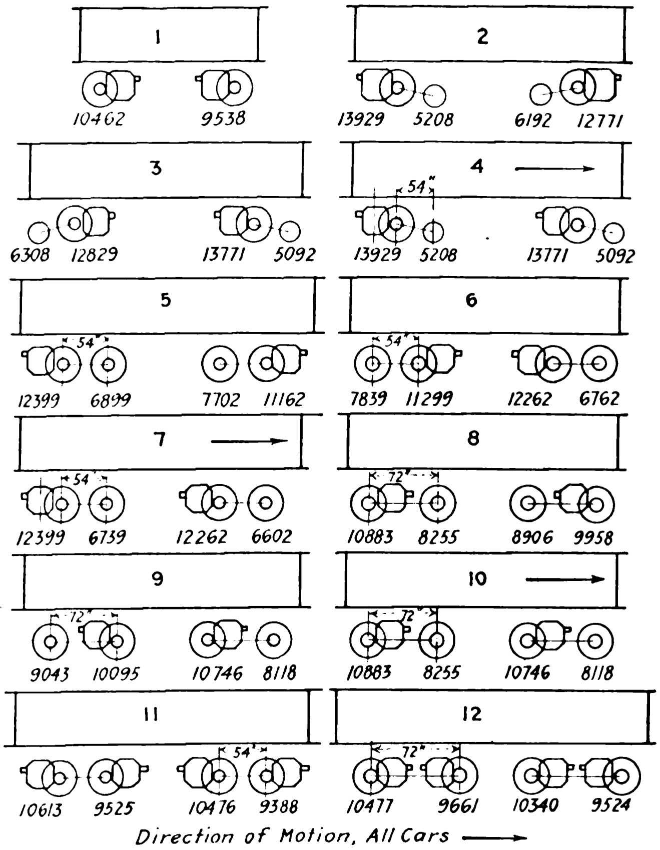
Creosote oil is much more expensive, and the price is constantly advancing. Ten years ago it was selling at 6 cents a gallon, while to-day the price is around 10 cents a gallon. Thoroughly seasoned ties, treated to refusal, will absorb an average of 4½ gal. of oil per tie, or from 40 cents to 50 cents worth of oil, at current prices. This makes it almost prohibitive to treat ties to refusal so we find it is a common practice to inject only a partial dose, say 2½ gal. of oil, or less, per tie. Where such practice prevails, it is frequently observed that the ties are only superficially covered with black tar oil, and as good a penetration as this could have been obtained by open tank process at much less cost. It would be far better to use a combination of creosote oil and chloride of zinc and treat the material to refusal. The combination of creosote oil and chloride of zinc meets with much favor, both here and in European countries. The mixture consists of 12½ per cent creosote and 87½ per cent zinc chloride solution. The cost, based on the above prices, would be about 11 cents per tie.

In my opinion, the two most important factors in the treating of material are: (1) The proper seasoning or drying of the material before the injection of the preservative, and (2) a thorough and full impregnation of the wood with whatever preservative is selected. To obtain thorough treatment it is very essential that all saps and water be removed from the wood, so far as possible, before the injection of the fluid. This, however, can be effected quickly and economically by means of steaming the timber immediately upon arrival at the treating plant, then piling in open air for a period of a few months to season it, and then completing the drying in ovens or kilns. The condition of timber as regards moisture content at the time of treating is by far the most important of the many factors influencing the absorption of the preservative, and unless this feature has the utmost attention the results from treatment will hardly ever be satisfactory.

SELECTION OF RAILWAY EQUIPMENT

BY JOHN F. LAYNG, RAILWAY ENGINEERING DEPARTMENT
GENERAL ELECTRIC COMPANY

In this paper the author discusses some of the factors entering into the selection and arrangement of motors and controllers for city and interurban cars. For the purpose of analysis he divided these cars into two general classes, namely, those provided with two-motor equipments and those provided with four-motor equipments. Three types of trucks were also considered, namely, single, maximum traction and double trucks. With these elements a number of different combinations can be made, of which twelve, shown in the accompanying diagram, were analyzed to determine the distribution of weight on the axles, particularly during the period of acceleration. This distribution of weight largely determines the schedule possibilities and grade-climbing qualities of a car. In this analysis Mr. Layng called attention to the following considerations.



SELECTION OF ELECTRICAL EQUIPMENT—DISTRIBUTION OF LOAD DRIVING ACCELERATION

The single-truck car is ideal from the standpoint of weight distribution, but seating capacity and riding qualities limit its field of application. In the double-truck car the ideal distribution of power equipment is such as to give uniform weight on the axles to minimize wheel slippage. This ideal cannot be realized. During the accelerating period there is a shifting of the car-body weight, that on the front center plate being reduced and that on the rear increased. If a body weighing 10 tons is accelerated at the rate of 1½ m.p.h.p.s., and the center of mass is 24 in. above the center plate and the king pins are 20 ft. between centers, the weight on the front center plate during acceleration is 9863 lb. and that on the rear plate is 10,137 lb. A similar shifting of weights takes place on each truck.

The choice between two-motor equipment and four-motor equipment is decided largely on the basis of wheel slippage. Double-truck, two-motor equipments are not satisfactory on grades greater than 5 per cent or on bad rail made such by snow, sleet, mud or leaves. Trailer operation must also be considered in making this choice. The figures given on the chart show that from the standpoint of weight distribution the four-motor equipment is superior and that with inside-hung motors is best of all.

ANALYSIS OF WEIGHT DISTRIBUTION

The weight distributions given in the chart were determined in the following manner. The assumptions made were: (1) Acceleration $1\frac{1}{2}$ m.p.h.p.s. on tangent, level track; (2) single-truck car, weight 10 tons, wheelbase 10 ft., center of gravity 24 in. above center line of axles; (3) all double-truck car bodies, weight complete with car-body equipment, 10 tons, no live load; (4) trucks of double-truck cars, weight 6000 lb., wheelbase 72 in. for outside-hung motors or 54 in. for inside-hung motors, distance from surface of center plate to axle center line 12 in., wheel diameter 33 in., distance of center of gravity of body above center plate 24 in., distance between truck centers 20 ft., and weights and lengths of two ends of car equal; (5) slight tilting of body and rotating effect of dead axles neglected.

Referring to the second diagram the symbols are seen to signify as follows:

W = weight of car body (in pounds),
T = retarding pressure of car body during acceleration (in pounds),
P = pressure transferred from front to back truck at king pin (in pounds),
t = retarding pressure of truck during acceleration (in pounds),
L = distance between truck centers (in feet),
X = center of moments of car body,
Y = center of gravity of car body,
H = vertical distance X to Y (in feet),
K = vertical distance center plate to rail (in feet),
l = distance between axle centers (in feet),
Z = center of gravity of truck,
$l_1 l_2$ = horizontal distance, truck center of gravity to trailing and leading wheel treads respectively (in feet),
h = vertical distance rail to truck center of gravity (in feet).

The moment formulas then give the desired weights.

$$T = \text{mass} \times \text{acceleration} = \frac{W}{32.2} \times \frac{1.5 \times 5280}{3600} = 0.0684\,W$$

(1) Transfer of car body weight from front to rear truck:

Balancing moments

$$0.0684\,WH = 2P\frac{L}{2} = PL$$

$$P = 0.0684WH/L$$

$$W_1 = \frac{1}{2}W - P \qquad W_2 = \frac{1}{2}W + P$$

Where W_1 = car-body weight on front truck (in pounds),
and W_2 = car-body weight on rear truck (in pounds).

(2) Transfer of car-body weight from front to rear axle:

$$\frac{1}{2}TK = p_1 l_1 + p_1 l_2 = p_1(l_1 + l_2) = p_1 l.$$
$$p_1 = TK/2l.$$

Where p_1 = center-plate load transferred from front to rear axle (in pounds),

(2) Transfer of truck weight from front to rear axle:

$$t = 0.0684b \qquad 0.0684bh = p_2 l$$
$$p_2 = 0.0684bh/l$$

Where b = weight of truck (in pounds).
p_2 = truck load transferred from front to rear axle (in pounds).

$$p = (TK/2l) + (0.0684bh/l).$$

Where p is the total load transferred from the front to rear axle.

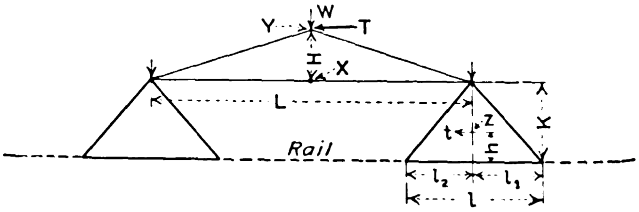
The distribution of wheel pressure is then:

FRONT TRUCK	REAR TRUCK
$W' = (W_1 l_2/l) - p$	$W' = (W_2 l_2/l) - p$
$W'' = (W_1 l_1/l) + p$	$W'' = (W_2 l_1/l) + p.$

CHOICE OF TYPE OF MOTOR AND CONTROL SYSTEM

In selecting a type of motor the problem is to secure the maximum power per pound of weight, the maximum efficiency and reasonable price.

The ventilated motor is now generally specified and the value of field control in increasing motor capacity is recognized. In considering field control the service must be studied to determine whether or not the increased cost and complication are warranted. These are not great in the motor but come in the controller and wiring. The extra connections also increase the difficulty of locating trouble. As all of the saving from the use of field control occurs during acceleration the saving is proportionately small when stops are infrequent. Comparatively few four-motor field control equipments have been purchased, but two-motor equipments have been extensively applied for city service.



SELECTION OF ELECTRICAL EQUIPMENT—FORCE DIAGRAM DOUBLE-TRUCK CAR

During three years past the interest in 24-in. wheel equipments has been increasing and efficient and well-constructed motors have been developed. This interest is due to the tendency to reduce weight. An innovation in control with these equipments has also been introduced in which three running points are provided. Its use should produce from 7 per cent to 8 per cent. saving over the two-running-speed control. It is necessary to analyze the service carefully in applying this control, as the heating is not equally divided among four motors. The small-wheel trucks can be purchased to weigh but 8000 lb. per pair, whereas standard trucks weigh approximately 12,000 lb. The comparative motor weights are 1750 and 2000 lb. The use of the small-wheel truck thus results in a saving of 5000 lb.

In interurban service are found most of the four-motor equipments which are used and field control has not been generally adopted here for the reasons stated. The use of voltages above 600 are attractive due to the resulting savings, but as many interurban roads supply city service the use of high voltage would require the replacing of much city car equipment. Interurban roads are considering the business of handling carload freight and the custom has been to start with 40-ton locomotives with four 125-hp motors. On some properties business has grown so that 60-ton locomotives with four 225-hp motors are necessary.

CONCLUSIONS

The selection of a proper equipment is not difficult, but it requires information based on actual observation and careful records. There is great likelihood that an equipment larger than necessary will be installed if a manufacturer is asked to make recommendations based on number of stops per mile and duration of stops. In this case both manufacturer and customer will allow safe margins.

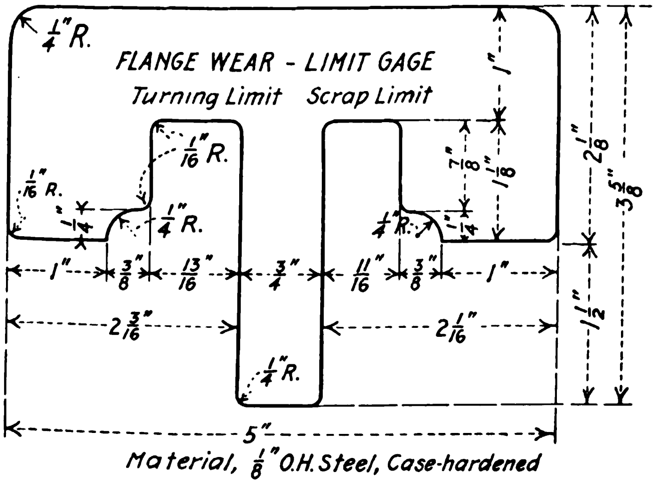
The effect of attempting to run faster than normal schedules is greatly increased expense. For example, with a 9.6 m.p.h. schedule speed for a 20-ton car making 7.75 stops per mile the energy consumption is, in a certain case, 145 watt-hours per car-mile. By slowing this schedule to 9.45 m.p.h. 122 watt-hours only are required, a saving of 19 per cent. The present tendency to increase schedule speeds results from the increase in platform wages.

REPORT OF COMMITTEE ON STANDARDS

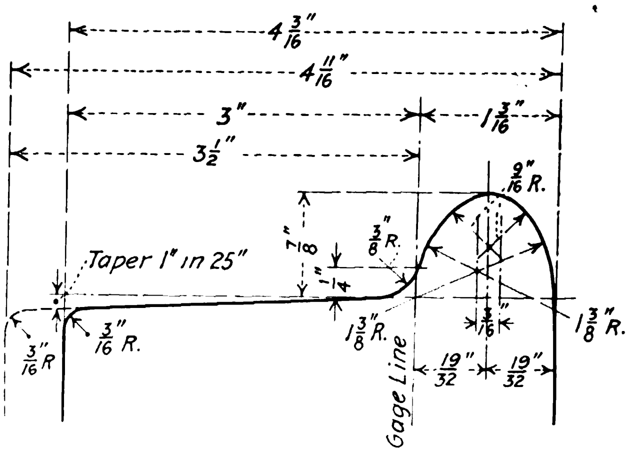
This committee presented for the consideration of the Association drawings for a proposed standard wheel flange and tread contour and for a proposed standard limit gage for wheel-flange wear. The data for the former design had been obtained from the twenty-three replies that were received from sixty-two question blanks sent out last September. Of the companies replying two gave preferred dimensions for special grooved rail and twenty-one answered negatively in regard to the proposal to use the A. E. R. A. grooved rail as standard. Eight of the companies reported that the type of rail on their lines was governed by city ordinance, and thirteen replied to the contrary. There follows a summary of the data showing the number of companies using various types of rail and flange contour and the average results obtained from the data contained replies.

Interurban rails, 70 lb. A.S.C.E	Fifteen companies
Interurban rails, other kinds	Eight companies
City rails, T-section	Twelve companies
City rails, grooved section	Two companies
Wheel-flange contour, A.E.R.A. dimensions	Sixteen companies
Wheel-flange contour, other dimensions	Five companies
Average maximum wheel mileage, first turning	98,000 miles
Average guard-rail opening	1.71 in.
Average minimum curvature	42.4 ft.
Average number of minimum curves	3.45
Average flange wear-limit thickness	11/16 in.

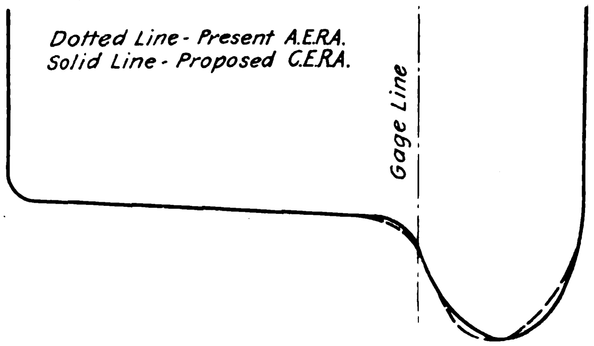
This data was used by the committee for the design of a flange wear-limit gage for determining the minimum thickness of flanges commensurate with safety in operation and economy in turning. This design is shown in the accompanying illustration. The committee stated that at the present time, while a majority of the member companies were employing a uniform flange contour corresponding with the A. E. R. A. standard, nevertheless there was a considerable variation in the practice governing minimum flange thickness, and there appeared to be no reason why definite limitations could not be adopted and adhered to. The committee therefore recommended that the flange wear-limit gage should be adopted as standard by the association.



C. E. R. A. STANDARDS—FLANGE-WEAR LIMIT GAGE



C. E. R. A. STANDARDS—PROPOSED FLANGE AND TREAD CONTOUR



Dotted Line - Present A.E.R.A.
Solid Line - Proposed C.E.R.A.
Gage Line

C. E. R. A. STANDARDS—COMPARISON OF A. E. R. A. STANDARD FLANGE CONTOUR WITH THAT PROPOSED BY C. E. R. A.

With regard to modifying the present standard flange and tread contour, with a view toward improving the efficiency of the design, the committee recommended that the flange and tread contour as shown in the accompanying illustration be adopted as standard by the association. The report was made by the following committee members: R. N. Hemming, chairman; L. M. Clark, H. H. Buckman, Charles Sigler and Edward Heydon.

PROCEEDINGS ON THURSDAY

The Fort Wayne meeting of the Central Electric Railway Association was opened by President Schneider on Thursday, Nov. 19, at the Hotel Anthony, with a large number of delegates in attendance. After calling the meeting to order the president announced that the report of the standardization committee would not include the question of charges for interline equipment repairs and that consideration of this subject would be deferred. The report of the standardization committee was then read by Chairman R. N. Hemming, Union Traction Company of Indiana. H. H. Buckman, Louisville & Northern Railway, spoke of mileage results that his company had obtained with A. E. R. A. standard wheel-flange contour and with the proposed C. E. R. A. wheel-flange contour. These tests had been made on both steel tired and rolled steel wheels. G. K. Jeffries, Terre Haute, Indianapolis & Eastern Railway, stated that the proposed C. E. R. A. contour was approximately the same as that used on his road.

L. A. Mitchell, Union Traction Company of Indiana, called attention to influence of track special work on wheel wear. He stated that rail wear was too small to be measured accurately even after several years of service. That due to wheel-flange wear, however, governed the life of rail in track special work, especially in curves. He approved of the proposed new contour because he thought it would reduce nosing. Mr. Mitchell also spoke of the tendency to use blunt flanges so as to provide for flange-bearing special work.

Regarding the recommended wheel-flange wear-limit gage C. L. Henry stated that no action had been taken on this subject by the American Electric Railway Engineering Association. The association then voted to adopt as recommended practice the wheel-flange wear-limit gage designed by the committee. This design will be submitted to the American Electric Railway Association for adoption as standard at the next convention.

W. F. Goltra was then requested to read his paper on "Treatment of Ties or Wood Preservation," of which an abstract appears on another page. This was discussed by R. N. Hemming and L. A. Mitchell. Mr. Mitchell called attention to the zinc-chloride treatment and its effect on spikes and rail. While the steam roads had not been affected, electric roads had experienced a rapid corrosion of spikes when used with zinc-treated ties. He mentioned that he had removed spikes, after about five years' service, which showed from 20 per cent to 50 per cent reduction by corrosion. This experience had led him to believe that the zinc-chloride treatment for electric roads was unsatisfactory. W. A. Carson, Evansville Railways, stated that he had had similar experience with zinc-treated ties. In reply to an inquiry, Mr. Mitchell stated that he was using a combination zinc-chloride and creosote treatment for ties and, so far as he could determine at this time, the combination had eliminated the objections to zinc treatment so far as electric roads were concerned.

E. S. Sawtelle then read his paper entitled "What Results Have Been Secured by Running Tool-Steel Pinions With Low-Carbon Untreated Gears," which appears elsewhere in abstract form. Mr. Buckman, in discussing this subject, approved the recommendation that better results would be obtained with mated than with unmated gears and pinions. He also stated that he had found quite a marked difference in the wearing qualities of different types of case-hardened gears and pinions. W. E. Rolston, Chicago, Lake Shore & South Bend Railway; F. A. Bundy, Ohio Electric Railway, and R. N. Hemming, Union Traction Company of Indiana, reported similar experiencees in intermating gears and pinions. Rather than use mis-mated gears and pinions Mr. Bundy stated that his company had scrapped about $1,000 worth of untreated material.

The recommendation of the standards committee that a way committee be appointed to study the problems affecting this department of electric railways was then approved by the association. The following were appointed as members of the new committee: T. R. H. Daniels, Terre Haute, Indianapolis & Eastern Traction Company; W. A. Carson, Evansville Railways; J. H. Sundmaker, Ohio Electric Railway; L. A. Mitchell, Union Traction Company of Indiana, and E. Smith, Toledo, Fostoria & Findlay Railway. The meeting then adjourned until the next day, Friday, Nov. 20.

In connection with the meeting, the Cleveland, Southwestern & Columbus Railway and the Union Traction Company of Indiana ran special cars to Fort Wayne, from Cleveland and Indianapolis respectively. The Cleveland car, in charge of President Schneider, carried a party of forty, and stopped en route at the Fostoria shops of the Toledo, Fostoria & Findlay Railway. The shops at this point were inspected as well as the company's new, 56-ft., all-steel cars that had been recently received from the Niles Car Company.

Pennsylvania Railroad Tries Out Storage-Battery Car

A successful demonstration of Edison storage battery car operation was conducted on Nov. 16 over the main line of the Pennsylvania Railroad from Newark to Holmesburg Junction, near Philadelphia. The trial trip was taken by a number of representatives of the Pennsylvania Railroad and several other railroads. The car used for the demonstration had been ordered by the Lorain, Ashland & Southern Railway, Ashland, Ohio, from the Railway Storage Battery Car Company, New York, and on the occasion of the test was on its way to be delivered to the railway company as a second storage battery car equipment for that line.

The demonstration car measured 48 ft. 9½ in. in over all length and was composed of a passenger compartment, a 14-ft. 6¾-in. baggage compartment and a 5-ft. 5¼-in. smoking compartment. Power was supplied by 240 Edison A-12-H storage battery cells. The car was operated by double-end control. The total weight of the car was 31 tons.

The schedule of the run was as follows:

	Miles
Leave Newark 11.45 a.m.	0
Arrive Trenton 1.24 p.m.	48.1
Leave Trenton 1.31 p.m.	—
Arrive Bristol 1.54 p.m.	58.1
Leave Bristol 1.55 p.m.	—
Arrive Holmesburg Junction 2.21 p.m.	68.3

The 68-mile run was made by smooth operation in 2 hours 31 minutes actual running time, excluding stops at Trenton and Bristol to let off passengers. The average running speed of the car, 27 m.p.h., and maximum speed of 36 m.p.h. was very creditable in view of the fact that forty-four passengers were on board, and, especially owing to the short-circuiting of one of the motors while charging in the Newark yard, so that the run was made with only three 20-hp motors in service.

This car will be operated temporarily for about thirty days on the 4-mile Holmesburg Junction-Bustleton branch of the Pennsylvania Railroad, and thereafter two new storage battery cars, operated separately, will probably be introduced for the regular passenger service of the branch line. These two cars will be either suburban passenger cars of the Pennsylvania Railroad re-equipped with storage batteries, motors and control or standard 50-ft. double-truck Edison storage battery cars of the Railway Storage Battery Car Company with 32-ft. passenger and 12-ft. 10-in. baggage compartments. They will operate for about 130 miles each day on one battery charge and will be designed for maximum speeds of 30 to 35 m.p.h. At the end of about six months, if the operation of this equipment proves satisfactory in reliability and saving of car-mile costs, from fifty to seventy-five storage battery cars may be adopted for general branch line service on this steam railroad.

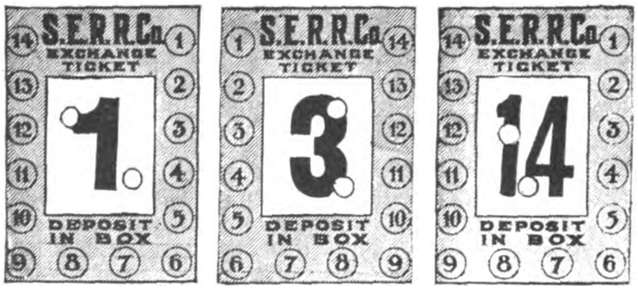
Arrangements have been made with the officials of the public library whereby the United Railroads, San Francisco, Cal., can take books out in bulk to the divisions where there is a demand for them. A bookcase was installed at the Sutro carhouse and about fifty books placed upon the shelves. Most of the books were immediately taken out. The selection was made by Superintendent Nougues and the editor of the *United Railroads Magazine*, but the men will be permitted to apply for any book desired, and it will be procured.

Interurban Prepayment Operation with Zone Tickets by the Stark Electric Railroad

BY A. J. SAMPSON, ASSISTANT GENERAL MANAGER AND AUDITOR

A decided departure from the usual method of fare collection and receipting, which also includes an important change in door location, was inaugurated on Oct. 19 by the Stark Electric Railroad on its 32-mile line between Canton and Salem, Ohio. In all respects but one the two cars used are of interurban, arch-roof type with standard side-door baggage compartment. The exceptional feature is the replacement of the standard vestibule side doors by quadruple doors hinged to the sides and opening in the middle, and by wide fixed steps which give direct access to the conductor's position in the body of the car. The successive rails from ground to car floor are as follows: 14¾ in., 12¼ in., 12⅛ in. and 12⅛ in. The usual stanchions and dividing rails are provided. When the car is under way the steps are completely inclosed. The fact that the conductor is always stationed at the rear should be a big factor in the elimination of platform accidents. At wayside stops the ground between the rails has been filled in and planked to afford passengers a safe and dry footing.

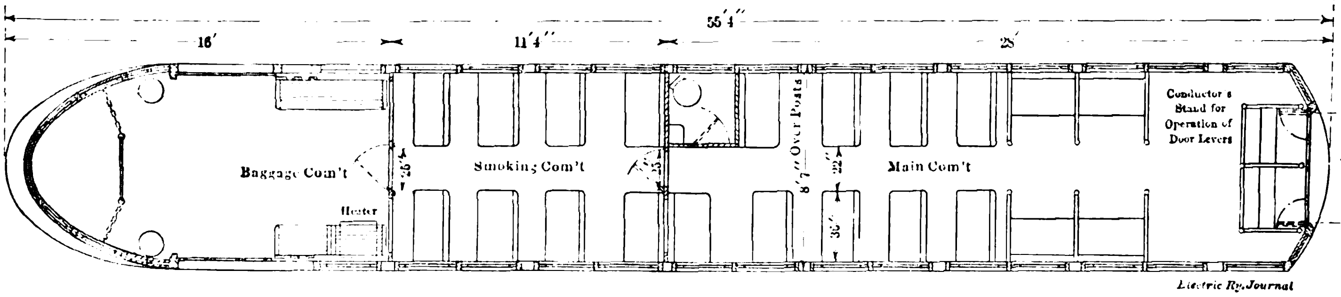
When passengers board the car they must deposit in a Cleveland fare box, a fare of some class—namely, ticket, cash or mileage. As the fare is deposited the conductor issues an exchange ticket showing in large type the number of the fare zone into which the passenger is entitled to ride. This exchange ticket must be deposited in the fare box as the passenger leaves the car at his destination.



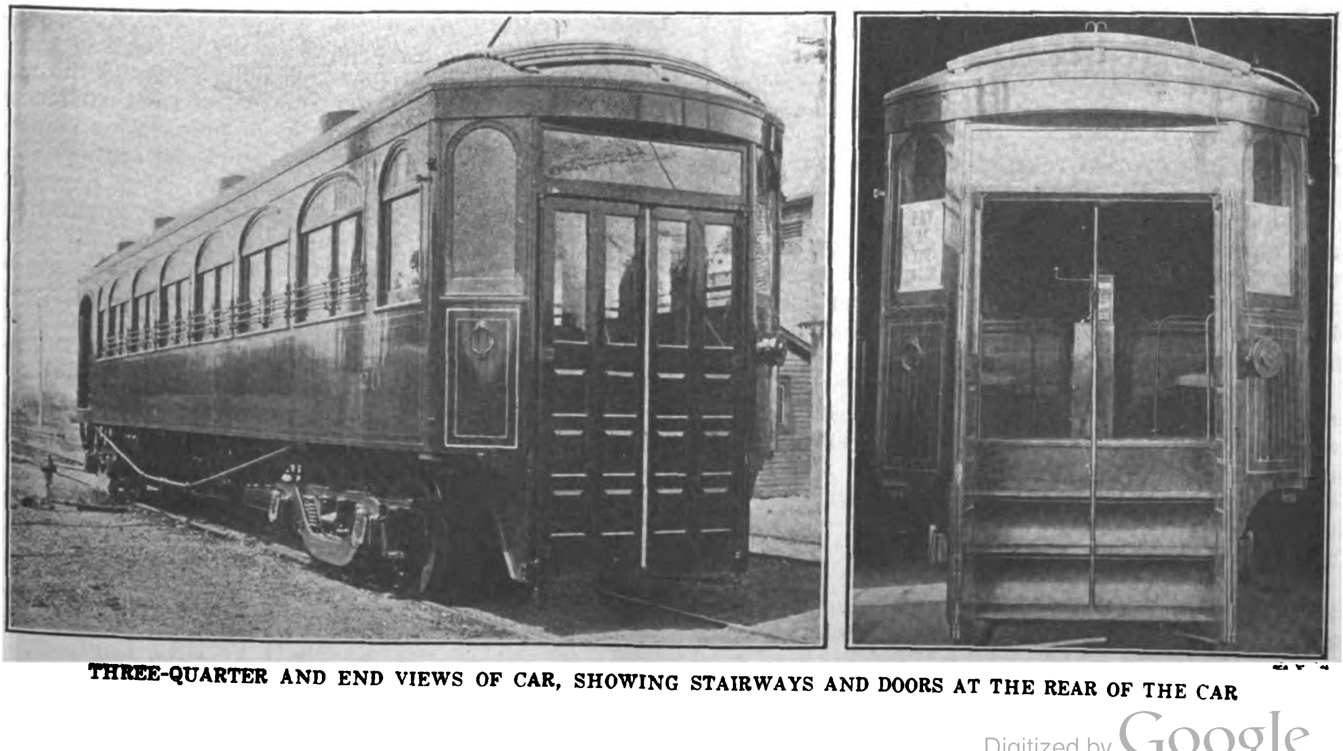
FARE RECEIPTS NUMBERED ACCORDING TO ZONES OF PASSENGERS' DESTINATION

If a passenger should attempt to ride into a different fare zone than the one to which the fare was paid the conductor would then collect an additional fare. Our road has been divided into fourteen fare zones, and each of the large corresponding numbers are plainly seen as the ticket is dropped into the box so that it is easy for the conductor to detect anyone who is trying to over-ride. The small numbers on the edges of the exchange ticket are punched out only when the passenger pays a cash fare. The actual fare paid is five times the difference between the small number punched out and the big number on the ticket, 70 cents (14 × 5) being the largest cash fare collected.

We use a small box made like a ticket case with tubes holding 100 each of the fourteen fare zone tickets.



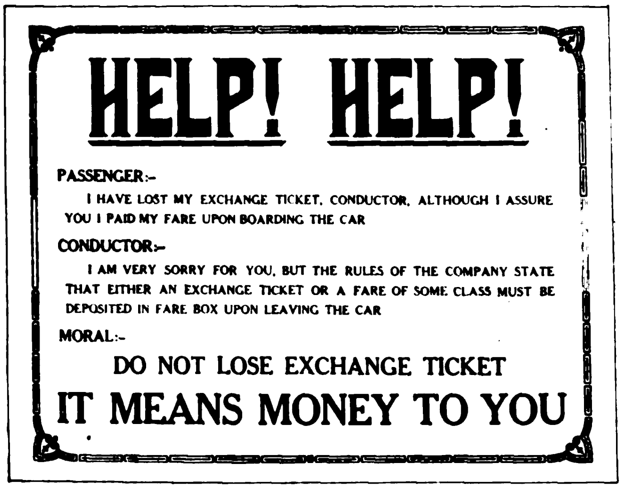
PLAN OF STARK ELECTRIC RAILROAD'S INTERURBAN PREPAYMENT CAR WITH ALL ENTRANCE AND EXIT VIA END DOORS AT THE REAR



THREE-QUARTER AND END VIEWS OF CAR, SHOWING STAIRWAYS AND DOORS AT THE REAR OF THE CAR

This case rests upon an upright piece of pipe and is taken off by the conductor at the end of the run. Each conductor is held responsible for maintaining at all times his supply of exchange tickets.

The cash box is sent to the auditing department each morning for the checking of the contents. Each fare collected must have an exchange ticket to balance same, and the cash in the box must check against the amounts indicated by the punches made in the exchange ticket by the conductors. This may seem a rather long method of checking the conductor, but we have found it saves time when compared with all the steps necessary under the old system of checking cash fare receipts issued and tickets collected. In addition, when the daily report is put on the auditor's desk for the day's business, he knows that all work in regard to checking conductors' reports in his department has been completed and that nothing has been carried forward to do the next day.



HELP! HELP!

PASSENGER:-

I HAVE LOST MY EXCHANGE TICKET, CONDUCTOR, ALTHOUGH I ASSURE YOU I PAID MY FARE UPON BOARDING THE CAR

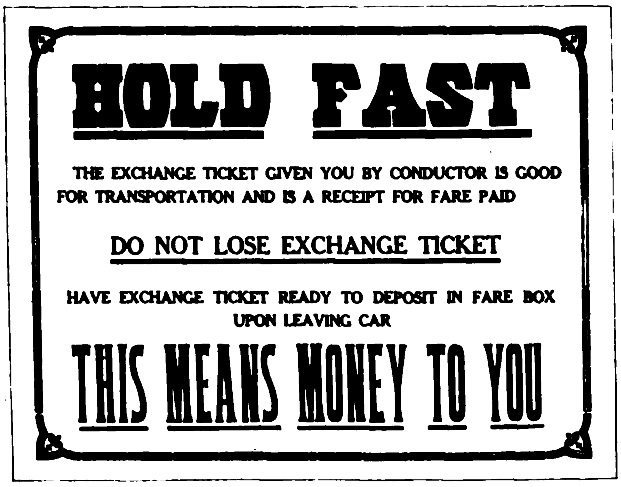
CONDUCTOR:-

I AM VERY SORRY FOR YOU, BUT THE RULES OF THE COMPANY STATE THAT EITHER AN EXCHANGE TICKET OR A FARE OF SOME CLASS MUST BE DEPOSITED IN FARE BOX UPON LEAVING THE CAR

MORAL:-

DO NOT LOSE EXCHANGE TICKET

IT MEANS MONEY TO YOU



HOLD FAST

THE EXCHANGE TICKET GIVEN YOU BY CONDUCTOR IS GOOD FOR TRANSPORTATION AND IS A RECEIPT FOR FARE PAID

DO NOT LOSE EXCHANGE TICKET

HAVE EXCHANGE TICKET READY TO DEPOSIT IN FARE BOX UPON LEAVING CAR

THIS MEANS MONEY TO YOU

REPRODUCTIONS OF TWO POSTERS GIVING NOTICE OF PRE-PAYMENT OPERATION

We are very well satisfied with the experiment so far and the public seems also to be well pleased. I spent two days riding the cars and heard far more compliments than kicks in regard to the system. I might add that several educational cards, two of which are reproduced, were posted in the cars to prepare our patrons for the change.

The cars, which were furnished by the Jewett Car Company, Newark, Ohio, are 55 ft. 4 in. long over all, 54 ft. over the body, 8 ft. 7 in. wide and seat fifty passengers. The body, which weighs 35,000 lb., is of wood with composite underframe, mahogany trim and Agasote headlining. The arch roof is used. The plan on page 1163 shows the division of this single-end type into three compartments and the layout of the prepayment section.

COMMUNICATIONS

Calculating Depreciation

Barclay Parsons & Klapp, Consulting Engineers
New York, Nov. 19, 1914.

To the Editors:

Replying to the communication from John A. Britton, vice-president and general manager of the Pacific Gas & Electric Company, appearing in your issue of Nov. 7, 1914, page 1059, wherein Mr. Britton takes exception to the methods of calculating depreciation as brought out in my article, I feel that Mr. Britton's views on this matter cannot be lightly passed over because of his forty years of experience in the handling of public utility properties and his ripe judgment and the success of the corporation with which he has been so long connected.

In a statement defending the adaptability of the per cent of gross earnings method of accruing depreciation, admission must be made that at best the method is a rule of thumb and, as described by others, "unscientific." However, as brought out by the article, the question of depreciation is exceedingly complex and the application of the more refined methods seems on study to be unwarranted on account of the variations and exceptions which are found to upset the plans as outlined by any one refined method. Among bankers whose experience covers a variety of public utility properties widely scattered, the conclusion has been drawn that adequately to protect the investor in funded securities, and at the same time create no hardship to the stockholders in the accruing of unnecessary reserves, simple, hard and fast rules are sometimes necessary, and in order to obtain simplicity of application rule-of-thumb methods are advisable, and that the per cent of gross earnings method for the determination of depreciation and maintenance has proved to be of merit.

An instance occurs to the writer in a large generating and operating company where objection was raised to the proposal of using the per cent of gross-earnings method for the determination of the reserves, and a suggested method was tried based on the per cent of additions to physical property, bearing in mind the experience of the rates of depreciation of each particular kind of property. After months of preparation requiring extended conferences of engineers and accountants, a schedule was prepared and applied. This has now been in use for a sufficient period to test its application and it is surprising to note the negligible error with which the per cent of gross earnings method reaches the same result, the one requiring considerable eliminations and judgment on the part of the accountants to obtain the monthly total, the other a simple multiplication that can be checked by anyone seeing the report.

Sifting down the various arguments that have been advanced, and agreeing that depreciation is necessary, the answer which comes to mind is that simplicity of method and application is eminently desirable. In view of the success of the per cent of gross earnings method for calculating depreciation and its extended use, the answer to Mr. Britton's criticism can be summed up by the users of the method with the statement that it obtains a satisfactory result by a simple and direct process.

Ralph U. Fitting, Engineer.

The Revival of the Flagging Rule

Illinois Traction System
Springfield, Ill., Nov. 12, 1914.

To the Editors:

The writer has previously commented on your criticism of the so-called revival, by several roads, of a rule permitting a train to proceed under flag protection such as that which once appeared in the standard interurban code. It is undoubtedly a fact that several roads have, in connection with their automatic signals, adopted a form of flagging rule, but this, in every case with which the writer is at all familiar, differs very materially from the rule which was eliminated in 1911. It is apparent that the opinions expressed in my letter of Sept. 4 have been understood as an argument for the revival of the old rule. Nothing was farther from my intentions, as I firmly believe that such a rule is unsafe.

Under the conditions existing in 1911 the occasions on which a train would have reason to flag itself ahead were when it had arrived at some carded or ordered meeting point and could not obtain other orders, or at a junction or end of double track where a train was permitted to flag ahead in case the dispatcher could not be communicated with, this latter condition being as unsafe as the first. Under these circumstances it would be better to have the train delayed several hours, if necessary, than to have it proceed past the meeting point or junction, meet the opposing train somewhere between the two sidings and then have to back up to the siding to allow the other train to pass. This is surely what would happen, if not in the first section of track, at least in the second or third. In addition to the fact that such a procedure is most desirable from an operating standpoint, the danger is too apparent to need mentioning.

Under the conditions existing on signaled roads to-day, however, it is not the right to proceed past meeting points or junctions that is being given to the trainmen, but rather the right to adhere to the time-carded or ordered meets, after properly protecting themselves, under conditions where it is perfectly safe for them to do so. It appears to the writer that if the Transportation & Traffic Association desires to include a rule covering this condition, which is a new one on electric roads, it can with proper differentiation, very safely do so. The entire question seems to be whether the signals are to take precedence over the regular train-operating rules or are to be adjuncts to them.

John Leisenring, Signal Engineer.

ASSOCIATION NEWS

PUBLIC SERVICE RAILWAY SECTION MEETING

A most enthusiastic meeting of the Public Service Railway section was held in Newark on Nov. 19 with an attendance of about 350. The speakers were Thomas N. McCarter, president of the company; R. E. Danforth, general manager, and C. Loomis Allen, president American Electric Railway Association. Mr. McCarter's address was a forceful statement of how the men can assist the officers of the company in fostering cordial relations with the thinking public by doing their work in a thorough manner and thus helping the company to earn a fair return on the investment in the property.

Mr. Allen spoke on "Public Relations" and outlined the development of the association during the past ten years. He traced the work of the public relations committee year by year and especially commended, and urged the study of, the 1914 report. Mr. Danforth's talk was announced as a report upon the plans for the coming year. He outlined an instructive program in which the section is to be systematically informed upon the problems connected with the operation of a great corporation. He expanded his talk, however, to give concrete suggestions as to ways in which the employees can carry out Mr. McCarter's advice.

The experience of the section officers has demonstrated that the section is an important agency for the promotion of a spirit of co-operation and good-fellowship. The hearty reception given to the plan outlined by Mr. Danforth shows that the members desire to utilize the meetings for the good of the company as well as themselves.

The next meeting on Dec. 17 will be the occasion of the annual dinner, for which an attractive menu has been prepared.

WASHINGTON RAILWAY & ELECTRIC COMPANY SECTION

At the meeting held on Oct. 26 the following were re-elected, the only changes being that the terms of the two directors were interchanged. President, G. C. Whitney, accident department; vice-president, C. S. Kimball, bookkeeper; two-year director, William L. Clarke, secretary to the president; one-year director, J. T. Moffett, superintendent of transportation, and secretary, B. F. Hunter. C. P. King and W. F. Ham, president and vice-president of the company, respectively, are directors ex-officio by the terms of the constitution. The meeting was devoted to reports from delegates to conventions recently held, namely, those of the National Electric Light Association, the Association of Edison Sales Managers and, of course, the A. E. R. A. The formal part of the proceedings was relieved by music from the PEPCO (Potomac Electric Power Company) glee club.

In reporting on the Atlantic City convention President Whitney commended the work of the Accountants' Association and especially of the committee on standard classification of accounts and the educational committee. He valued highly also the papers on valuation and depreciation. W. N. Deneale appreciated particularly the paper by N. W. Bolen and the exhibits, which he described briefly. J. E. R. Shaw described some of the exhibits of particular interest to transportation men. W. F. Dement reported on other transportation matters, particularly the training of employees. J. T. Moffett, who did not attend the convention, read a letter which he had received from the delegates as follows:

"Dear Sir:—We attended the 1914 meeting of the American Electric Railway Convention, held at Atlantic City, N. J., attending each meeting of the Transportation & Traffic Association and several meetings of the American and other associations. The papers read and the discussions were both interesting and instructive, especially those at the meeting of the Transportation & Traffic Association.

"We had a splendid time, enjoying every minute that was spent at the convention, and we feel very much indebted to you and the officers of the company who made it possible for us to attend. We shall endeavor to repay the company with renewed interest.

"Again thanking you for the splendid time we had, we beg to be

"Respectfully yours,
———— ————"

The regular October meeting of the Denver Tramway Company section was held in the Tramway Auditorium on Thursday, Oct. 15. The feature of the evening was a paper by R. H. Ingersoll, chief dispatcher, Denver Tramway Company, entitled "Telephone Dispatching."

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Hot-Banding Armatures at Decatur Shops

BY O. P. CHUBBUCK, SUPERINTENDENT OF SHOPS, ILLINOIS TRACTION SYSTEM

At the Decatur shops of the Illinois Traction System, where all of the interurban equipment is maintained, the practice of hot-banding armatures is followed. After an armature is stripped, all slots are cleaned and the armature receives a coat of insulating varnish. Then in each of the coil grooves is placed a trough made of fish paper about 0.007 in. thick. In the bottom of this trough there is placed a piece of fiber 1/32 in. thick, upon which the bottom coil rests. Another piece of fiber, 1/32 in. thick, is placed between the bottom and top coils. This raises the coils about 1/16 in. above the laminations.

The armature is then wrapped with a temporary banding and placed in an oven having a temperature of from 65 deg. to 75 deg. Cent., for a period of from eight to ten hours, or until the winding is thoroughly warmed through. Next, the temporary banding is removed and the armature is placed in the banding lathe so that a temporary wire band can be run on, using a soft brass strip over each slot. These strips are of sufficient thickness to draw the coils down flush with the bottom of the banding recesses, when a tension of about 200 lb. is put on the wire. The coils, being thoroughly warmed, soften and draw down into all corners, so that they fit the slots very snugly. The armature is now laid aside to cool, after which the temporary banding is removed and a permanent banding put on.

In making this permanent banding a strip of tin is put all the way around the armature underneath the banding wire. In this way we are able to draw down the coils very tightly. Also, this tin acts as a reinforcement, holds the solder and makes a very firm job when complete. This system of hot-banding armatures was recommended by the General Electric Company. We have been using it for about eighteen months and do not know that we have ever had a case where coils became loose in an armature so banded.

Warning and Stop Signs—Durability of Markings

BY R. C. CRAM, ASSISTANT ENGINEER WAY AND STRUCTURE DEPARTMENT, BROOKLYN RAPID TRANSIT SYSTEM

In the ELECTRIC RAILWAY JOURNAL for July 25 there appeared an article describing the use of white bands on poles along the roadway to serve as a warning sign at approaches to grade crossings with other lines.

There are other uses to which this scheme may be applied. In particular, it will be found valuable if applied to poles on approaches to sharp or hidden curves and at control points for sidings and turnouts. The usual custom is to indicate the distance from the control point by the number of bands upon the pole, as indicated in the article mentioned, it being assumed that poles are approximately 100 ft. apart.

On city properties where it is desirable to have cars stop at definite points constantly, to facilitate loading and proper spacing, the scheme of painting a white strip about 12 in. wide upon the pavement between gage lines has been found very valuable, particularly at transfer points and congested places where several cars are likely to be loaded at the same time.

Experiments have been tried with colored paving materials differing from the general pavement, but the painting method seems to work out best. Whiting has been found quite satisfactory as a painting medium if a little salt is added to the solution to aid in making it adhere to the pavements. Such strips last about a week under ordinary vehicular traffic before requiring repainting, which is done usually by the transportation inspector or by curve cleaners.

Comparative Costs of Building the Rivoli Suburban Line

BY CARL H. FULLER, FORMERLY ENGINEER MAINTENANCE OF WAY, MACON (GA.) RAILWAY & LIGHT COMPANY

The Rivoli line is a 3.19-mile extension added to the Macon Railway & Light Company's Vineville Avenue line and intended to assist in the development of new suburban territory adjacent to Macon. For the first 1¼ miles the track occupies the streets of a subdivision that was being platted and developed at the time of its construction. The following 1½ miles was constructed along an excellently graded county highway, when it leaves the road for private right-of way through rolling farm and woodland and to its terminal at the Country Club.

The contract for the grading and track laying was awarded to the contractor, who graded the streets of the new subdivision, for $1,780 per mile. All cuts and fills exceeding 16 in. were to be figured as an extra, and the railway company was to furnish all ties, rail and fittings within 200 ft. of the end of the track. In the subdivision the streets were supposed to be cut to the established grade before the railway company's contract became effective.

The contractor handled the track construction in connection with his street grading. As he was well equipped with men and teams, he had everything in his favor for doing economical work. Yet on the completion of the first 1.45 miles of track he asked to be released on the ground that he was losing money. The contract was cancelled, the railway company paying the contractor the price agreed on plus some extras, making a total of $1,850 per mile.

This first section of 1.45 miles was laid at an average of 68 ft. a day, or 77 days per mile, requiring a total of 112 days. The railway company then entered on the work. It used its own track gang with the addition of rented teams and men for the grading and completed the remaining 1.74 miles of track in 56 days, averaging 164 ft. of finished track a day, or 32 days per mile.

The work corresponded with that previously performed by contract, with the addition of removing some twenty pines, building a 48 in. metal culvert with riprap bulkheads, some blasting and the installation of one diamond turnout. The cost amounted to the following:

Team foreman, 28 days at $2	
Per foot of track at $0.0061	
Per mile of track at $32.50	$56.00
Rented teams, 128 days at $5	
Per foot of track at $0.0695	
Per mile at $366	640.00
Extra labor on grade, 227 days at $1.25	
Per foot of track at $0.0309	
Per mile at $163	283.62
Company track gang, foreman at $75 per month	
Labor at $1.25 and $1.35 a day	
Per lineal foot at $0.225	
Per mile at $1,080	1,880.33
Hauling men to and from work on special car	
Average haul 10 miles a day	
53 days at $2.26	
Per foot of track at $0.0135	
Per mile at $69	119.91
Company work per mile........$1,710.20 Total	$2,979.86
Contract work per mile........$1,850.00 Total	$2,862.50

Both sections had the same engineering supervision and the company work was better done as evidenced by the necessity for resurfacing the contract work within a year. The following additional labor of hauling was common to both sections of the work:

Hauling rail—6 miles or 12 miles for the round trip—1020 bars at $0.24 each, per ton of rail at $0.73, per foot of track at $0.0144, per mile of track at $140.69	$244.80
Hauling ties, average haul same as above, 8415 ties at $0.0395 each per foot of track at $0.0198, or per mile of track at $104.50	336.60
Hauling miscellaneous material at $10 per mile	17.29
Hauling dirt for two fills	81.46
Hauling per mile at $238, total	$680.15

The following material was required to construct 3.19 miles of track:

8415 ship pine ties at $0.60 each, per foot of track at $0.30, or per mile at $3,696	$5,049.00
1020 bars 60-lb. rail, A. S. C. E. section, per foot of track at $0.70, per mile of track at $105.60 or per ton at $35, or $3,696 per mile	11,790.24
1029 splice bars at $0.75 per pair, per ft. of track at $0.196, or per mile at $560	1,785.04
93 kegs of spikes at $3.63, per ft. at $0.02, or per mile at $105.60	337.59
21 kegs of bolts at $7.50, per ft. at $0.0095, or per mile at $49.40	157.50
One standard long radius diamond turnout	886.00
One single left-hand branch-off	415.00
Metal culvert 48-in. diameter, 24 ft. long	99.00
Miscellaneous material	107.50
3.19 miles at $6,484.90 per mile, or	$20,686.83

After the track had been surfaced and in use for several weeks, 1020 concealed No. 0000 compressed terminal bonds 9 in. long were installed, necessitating the removal of splice plates, drilling two holes with a Duntley electric track drill, applying the bonds with screw press and replacing the plates.

1020 concealed bonds at $0.375 each, or $123.75 per mile of track	$382.50
Bond labor at $0.2405 each, or $77.00 per mile	246.21

We used 1560 lin. ft. of 4 in. x $^3\!/_4$ in. flat-iron guard rail on curves which were fastened to the running rail with bolts and cast-iron filler blocks spaced 30 in. on centers, costing as follows:

1560 lin. ft. bar iron at $0.169 per foot	$263.64
Shop drilling of holes in guard at $0.0291	45.40
Bolts, cast fillers and washers at $0.065	101.57
Labor, 46 days at $1.35 or $0.04 per ft	61.22
Total 1560 ft. guard rail in place at $0.303 per foot	$471.83

SUMMARY

Labor grading and track laying at $1,831.46 per mile	$5,842.36
Hauling all material at $238 per mile	680.15
Track material at $6,484.90 per mile	20,686.83
Bonds at $197.08 per mile	628.71
Guard rail	471.83
Engineering and supervision at $263.32 per mile	840.00
Total, 3.19 miles at $9,137.89 per mile, or	$29,149.88

The foregoing figures may be taken as a fairly average cost for constructing unballasted track in dirt roads, using 60-lb. rail and negro labor under white foremen. Such construction will require an annual maintenance charge of $195 a year to keep it up until it is necessary to begin tie renewal when, of course, the expense will be materially increased.

One point is brought out quite forcibly in the comparison between the contract versus company method of construction and laying track, namely, that no particular advantage in cost is obtained by subletting the work. The railway can buy all material as cheaply as the contractor and use ordinary track labor under competent supervision with the addition of rented teams. The railway suffers little or no disadvantage on account of equipment, and it has no incentive to slight work in the surfacing.

Equipment Defects—Control Connections —II—Grouping Motors

BY C. W. SQUIER, E.E.

The series-parallel grouping of motors is the one most commonly used for car operation, and it can be employed whenever the number of motors is a multiple of two. With this method the motors may be arranged in any combination so that there will be at least two motors in series at the start, the final arrangement being all in parallel. This provides two economical operating speeds, that of two motors in series, or approximately half speed, and that with all motors in parallel or full speed. By economical operating speeds are meant the speeds at which the motors are operated without external resistance in circuit. It is also possible to use this method with three motors by connecting all three in series and then in parallel. However, this combination is seldom used in railway service.

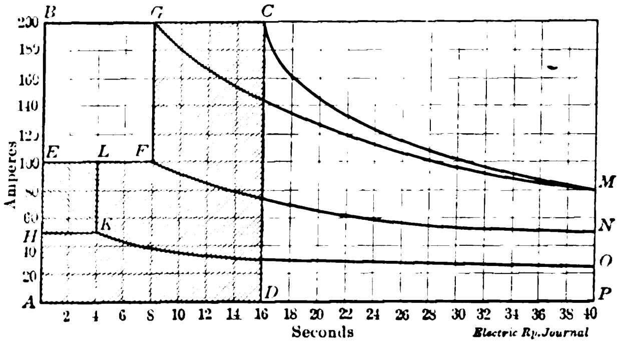


FIG. 6—CURRENT-TIME CURVES FOR STARTING A CAR WITH FOUR MOTORS

Series, Series-Parallel and Parallel.—This method is often used with four-motor equipments and can be employed only when the number of motors is four or some multiple of four. With this method the motors are started with four in series, then changed to two in series and two in parallel, and then all in parallel. This arrangement gives three economical operating speeds, namely, one-fourth, one-half and full speed.

ENERGY CONSUMPTION

The amount of energy required to start and operate the motors varies considerably with the different combinations just referred to. This is best illustrated by referring to the current-time curves of Fig. 6, which show the current taken in starting a four-motor car equipment with the different combinations. By referring to the characteristic curves of the motors it was found that a current of 50 amp per motor was necessary to start the car from rest and accelerate it at a rate of $1\frac{1}{4}$ m.p.h.p.s. With this rate of acceleration sixteen seconds would be required to attain a speed of 20 m.p.h., which is the speed corresponding to 50 amp in the motor with full voltage impressed upon its terminals. With all four motors connected in parallel the energy consumed in starting and accelerating the car will be represented by the area *A-B-C-D*. After the point *C* is reached in the current curve the current will fall off along the curve *C-M*. If we assume an average line voltage of 600, then the energy consumed will be 1,920,000 watt-seconds. Now consider the motors connected first two in series, two in parallel up to half speed, then all in parallel, and the energy consumed will be represented by the area *A-E-F-G-C-D* or 1,440,000 watt-seconds, which saving is represented by the area *E-B-G-F* or 480,000 watt-seconds, equivalent to a decrease of 25 per cent in energy input. Next if the motors be started all four in series, then changed to two in series, two in parallel and then four in parallel, the energy will be represented by the area *A-H-K-L-F-G-C-D*, which is a further saving of the area *H-E-L-K* or 120,000 watt-seconds, equivalent to 6.25 per cent additional of the first input.

This discussion illustrates the saving that can be obtained by starting and accelerating the car to a speed of 20 m.p.h., but if the running speed is to be less than this then the saving will be still more pronounced. For the sake of comparison let us assume that it is desired to operate at half this speed, then with all four motors in parallel this speed will be attained in eight seconds and it will be necessary to stop cutting out resistance. The current will then fall off along the curve *G-M* and at the end of forty seconds the energy input will be represented by the area *A-B-G-M-P*. If, however, the motors are operated according to the second combination of two in series, two in parallel, then all external resistance can be cut out at the end of eight seconds and the current will fall off along the curve *F-N*, which is but half the amount represented by the curve *G-M* with the speed of the motors remaining the same.

The area *A-H-K-O-P* represents the energy input with all four motors operating in series and accelerating up to a speed of one-fourth full speed.

Yoke for Handling Armatures

BY R. H. PARSONS, ELECTRICAL FOREMAN

The old-style rope slings used for hoisting armatures were dangerous. If discarded as soon as the strands were beginning to break the danger was decreased, but the possibility that the rope would be cut on striking a sharp edge during some lift was always present. Further, the armature might slip out of the sling almost any time.

The accompanying sketches illustrate safe, convenient and durable yokes for hoisting armatures, either with or without a carriage. The armature cannot slip out because it always hangs level. On account of its compact design, this form of suspension can be used where headroom may be limited, as in raising an armature on a high platform or rack where the distance from the chain hoist to the platform is scant. Fig. 1 shows a yoke for raising the armature alone. The dimensions, of course, must be varied according to the sizes of armatures. The spacing between the ends can be arranged to permit suspension from either the armature shaft or oil collars. If only one type of armature is to be carried the yoke may be designed to close measurements; but more liberal measurements must be used if the same yoke is to be used for different armatures. The suspension hole must be offset a little from the center to secure proper balance, for an armature is heavier on one end than on the other. Fig. 1 shows the proper offset in proportion.

Fig. 2 illustrates a yoke for hoisting an armature and carriage. In transporting an armature from the armature room to the motor shop or the car the armature often is carried part of the way by a crane and then is dropped either on the floor or on another carriage. The yoke of Fig. 2 makes it easy and safe to carry both armature and carriage anywhere. It avoids any handling of the armature, thus preventing damage to coils, etc.

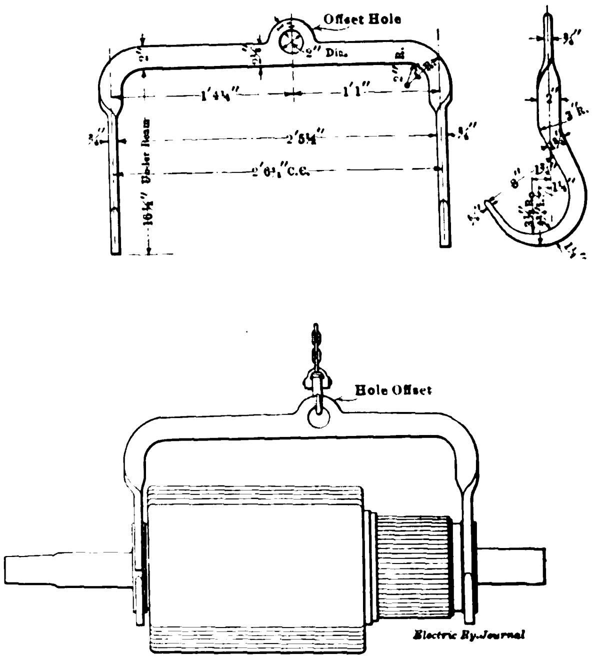

FIG. 1—YOKE FOR SUSPENDING ARMATURE ALONE

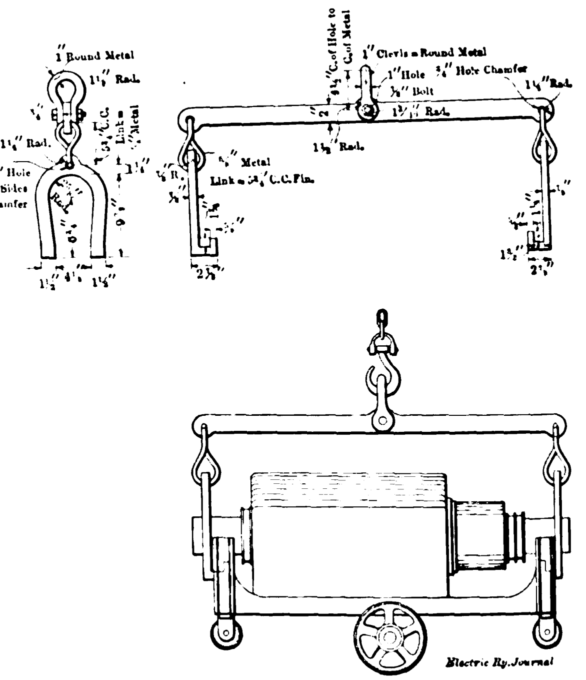

FIG. 2—YOKE FOR SUSPENDING ARMATURE AND CARRIAGE

At the same time it makes it possible to have the armature trucks where they are needed, since for every armature transported one way there is one to go back.

The confirmation of the report that England has embargoed ferro-manganese steel to the United States has caused a rapid rise in the market price of this alloy and no doubt will work a serious hardship on manufacturers making a specialty of manganese steel products. While at the beginning of the European war several manufacturers announced that they had quite a stock of ferro-manganese steel on hand, they had hoped that the opening of the seas would release the great stores of this product said to be held in England.

Combination Step Lamp and Marker

While it has not become general practice to provide markers and tail-lights on street railway cars, the ease with which these may be combined with step lamps which are in general use should increase their popularity. These have been provided on the new cars recently purchased by the Evanston (Ill.) Railway. By connecting the step lamps on each side of the car in one of the headlight circuits, the headlight and the step lamps at the rear entrance and the front exit are turned on simultaneously. Essentially this step-lamp fixture consists of a flared rectangular metal reflector, 6 in. wide x 10 in. long x 6 in. deep, set in the usual position under the vestibule bonnet and over the entrance and exit steps. A 4-in. green roundel is provided in the front end of the reflector at the exit door at the motorman's end of the car, and a 4-in. red roundel in the rear end of the metal reflector over the rear entrance. When the step lamp is lighted with the headlight, a green marker shows ahead and the red tail-light behind. These reflectors are fitted with 23-watt tungsten lamps.

COMBINATION STEP LAMP AND MARKER

Commutator Slotting

According to B. G. Lamme, the slotting of commutators, or the undercutting of the mica between bars, for the purpose of reducing rapid wear, burning, grooving or undue heating of the commutator or the deposit of copper on the brushes will not remove the primary cause of the trouble, namely, the large local currents or high current density on the brush contact. However, it lessens the harmful effect by allowing the brush to maintain better contact with the commutator. In this way the burning action can be diminished, in most cases to such an extent that the commutator face will polish, and this in turn will enable the brush to make better contact with the copper. Undercutting in general is advantageous where the mica takes up a relatively large portion of the total surface, such as 20 per cent or more. The general practice at present with non-undercut commutators is about 1/32 in. thickness between bars. Where the commutators are undercut there is a liability that carbon dust will collect in the slots and short-circuit between bars, unless the peripheral speed is sufficient to keep the slots clear. Therefore, in slow-speed commutators which are undercut it may be necessary at times to brush out the slots. In high-speed commutators, or in variable-speed machines which intermittently reach high speeds, there is usually but little difficulty from the collection of carbon in the slots.

Slotted commutators, while advantageous in some ways, present certain operating objections in others. Except where the brushes cover several bars, the slotted commutators of generators are likely to produce chattering of the brushes, unless frequently lubricated. Therefore, with such commutators, self-lubricating brushes are recommended. These brushes usually contain, or consists of, graphite, and generally are of lower resistance than ordinary carbon brushes; therefore, they are not as useful in assisting commutation. In commutating-pole generators where the resistance of the brushes is of relatively little importance, graphite brushes are often satisfactory. As such brushes are usually soft, they are not well adapted for wearing away the mica in commutators which are not undercut.

Car Maintenance in Manila

A brief outline of the experience of The J. G. White Management Corporation in operating traction lines in the Philippines, as regards the principal causes which led to the use of steel cars on the Manila city lines, may be of interest.

Wooden cars exported to Manila from the United States were found to be very expensive in the long run, due to the destructive activities of the Philippine white ant. The habits of these ants are more or less similar to those of the teredo except that the latter generally attacks wood under water only. The white ant bores readily through both paint and varnish and destroys the inner portions of the wooden members of the cars.

Various methods for protecting the car equipment were tried in an endeavor to avoid the necessity of continually replacing portions destroyed by the ants. In accordance with recommendations of the bureau of forestry all open edges of wood were coated with carbolineum, and gasoline was sprayed over all portions open to attack. However, these methods proved unsatisfactory as well as costly, and the company was forced to resist the depredations of the native insect by a change in type of car construction.

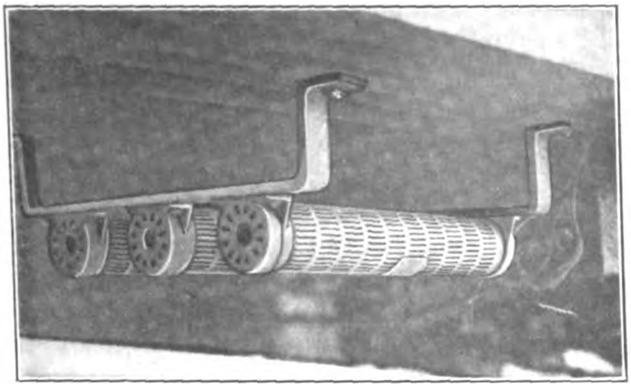
Six center-entrance cars, similar to those in service on the Brooklyn Rapid Transit System, were constructed with steel sills and superstructure; the various wooden parts, including post fillers, etc., were made of a native wood known as pagatpat which grows in Philippine swamps. This wood is very heavy, of dense grain and is not attacked by the white ant. It also seemed to offer great possibilities as a material for car construction in view of its low cost and good appearance when finished.

The results, however, were not so pleasing as was expected, for a new difficulty arose. The native wood was found to cause indirectly a corrosion of all brass, iron and steel parts which came in contact with it. The wood contains about 1 per cent, by weight, of salts which are acidified in the presence of water, the acids thus produced eating the metal parts reached by them. The same was found to be true of insulation on motor control cables as well as ordinary lighting wires.

Six new center-entrance cars are now being constructed in the company's shops at Manila and are more or less of the same design as the first six. However, the wooden post fillers, etc., are being made of ash shipped from the United States and thoroughly treated with carbolineum. It is expected that this new semi-steel car will solve the problems of excessive car maintenance in Manila.

Resistances for Operating 220-Volt Fan on Trolley Circuit

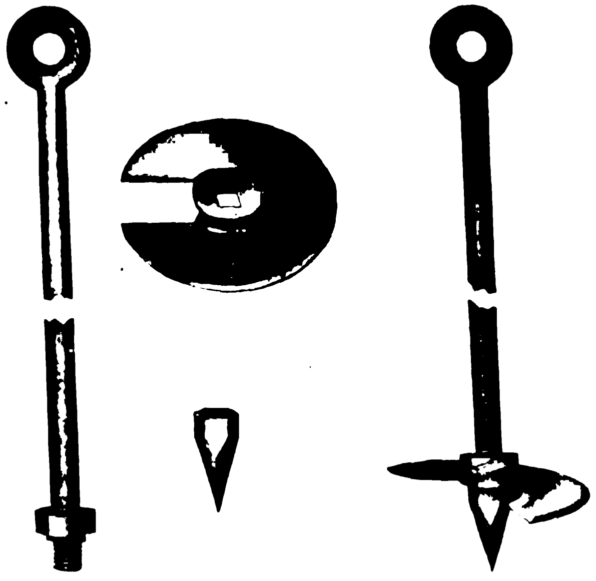
On the office car of H. E. Chubbuck, vice-president executive of the Illinois Traction System, are three 220-volt fans. It was desired to arrange each fan for independent operation from the trolley, and so three special resistances were obtained and mounted underneath the car, as illustrated. Nichrome wire, obtained from the Driver-Harris Wire Company, was used because of its constant temperature coefficient. The wire was wound on standard electric car-heater cores and held in the regular electric heater casings.



FAN RESISTANCES UNDER CAR

Guy Anchors with Interchangeable Wings

An all-steel screw anchor with interchangeable wings to provide for different soil and load conditions is being manufactured by Hubbard & Company, Pittsburgh, Pa., and is known as the "Steelwing" guy anchor. This anchor has a much larger bearing surface than other all-steel anchors, and as it is made of open-hearth steel throughout and galvanized by the hot-dip process, it is far more reliable than the various cast-iron combinations, to say nothing of the old-style wooden deadman. The wings are made in three sizes, 6 in., 8 in. and 10 in. diameter, with rods of ¾ in., 1 in., 1¼ in. diameter, 5 ft. 6 in. long. Wings and rods are made of high-carbon open-hearth steel, securing great strength and stiffness without excessive weight. A drop-forged cap screws on the end of the rod and holds the plate absolutely rigid.



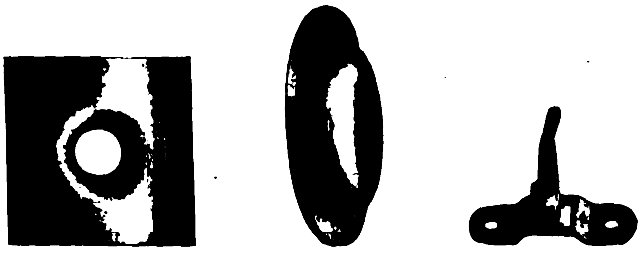
GUY ANCHOR DISASSEMBLED AND ASSEMBLED

To install this anchor a shovelful of earth is removed to give it a start, and with a bar thrust through the eye of the rod the anchor may be screwed to place in a minute or two. No special tools, such as wrenches, post-hole augers, etc., are needed, and since the wings are thinner than the old cast-iron type and specially sharpened, and since the cap is designed to offer little resistance to the earth, installation is greatly simplified.

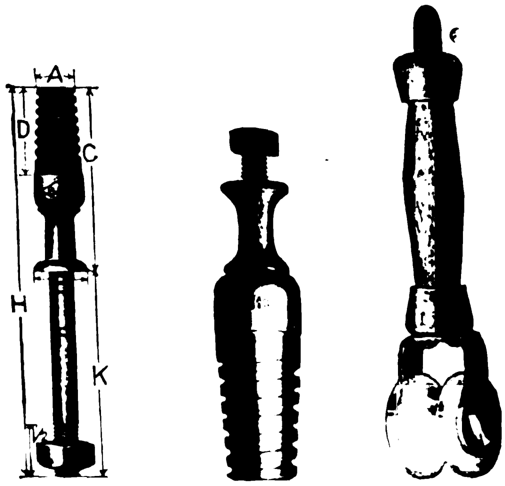
The interchangeability of the wings is a valuable feature, as this permits the use of a larger wing in soft loam or sand without the added expense of a heavier rod. Of greater importance, however, is the absolute dependability of the anchor, which does not contain a single welded joint, even the eye on the end of the anchor rod being drop-forged.

Recent Improvements in Line Hardware

The accompanying illustrations show a few of the latest line specialties of the Barnes & Kobert Manufacturing Company, Milldale, Conn., specialist in pole line hardware. One view shows a form of wood strain insulator, with porcelain or composition spool for use where extra insulation is required. The wood is of impregnated, second-growth hickory with heavy drawn-steel caps. The detachable pole step shown is made to hold 400 lb. with safety. This step when detached weighs less than 5 oz. and several can easily be carried in a lineman's tool kit. The cupped washers illustrated alongside are made to hold either 1½-in. or ⅝-in. steel pins in the center of 1¼-in. or 1½-in. wood pinholes. The square one goes on top of the cross-arm and conforms in shape to the crown of the latter. The round one fits underneath the cross-arm. Of the two types of pins presented the short one is for use on cross-arms made of angle-iron, while the long one is the company's new Western Union type made either ½ in. or ⅝ in. in diameter. When used with cup washers these pins will fit either 1¼-in. or 1½-in. wood pinholes. Several types of brackets, guy clamps and break arms are also announced by this manufacturer.



CUPPED WASHERS AND POLE STEP



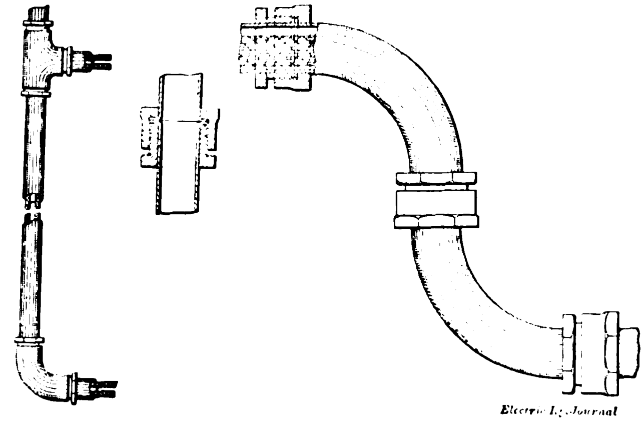
TWO TYPES OF PINS AND WOODEN STRAIN INSULATOR

A Threadless Flanged Conduit

Convinced of the need for better conduit, the National Formed Metal Products Company, Chicago, Ill., has developed after experimenting three years a flanging machine which will produce a light-weight, threadless conduit on a commercial basis. The collapsing of pipes was the one feature that prevented pipe manufacturers from marketing a light-weight conduit. It is believed that a conduit of this kind will be of particular interest to the electric railroads from several standpoints.

The conduit and the fittings shown in the illustrations have been especially designed for car work. It has been the aim of the manufacturer to eliminate practically all present car-conduit difficulties, and at the same time add some advantages over the present threaded conduit. In weight alone, the new conduit saves approximately 60 per cent. Any desired thickness of wall may be secured at a very slightly increased cost.

Owing to the design of the coupling it is possible to feed rigid conduit onto the cable in much the same way as is done with flexible conduit, thereby freeing the insulation from all mechanical strain. The joints can then be coupled and made absolutely watertight after the cables are in place. The coupling also has been especially designed to withstand, without loosening, the severe vibration inevitable in car service. To this end it has been provided with an automatic lock that forms an integral part of the fitting.



Electric Ry. Journal

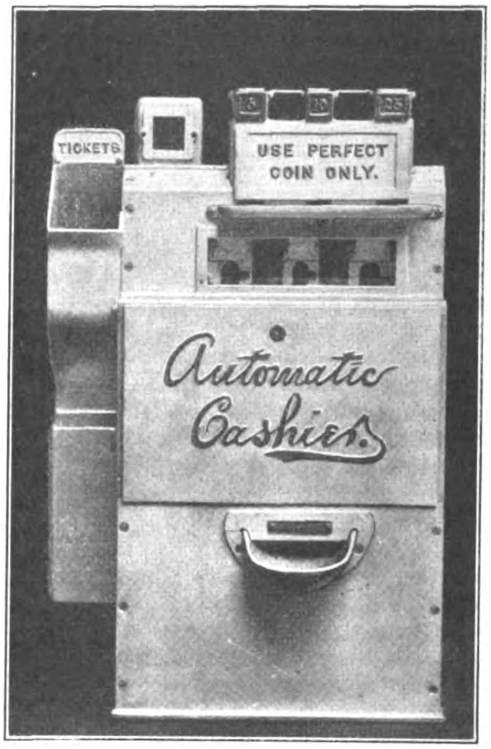
THREADLESS CAR CONDUIT

It is also asserted that the conduit is absolutely foolproof against the oversight or carelessness of pipemen in neglecting to ream cut pipe ends, since the sections cannot be coupled unless they are properly flanged and filleted. As the conduit is threadless, no difficulty is experienced from the entrance of oil and thread turnings into the pipe, nor has difficulty arisen from eccentric pipes as the coupling forces the abutting sections into alignment. In the matter of maintenance and repairs this conduit possesses an advantage over the threaded type since it is possible to remove any section without disturbing the adjacent sections, and at the same time the conduit is free from the weakness of running thread joints.

To resist corrosion this conduit is protected by a lead-like, rustproof coating. The pipe is also absolutely free from scale and this, together with the coating process, makes it possible thoroughly to impregnate both the interior and exterior surfaces and ends. All surfaces are perfectly smooth, and the lead-like coating presents a surface that very materially assists in fishing cables. In coupling up abutting sections it is unnecessary to use a wrench, a pipe vise with smooth-faced jaws being furnished. The combination of these two features makes remote the injury of the rustproof coating by the workmen. The conduit flanging machine is a small portable device, and the time required for producing a finished flange is far less than that required for cutting a standard thread on the same size of pipe.

Automatic Cashiers for Car Service

One of the new exhibits at the last convention of the American Electric Railway Association was the "Automatic Cashier" of the Automatic Cashier Corporation, Norfolk, Va. This machine was devised to permit quick and accurate change-making on prepayment cars and at terminals, stations, etc. Ordinarily it is made to give change for dimes, quarters and half dollars. The machine retains the desired number of fares from any of these coins as inserted, and instantaneously delivers the required change to the patron. The conductor or other attendant does not take any money from the passenger. The machine simultaneously records the transaction and automatically locks after every transaction. It unlocks only when a coin has been inserted and only to the extent of that particular coin. No vexatious calculation or delay on the part of the operator is required. Should a passenger inadvertently place his coin in the wrong slot it is automatically returned for correct insertion.



AUTOMATIC CASHIER FOR CAR PLATFORM AND STATION

All transactions are between the passenger and the machine, access to which can be had only by an authorized person having the key. Records and registers can be made visible or invisible. A verification of the number of fares paid is indicated and the coin inserted is held suspended to the full view of the passenger and operator. Spurious coins are ejected and confiscated. All coins inserted immediately become available for change from the tills. Provision for extraordinary runs of business is made by overflow packets. An attachment for registering and canceling tickets is also one of the many features of the machine. The weight of the machine is approximately 50 lb. Its dimensions at the base are 12 in. x 13 in. and its height 22 in.

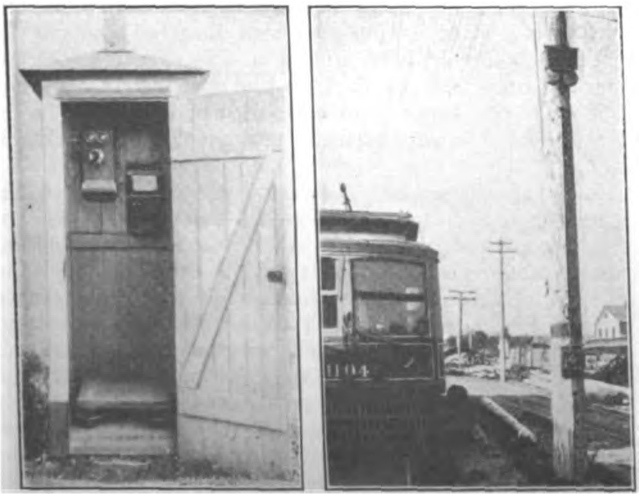
Telephone Dispatching on the Milwaukee Railway System

The efficiency of the telephone as a means for dispatching on railway lines is being demonstrated almost daily by the increasing number of railroads that have adopted it for controlling train movements. Until a few years ago electric street railway lines had no uniform method of dispatching cars. Their usual practice was to start cars at certain intervals and check the maintenance of schedules by having inspectors stationed at various points along the road. The telegraph was not considered as this would have entailed the establishment of way stations with experienced operators. The need of a satisfactory dispatching system was felt particularly on interurban lines, where it often became necessary in an emergency for a car crew to communicate with the dispatcher and for the dispatcher to communicate with the car crews and inspectors.

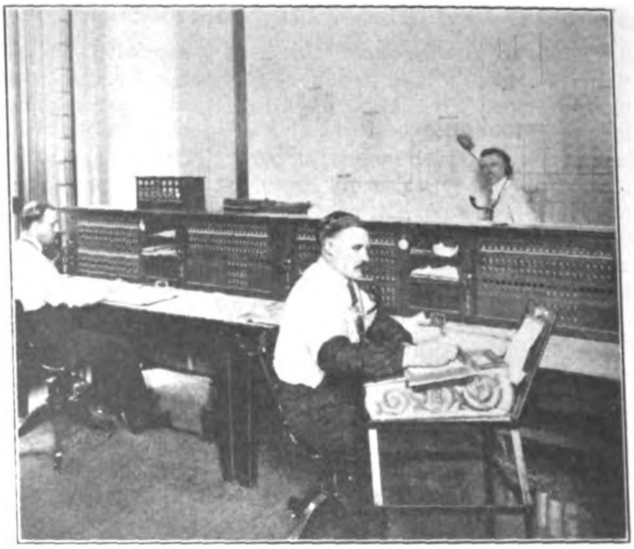
An equipment that is one of the most extensive of its kind has been operated for several months by The Milwaukee Electric Railway & Light Company. Three switchboards are in service—one for the use of the train dispatchers, another for handling all calls within the company's Public Service Building, and a third for handling public telephone messages, operated by the Wisconsin Telephone Company.

The train dispatchers' switchboard is a Western Electric six-panel, three-position board with two of the positions in service at present. The equipment of the four panels now in use is sufficient to talk to the 240 telephones located at various points along the car lines. These telephones, which are usually found at transfer points and track intersections, are mounted on poles that may be readily distinguished by broad yellow bands painted on them a short distance above the telephones.

The telephone instruments are of two kinds—the metal box type operated on central battery within the city, and the familiar Western Electric No. 1317 magneto wood telephone for the outlying districts. The latter are inclosed in shelter booths. There are also twenty-five loud-ringing call bells located at track intersections, parks, etc. These are mounted on poles with the telephone instruments and are used to signal the supervisors. They are operated from the train dispatcher's switchboard. On the top of the switchboard in the first position is placed a small lamp signal box which indicates open bridges or closed steam railroad gates, thus enabling the dispatcher to note the location and length of all delays to traffic. Harmonic ringing is used.



BOOTH FOR TELEPHONE: POLE TELEPHONE WITH LOUD-RINGING BELLS ABOVE



TELEPHONE EQUIPMENT AT DISPATCHING HEADQUARTERS

The dispatchers handle 490 trains and receive approximately 3900 calls daily. In all 1600 miles of telephone circuits are operated, a part of the lines being in lead-covered cable, of which there is a total of 80 miles.

A commercial switchboard for handling calls within the Public Service Building is made up of a single section arranged for three operators and equipped for 270 commercial lines, which connect 425 telephones, some of which are on party lines in the suburban districts. This switchboard, also manufactured by the Western Electric Company, is connected through to the dispatcher's switchboard to take care of transferred calls. Three private branch exchange switchboards are operated in conjunction with the main switchboard, one at Cold Springs operating thirty-eight lines, one at Racine operating fifteen lines and another in the way department operating ten lines. In conjunction with the commercial and dispatcher's switchboards, there is a complete power plant, terminal and wire chief equipment.

The public switchboard operated by the Wisconsin Telephone Company has sixty-five extension telephones connected to it. There are ten trunk lines, four of which are for incoming calls exclusively. One private line connects directly with the trouble department and has a "silent" number known only to the outside trouble men and heads of departments.

London and North-Western Rolling Stock

Some further particulars were recently made public as to the rolling stock to be used on the London & North-Western Railway's electrified lines. All the vehicles are 56 ft. 11 in. long over all. The motor cars are carried on two four-wheeled pressed-steel trucks of 8 ft. 9 in. wheelbase, with centers 37 ft. 6 in. apart; the trucks for the trailer and control-trailer vehicles have a wheelbase of 9 ft. and are 38 ft. apart. The vehicles are 9 ft. wide, 7 ft. 5¾ in. high from floor to center of roof inside, and 12 ft. from the rail level to the highest point outside. In the case of the motor cars, the motorman's compartment is built entirely of steel. The motor car includes the motorman's and apparatus compartment and baggage compartment, and an open saloon for smokers. The control trailer is open throughout, except for a motorman's compartment and a vestibule at each end, and seats sixty passengers—non-smoking. In all accommodation is provided for 128 third-class and thirty-eight first-class passengers. Each motor car carries four 250-hp motors.

News of Electric Railways

B. R. T. CO-OPERATES WITH POLICE AND FIREMEN

Lecture to Ranking Police Officials on Safety by the Brooklyn Rapid Transit Safety Bureau

On Nov. 18 inspectors, captains, lieutenants and other ranking officers of the New York police department to the number of about 350 attended a lecture on safety given jointly at police headquarters by the Brooklyn Rapid Transit System and the New York fire department. The railway was represented by E. C. Clarke, supervisor of instruction, and Jessica P. McCall, supervisor of the bureau of public safety, and the fire department by W. B. Northrop, special investigator.

Mrs. McCall gave an extended account of the safety work of the Brooklyn Rapid Transit System in connection with the children of the public schools and their mothers. She showed by means of numerous colored slides how the work has been extended beyond safety features relative to electric railroading. For example, children are shown the consequences of lighting a gas stove improperly, the wisdom of removing protruding nails, of passing from one side of the street to the other only at regular crossings, etc. Sanitation and fire prevention were also considered. At the talks to mothers the necessity is emphasized of labelling all drugs properly and of placing them on shelves high enough to be out of the reach of children. The enduring effect of the lectures to the children has been proved by references to safety in compositions written long after the talks had been presented. Mrs. McCall concluded with a presentation of the film "The Price of Thoughtlessness." This film was originated by Mr. Clarke and the staff of the Vitagraph Company of America. It has been very widely circulated.

Following Mrs. McCall, Mr. Northrop presented his new story, "The Locked Door." This picture, also prepared with the co-operation of the Vitagraph Company of America, most appropriately is made on a slow-burning film which permits it to be shown in any kind of a building. The story contrasts two clothing shops in the same building, one of which has the most approved fire protection devices and open doors to the stairways and fire escapes, while the other shop has no protection, the employees are permitted to throw findings on the floor at random and the doors are locked. In the protected shop an incendiary fire makes very little headway because of the operation of the automatic sprinklers and other devices, while in the unprotected shop a carelessly thrown cigarette results in a terrible catastrophe. This story of fire protection is entwined with a romance concerning the daughter and the son of the two shop owners. The film is most realistic.

Both films were received with much applause, and many notes were made by the various officers present, presumably for their guidance in furthering among their men the campaign for the saving of life and property.

CONNECTICUT AND RHODE ISLAND TRUSTEES

The trustees appointed to take over the securities of the Connecticut Company, New Haven, Conn., in accordance with the recent New Haven Railroad dissolution decree, the terms of which were noted in the Electric Railway Journal for Oct. 24, have organized. The trustees are Walter C. Noyes, Old Lyme; Lyman B. Brainard, Hartford; Charles Cheney, South Manchester; George E. Hill, Bridgeport, and William W. Hyde, Hartford. Judge Noyes has been elected chairman of the trustees and chairman of the board of directors, which will be composed of the other trustees and President L. S. Storrs of the Connecticut Company. Mr. Brainard has been elected treasurer of the board of trustees. While the trustees are to take over the direction of the affairs of the company as officers of the United States Court they have announced that it will be their purpose to continue the present personnel in the operation of the property.

The trustees for the Rhode Island Company, Providence, R. I., are Rathbone Gardner, John O. Ames, John P. Farnsworth, Theodore Francis Green and Charles C. Mumford, all of Providence. It was announced from Providence that the trustees of the Rhode Island Company had not yet decided anything about the future of the Rhode Island Company, but that they would meet soon to organize formally. The new directorate consists of Theodore Francis Green, Rathbone Gardner, Charles C. Mumford, John O. Ames and John P. Farnsworth, the trustees, and A. E. Potter and A. T. Potter, president and vice-president, respectively. Robert W. Taft, Howard Elliott, D. Newton Barney, Henry H. McHarg, Frederick A. Brewster, A. Heaton Robertson, L. S. Storrs, N. W. Smith, Duff F. Sherman and A. E. Clark of the old board resigned before the reorganization and it was voted to reduce the number of directors from twelve to seven.

GOVERNORS DISCUSS WATER-POWER

Led by Governor William Spry of Utah, who read a paper on "State Control of Natural Resources," the Governors' Conference in session at Madison, Wis., on Nov. 11 discussed topics of federal ownership of large tracts of public lands in Western states and the exemption of these lands from furnishing tax revenues to the state governments, the federal leasing of water-powers with right of withdrawal, and the state control of natural resources under conditions of commission regulation similar to those now imposed by utility commissions.

Governor Spry and other speakers declared that the conservation agitation originated in selfishness by self-appointed guardians of the nation's resources, and that the effect of this policy has been to retard seriously the development of the West. Although the first "conservation congress" of a few years ago was called ostensibly to prevent waste of natural resources, said Governor Spry, it actually developed into a spectacular and wordy exploitation of calamitous and misleading figures and information predicting the early bankruptcy of the nation's natural wealth. As a result valuable rights were withdrawn by the government after insufficient field investigation and this has interrupted the development of the West. The matter of who shall control and dispose of natural resources was a minor matter compared with the need for at once placing these resources in the hands of those who will develop their usefulness and to the best advantage.

In discussing Governor Spry's address, Governor S. V. Stewart of Montana pointed out that public utilities were now regulated by commissions in most of the states, and such a system of regulation applied to natural resources would prevent abuse of monopoly.

Governor A. O. Eberhart of Minnesota said the state should undertake no business which can be transacted efficiently by private interests, and the federal government should exercise no function which can be properly discharged by the state governments.

Governor E. M. Ammons of Colorado protested against the difficulties which have been thrown in the way of those who seek to construct storage reservoirs and waterpower plants on the upper headwaters of Colorado streams. With the aid of state commissions having supervision of water-power subjects, the Governor declared that the greatest use might be made of state waterpowers, instead of the least, as at present.

NEW YORK CITY RAPID TRANSIT MATTERS

The Public Service Commission for the First District of New York has failed to legalize the Flushing route, known as Route No. 52, by the filing of the necessary number of property owners' consents. Because the new rapid transit route parallels its Port Washington branch for a distance, the Long Island Railroad refused to sign the necessary consent. The commission may go to the Appellate Division, which is empowered to give its consent to the building of the line in lieu of the property owners' consents; or it may adopt two new routes, which, taken together, would be identical with the present route.

Mayor John Purroy Mitchel and Chairman Edward E. McCall, of the Public Service Commission for the First District, have executed on behalf of the city of New York, the deed from the United States government to the city for easements under the United States post-office property for the construction of the new subway line. William G. McAdoo, Secretary of the Treasury, had already executed the instrument in behalf of the United States government. This clears the way for the construction of Section No. 1 of Route No. 48, the Park Place, William and Clark Street subway.

A communication has been sent by the commission to the Board of Estimate and Apportionment asking whether the city will have funds available to defray its part of the expense in the removal of the existing elevated tracks and structure from Fulton Street, Brooklyn, to Adams Street. The New York Municipal Railway Corporation recently applied to the commission for such relocation, and stated that it would be willing to devote an amount equivalent to the sum it would otherwise spend for the third-tracking of the line from Brooklyn Bridge to the Borough Hall. The change, if made, will be in line with other improvements that are being made in the vicinity of Borough Hall, and was recommended by the city plan committee.

The commission will hold a public hearing on Nov. 30 to inquire whether the Interborough Rapid Transit Company should be ordered to retire the 477 composite cars operated in the subway, use them on the elevated lines in Manhattan and The Bronx and replace them in the subway with all-steel cars.

The commission is advertising for bids, to be opened on Dec. 1, for the reconstruction of the DeKalb Avenue station on the Fourth Avenue subway in Brooklyn.

LABOR ON NEW YORK SUBWAY

Work has been stopped on one section of New York's subway system as the result of the activity of the labor unions in resurrecting a provision of the State labor law which requires that only citizens of the United States shall be employed on public works contracts. On Nov. 16 all of the subway contractors received a letter from labor representatives charging them with "openly and wantonly violating the labor law of this State with regard to employing men who are not citizens of the United States." To decide upon a plan of action a closed meeting of all subway contractors concerned in the case was held on the night of Nov. 18. After the session had adjourned C. A. Crane, secretary of the General Contractors' Association, gave out the following statement:

"The General Contractors' Association at its meeting declared that it was the intention of its members to comply with the law of the State in every particular. At the same time it desires to call to public attention the extreme difficulty of constructing the vast public works now under way and at the same time exclude alien labor. It is believed that the alien labor law is not constitutional and is in violation of treaties with other countries. Steps will be taken as speedily as possible to submit the question to the courts."

WESTERN MASSACHUSETTS TRANSPORTATION

The western counties transportation commission, which is to report on the desirability of electric railway construction in the Berkshire district at the next session of the Massachusetts Legislature, opened final hearings at Springfield on Nov. 16. The session was occupied by addresses on behalf of electric railway extensions into the so-called hill towns. About 240 miles of new lines are desired by residents of the territory lying between the Connecticut River and the New York State line. The estimated cost of development is $5,000,000. Among the new lines desired are the following: Agawam-Feeding Hills extension to Southwick; opening of service on the Lee-Huntington line; East Longmeadow to Hampden; Goshen to Williamsburg; a through line from Pittsfield to Northampton; a line from Plainfield through the Cummington Valley; a line from Worthington to Williamsburg; a line through the Farmington Valley; Granby to Holyoke; Wales to the Connecticut State line; and Hampton Ponds through Southampton to the Westfield-Holyoke line. The speakers urged the construction of these lines through private or State aid.

ILLINOIS TRACTION EXTENSION

The Illinois Traction System plans an extension of its present system south from the Twelfth Street station in St. Louis through the city, over the free bridge to East St. Louis and to Belleville by way of the tracks of the Southern Traction Company. A line from Edwardsville to Belleville, swinging east of East St. Louis, is a part of the plan. An elevated structure is also proposed to be built from the Illinois end of the McKinley bridge, above Main Street in Venice, and the tracks of the Wabash, Alton and other railroads, and along a private right-of-way above Granville Street and the tracks of the St. Louis Terminal Railway at the north end of the Madison yard. The lines of the Southern Traction Company approach within a short distance of the Illinois end of the free bridge. This proposal when carried out will permit the operation of one of the largest interurban belt lines in the Central West, and it is believed to be a part of the plan of the Illinois Traction System to enter the southern Illinois district, which is one of the most valuable coal mining regions in the United States.

SUBWAY AND LABOR MATTERS IN CLEVELAND

The proposed amended franchise ordinance of the Cleveland Underground Rapid Transit Company was considered at a meeting of the Council on the evening of Nov. 11. Councilman Gahn objected to the amendments, especially the one relating to the price fixed in case the city should decide to purchase the property. He suggested that members of the Cleveland Engineering Society be called in to give some information on the matter. W. R. Hopkins, president of the company, told the Council that, barring unforeseen obstacles, the work proposed would be completed within two years. He expressed the belief that construction work could be begun in the spring if the city made the desired changes in the franchise.

It is said that Mayor Baker favors a working arrangement between the Cleveland Underground Rapid Transit Company and the Cleveland Railway whereby the former may use the surface tracks after it reaches the outskirts of the city. For instance, it is proposed to bring the subway cars to the surface at University Circle on the Euclid route, but to give East Cleveland and the eastern part of the city proper service the cars must run on to the end of the surface line or the passengers must transfer. Mayor Baker and Mr. Hopkins are said to hold that the people within a distance of 5 miles from the center of the city can be guaranteed a 3-cent fare indefinitely by such an arrangement. The subway will reduce the number of long hauls and the congestion in the business district, both of which at the present time operate to increase the expenses of operation of the Cleveland Railway.

The motormen and conductors of the Cleveland (Ohio) Railway have voted to appeal the question of an eight-hour day to the City Council, and a committee of seven men will be appointed to appear before that body and urge action. About 700 men were present at the meeting and they responded to a recommendation by President Mahon of the Amalgamated Association to stand united on this one point, although they had already become seriously divided over the nominations for officials of the local branch. Chairman Koch of the street railway committee of the Council said the men would be heard, but that Council has no jurisdiction in the matter. The opinion of the company officials seems to be that the appeal to the Council is part of a campaign to secure the re-election of the present officials of the local branch of the union.

Dr. Charles S. Howe, president of Case School of Applied Science, is not favorable to the announced plan of building a subway in the city. He believes the Boston plan best adapted to present needs. The first work should be on Euclid Avenue between the Public Square and East Ninth street and on Ontario Street between the Public Square and Broadway. Traffic is exceptionally heavy on both these streets, and Dr. Howe says the first step should be to relieve this congestion. Then the subways could be extended as the traffic demands on other streets. Dr. Howe has suggested that the city should own the subways and lease them to the Cleveland Railway for operation. In any event he believes that the city should retain the right to say where the stations shall be located and that transfers should be issued between the lines of the subway operating company and the Cleveland Railway.

BLANKET FRANCHISE APPLICATION IN RICHMOND

Proposals have been made to the city of Richmond, Va., by the Virginia Railway & Power Company to surrender its various franchise grants and accept in place thereof a blanket franchise. The franchises that the company desires to have extended have thirteen to fifteen years to run and cover 36.5 miles of streets. An extension of fifteen years is being asked on these grants, the company offering to relinquish its perpetual franchise rights on this plan on 10 miles of streets that have recently been annexed to the city. A committee has been appointed to investigate the subject.

Boston Elevated Asks Extension of Time.—The Boston (Mass.) Elevated Railway has asked the Massachusetts Public Service Commission for an extension of time for building the rapid transit line from Sullivan Square terminal to Everett and Malden, on account of unforeseen delay in dredging the Mystic River.

Arbitration in Lexington.—Much latitude has been permitted in the arguments and evidence to be presented in the arbitration of the controversy between the Kentucky Traction & Terminal Company and its union carmen over the discharge of a union motorman. Charles C. Bagby, Danville, Ky., has been named by the Governor as umpire.

Calvert Townley in South America.—Calvert Townley, assistant to the president of the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., is at present in South America making a detailed study of the business situation there in the interest of his company. Mr. Townley will spend several months in Brazil, Argentina, Chile, Peru and other countries.

Pittsburgh Chamber of Commerce on Subway.—The Chamber of Commerce of Pittsburgh, Pa., has adopted a report presented by its city transit committee recommending the construction by the city of a downtown subway loop to be leased and operated by the Pittsburgh Railways. The report commits the chamber to the policy of forcing the matter upon the attention of the Council until something is done to relieve the present surface railway situation.

New Pacific Electric Cut-off in Operation.—The new Lordsburg-North Pomona cut-off on the San Bernardino line of the Pacific Electric Railway, Los Angeles, Cal., was opened to through service on Nov. 4. The running time between Los Angeles and San Bernardino is two hours, the fastest service on the entire electric system. The cut-off is 1½ miles long, and shortens the route 7 miles, with the result that a saving of twenty minutes in running time is affected. The cost of the cut-off is said to have been $60,000.

Seattle Fare Injunction Hearing.—Judge Jeremiah Neterer and Judge William B. Gilbert, of the United States Circuit Court, and Judge E. E. Cushman will hold a hearing in Seattle on Nov. 23 on the application of the Seattle, Renton & Southern Railway, for an injunction to restrain the Public Service Commission of Washington from enforcing its order denying the company the right to increase its passenger rates. The order of the commission vacating and suspending the schedule of fares of the company was referred to in the ELECTRIC RAILWAY JOURNAL of Oct. 31, page 1031.

Ontario's Hydroelectric Railways.—Newmarket and Uxbridge, the two municipalities in the hydroelectric radial area in Ontario that turned down the radial railway project recently, will be asked to take another vote on the proposition. The municipalities which voted in favor of the radial proposals have complied with the by-law formalities. According to Sir Adam Beck all that remained to insure an early start on the line is the approval of the other two municipalities. Arrangements have been made to urge the Canadian government to secure the $6,400 a mile grant that was figured upon in the estimates of the commissioner's engineers.

Conditions of Montreal Franchise Extension.—Mayor Martin, of Montreal, Que., on Nov. 9 presented a report to the Board of Control with the application of the Montreal Tramway for an extension of its franchise, which has several years yet to run. The Mayor recommends an extension of thirty years. He would demand the extension of the company's system and a fare not to exceed 5 cents between morning and midnight. He also urges the establishment of a bus service within five years, and refers to subways which may be constructed by the city. In addition, he would require the company to pay for certain street repairs, $12,000 yearly for street watering, and be made liable for taxes in certain districts where it is now exempt.

Appeals From Pennsylvania Commission Decisions.—Three appeals were filed in the Dauphin County Court at Harrisburg, Pa., on Nov. 10 in cases involving orders of the Public Service Commission of Pennsylvania, and it is said that a case may be started to test the constitutionality of the public service company act. Several other similar appeals were taken recently. The appeals now filed are in the cases of the Pennsylvania Utilities Company and the Bangor Steam Heat Company from orders referring to furnishing heat for Bangor; in the Phoenixville, Valley Forge & Strafford Railway case, in which the approval of a contract with Phoenixville is appealed from, and by several small railroads which were ordered by the commission to pay a portion of the cost for a viaduct in Butler.

Toronto Railway Matters.—Non-concurrence was expressed by the Board of Control of Toronto, Ont., on Nov. 12 in the recommendation of the works committee of the City Council, that the city enter into an agreement with the Toronto Railway for the operation of the new line on Bloor Street, between Dundas Street and Quebec Avenue, on a basis of 20 cents per car-mile. It was decided to ask permission to introduce a by-law empowering the commissioner to construct, equip and operate the line. Comptroller Church moved that application be made to the Legislature for an act giving the city power to make direct application to the Legislature for such amendments to the railway act as might be required from time to time. This matter was referred to the legal department for report.

Petition for Additional Cambridge Subway Station.—Residents of the Dana Hill district of Cambridge, Mass., have filed a petition with the Public Service Commission asking that an additional station be constructed at Putnam Square in the Cambridge subway. The petitioners claim that the surface car service between Putnam and Central Squares is inadequate and that traffic congestion at the latter point, which is an important transfer station, justifies the building of a new station between Harvard and Central Squares. A hearing will be given by the board, but it is considered unlikely that the additional station will be required in view of the recognition by the Railroad Commission prior to the building of the subway of the importance of limiting stops on rapid transit lines articulated with surface car service.

PROGRAMS OF ASSOCIATION MEETINGS

Railway Business Association

Fairfax Harrison, president of the Southern Railway, and Warren G. Harding, United States Senator-elect of Ohio, are announced as the speakers for the sixth annual dinner of the Railway Business Association, which will be held at the Waldorf-Astoria Hotel, New York, N. Y., on Dec. 10, 1914.

NATIONAL FIRE PROTECTION ASSOCIATION

The biennial meeting of the electrical committee of the National Fire Protection Association will be held in March, 1915, in New York City, the day and place of the meeting to be announced later. As usual, the provisions of the national electrical code as they now exist will be considered, together with reports of all sub-committees. Suggestions for amendments to the code, in order to be included in the bulletin, must be specific, and where a change is desired in a rule or section of a rule definite wording for such change must be given, together with the reasons why the change is recommended, and these suggestions, together with all committee reports, must be in the hands of Ralph Sweetland, 141 Milk Street, Boston, Mass., secretary of the electrical committee, not later than Jan. 15, 1915. The meeting will be open to all persons interested, and such persons will not only be welcome but are urged to be present and give the committee the advantage of their experience and advice.

Financial and Corporate

RECENT FINANCIAL TENDENCY

Analysis of Improved Conditions Brought About During the Last Week—Abstracts of Interviews Concerning Utility Earnings

The last week has been the most encouraging of any period since business was closed in the financial district. On Nov. 14 the committee of five announced that supervision over the prices of listed municipal bonds would no longer be required, and shortly afterward the committee of seven gave notice that dealings in unlisted municipal bonds for domestic accounts might be conducted without restriction. Not only was trading on the curb begun and maintained but the quotation of prices was resumed. Wire houses enjoyed a substantial volume of business for the first time in many weeks.

The opening of the twelve Federal reserve banks on Nov. 16 is believed to have brought about a relief in commercial circles and to have had a stimulating effect on all branches of business. Paul M. Warburg, of the Federal reserve board, declared that Nov. 16 might be considered the Fourth of July in the economic life of the United States, marking the foundation of its financial emancipation. October trade figures show an excess on exports over imports of $57,300,000. A general feeling of betterment is reported in trading and manufacturing centers. The cotton exchanges in New York and New Orleans resumed business on Nov. 16 at about the level of prices expected. This move should ease some phases of the problem which the sudden restriction of markets imposed upon the South and the country at large. In London the publication of the treasury scheme for relieving the stock exchange loan position, the issuance of new emergency rules and finally the announcement of the government's plan for financing trade, have ended the heroic measures, and it is believed that a gradual return to normal should ensue.

The New York Stock Exchange has considered plans for reopening its business in listed bonds, which would involve as one feature the establishment of minimum prices for trading. According to latest reports the exchange will not open on Nov. 23 as expected. The committee of seven has been dissolved. Tentative arrangements have been entered into between the Stock Exchange and representatives of the banks for the reopening of the Stock Exchange call money market. In Chicago the Stock Exchange will resume business on Nov. 23. Trading will be permitted in all listed and unlisted stocks at the closing prices of July 30 and the same will apply as to bonds. In handling dividend-paying stocks traders will be permitted to deduct one dividend. Walter Jackson, chairman of the special committee of five in the Boston Stock Exchange, issued a notice on Nov. 18 stating that the committee had rescinded its former order requiring members to confirm by letter all transactions made through the committee. All trades in listed securities made outside, however, must still be reported.

Transactions to the New York Stock Exchange clearing house committee on Nov. 16 were the heaviest recorded at any time since the closing of the exchange. Bond dealings passed the high record of $3,000,000 recorded on Nov. 13. There were also heavy dealings in listed stocks and unlisted bonds and notes. On Nov. 16 Commonwealth Power & Railway Light Company preferred stock showed an advance of one and one-half points over Nov. 12, while American Light & Traction Company common and American Gas & Electric Company common advanced five points and two points respectively in the bid prices. Utah Securities Company 6's were probably the strongest bonds on the list, with sales at 76, an advance of two points. By Nov. 18 American Light & Traction Company common had advanced six additional points, while Utah Security Company 6's sold for 76¾. Advices from Chicago state that the municipal bond market is showing improvement in demand and prices and the same is true of public utility issues.

In an interview published in the *Electrical World* of Nov. 14, Harrison Williams, who is on the executive committees of the Federal Light & Traction Company and the Republic Railway & Light Company, said that the gross earnings of the average public utility have been comparatively little affected by present conditions. There is little difficulty in supplying the necessary capital for the present limited requirements of companies of recognized standing. Until conditions become settled, however, short-time financing for the minimum construction requirements is likely to prevail. When the time arrives for permanent financing a broader market for public utility bonds should readily be obtained at prevailing rates of interest and at former or perhaps slightly better prices. In Mr. Williams' opinion there seems to be nothing in the present situation to compel any further action by public utilities other than to limit their immediate capital expenditures to the minimum consistent with meeting the requirements of the individual situation.

According to an interview in the same issue with F. G. Sykes, president American Power & Light Company, the earnings of the company and its subsidiaries were better in September than for a long previous period, the net from operation having increased 21 per cent over September, 1913, and for the twelve months 18 per cent over the preceding twelve months. This increase is largely caused by the fact that the company's properties are located in widely separated sections of the country and therefore reap the benefits accruing from diversification of industries. The company has found the cost of new money too high for ordinary construction purposes at this time and has curtailed its proposed construction operations. It is trying to shape its course so as to increase earnings through the acquisition of new business largely on lines already constructed.

The quotation prices of securities of a number of prominent public utility companies have been collated from sources of information available on Nov. 19 with the idea that they would probably prove of general interest as indicative of recent price tendencies. As best suited to meet the requirements of such a list it was decided to give wherever possible recent bid and asked quotations and the bid quotation on July 30, the last day that the New York exchange was opened for business. The quotations follow:

FINAL RECEIVERSHIP REPORT FILED

In filing with the United States Federal Court his final report as receiver of the Indianapolis, Crawfordsville & Western Traction Company, the predecessor of the Indianapolis, Crawfordsville & Dansville Electric Railway, Harry J. Milligan asked that he be discharged from his receivership duties. The report shows that all payments ordered by the court on April 17, 1912, have been made and that all taxes, assessments and valid claims against the company have been satisfied. There remains only for the court to enter an order for the disposal of $87,360 now held by the clerk of the United States Federal Court. It is expected that bondholders will receive part, if not all, of the money in registry. Mr. Milligan was appointed receiver on July 8, 1909, after a complaint had been filed against the company by the Chicago Installation Company.

ANNUAL REPORT

Fonda, Johnstown & Gloversville Railroad

The statement of income, profit and loss of the Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y., for the year ended June 30, 1914, is as follows:

Revenue from transportation:	
Freight revenue	$264,198
Passenger revenue, steam division	66,113
Passenger revenue, electric division	598,847
Mail revenue	3,109
Express revenue	15,741
All other revenue from transportation	7,134
Revenue from operations other than transportation	31,735
Total operating revenues	$986,877
Operating expenses:	
Maintenance of way and structures	$86,859
Maintenance of equipment	55,925
Traffic expenses	8,330
Transportation expenses	275,590
General expenses	68,068
Total operating expenses	$494,772
Net operating revenue	$492,105
Outside operations (Sacandaga, N. Y.—summer resort)—deficit	7,279
Total net revenue	$484,826
Taxes accrued	45,366
Operating income	$439,459
Other income:	
Dividends declared on stocks owned	$6,300
Interest on other securities, loans and accounts	17,957
Miscellaneous income	9,322
Total other income	$33,580
Gross corporate income	$473,040
Deductions from gross corporate income	380,333
Net income (available for dividends)	$92,707
Dividends, 6 per cent on preferred stock	30,000
Balance surplus	$62,707

The passenger revenue of the company increased $3,876 during the year and the other operating revenues $6,659, while the freight revenue decreased $11,981, giving a decrease in total operating revenue of $1,446. The total operating expenses decreased $3,314, but the net operating revenue increased $1,868 and the gross corporate income $6,091. The deductions from the gross corporate income decreased $7,484, giving a decrease in net income available for dividends of $1,393. It is stated that the decrease of $3,314 in operating expenses was a good showing in view of the extraordinary expenses, such as an increase for removal of snow and ice of $8,983 over the previous year, an increase of $4,842 in repairs of power plant steam equipment and an increase of $11,553 in the company's payroll.

The revenue of the company from transportation was divided $350,707 for the steam division and $604,434 for the electric division, these amounts being a decrease of $16,128 for the steam division and an increase of $5,345 for the electric division. The revenue from operations other than transportation for the period was made up as follows: Steam division, $2,912, or an increase of $1,611; electric division, $28,824, or an increase of $7,727. The main sections of operating expenses show the following comparative expenses: Maintenance of way and structures—steam division, $27,352, or a decrease of $922; electric division, $59,506, or a decrease of $6,518; maintenance of equipment—steam division, $16,430, or a decrease of $4,846; electric division, $39,495, or an increase of $4,406; traffic expenses—steam division, $4,954, or a decrease of $441; electric division, $3,376, or a decrease of $377; transportation expenses—steam division, $91,114, or a decrease of $485; electric division, $184,476, or an increase of $5,181; and general expenses—steam division, $19,091, or a decrease of $182; electric division, $48,977, or an increase of $870.

The road and equipment account was charged during the year with amounts aggregating $57,668 for various additions and improvements. The operations during the year showed practically the same surplus available for dividends as in the previous year, and the usual 6 per cent dividend was paid on the preferred stock but none on the common stock. In view of the general financial conditions and the amounts needed to complete construction work rendered necessary in connection with street improvements being made by the State highway department and the cities of Amsterdam and Johnstown (which will cost the company about $100,000), it was deemed advisable by the board of directors to conserve the cash resources of the company. The company still has available $500,000 of preferred stock for future improvements and additions. Advances made to subsidiary companies on account of new construction and for the Sacandaga investment amounted to $23,071.

American Water Works & Electric Company, Pittsburgh, Pa.—William T. Wallace, general manager Great Shoshone & Twin Falls Water Power Company, a subsidiary of the American Water Works & Electric Company, has been named receiver of the former company by the Federal Court at Boise, Idaho. The proceedings had the approval of the holding company and the noteholders' protective committee and is a step to facilitate reorganization. This protective committee, of which Alvin W. Krech is chairman and H. Hobart Porter a member, was formed to obtain deposits of $1,780,000 of serial notes outstanding and to perfect the reorganization plan. Already $1,299,500 of the notes, or 73 per cent, have been deposited with the Union Trust Company, Pittsburgh.

California Street Cable Railroad, San Francisco, Cal.—The Railroad Commission of California has rendered a decision authorizing the California Street Cable Railroad to issue $384,000 of 6 per cent serial bonds secured by deed of trust to the Union Trust Company, San Francisco. These bonds are to be used for the purpose of refunding $384,000 of bonds maturing Jan. 1, 1915. The new issue will be subject to call on payment of a 5 per cent premium within 5 years from the date of the bonds, and upon payment of a 3 per cent premium at any time after 5 years from the date of the bonds. A sinking fund will be provided, the annual payments on which will range from $24,000 in 1916 to $46,000 in 1927. The commission's order provides that the bonds shall be sold to net not less than 99 per cent of their face value with accrued interest. The application to the commission to issue these bonds was noted in the ELECTRIC RAILWAY JOURNAL of Oct. 31.

Chicago & Oak Park Elevated Railroad, Chicago, Ill.—Arguments on the motion of the Continental & Commercial Trust Company for dismissal of the petition of Samuel Insull, receiver of the Chicago & Oak Park Elevated Railroad, for an order to issue receiver's certificates were continued until Nov. 21 by Judge Kohlsaat.

Cumberland County Power & Light Company, Portland, Maine.—The York County Power Company, a subsidiary of the Cumberland County Power & Light Company, recently filed with the Fidelity Trust Company, Portland, as trustee a first and refunding mortgage to secure not more than $2,500,000 of 5 per cent bonds dated Dec. 1, 1913, and due Dec. 1, 1943, subject to call on any interest date at 105. Of the new bonds, $500,000 has been certified and guaranteed principal and interest by the Cumberland County Power & Light Company. An additional $719,500 is reserved to retire a like amount of underlying bonds, and the remaining $1,280,500 is issuable only for future extensions and additions.

Georgia Railway & Electric Company, Atlanta, Ga.—A petition for authority to issue $160,000 of bonds has been filed with the State Railroad Commission by the Georgia Railway & Electric Company. The proceeds arriving from the sale of the bonds, which are to be a refunding and improvement mortgage forty-year 5 per cent sinking fund gold coupon issue, are to be used to cover expenditures made from Jan. 1 to June 30 for extensions and betterments. It is stated that more than $200,000 was expended by the company for improvements during this period.

Kentucky Utilities Company, Somerset, Ky.—The Illinois Trust & Savings Bank, Chicago, is offering for sale at 95.84 to yield 7 per cent the first mortgage five-year 6 per cent gold bonds of the Kentucky Utilities Company, dated Oct. 1, 1914, and due Oct. 15, 1919. These bonds are redeemable as a whole or in part at 100 and interest upon thirty days' published notice. They are coupon bonds, registerable as to principal, in denominations of $100, $500 and $1,000. Of an authorized amount of $2,000,000, $1,500,000 is outstanding. These bonds are followed by $1,849,000 of junior securities, all of which are under the control of the Middle West Utilities Company. The Kentucky Utilities Company was organized in 1912 and now serves eighteen cities and towns in central and southeastern Kentucky, all with electric light and power, five with ice, three with water, one with gas and one with street railway service.

Joliet & Eastern Traction Company, Joliet, Ill.—The Joliet & Eastern Traction Company has taken over the business of the old Joliet & Southern Traction Company under arrangements made at a recent meeting of the bondholders' committee in Chicago. It was voted to issue $300,000 in stock to be given in exchange for the outstanding $800,000 of bonds of the old company. The remaining $50,000 of the authorized stock will be held in the treasury to be issued in payment for improvements and betterments when they are made. All of the holders of the bonds were recognized in the reorganization of the new company. The old property was appraised at $350,000 by the Illinois Public Utilities Commission. After the old company went into bankruptcy it was known that nothing but a reorganization would result and a committee was appointed by the bondholders to look after their interests. This committee was composed of Joy Morton, Chicago, Ill.; Robert T. Kelley and Charles E. Wilson, Joliet, Ill.; F. B. Watson, Aurora, Ill., and F. J. Kohlhagen, Frankfort, Ill. This committee has watched closely the bankruptcy proceedings, and when sale of the property was made by order of the court the line from Joliet to Chicago Heights, Ill., twenty-five miles long, was bid in for the benefit of the bondholders. The sale extinguished all stock interests in the company, and now the new stock will take the place of the former bond issue. Officers of the new company have been elected as follows: Joy Morton, Chicago, Ill., president; Robert T. Kelley, Joliet, Ill., vice-president; E. H. Stearns, Chicago, Ill., secretary, Daniel Peterkin, Chicago, Ill., treasurer, and F. C. Eckman, Joliet, Ill., general manager.

London (Ont.) Street Railway.—According to the annual report of the London Street Railway for the year ended Dec. 31, 1913, the passenger earnings amounted to $327,075, and miscellaneous earnings to $4,891, a total of $331,966 for the year. The total operating expenses were $234,916, giving net earnings of $97,050. The total fixed charges were $29,114 and the net income $67,936. During the year passenger earnings increased $25,879, while miscellaneous earnings decreased $143, giving an increase in gross earnings of $25,735. Operating expenses increased as follows: Maintenance of way and structures, $2,796; maintenance of equipment, $1,790; power plant expenses, $5,978; car service expenses, $13,449, general expenses, $624, or a total increase of $24,638. The net earnings increased $1,097, which, combined with an increase in total deductions from income of $203, gave a net increase of $894. During the year $91,440 was expended for improvements, extensions and betterments. The number of passengers carried in 1913 was 9,078,489, as compared to 8,353,230 for 1912.

Los Angeles & San Diego Beach Railway, San Diego, Cal.—The Railroad Commission of California has rendered a decision authorizing the Los Angeles & San Diego Beach Railway to issue three promissory notes totaling $32,000 and bearing interest at not to exceed 7 per cent per annum.

New York (N. Y.) Railways.—Darwin P. Kingsley, president New York Life Insurance Company, on Nov. 16 wrote Alexander J. Hemphill of the bondholders' committee of the New York Railways to the effect that the real issues in the present dispute between the income bondholders and the company are the asserted right of the insurance interests having large holdings of the bonds to elect five of the eleven members of the board of directors, and the claim that specific provisions of the income bond indenture in regard to the setting up of reserves have not been followed by the company. This was in answer to a statement recently made by several of the directors, as noted in the ELECTRIC RAILWAY JOURNAL of Nov. 14.

Northern Electric Railway, Chico, Cal.—At a convention of bankers holding overlying bonds of the Northern Electric Railway, held at San Francisco on Nov. 2, a committee of eight was appointed for the purpose of suggesting a feasible plan for the protection of the properties of the company and its creditors. On Nov. 6 a second convention of bankers was held, at which forty-six banks were represented. The convention adopted the recommendation of the committee that the country banks holding overlying bonds form a syndicate to purchase at 90 the underlying bonds held as collateral against loans. This would pay off all such obligations and leave a sufficient working capital to insure the successful operation of the company. This plan is calculated to preserve the equities of the underlying bondholders and leave the country banks in control of the situation. The endorsers, who are the owners of practically all of the company's stock, are to cause this stock to be transferred to trustees named by the country bankers in consideration of their being relieved as endorsers on notes secured by first mortgage bonds. This stock is to be used by the trustees for the benefit of the overlying bondholders and unsecured creditors as determined by the country banks. The committee was instructed to prepare the necessary papers to put the plan in operation and to secure the approval of the San Francisco banks and other creditors of the company. The San Francisco bankers interested in the securities of the company have expressed to the committee a general approval of the plan.

Paducah Traction & Light Company, Paducah, Ky.—It is reported that nearly $12,000 of 5 per cent gold mortgage bonds of the Paducah Traction & Light Company will be sold by the State Street Trust Company, Boston, Mass., bids being received up to Nov. 26.

Staten Island Midland Railway, New York, N. Y.—The Staten Island Midland Railway has applied to the Public Service Commission for the First District of New York for authority to issue $135,000 of equipment trust certificates. The commission has ordered a public hearing upon the application for Nov. 23. These certificates are not to be sold for cash but are to be issued directly for the acquisition of thirty-two double-truck closed cars. The certificates are in denominations of $500 and are dated January, 1915, to mature about 5 per cent every six months.

Third Avenue Railway, New York, N. Y.—At the recent annual meeting of the stockholders of the Third Avenue Railway, A. E. Cottier presented a prepared list of questions to President Whitridge dealing principally with the acquisition of the New York City Interborough Railway, The Mid-Crosstown Railway and the Belt Line Railway Corporation. Discussing the acquisition of property by the Third Avenue Railway since the organization, Mr. Cottier said that about $1,000,000 had been taken from the treasury and not capitalized. He also questioned the wisdom of keeping the depreciation fund untouched until it reached $2,000,000. In reply Mr. Whitridge said that it was possible he had made a mistake in purchasing the Mid-Crosstown Railway, but it was too early yet to tell that. In his opinion, the setting up of an actual depreciation fund was the soundest thing he had done and he regarded his first duty as due to the bondholders, the real owners of the property, who had supplied all the money. A resolution to appoint a committee of stockholders to examine the affairs of the company was lost by a stock vote of 98,363 shares against 7,435, but Mr. Whitridge appointed the following committee to conduct such an investigation: H. Lock, L. F. Strauss and E. A. Manice.

Tidewater Southern Railway, Stockton, Cal.—The Tidewater Southern Railway has purchased from the Modesto & Empire Traction Company the railway line from Modesto to Empire, taking over with it all freight agreements with the Santa Fé Railroad.

Union Traction Company of Indiana, Anderson, Ind.—The Union Traction Company of Indiana has filed suit in the United States Court for $1,544, the suit being directed against Peter J. Kruyer, collector of internal revenue for the sixth district in Indiana, and his predecessor, Elam H. Neal. The railway says that the money was collected from it under the government excise tax law of 1911, although the amount was not due, because the company was not doing business. The street car and interurban systems and plant of the company were leased to the Indiana Union Traction Company in that year.

West End Street Railway, Boston, Mass.—The annual meeting of the stockholders of the West End Street Railway will be held on Nov. 24 to choose directors and to vote on the increase of the common stock by the issue of not exceeding 13,000 shares, par value $50, to provide

means for repaying to the Boston Elevated Railway amounts expended by it for permanent additions and improvements to the West End Street Railway property.

DIVIDENDS DECLARED

American Railways, Philadelphia, Pa., quarterly, 62½ cents, common.

Baton Rouge (La.) Electric Company, 3 per cent, preferred.

Norfolk Railway & Light Company, Norfolk, Va., 3 per cent.

Northern Texas Electric Company, Fort Worth, Tex., quarterly, 1¾ per cent, common.

Traffic and Transportation

TORONTO SERVICE CASE

Recommendations Regarding Service Made by the Toronto Railway & Municipal Board

The appeal made in November, 1911, against the Toronto (Ont.) Railway by the city for relief from alleged defects in the street railway system resulted on Nov. 9 in judgment by D. M. McIntyre, chairman of the Ontario Railway & Municipal Board. The board takes the view that as the expenditure involved in the application of the city as practically $3,000,000 and would involve replacing much of the present equipment the company is entitled to consideration, particularly as its franchise has only seven years more to run. The board, in its judgment, leaves it to be inferred that any additional equipment put on by the company should be compensated for at the termination of the franchise. The judgment reads as follows:

The conclusions reached by the board for the improvement of the company's service and which may be incorporated in a formal order, are the following:

1. That before Jan. 1, 1915, the company reconstruct 13.45 miles of track classified as in poor condition in the report of Mr. Barnes.
2. That before June 1, 1915, the company extend its tracks, with all necessary overhead work, pursuant to plans and specifications to be approved by the board, from their northerly terminus on Ossington Avenue at Bloor Street, northerly along Ossington Avenue to and along Hallam Street to Dufferin Avenue, thence along Dufferin Avenue to Lappin Street, and thence along Lappin Street to Lansdowne Avenue, and operate cars along such extension according to a schedule approved by the board.
3. That before Dec. 1, 1914, the company extend its tracks, with the necessary overhead work, pursuant to plans and specifications to be approved by the board, along Teraulay Street from its tracks on College Street southerly to a junction with its tracks at the corner of Teraulay and Agnes Streets, and operate its cars thereon according to a schedule to be approved by the board.
4. That before Jan. 1, 1915, the company place metal troughs of an approved type on the trolley wire where it is carried over steam railway tracks.
5. That before Jan. 15, 1915, the company reconstruct the platform and steps of thirty-four of the cars as recommended in the report of Mr. Barnes and report to the board upon the feasibility of reconstructing the remainder of the 202 cars referred to in said report.
6. That not later than June 1, 1915, the company build and have in operation upon routes approved by the board fifty double-truck motor cars of a design approved by the board.
7. That on or before May 1, 1915, the company equip each of its cars with a legible route sign on the right-hand side, and a destination sign at the front end, both signs to be suitably illuminated during the hours of darkness.
8. That cars reconstructed by the company in future be equipped with push buttons.
9. That not later than Jan. 15, 1915, the company report to the board on an approved heating system for its cars and the cost of the same.
10. That during the summer months and the hours of congested travel in other months, all the College Street cars going west be run along Howard Park Avenue, and around the High Park loop, but that only each alternate car at other times be run along Howard Park Avenue and around the High Park loop.
11. That not later than Jan. 15, 1915, the company report to the board on the practicability of the rerouting proposed in the recommendation of Mr. Barnes' report.
12. That not later than Jan. 15, 1915, the company report to the board on the operation of its cars at certain points, with a view to preventing unnecessary delays.
13. That not later than Jan. 15, 1915, the company submit to the board a draft by-law dealing with the several matters referred to in Mr. Barnes' report.

The board has already disposed of the application for an order to extend the Bloor Street line from Lansdowne Avenue to the northeastern corner of High Park on the ground that by reason of the company's abandonment of its charter the board has no jurisdiction to make such an order.

The board is of the opinion that the Wilton Avenue line should be extended to Danforth Avenue as recommended in Mr. Barnes' report, but no such order will be made until the subways are constructed under the steam railways and the new streets being opened up by the city are put in condition to receive the tracks.

The board is of the opinion that the extension of the company's tracks along Ossington Avenue, Hallam and Lappin Streets should be extended westerly from Lansdowne Avenue to Dundas Street, but no order for such further extension can be made until subways are constructed under the steam railway tracks.

The board further orders that the cost of procuring and having printed the report of Mr. Barnes, amounting to $9,960, be borne equally by the parties concerned. The board further orders that each of the parties pay to the board in law stamps the sum of $100.

COMMISSION ORDERS CHARLESTOWN SERVICE RESTORED

The Massachusetts Public Service Commission has issued an order restoring direct subway service to and from Charlestown on the lines of the Boston Elevated Railway. The order was issued at the request of the Charlestown Improvement Association, which was dissatisfied with the experimental service recommended by the board in its order of June 26, 1914, and which asked the commission at a recent hearing to restore the original facilities furnished by the company. It is the opinion of the board that the belt-line service from Sullivan Square via Bunker Hill Street, Chelsea Street, City Square, Main Street and vice versa, should be operated for a further experimental period of two months. Regarding the provision of belt-line service between Sullivan Square and South Boston, via Summer Street, the board suggests that the petitioners and the company confer prior to action by the commission, which will follow if agreement is not reached. The order provides that during normal hours a 20-minute schedule in each direction be maintained on the Bunker Hill belt line; and that the company shall restore the former 10-minute line from Winter Hill, Somerville, through Charlestown and Washington Street, Boston, and return; the former 10-minute line from Sullivan Square via Main Street, through the Tremont Street subway to Pleasant Street and return; the former 10-minute line from Sullivan Square to Dorchester Street, South Boston, and return, via Main Street and the Tremont Street subway, and the former 10-minute line from Sullivan Square via the Tremont Street subway to Dudley Street terminal and return. Free transfer privileges are to be effective as at present between surface and elevated cars at City Square.

INCREASE IN PHILADELPHIA SUBURBAN FARES

The Pennsylvania Railroad, the Philadelphia & Reading Railway and other carriers have filed new tariffs containing substantial changes with the Interstate Commerce Commission. Though no changes will be made in suburban or local one-way fares, holders of monthly trip and school tickets will be required to pay from 20 to 25 cents above the present charges. A number of trip tickets will be withdrawn from sale altogether, and all excursion tickets except those to resort points will be discontinued. The changes in suburban rates have been so adjusted that no person traveling on commutation tickets will have to pay more than 1 cent a day additional fare. The change will go into effect on Dec. 15. The sixty-trip monthly ticket of the Pennsylvania Railroad will be advanced 25 cents above the present rate. The forty-six-trip school ticket will be advanced 20 cents. The 100-trip ticket will be withdrawn from sale. The 180-trip quarterly ticket will be sold at three times the monthly rate. This ticket will be kept on sale for the convenience of those who do not care to purchase a ticket every month. The fifty-trip ticket will be withdrawn from sale. Strip tickets will be withdrawn from sale. Ten-ride tickets will be sold, good for bearer. They will cost nine times the one-way fare.

Excursion tickets to Atlantic City, Cape May and other seashore points will be advanced 25 cents. All excursion tickets except those to resort points will be withdrawn from sale. Round-trip tickets will be sold at twice the one-way fare and will be good until used, with stop-over privileges. No changes will be made in any suburban or local one-way fares. Through or inter-territorial, fares have been revised on a basis of 2½ cents a mile as the maximum rate.

KANSAS CITY REROUTING

The rerouting of cars as arranged by the Board of Control and installed by the receivers of the Metropolitan Street Railway in Kansas City, Mo., has met with comparatively few complaints. An interesting feature was the arrangement to care for the traffic at the new Union station, which is located in another part of the city from the old one. Two loop cars run each way on Grand avenue and Main Street to and from the depot, gathering direct transfers from every line in Kansas City, Mo., and Kansas City, Kan., and all the interurbans. Some of the other lines were routed by the depot, being turned two blocks apparently out of their normal routes north of the station in order that they might pass the station, and emerging from the station vicinity to their previous routes by going another block, apparently, "out of their way." Main Street is being excavated south of the station, and a street made where eventually tracks will be laid, after which the street cars will find a direct route southward from the station to their present southbound tracks. The present apparently circuitous routing was put into effect at once, to avoid a later rerouting that probably would cause confusion. The radical rerouting necessary at this time naturally was expected to be later corrected in minor details and the Board of Control now has expert traffic men inspecting traffic with the object of making reports and suggesting such changes as may be deemed necessary.

Investigate Height of Car Steps.—The New Hampshire Public Service Commission will give a hearing at its offices in Concord on Dec. 1 upon the height and safety of steps on electric railway cars throughout the State, with a view toward the regulation of step heights and designs.

Massachusetts Fare Case Appealed.—George B. Willard, president of the Waltham Board of Trade has asked the Supreme Court of Massachusetts to review and modify the action of the Public Service Commission, which recently handed down a decision granting 6-cent fares to the Middlesex & Boston Street Railway.

Suburban Express Service at Memphis.—Suburban electric express business is to be begun immediately by the Memphis (Tenn.) Street Railway under the terms of an ordinance passed some time ago by the City Council. At the outset one car will be employed, running daily over each of the three suburban lines, to Lakeview, to Raleigh Springs and to Normal. The downtown station will be on Front Street. According to T. H. Tutweiler, president of the company, other cars will be added as the business grows.

To Mayors' Conference by Trolley.—Harrison R. Fehr, president of the Lehigh Valley Transit Company, Allentown, Pa., placed private car "999" at the disposal of the various municipal officials of all the cities located along the lines of the company for the trip to the conference of mayors and city officials held in Philadelphia beginning on Nov. 12. The car started from Easton and passed through Bethlehem to Allentown, from which place it followed the "Liberty Bell" Interurban Line to the Sixty-ninth Street terminal in Philadelphia.

Progress of New Kansas Road.—The Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan,, is said to be more than meeting expectations as to traffic. The first car was operated on July 20. There are now eighteen round trips a day between Bonner Springs and Kansas City, 17 miles. An express car was added to the equipment on Nov. 18, and put into operation at once. Heretofore the company has carried parcels from the city, and small packages from the country, in the baggage sections with which all the passenger cars are equipped. The company refused to carry poultry, milk and farm products on the passenger cars, but the large business of this kind that presented itself demanded the addition of the regular express car. The car will make two trips a day.

Increase in Philadelphia Service.—Effective on Nov. 15, the Philadelphia (Pa.) Rapid Transit Company increased the service on the subway-elevated line in the rush hours. During the periods of greatest congestion trains of five cars are now operated every two minutes instead of trains of six cars every two and one-half minutes. It was found that the end cars of a train were seldom used to capacity, while the center cars carried an undue proportion of the total load, and it is believed that with the cars divided into five-car trains on a two-minute interval the cars will be more equally loaded and better service will be provided. The owl car service has also been improved by operating a ten-minute service instead of a fifteen-minute service until 1 a. m. from the Sixty-ninth Street terminal and until 1.30 a. m. from the ferries terminal.

Agricultural Department Established.—T. W. Cross, Gresham, Ore., has been selected by the Portland Railway, Light & Power Company, Portland, Ore., as head of the agricultural department which the company has established with a view of developing the knowledge of ranchmen and farmers along its interurban lines. One of the first steps taken by Mr. Cross was to secure a list of the ranches in the district in which the company operates. Each owner of land was canvassed by mail as to the number of acres under cultivation, the crop raised, the amount of live stock, etc. Meetings are being held in the schoolhouses and in depots, at which Mr. Cross advises the men as to increasing their output. The company has enlisted the services of the agricultural department of the State and of the United States in furthering the movement looking toward increased output.

Employees' Publication in Louisville.—Under the direction of Samuel Riddle, superintendent of the Louisville (Ky.) Railway, the transportation department of the company has arranged to publish every two weeks a bulletin which will circulate among the trainmen and other employees of the company. It will be a medium by which new rules and regulations will be communicated from the management of the company to the men, and various members of the transportation department and official corps of the company will contribute to it. The work of editing it will fall upon Mr. Riddle, whose idea it was and who is working out the plan. The first issue of the publication will be out shortly. It will be called Trolley Topics. "Safety first" matters will be considered in the various issues, and other questions relating to operation of the cars and improvement in the company's service.

Order Requiring Exchange of Transfers.—The Public Service Commission of the First District of New York has issued an order directing the Coney Island & Brooklyn Railroad, the Brooklyn Rapid Transit Company, the Coney Island & Gravesend Railway, the Brooklyn, Queens County & Suburban Railroad, the Nassau Electric Railroad, the Brooklyn Heights Railroad and the Van Brunt Street & Erie Basin Railroad to establish through routes and joint rates, fares and charges over their lines, so that free transfers may be given from the Van Brunt Street line to the intersecting lines of other companies, and vice versa. The division of the fares between the company issuing the transfers and the company accepting the transfer, is left to the companies to agree upon. The Van Brunt Street & Erie Basin Railroad operates 3 miles of line in downtown Brooklyn. Its equipment includes fifteen motor cars.

Misuse of Seats a Misdemeanor.—A recently promulgated rule of the Louisville (Ky.) Railway which prohibits passengers from propping up their feet on the seats in front of them has just been sustained in the City Police Court. A conductor on the Shelby Street line found John Hoffman with one foot on the seat in front of him. He notified Hoffman of the rule and requested him to remove his foot. Hoffman refused repeatedly, so when the car reached the police station located on the line, the conductor stopped the car and caused Hoffman's arrest. In the police court counsel for Hoffman sought to show that the infraction of the company's rules did not constitute a misdemeanor as charged in the warrant. Judge Samuel Boldrick, however, ruled otherwise, saying the rule was a good one. He assessed a fine of $5 against Hoffman and then suspended the fine. The moral effect of the conviction, however, was not lessened.

Effect of Cattle Quarantine on Electric Railways.—The Southern Indiana lines of the Insull corporations, which cross the Ohio River at Louisville into Kentucky, have been considerably benefited since the quarantine regulations against live stock seeking to prevent the foot and mouth disease from spreading. No horse-drawn vehicles have been permitted to cross the wagon bridge between Louisville and New Albany, Ind., while the ferry boats can carry wagons but not horses. This has added to the volume of the local express business of the Louisville & Southern Indiana Traction Company and the Louisville & Northern Railway & Lighting Company, the shippers arranging for deliveries at the other end of the line outside of the companies' delivery districts. The quarantine has been so strictly enforced that the railway companies have prohibited carrying of dogs across the river. Ordinarily many dogs are carried across the river by hunters seeking fields in Indiana, but this traffic has been cut off altogether at this time.

Toledo Safety Movement.—The Toledo Railways & Light Company, Toledo, Ohio, is co-operating with the city of Toledo, through its Commerce Club, in the "safety first" campaign which has been started in that city. E. R. Kelsey, chairman of the company's committee on safety, represents the company as its member of the Toledo safety league. The company has also launched the safety movement independently so far as it and the public are concerned. The work is under the supervision of George Oliver Smith, in charge of safety for all companies operated by Henry L. Doherty & Company. The company has a general safety committee consisting of the heads of the operating departments. This is divided into two sub-committees, one committee on safety for the employees, of which D. C. Bailey, claim agent, is chairman, and the other committee on safety for the public, of which E. R. Kelsey is chairman. The company has arranged to show the well-known Vitagraph film "The Price of Thoughtlessness."

Philadelphia "Safety First" Prizes Awarded.—The award of $100 in cash prizes for the best practical suggestions as to how the public can be induced to exercise proper care in avoiding accidents has been announced by the safety bureau of the Philadelphia (Pa.) Rapid Transit Company. The contest, which closed on Oct. 31, was proposed by the safety bureau during the carnival of safety, in which the Philadelphia Rapid Transit Company participated, at Convention Hall, in September. The suggestions submitted, about 10 per cent of them from children, contain little originality, thus emphasizing the fact that the company has pretty generally covered the field in its safety campaign. Many of the contestants praised the company for the adoption of the most modern cars and safety devices; referred to the efficiency and co-operation of the car men, and to the continued campaign carried on in the public schools through the co-operation of the board of education. The safety bureau, in making the awards did not commit itself to indorsement of all of the suggestions by the successful participants. The first prize was $25, the second $15, and the third $10. Ten fourth prizes valued at $5 each were also distributed.

Preparing for Christmas in Washington.—The Washington Railway & Electric Company, Washington, D. C., will on Dec. 29 again entertain the 2500 children of its employees with a Christmas festival at the New National Theater. Gifts, comprising everything in the way of the newest novelties in toys, books, bags of assorted candies and fruits, all purchased from Washington merchants, will be distributed. Clarence P. King, president of the company, has issued instructions to make the year's event, the fourteenth annual celebration, the biggest and best ever attempted. Free transportation in special cars to the New National Theater will be provided for all the children and the parents accompanying them, and at the conclusion of the entertainment tickets will be distributed for the return trip home. Last year the feature of the entertainment was a company baby show. This year arrangements are under way for children of company employees, between the ages of nine and fourteen, to offer a diversified program, consisting of exhibition drills, fancy dances and songs and choruses. Mr.

King has appointed Assistant Secretary William L. Clark as general chairman of the Christmas committee. E. S. Marlow, manager of the lighting and power company commercial department, will serve as vice-chairman and J. F. Sullivan as secretary.

Rehearing Denied Southern Pacific in Rate Case.—The Railroad Commission of California has rendered a decision denying the application of the Southern Pacific Company for a rehearing of the transbay commutation rate case in which the company sought to raise commutation rates between San Francisco and cities on the other side of the bay. The commission denied the company's original application upon the grounds that the company's apportionment of its investment and expenses between main line and suburban service was erroneous; that many of the transbay lines were built for competitive purposes, and that where a duplication of investment had been made, the burden should not fall upon the patrons of the company, and that in electrifying and extending its lines the company had done so with a view not only to present but to future traffic. The application for rehearing was based, primarily, upon the ground that the commission's refusal to allow it to raise its rates was in violation of the federal constitution in that it deprived the company of property without due process of law. The denial of the original petition by the Railroad Commission was noted in the ELECTRIC RAILWAY JOURNAL of Oct. 24, page 984. The application for a rehearing was noted in the issue of Nov. 14, page 1120.

The Toronto Overcrowding Case.—After the jury had twice disagreed and had been twice sent back to reconsider its verdict by Chief Justice Sir Glenholme Falconbridge, at Toronto, Ont., the members filed into the Assize Court on Nov. 14 with a verdict of guilty against the Toronto Railway. The charge was of maintaing a public nuisance in the operation of cars, particularly with regard to overcrowding. At the request of counsel for the railway the jury was polled, and it developed that the verdict was unanimous. H. H. Dewart asked for a stated case, the main reason being the charge delivered by his Lordship. Mr. Dewart said that it was practically an order to the jury to bring in a verdict of guilty. He contended that the interpretation his Lordship gave on points of law practically took the matter out of the hands of the jury. The Chief Justice said that he would assist in having the case sent to the Court of Appeal for final judgment. Mr. DuVernet, appearing for the Crown, said that he would consent to sentence being suspended until the stated case had been disposed of. In replying to Mr. Dewart, the Chief Justice said that R. J. Fleming, the manager of the railway, in his evidence had admitted that if the power were conferred on the railway to refuse passengers when the cars were overcrowded and use force he would do so.

Hearing on Allston (Mass.) Transfers.—The Massachusetts Public Service Commission gave a hearing on Nov. 6 upon the petition of residents of the Allston district of Boston for the granting of free transfer privileges at the junction of Commonwealth and Harvard Avenues on the Boston Elevated Railway. For the company, H. B. Potter, assistant to the second vice-president, pointed out that the number of free transfer points on the system has increased in the past sixteen years from seventy to 170; that the carrying power of the free transfer has been enormously increased, and that the situation is fast getting beyond control. On general principles the company opposes any further extension of such facilities at the present time. Chairman McLeod said that the board was convinced that transfers should be granted at Harvard and Commonwealth Avenues to and from Brookline Village and would so order. Mr. Potter urged that such facilities be limited to points north of the intersection of Commonwealth and Chestnut Hill Avenues, in the Aberdeen district, to prevent round-trip riding on a single fare. Mr. Potter said that almost 100,000,000 free transfers were issued yearly by the company. This is 60 per cent of the revenue-passenger traffic. Chairman McLeod said that there were many transfer abuses daily in Boston and intimated the board's appreciation of the difficulties and inconsistencies under which the company was working. The board took that part of the case bearing upon Allston station transfers under advisement.

Personal Mention

Mr. J. L. Greatsinger, formerly second vice-president of the Elmira, Corning & Waverly Railroad, Waverly, N. Y., has been elected president of the company, to succeed Mr. G. Tracy Rogers.

Mr. R. C. Hardy, who has been chief clerk of the Alton, Granite & St. Louis Traction Company, Alton, Ill., has been appointed chief clerk to the assistant general superintendent of the company.

Mr. Henry K. Greenwood, who was superintendent of the Mesaba Railway, Virginia, Minn., now has the title of assistant to the general manager and superintendent of overhead construction.

Mr. W. H. Gayton, superintendent of the transportation of the Alton, Grainte & St. Louis Traction Company at East St. Louis, Ill., has had his jurisdiction extended to cover the Alton City lines.

Mr. Thomas E. Mitten, who has been chairman of the executive committee of the Philadelphia (Pa.) Rapid Transit Company, has been elected president of the company to succeed the late Charles O. Kruger.

Mr. W. J. McGraw has been appointed auditor of the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind., to succeed Mr. C. A. Smith. Mr. McGraw has also been appointed auditor of the Southern Michigan Railway succeeding Mr. Smith.

Mr. Frederick Nicholls, president of the Canadian General Electric Company, Toronto, Ont., vice-president of the Toronto Railway and director of the Canadian Northern Railway, has been appointed an honorary colonel of the Canadian militia.

Mr. R. D. Benson, who was vice-president of the Muskogee (Okla.) Electric Traction Company, has been elected president of the company to succeed Mr. Willis E. Fertig, and has in turn been succeeded as vice-president of the company by Mr. W. S. Benson.

Mr. H. Brady has been appointed chief engineer of the power station of the Lancaster & York Furnace Street Railway, Millersville, Pa., to succeed Mr. A. Hobble. Mr. Brady also succeeds Mr. Hobble as chief engineer of the power station on the Lancaster & Southern Street Railway.

Mr. J. G. Herrin, assistant superintendent and purchasing agent of the Kansas City-Western Railway, Leavenworth, Kan., is acting as general superintendent of the company pending the return of Mr. J. W. Richardson, who has relinquished his active duties with the company on account of his health.

Mr. George T. Ordway has been elected president and a director of the Federal Utilities, Inc., New York, N. Y. He succeeds Mr. DeForest Candee as president, but Mr. Candee continues as a director. Mr. Ordway was formerly connected with the banking house of Bertron, Griscom & Company, New York, N. Y.

Mr. J. B. Rowray has been appointed superintendent of the Northern Electric Railway, Chico, Cal., to succeed Mr. W. R. Lawson, resigned. Mr. Rowray was formerly superintendent of the company, but resigned following the appointment of receivers. He was previously superintendent of the north division of the Pacific Electric Railway.

Mr. T. J. Kennedy, president and general manager of the Algoma Central & Hudson Bay Railway and the Algoma Eastern Railway, Sault Ste. Marie, Ont., has also been elected vice-president and general manager of the International Transit Company and the Trans St. Marys Traction Company, in charge of street railways and ferries.

Mr. Thomas G. Orr has been appointed traffic manager of the Pittsburgh & Butler Street Railway, Pittsburgh, Pa., to succeed the late Thomas D. Parrack. Mr. Orr was formerly excursion agent of the Pittsburgh & Butler Street Railway. Previous to that he had been connected for many years with the Buffalo, Rochester & Pittsburgh Railroad and the Canadian Pacific Railroad.

Mr. E. B. Allen has been appointed purchasing agent of the Louisville (Ky.) Railway, to succeed the late William H. McClure, whose place he filled during the latter's last illness. Mr. Allen entered the treasurer's office of the company thirteen years ago, soon after his graduation from the Louisville male high school, and had been employed in various capacities until he resigned last summer. He then went East and enrolled in the Massachusetts Institute of Technology as a student of mechanical and electrical engineering. Serious illness of his father recalled him to Louisville at the same time that Mr. McClure was absent from the office, and Mr. Allen took up the work, continuing in the post after Mr. McClure's death until the formal appointment.

Mr. A. E. Green has been appointed superintendent of transportation of the Kalamazoo City lines of the Michigan United Traction Company to succeed Mr. C. H. Smith. Mr. Green was employed at the Jackson County Jail, Jackson, Mich., from January, 1901, to January, 1903. He then received a commission and acted as deputy sheriff in Jackson from 1903 to 1907. He entered electric railway work in the latter year as motorman with the Jackson City lines of the Jackson Consolidated Traction Company and continued with the company until July, 1907. He was employed by the Michigan United Railways, Jackson, Mich., as despatcher from July 1, 1909, until Nov. 22, 1909, when he was promoted to chief inspector of the Kalamazoo City lines of the Michigan United Railways, which has been succeeded by the Michigan United Traction Company.

Mr. W. E. Boileau, who as previously announced has been appointed general manager of the Scranton (Pa.) Railway, entered railway work in the early 80's with a large steam railroad system. In 1888 he became connected with electric railway work and spent a number of years constructing and operating properties in the South. In 1904 he went to Dubuque, Iowa, where he was in charge of the construction of a new power station, carhouse and shops and the rebuilding of tracks for the Union Electric Company. In 1905 Mr. Boileau became connected with the New York, Westchester & Boston Railway, New York, and remained with the company until after the property passed into the control of the New York, New Haven & Hartford Railroad. Until recently he has been general manager of the Chattanooga Railway & Light Company, the Lookout Mountain Railway and the Lookout Incline Railway, Chattanooga, Tenn. He is an individual member of the American Electric Railway Association, an associate of the American Institute of Electrical Engineers and a member of the New York Railroad Club.

Mr. R. S. Buck, who as previously noted in the ELECTRIC RAILWAY JOURNAL has been appointed engineer of maintenance of way of the New York (N. Y.) Railways, was born in Vicksburg, Miss., and was graduated from Rensselaer Polytechnic Institute in 1887 as a civil engineer. His early professional work was chiefly on United States river and harbor surveys and improvements in the Missisippi Valley. From 1893 to 1899 he was associated with Mr. L. L. Buck, civil engineer, serving for most of the time in charge of the construction of the two Niagara arch bridges and the Lewiston suspension bridge. From 1899 to 1902 he was chief engineer in charge of the Manhattan and the Queensboro bridges over the East River at New York. During this time he also acted as consulting engineer for the State of New York on the construction of the reinforced concrete briges on the Niagara State reservation between the mainland and Goat Island. From 1902 to 1904 he was chief engineer of the Dominion Bridge Company, Montreal. In 1904 he resumed his connection with the Manhattan and the Queensboro bridges as consulting engineer. In 1907 he resigned this position to become a member of the firm of Sanderson & Porter, New York, N. Y., engaged in the development of electric railways and other public utility properties. In 1913 he retired from Sanderson & Porter to return to the Dominion Bridge Company as chief engineer, and remained with that company until his apppointment to the New York Railways.

OBITUARY

Daniel V. Murphy, special counsel for the Public Service Commission of the Second District of New York, is dead. Mr. Murphy was fifty years old. He resided in Buffalo.

J. E. Lamb, treasurer of the Terre Haute & Western Railway, Paris, Ill., which is leased to the Terre Haute, Indianapolis & Eastern Traction Company, died recently. No successor to Mr. Lamb has yet been elected.

RECENT INCORPORATIONS

Morrisburg & Ottawa Electric Railway, Ottawa, Ont.—Incorporated under the Ontario companies act to build an electric railway and other public utilities in Ottawa. The company is apparently being formed in connection with a New York syndicate with which negotiations have been in progress for some time for building the line from Morrisburg to Ottawa, 55 miles. Capital stock, $40,000. Headquarters: Ottawa. J. G. Kilt, Citizen's Building, Ottawa, president. [E. R. J., Aug. 8, '14.]

FRANCHISES

Bisbee, Ariz.—W. A. Bradford and associates have asked the Cochise County Supervisors for a franchise through Cochise County from Bisbee to Naco. [E. R. J., Nov. 7, '14.]

Stockton, Cal.—The Stockton Terminal & Eastern Railway has asked the Council for a franchise over Miner Avenue from Union Street to American Street, and for trackage of the north side of the water front in Stockton.

Jacksonville, Fla.—The Jacksonville Traction Company has asked the Council for authority to build the following extensions of its lines: on Spearing Street from Adams Street to Beaver Street, thence along Beaver Street to Fairfield Street; an extension on Albert Street from Florida Avenue east to Fairfield Street; from Enterprise Street north to Tyler Street to Kings road, thence westerly along Kings road to the city limits. The repaving of Main Street from Hogans Creek to Eighth Street with asphaltic concrete is also being considered.

Peoria, Ill.—The Peoria, Canton & Galesburg Railway has asked the Council for an extension of time on its franchise in Peoria.

Sandwich, Ill.—The Aurora & Mendota Electric Railway has asked the Council for a franchise in Sandwich. This railway will connect Aurora and Princeton, via Yorkville, Plano and Sandwich. [E. R. J., Sept. 19, '14.]

Boston, Mass.—The Berkshire Street Railway has asked the Massachusetts Public Service Commission for an extension of time on its franchises in which to build the extensions to North Adams, known as the northern and eastern routes.

Orange, N. J.—Terms which meet the approval of the Orange City Council and the Public Service Railway Company having been settled, the ordinance giving a fifty-year franchise for the extension of the Central Avenue line is now ready for final adoption by the Council.

North Tonawanda, N. Y.—The International Railway has received a franchise from the Council to extend its line from Niagara Falls to Buffalo through North Tonawanda.

Toronto, Ont.—The City Council has authorized Works Commissioner Harris to proceed with the construction of a temporary track on Bloor Street, west from Dundas Street to Quebec Avenue, as he stated it would be impossible to lay a permanent track until Spring. The committee discussed the matter of the operation of a service after the track was completed some six weeks hence. Several of the aldermen thought it should be operated by the city as a separate unit, but on the motion of Alderman McBride the commissioner was directed to negotiate with Manager R. J. Fleming of the Toronto Railway Company, for the operation of the line.

Middletown, Pa.—The Harrisburg Railways has received a franchise from the Council to relocate its line in Middletown. The route of the line will be changed so as to continue out Main Street to Catherine Street and along Catherine Street to Water Street. In completing the loop the line will be extended up Catherine Street from Emaus Street. Plans are being considered to extend this line across Swatara Creek and into Royalton.

Richmond, Va.—The Virginia Railway & Power Company has asked the Council for a thirty-year franchise in lieu of all the various franchises now held by the company.

TRACK AND ROADWAY

Florence & Huntsville Interurban Railway, Florence, Ala.—This company, which was recently incorporated to build a 60-mile electric railway from Florence to Huntsville, has taken over 5 miles of the old Huntsville & Nashville Railroad grade, and the terminal at Huntsville. It has bought material for 10 miles of track and two gasoline cars. Thurston Allen, Florence, is secretary. [E. R. J., Sept. 26, '14.]

Tucson (Ariz.) Rapid Transit Company.—Work has been begun by this company relaying some of its tracks in Tucson with 65-lb. rails bound with steel ties and all laid in a bed of concrete. The paving between the rails and 1 ft. each side of the rails will also be of concrete.

Marin County Electric Railways, Mill Valley, Cal.—This company has filed an amended application with the Railroad Commission of California requesting authority to start construction work at Mill Valley on private funds, pending the sale of the stock and of the receipt of deferred payments on stock already subscribed. The Commission in a previous decision authorized the railway company to begin construction when $35,000 received from the sale of stock has been deposited in Marin County banks. This is part of a plan to build an electric line in Mill Valley and to the Northwestern Pacific Railroad depot and thence to the high school on the Sausalito road. W. Wesley Hicks, 320 Market Street, San Francisco, chief engineer. [E. R. J., Oct. 12, '14.]

San Rafael & San Anselmo Valley Railway, San Rafael, Cal.—An order has been issued by the Railroad Commission of California authorizing this company to return to its stockholders 80 per cent of the money which it has collected. An order authorizing the company to build a line between San Rafael and San Anselmo was made by the commission in November, 1913, together with permission to issue $55,000 par value stock and $45,000 face value of bonds with the provision that the moneys thus secured should be deposited in Marin County banks as trust funds. It was also provided that if the company should fail to deposit $50,000 in one year, the money collected should be repaid to the purchasers with certain deductions for expenses. The total amount collected by the company on the sale of its stock was $4,910. Out of this bills amounting to $1,102 were paid. E. S. Rake, San Rafael, president. [E. R. J., Dec. 20, '13.]

Stockton (Cal.) Electric Railway.—This company is asked to consider plans to extend its tracks down Fourth Street in Stockton.

Shore Line Electric Railway, Saybrook, Conn.—Plans with respect to the proposed extension of this railway from Chester to Middletown have progressed to the point where it is an assured fact that application will be made to the next General Assembly for a charter permitting the construction of this connecting link. A separate company will be incorporated to obtain the charter.

Washington Railway & Light Company, Washington, D. C.—An extension over Portland Street in Washington, from Anacostia to the Firth-Sterling steel plant at Giesboro Point, is being planned by this company.

Miami (Fla.) Traction Company.—Work has been begun by this company at the west approach to the Twelfth Street bridge from where it will be continued westward in Miami. This is part of a plan to build a 3-mile electric railway in Miami. B. B. Tatum, Miami, president. [E. R. J., Oct. 31, '14.]

People's Traction Company, Galesburg, Ill.—An extension of its tracks to the new station in Abingdon is being built by this company. It will place in operation a "Y" which will permit the turning of all cars. Freight and passenger cars will be operated on different tracks after the completion of this work. The company will also raise the track through the town and renew all of the poles.

Southern Illinois & St. Louis Railway, Harrisburg, Ill.—Financial backing has been secured and work will be begun at once by this company at Johnston City on the first section of the line between Johnston City, Frankfort and Benton. When completed the railway will connect the following towns in southern Illinois: Eldorado, Harrisburg, Carrier Mills, Pittsburg, Marion, Spillertown, Whiteash, Johnston City, West Frankfort, Benton and Herrin. W. H. Schott, president. [E. R. J., July 11, '14.]

Pekin, Ill.—Bids are being received by the Council for the construction, rehabilitation and equipment of an electric railway in Pekin. Municipal ownership of this electric line was adopted at the last election, and the city plans to sell bonds, rebuild the present line, and extend it to the city park in Pekin. It is planned to begin work in the spring.

Terre Haute, Indianapolis & Eastern Company, Indianapolis, Ind.—This company has placed in operation its new line to Beallview.

New Albany & French Lick Valley Traction Company, New Albany, Ind.—Those who subscribed about a year ago to the stock of this proposed electric line, assembled recently in Fredericksburg, Ind., and initiated a movement which seeks to revive the project to build the railway. Fredericksburg is on the route of the proposed line 25 miles north of New Albany. The line would reach from New Albany to Paoli, via Mooresville, Galena, Greenville, Palmyra, Fredericksburg, Hardinsburg, Rego and Chambersburg, 40 miles. Promotion of the project has languished since the death of Charles A. Hernley, Newcastle, but tentative plans were made at the meeting referred to to revive the project. [E. R. J., April 4, '14.]

Tri-City Railway, Davenport, Ia.—Work will soon be begun by this company on its Oregon Street extension in Muscatine.

Keokuk, Ia.—Progress on the proposed electric line between Keokuk, Ia., and Jefferson City, via Kahoka, Williamstown, Newark, Shelbyville and Mexico, has taken the form of obtaining signed subscriptions for the project. Substantial bonuses have been subscribed at St. Francisville and Wayland, Mo. H. W. Knight, the promoter, has other public meetings scheduled along the proposed route for the purpose of explaining this proposition. [E. R. J., Oct. 17, '14.]

New Orleans Railway & Light Company, New Orleans, La.—Extensive improvements for its lines in New Orleans are being planned by this company.

Bangor Railway & Electric Company, Bangor, Maine.—Plans are being made by this company to build a new loop through Post-office Square, Harlow Street and Central Street in Bangor.

United Railways & Electric Company, Baltimore, Md.—This company is asked to consider plans to extend its lines from Eastern Avenue and Eighth Street to Eastern Avenue and Fifteenth Street in Baltimore.

Kensington Railway & Sandy Spring Railway, Kensington, Md.—Within the next few weeks this company expects to complete and place in operation a ½-mile extension in Kensington.

Boston, Mass.—Bids desired until Dec. 15 by the Boston Transit Commission, B. Leighton Beal, secretary, Boston, for building Section E, Dorchester Tunnel, located under and near Ft. Point Channel, extending from a point in Summer Street about 200 ft. west of the channel to a point about 80 ft. north of the corner of West Second Street and Dorchester Avenue in South Boston, a distance of about 3200 ft. The tunnel will be of concrete and for a length of about 300 ft. it will consist of two tubes, each tube to be built inside of a circular shield and to have an outside diameter of about 24 ft., the part under the channel to be constructed in compressed air. Specifications and forms of contract can be obtained at 15 Beacon Street, ninth floor.

Minneapolis, St. Paul, Rochester & Dubuque Traction Company, Minneapolis, Minn.—This company has just ordered new steel rails for 18 miles of extensions of its lines.

***Corinth, Miss.**—Financial backing has been secured and preliminary arrangements are being made to build an 80-mile railway between Corinth and Nashville. It has not yet been decided whether the line will be electric, gas-electric or steam. Carl H. Fuller, Corinth, formerly engineer of the Macon Railway & Light Company, Macon, Ga., is investigating the possibilities of this proposed road, in which Allen W. Jones, Bradentown, Fla., and Clopton C. Thomas, Corinth, are interested.

***Plentywood, Mont.**—Plans are being considered to build a 7-mile electric railway to connect Plentywood and Raymond. No names are yet given of those interested in the project.

New York & Queens County Railway, New York, N. Y.—This company is asked to consider plans to extend its line on Flushing Avenue from Ehret Avenue to Jackson Avenue in Flushing.

New York, N. Y.—Bids are desired until Dec. 11 by the Public Service Commission, First District, 154 Nassau Street, New York, for constructing Section 4 of Routes 4 and 36, a part of the Broadway-Fourth Avenue Rapid Transit Railroad in the Borough of Manhattan, consisting of a two, four and six-track underground railroad, extending northerly under Seventh Avenue, from Fifty-first to Fifty-ninth Streets, and easterly under Fifty-ninth Street to a point about 22 ft. west of the westerly building line of Seventh Avenue extended.

Tidewater Power Company, Wilmington, N. C.—The extension on Red Cross Street to the hospital in Wilmington and thence to a point one block from the Oakdale cemetery gate has been placed in operation by this company.

Cushing (Okla.) Traction Company.—Contracts have been awarded and work has been begun by this company on the construction of the 13-mile line from Cushing in an easterly direction to the oil fields. Frank Brown, Independence, president. [E. R. J., Oct. 17, '14.]

Lake Erie & Northern Railway, Brantford, Ont.—The stockholders of this company will vote on Dec. 7 on the authorization of an issue of mortgage bonds.

Toronto, Ont.—The Ontario Railway and Municipal Board has ordered the Toronto Street Railway to put fifty new cars into commission, to complete the Teraulay line to College, and to make a number of improvements to existing rolling stock.

Willamette Valley Southern Railway, Oregon City, Ore.—Grading has been completed and tracklayers are now near the terminus of this line between Oregon City, Beaver Creek, Mulino, Molalla and Mount Angel. It is planned to have this line in operation by Dec. 1. Power will be purchased to operate this line from the new substation of the Portland Railway, Light & Power Company at Beaver Creek. [E. R. J., April 25, '14.]

Corry & Columbus Street Railway, Corry, Pa.—An extension will be built north from Columbus to Clymer, Sherman, Summerdale and Mayville, N. Y., connecting at Mayville with the Chautauqua Traction Company's line to Westfield and for Chautauqua & Jamestown, N. Y., also Chautauqua Lake boats and Pennsylvania Railroad. Surveyors are now on the route.

Slate Belt Electric Street Railway, Pen Argyl, Pa.—Westbrook & Voss, engineers, have laid plans before the directors of this company for the extension of the tracks from Wind Gap Park, through Wind Gap, to Saylorsburg and Lake Poponoming. A new line will have to be built from Saylorsburg to the lake to complete the extension proposed.

Rhode Island Company, Providence, R. I.—Work has been begun by this company relaying its tracks on Westminster Street and on Weybosset Street in Providence. A complete new equipment of rails and bonding will be laid.

Brenham, Tex.—All stock has been subscribed and surveys will be made at once for a route to build an electric line to connect Brenham, Navasota, William Penn and Independence. L. M. Hewitt, Bryan, is interested. [E. R. J., Nov. 7, '14.]

Tennessee & Kentucky Railroad, Nashville, Tenn.—Arrangements are being made by this company to begin work soon on the construction of its 45-mile line between Nashville, Tenn., and Adairville, Ky., via Goodlettsville, White House, Orlinda and Lamont. Nearly all the right-of-way has been secured. Power for operation of this line will be purchased from the Nashville Railway, Light & Power Company, so that the company will not have to build a power plant of its own. Headquarters: 312 Third Avenue, Nashville. Officers: J. P. Helms, president; A. G. Merrit, Jr., vice-president; Paul D. Denton, secretary, and H. L. Sperry, treasurer. [E. R. J., July 25, '14.]

Cleburne (Tex.) Street Railway.—Plans are being made by this company for improvements of its lines in Cleburne.

Beaumonth, Liberty & Houston Traction Company, Houston, Tex.—This company is making surveys for its proposed line between Houston and Beaumont. It is also planned to make preliminary surveys between Houston and Waco, and to begin actual construction work on the Houston-Beaumont line at once. E. Kennedy is president and Charles Fox is chief engineer of the company.

McKinney, Bonham & Paris Interurban Railway, McKinney, Tex.—Right-of-way has been secured and work will soon be begun by this company on its interurban line between McKinney, Bonham, Paris, Blue Ridge and Leonard. L. A. Scott, president. [E. R. J., Oct. 24, '14.]

Danville Traction & Power Company, Danville, Va.—The extension to Cragshead Street in Danville has been completed by this company.

Princeton (W. Va.) Power Company.—Plans are being made by this company to build five new steel bridges on its line between Bluefield and Princeton. [E. R. J., Oct. 24, '14.]

SHOPS AND BUILDINGS

Georgia Railway & Electric Company, Atlanta, Ga.—This company has opened its new frieght station at North Butler Street in Atlanta. This supplants the old freight depot at Walton Street and Fairlie Street. The Atlanta Northern Railway will also use this building for handling its freight in Atlanta.

East St. Louis & Suburban Railway, East St. Louis, Ill.—This company has moved into its new three-story office building on Collinsville Avenue and Main Street in East St. Louis. The East St. Louis Light & Power Company, a subsidiary, will also have its offices in this new structure.

Bangor Railway & Electric Company, Bangor, Maine.—Plans are being made by this company to open a new passenger station in the Graham Building in Bangor.

Columbia Electric Street Railway, Light & Power Company, Columbia, S. C.—One bay of this company's carhouses in Columbia was destroyed by fire on Nov. 10. Nineteen cars were burned.

POWER HOUSES AND SUBSTATIONS

Fresno (Cal.) Interurban Railway.—This company has placed in operation its new substation at Barton Vineyard, which will furnish power for its line between Fresno, Clovis and the Normal School.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for the following apparatus: two 150-kw, 250-volt, three-phase, sixty-cycle, 1200-r.p.m. compound-wound commutating-pole self-starting rotary converters; two 165-kva, 2400-volt high-tension to rotary volts low tension, three-phase, sixty-cycle, oil-insulated, self-cooled transformers, and one three-panel switchboard to control same.

Sioux City (Ia.) Service Company.—One motor-generator set, 300-kw, 275-volt, d.c. compound-wound commutating-pole generator with one 450-hp, 550-volt, 900-r.p.m. shunt-wound d.c. motor on common base and shaft, and one five-panel switchboard for the above will be installed by this company at its power plant in Sioux City. The order for this apparatus has been placed with the Westinghouse Electric & Manufacturing Company.

South Covington & Cincinnati Street Railway, Covington, Ky.—Contracts have been let by this company for installing two 1500-kw synchronous rotary converters, six kva transformers and other accessories, including two switchboards, in substations.

Richmond Light & Railroad Company, New York, N. Y.—This company has been ordered by the Public Service Commission to install and have ready for operation by March 15, 1915, in its electric plant at Livingston, additional boilers having a capacity of at least 1800-hp; also one auxiliary smokestack and appurtenances; also by May 1, 1915, electrical generating apparatus of at least 6000-kw capacity; and to submit plans by Dec. 15 for the reconstruction of the plant.

Manufactures and Supplies

ROLLING STOCK

Empire United Railways, Syracuse, N. Y., has recently purchased five express cars.

Springfield, Troy & Piqua Railway, Springfield, Ohio, expects to build one freight car.

Toronto (Ont.) Street Railway has been ordered by the Ontario Railway and Municipal Board to put fifty new cars into commission.

Columbia (S. C.) Railway, Gas & Electric Company lost nineteen cars in a fire on Nov. 10, 1914, which destroyed one bay of its car barns.

Florence & Huntsville Interurban Railway, Florence, Ala., a new road, is reported to have ordered two gasoline motor cars and two trailers.

Binghamton (N. Y.) Railway has issued specifications for about twenty cars, including probably ten double-truck and ten single-truck cars.

Westchester Electric Railroad, Mt. Vernon, N. Y., has purchased and placed in operation four of the new Third Avenue type stepless cars equipped with radial axle trucks. The cars are handling the service of the Chester Hill line which runs from Mt. Vernon to Tuckahoe, through Bronxville and Chester Hill.

TRADE NOTES

U. S. Metal & Manufacturing Company, New York, N. Y., has been appointed New England agent for Thayer & Company, New York, who manufacture the Chillingworth seamless gear case.

Wasson Engineering & Supply Company, Milwaukee, Wis., has appointed R. R. Holden as district sales representative for Illinois, Indiana, Ohio, Wisconsin and Michigan. Mr. Holden's headquarters are in the New York Life Building, Chicago.

Jesse Coogan Engineering Company, Salt Lake City, Utah, has received a contract to install the Evans automatic fire sprinklers in the new carhouse of the Utah Light & Railway Company, and another contract to install the Coogan system of hot water heating in the new joint terminal station for the Ogden Rapid Transit Company and the Ogden, Logan & Idaho Railway.

Hall Switch & Signal Company, New York, N. Y., has just elected as president Col. Henry G. Prout, whose resignation as president of the Union Switch & Signal Company was announced in these columns some months ago. Col. Prout was editor of the *Railroad Gazette* from 1887 to 1893. He was a graduate of the University of Minnesota with the degree of C.E. in 1871. He then entered the service of the Khedive of Egypt and was major of engineers and later colonel of general staff in 1873 to 1878 and later governor of the Provinces of the Equator. William P. Hall is now vice-president and chairman of the executive of the Hall Switch & Signal Company. Other changes in the organization which have been announced are as follows: W. J. Gillingham, hitherto Western representative of the company, with office at Chicago, has been appointed general sales manager, with headquarters at the main office in New York City. W. A. Peddle has been appointed acting chief engineer, in charge of engineering and production, and W. H. Lane, chief engineer, has been granted leave of absence until January 1, on account of ill health.

ADVERTISING LITERATURE

G. C. Reiter, Canton, Ohio, has issued a folder describing its motorman's foot gong signal.

Tool Steel Gear & Pinion Company, Cincinnati, Ohio, has issued a catalog which shows several illustrations of gears and pinions which have rendered remarkably long actual service on a number of electric railways.

T. O. Smith Company, Milwaukee, Wis., has issued a folder describing its "Mixerette," the latest addition to its line of non-tilting mixers. This mixer has a capacity of 5 cu. ft. of mixed concrete per batch and will easily produce 45 cu. yd. to 50 cu. yd. per day.

National Scale Company, Chicopee Falls, Mass., has issued folders describing its counting machines, elevating trucks and multi-call, a factory signal system. The company has also issued a testimonial letter from the New York Central lines in regard to its counting machines.

Ohmer Fare Register Company, Dayton, Ohio, has issued a booklet entitled "Know Your Men," which contains a general discussion on fare collecting and includes data on results of this company's fare registering system as practised by the Denver Tramway Company, Southern Pacific Railroad, Portland (Ore.) Railway, Light & Power Company, New York State Railways and Chicago & West Towns Railway.

Joseph Dixon Crucible Company, Jersey City, N. J., has issued a mailing card in the form of a barrel of boiler graphite. This graphite is intended for the reduction of fuel consumption, prevention of scale hardening and for the purpose of giving to the surface of boilers a smooth polish, thus preventing pitting and making the removal of scale easy by a gentle mechanical action.

Auto Utilities Manufacturing Company, Chicago, Ill., has issued a folder describing its Peerless building ventilator, for use on railway shops and power houses. This ventilator is square in design, giving it a great wind-resisting surface at any angle. This surface or face is divided in the center in the form of a V, splitting the wind and forcing it over the corner openings at a great velocity. The vacuum thus formed creates a powerful suction through the corner openings. It is dust and storm proof. It has no parts suspended on braces and no tops to blow off, but is double seamed and interlocked. Another folder issued by this company describes Peerless smoke jacks for electric car stoves. A list is included of 113 electric railways which are using this smoke-jack in connection with Peter Smith heaters.

Electric Railway Equipment Company, Cincinnati, Ohio, has issued Catalog No. 16 describing its iron and steel tubular poles for electric railway and combined lighting and railway service, assembled with its wire-block swedge joints, also its complete line of fittings for iron and steel tubular poles including feeder arms, cross-arm supports, iron pole tops, section collars, wheel guards, bands, steps, and feeder wire insulator pins. The catalog also contains valuable data showing the weights and the sizes of various three-section poles of lengths from 28 ft. to 35 ft., inclusive, as well as the moment of inertia of the iron sections of the bottom ends of the poles, the deflection of the poles under various loads and the maximum safe load that should be applied to the poles. An additional chapter has been inserted in this catalog which supersedes Catalog No. 15, entitled "Selection of Poles," selected from the 1913 report of the A. E. R. A. committee on power distribution. This report is accompanied by very convenient tables for assisting engineers to select the proper size poles to meet local conditions. The tables show the pull on span wires in pounds for various street widths, and also the sag and tension of single and double track trolley span wires.

General Electric Company, Schenectady, N. Y., has issued Bulletin No. 40500 describing a.c. generators for direct connection to reciprocating engines. The object of the bulletin is to illustrate and to describe some of the recent improvements in the alternators equipped by this company for direct connection to steam, oil and gas engines. The construction of the alternator is explained in considerable detail and the bulletin contains data relative to dimensions, capacities, weights, etc., of alternators of this description. Bulletin No. 41500 describes small d.c. and a.c. motors of the drawn-shell type. These are all of fractional horse-power motors which have been specially designed for application to the diversified forms of small machines which may be driven by electric power. These motors range in capacity from 1/30 hp to ¼ hp inclusive, and are furnished for use on circuits of standard voltages. Bulletin No. 44404 describes this company's new line of ventilated commutating-pole motors. This motor has a rated capacity of 88 hp on 600 volts, but owing to the special feature of induced ventilation has a greater service capacity than motors of the closed type having the same hourly rating. The bulletin contains a schedule of speed tables and characteristic curves of the motor.

FUNCTIONS OF THE A. E. R. A. SECTION

As one reads the reports of the association company section meetings in the "Association News" column of this paper, and especially if he has the good fortune to be an attendant upon the meetings of a section, he cannot but be impressed with the substantial and helpful character of the section movement. When President Allen faced an enthusiastic audience of three hundred or more on a stormy night in Newark last week he stated that the largest number of attendants at a session of the Atlantic City convention was less than three hundred. Obviously an institution which will bring out an audience like this from all parts of the State of New Jersey has something worth while to give its members. The active company section yields, among others, these benefits: It furnishes a medium through which the results of the work of the parent association can be disseminated locally. It furnishes an effective channel for the exercise of individual enthusiasm and initiative. It promotes loyalty to the local company and to the industry. It provides for give-and-take discussion of local problems, and it reduces operating friction, or, to change the figure, it provides a safety valve for the critical spirit. But while section work is good, its development cannot be forced. It depends for its success in any community upon the enterprise of a few individuals, and it must be initiated to meet a real local need. Given the need, together with suitable leadership, however, it will be found everywhere that the thinking class in the railway organization will support section meetings and other co-operative activities.

HELPING THE SIGHTSEER

The sightseeing vehicle is not so common in American cities as it is abroad because of the absence of historical places, remarkable buildings of past ages, art museums and the like. For all that it is doubtful whether American railways take advantage of the sightseeing business that is available. There are not many places in America with the charms of a Quebec or New Orleans, but there are many which for one reason or another do entertain many strangers, whether from day to day or on the occasion of conventions, fairs, etc. If there is enough permanent sightseeing business it can be secured largely for special car transportation at a special rate—say 25 cents to 50 cents for a complete trip with guide. Where a sightseeing car can attract business for many days of the year it will pay the company to build an open-tier car, say like that of Montreal and Quebec, from which the riders can get real snapshot views of the city. Wichita, Kan., at first thought does not suggest a promising place for sightseeing travel. Yet on the occasion of a recent dry-farming congress the Wichita Railroad & Light Company ran a "Seeing Wichita" car twice a day at 25 cents per trip. Furthermore, every employee was decorated with an "Ask Me" badge to encourage the diffident visitor to ask for information. Thus the company not only gained extra revenue but performed a service that was a great convenience to the stranger. Furthermore, the idea of offering every platform man as a guide showed the kind of spirit that leads the local public to feel that its railway system is doing good work to make the town a by-word for enterprising hosptality.

PERMANENT TRAFFIC BUREAUS

Although the traffic bureau, or traffic squad as it has sometimes been called, has been in use in some cities for at least ten years, the general growth of the idea of keeping continuous records of traffic and subjecting the whole service to periodical inspections by specialized observers has been singularly slow. It is true that a comparatively small amount of attention has been devoted to the extent of the possible savings that can be made through the annual expenditure of the several thousand dollars necessary to support a permanent staff of men for this work. However, this does not alter the fact that enormous savings are easily available in many cases. Even at the risk of meeting the "local conditions" argument, it might well be asked why the average schedule speed in one city is satisfactorily maintained at 10 m.p.h., although the speed in another town of about the same size and general character is only 8 m.p.h. In the former case the average car and its crew are performing 25 per cent more effective work than in the second case, and the cost of this work has been estimated to constitute fully half the total cost of operation. Of course, there is a reason for such differences in schedule speed, which might easily make the difference between failure and prosperity, and this reason is just what the traffic bureau is likely to know. If in such a case it was able to point out the real sore spots and to offer a remedy for them it would pay for itself even if none of its members ever did a stroke of work during the rest of their lives. Indeed, it may be safely said that an efficient traffic bureau is about the most inexpensive economy that can be introduced by any street railway of reasonable size, because the opportunities for saving time and money by the real study of traffic are, at once, the most prolific and the most completely neglected ones that can be found today in any of the various departments.

PROBLEMS IN SPECIAL WORK STANDARDIZATION

In a recent editorial we urged the appointment by the Engineering Association of a committee on special work standardization and suggested that it begin with foundations. Following a study of the supporting structure, it appears that the question of standardizing layouts might next be considered. While the association has adopted standard dimensions for right and left-hand switches and mates for 100-ft. and 200-ft. radius curves, the scope of this good work could be enlarged to embrace standard spirals for lead curves, for which the lengths of connecting rails could be prescribed. The final step in this plan of special-work standardization could include the over-all dimensions for 90-deg. frogs, limiting dimensions for all frogs and crossings less than 90 deg. so as to permit the use of but a single joint in each rail between gage lines, and at the same time provide ample spread in the arms to facilitate the application of connections. Pioneer work of this character has been done on several large systems, and its economy is unquestioned.

The standardization of the design and materials employed in the manufacture of frogs, crossings, switches and mates also affords a vast field for constructive study. While the manufacturers have developed the art to a point where each knows the steel or cast-iron section required to meet certain loads, they no doubt would welcome a set of standards for various loadings, so that all could bid for work on the same basis. In the size of the binder casting section to carry certain loads there is a wide range of difference, owing to the diversity in methods of reinforcing or toughening the metal used by different manufacturers. The size of the rolled-rail-arm grip area and the method of preparing the rail to insure a positive bond between it and the casting may be specified by establishing certain minimum limits. These must necessarily vary with the different railway loads and should include a factor of safety to cover maintenance deficiency.

Insert fastenings and settings may also be standardized to a certain extent, including the size and number of bolts or wedges and the method of locking them in position. Regarding the size of the insert, there is not a wide difference of opinion among manufacturers, and, in fact, it is doubtful if many engineers have ever given it consideration. The thickness of the plate and the method of setting and fitting in the casting pocket are all subject to standardization to a limited degree. Gentle approaches to the narrow throatways and gradual changes from tread to flange or to equal flange and tread bearing could be specifically defined. Throatway widths and depths, however, will manifestly vary with the standard wheel flanges.

The foregoing suggestions represent in a general way what subjects could be taken up by a committee inquiring into the subject of special-work standardization. Undoubtedly the results of such a study would be of immeasurable benefit to the industry from the standpoint of economy, and the information collected would be of great intrinsic value.

ELECTRIC RAILWAYS AND PUBLIC LIBRARIES

The communication from K. E. Walker, a librarian of New Haven, Conn., printed in this issue, discloses an ally to the improvement of conditions in electric lines of whose assistance insufficient advantage has been taken in the past. By means of a systematic effort to interest electric railway employees in the reading of technical literature Mr. Walker has secured very satisfactory results. His letter is indicative of what might be called the modern idea of the function of a library—namely, to study the literary needs of its own community and then to endeavor to meet these needs even if traditions must be violated in so doing.

The old-fashioned library was a cloistral place appealing only to the scholar, who moved silently among shelves laden with dust-covered tomes. The modern library possesses a different atmosphere and one more akin to that of a business office, and most of the readers have the appearance of seeking information which will be of assistance in their daily problems rather than abstract knowledge. There is a similar change in the appearance and attitude of the librarian. Formerly he seemed to look on the library as an end in itself and as a "collection" of interesting curiosities; he was willing to let it remain a stagnant literary pool. Now he is an alert specialist, keen to keep a stream of vital, useful knowledge flowing from the library to all parts of the community.

That the local libraries should be useful to an industry as important as the electric railway industry goes without saying, but it may be worth while to restate it for the purpose of raising in the mind of electric railway managers the question whether their own companies are utilizing all of the benefit of which the public libraries in the communities which they serve are capable.

SURPLUS AND CREDIT

One of the criticisms directed against the steam railroads at a recent rate hearing in Washington by the counsel representing the shippers was that some of the companies which petitioned for an increase in rates were earning a surplus in addition to paying dividends. The thought underlying this criticism is a common one and applies as well to rate hearings of electric roads as to those of steam roads. Carried to its logical conclusion, it would mean that no company is justified in asking for an increase in rates except as a means for keeping itself out of bankruptcy. Nevertheless there is a close relation between a surplus and credit which is of vital importance in the financing of any company, even though it may occasionally be overlooked by the short-sighted investor to whom the dividend or interest rate paid on securities seems all-important. The cheapest financing is that which is done with a large margin of safety, and companies should be encouraged to maintain a fair surplus over fixed charges and dividends in order to insure sufficient credit for securities to flow freely to investors.

The price at which a security can be sold depends quite as much upon the margin between the earnings of the company above and beyond that required to pay interest or dividends on the security as upon the rate of interest or dividends actually being paid. The difference between the amount received and that paid out not only provides an opportunity for an increase in dividends later but gives a reserve for contingencies. One electric railway property which we have in mind went as far, for instance, as to spend more than $20,000,000 in twelve years to put its property in excellent physical condition before payment of dividends in 1912. While a property operated under such conditions may not be attractive to those who desire a quick return through stock dividends, it is a much more conservative investment than one dispensing its net income without any thought of future requirements. The ideal situation, of course, is where a railway can pay attractive dividends and still have sufficient surplus for the protection of its corporate interests. We believe that a reasonable margin for such a surplus should be allowed in rate making.

THE RECEPTION OF THE JOB SEEKER

The attitude that a man takes toward the corporation that employs him is determined very largely by the reception he receives when he first applies for a job. If that reception indicates distrust in his integrity and involves a degradation of his rights as a man the employer need feel no surprise later at sullen behavior and worse. Thus the first essential is that the man who guards the gates of employment should be kindly as well as keen. Yet for years one of our largest electric railways retained in its employment bureau an individual who addressed each applicant as follows: "Damn you, weren't you a conductor on the ——— Street line?" Of course, his object was to catch repeaters off their guard, but he offended ninety-nine innocent men to catch the hundredth wrongdoer. To make matters worse, most of the men had been forewarned of this method of attack, so that little good was accomplished any way. Eventually Mr. Brusque was dismissed. To-day, a different practice is followed. After a group of recruits have passed the school tests they are introduced to an assembly of dispatchers and carhouse superintendents, who generally find no trouble in singling out the men who have been in their service before. The plan as carried out involves no humiliation of innocent men and permits few guilty ones to escape. The company could save a little money, however, if the recruits were inspected before going through the course of instruction. This change would not involve much extra inspection because only a comparatively small number of men who have passed the preliminary physical and oral examinations are rejected in the course of the training on the car platform.

Another humiliating experience for the man who seeks a platform job is to be photographed for the company's rogue's gallery. How many men have been deterred from stealing by this practice? and is the number large enough to offset the outraged feelings of the innocent majority? It is doubtful even whether the demand for three or four personal references does any good, since the crook is the very person who can supply as many references as desired. It may do no harm to ask for references, but one inquiry followed up carefully is worth a dozen followed up by mail and is enough to indicate whether the others are genuine. Incidentally this practice will save time, stationery and postage. What every railway needs in its employment bureau is an experienced reader of character who can "tell the mind's construction in the face." Such men when found cost more than bulldozers, but they are worth the difference.

ADOPTING THE UNEARNED INCREMENT

From time to time we hear the moss-grown argument that the location of a carhouse or operating station in a residential district tends to depreciate property values. While this may be true of exclusive residential districts in which a railway company could not afford to locate its stations, the experience of the Cleveland Railway most emphatically controverts this argument as a general proposition. Early in its history it adopted the policy of locating the carhouses at points, first, where they were best suited from an operating standpoint, and second, in residential districts where its trainmen could afford to have their homes. While in many instances the location of the site selected was in an undeveloped district, it was but a few years until the surrounding property was cut up into building lots. Although these carhouses and their surroundings might not appeal to the very esthetic they were kept attractive in appearance and as a result did not detract from the desirability of the surrounding property for residential purposes.

Having demonstrated the fallacy of this fogy idea to its entire satisfaction, the management of the railway proceeded to purchase other sites with areas more than ample for its requirements. As the territory developed and the property enhanced in value, portions of these sites were cut off and sold as lots, and in some instances the company realized from these extra lots more than the cost of the original property. At other points property which now has been outgrown and must be thrown on the market has enhanced in value so that the profit will net 1000 per cent. Although this increase has taken from ten to twenty years, it must be borne in mind that in the meantime the property has been serving the full purpose for which it was intended.

At the present time in seeking new sites for carhouses and repair shops, the management is adhering to this policy. As an added incentive to those seeking locations for high-class homes, the new carhouses are being built of a high standard architecturally, and the surrounding grounds are being parked, paved and kept in a neat and clean condition. Already a number of these new sites have appreciated in value, and there can be no doubt but that this company's policy of adopting the "unearned increment," arising in large part from its own improvement, is an excellent one.

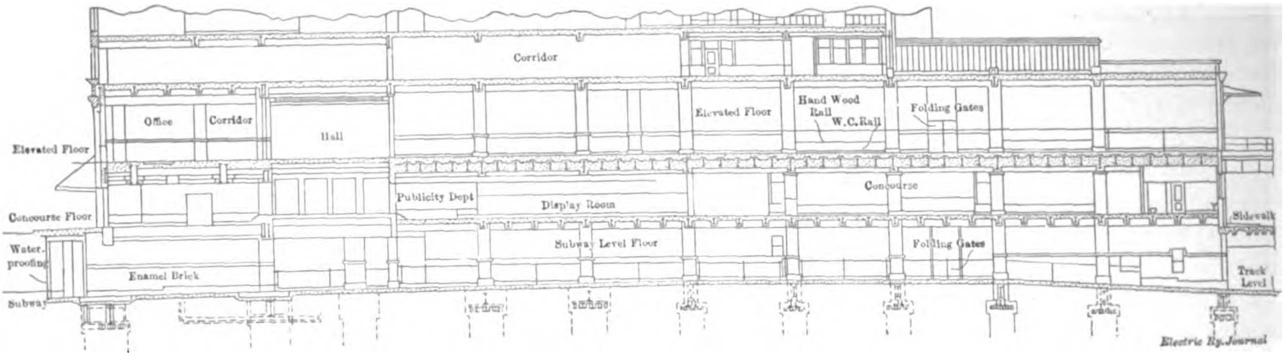
Progress on the Newark Terminal

In His A. E. R. A. Public Service Company Section Paper, Abstracted Below, Martin Schreiber Gives Interesting Facts Regarding the $5,000,000 Terminal Now Under Construction

As mentioned in the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 31, page 1015, Martin Schreiber, engineer of maintenance of way Public Service Railway, gave an illustrated description of the work on the terminal now under construction in Newark at the meeting of the A. E. R. A. Public Service Company section held on Oct. 29. This project was described in a preliminary way in the issue of this paper for Feb. 8, 1913, page 246. The terminal will be a handsome building fronting on Park Place, in the business center of the city. It will be but a step from the intersection of Market and Broad Streets, said to be the second most congested intersection in the country, the maximum rate at which cars are scheduled through it being 532 per hour. As will be remembered from the previous article the new terminal building is a combined terminal for local and interurban cars, and a sales and office building for the several subsidiary companies forming the Public Service Corporation. The terminal tracks are located on a subway or basement floor and on an elevated floor, the ground floor between these being occupied by a concourse and salesrooms.

This terminal project of the Public Service Corporation is unique in the electric railway development of the country, not only on account of its magnitude and the cost involved, but because the operating problems to be solved were diversified and complicated.

Mr. Schreiber outlined the steps which led up to the present plan, which is the indirect outcome of President T. N. McCarter's association tour of 1912. On this trip Mr. McCarter was impressed by the results obtained from electric railway terminals, particularly in the West. In applying the principle to conditions in Newark he devised the two-train-floor plan with the concourse on the ground level between the two train floors. Before it was possible to carry out the plan it was necessary to secure twenty-seven franchises covering subway, overhead, coincident trackage and extensions in the city. On March 16, 1914, the final stamp of approval was placed upon the plans by the Board of Public Utility Commissioners, fourteen months after the scheme was first introduced to the city authorities. Actual construction was begun on June 14, and it will require two years for the completion of the work.



NEWARK TERMINAL—PARTIAL VERTICAL SECTION OF TERMINAL

TRAIN AND CONCOURSE FLOORS IN THE TERMINAL

Cars enter the subway floor from a subway located under Halsey and Cedar Streets and crossing under Broad Street, the construction of which is well advanced. The tracks enter the building at an elevation 21 ft. below the curb line. The ingoing track diverges into two unloading tracks, each 280 ft. long on the southerly side. The loading tracks are three in num-

ber, are 225 ft. long, and are located on the northerly side. The total area of the sub-surface terminal is about 104,000 sq. ft. Six stairways for the loading tracks and four for the unloading tracks connect this floor with the concourse above. There is also one stairway on the center platform. On this floor are also spaces for boilers and power plant accessories, building stores, mailing room, etc.

On the elevated train floor are two unloading tracks on the north side, respectively 140 ft. and 170 ft. long, and 190-ft., 180-ft. and 140-ft. unloading tracks on the south side. From the loading platforms there are six stairways leading to the concourse and from the unloading platform there are five stairways. The East Park Street wing on this floor is taken up with coal-conveying machinery for the power plant, and the North Canal Street wing is utilized for division offices and the general employment bureau. The entire area of this train floor is about 70,000 sq. ft.

The 70,000 sq. ft. of the concourse floor provide a concourse for the interchange of passengers between the two train floors, salesrooms for the gas and electric companies, waiting rooms, lavatories, booths, etc. On this floor are also the railway school of instruction, the station master's office and the assembly hall checkroom.

THE OFFICE FLOORS

From the third floor up is the office building, each floor of which has an area of about 30,000 sq. ft. The floor is so planned that the wings are but two rooms deep and all offices have outside light and air. The offices of the railway company will be on the sixth floor; the dining rooms for officers and employees on the eighth floor, with kitchen and chef's quarters above; the general assembly room, in which the A. E. R. A. company section and other meetings will be held, on the fourth floor, and the technical library on the seventh floor.

NEWARK TERMINAL—TRACK LAYOUT ON SUBWAY AND ELEVATED TRAIN FLOORS

GENERAL FEATURES OF THE BUILDING AND SITE

The complete floor space will be 451,000 sq. ft. and the building will contain a total of 394 rooms, of which 235 are working rooms and the remainder are general utility rooms. The site contains about three acres, and adjoining real estate has been purchased so that if the neighboring canal is electrified in the future a connection can be made into the terminal.

The excavation necessary is about 100,000 cu. yd., and 92,000 cu. yd. of concrete, 460,000 sq. ft. of waterproofing, 44 miles of conduit and piping and 9000 tons of steel will be required.

TRACK CONSTRUCTION

The subway track construction outside of the building will consist of 80-lb. T-rail, with Bonzano joints, laid on concrete ties on 2-ft. centers, with 6 in. of ballast.

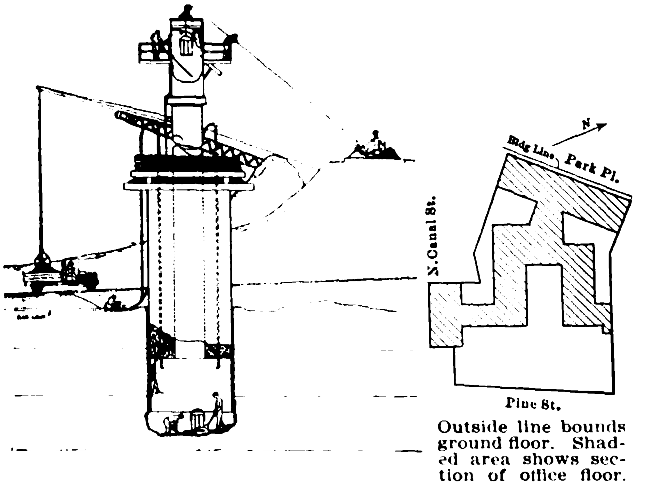
NEWARK TERMINAL—PLAN OF CONCOURSE FLOOR

On the elevated and subway floors in the terminal 90-lb., 7-in. T-rail will be used. This will be fastened to short ties with screw spikes and anchored to concrete, as shown in an accompanying illustration. The rails will rest upon special tie plates equipped with 1-in. cowhair felt. All curves and special work will be of solid manganese construction and this, as well as the other track, will be exposed for convenience in making renewals. The track will be well drained, as shown, to take care of water from cars or platforms, being located well below the latter, which is crowned to shed water into the track spaces.

DESIGN AND OPERATING PROBLEMS

Mr. Schreiber outlined many of the unusual problems involved in the terminal undertaking. These covered all branches of the engineering profession, so that a special staff had to be organized to handle them. An assistant engineer was assigned to supervise the work under the engineer of maintenance of way. A corps comprising an architect, a foundation engineer, a structural engineer, a heating and ventilating engineer and an electrical engineer was organized. Jacobs & Davis, of New York, were retained as consulting engineers, and George B. Post & Sons, of New York, as consulting architects.



Outside line bounds ground floor. Shaded area shows section of office floor.

NEWARK TERMINAL — DIAGRAMMATIC CROSS-SECTION OF CAISSON; FLOOR SECTION DIAGRAM

As the foundations were of unusual importance in a building which must carry loaded cars on an elevated floor without producing serious vibration, the character of the soil was carefully studied in advance. In the borings, sand and clay were encountered at 4 ft., sand and fine stone at 18 ft., fine sand at 21 ft., fine moist sand and water level at 26 ft., quicksand at 35 ft. and red shale in horizontal layers at 53 2/3 ft. After considering a plan involving separate sets of columns for the train floor and the office building, it was abandoned and a single set of columns resting on bedrock, with a well-braced, deep floor system for train platforms and concourse, was decided upon. The reasons for this selection were: first, that heavy floors would assist in eliminating noise, and, second, that clearances among columns had to be provided for the cars on train floors.

An eccentric arrangement of columns was necessary on account of the clearance feature, rendering the whole design difficult and dictating many of the design features. The columns were located with the aid of templates of the cars to allow a minimum clearance of 1 ft.

The arrangement of stairways was made with a view to enabling passengers to use the proper ones in reaching the cars desired so that no crossing of tracks on train floors will be necessary. The climb from the concourse floor to the elevated train floor will be 17 ft. and that from the subway floor to the concourse floor will be 18 ft., the subway floor track being crowned to minimize climbing. These heights compare favorably with 32 ft. in the Hudson River tube at Fulton Street, New York; 30 ft. at the 180th Street elevated station, New York; 58 ft. from subway train platform to bridge platform at Brooklyn Bridge, New York; 36 ft. at Ninety-ninth Street elevated station, New York; 44 ft. from the Pennsylvania Railroad train platform to the street, New York terminal; 43 ft. from the subway platform to the street, Long Island Railroad, New York terminal.

The general layout of the terminal was designed to care for 400 cars per hour, or say 50,000 persons going in both directions, doubling the capacity for handling passengers in the business district of Newark.

Safety in Street Railway Work

Dr. W. H. Tolman, director of the American Museum of Safety, discussed the topic of "Safety as Applied to Street Railway Work" at a meeting of the New England Street Railway Club on Nov. 19. A large number of lantern slides were shown.

According to Dr. Tolman, a new figure has appeared in the industrial field—the safety engineer—whose work lies in the direction of reducing accidents in industrial, manufacturing and transportation enterprises. A museum of safety has been in existence in New York for some time, and one has recently been established in Boston by the Massachusetts Industrial Accident Board. From such a museum safety men can go forth to explain safety methods to manufacturers and workers. An important feature of this campaign is in the public schools, and in New York, Brooklyn and Buffalo more than 500,000 children have been reached in this way. Excellent work has also been done by the Public Service Railway, New Jersey, which is now beginning its fourth year of educational work.

An address on safety work was also presented by Dr. Tolman at a meeting on Nov. 10 of the Hudson & Manhattan Railroad Athletic Association. President Fisk was also a speaker at this meeting.

The Pennsylvania System's Exhibit at the Panama-Pacific Exposition

The Pennsylvania System exhibit at Chicago was historical; at St. Louis scientific; at the Panama-Pacific International Exposition in 1915 the exhibit will be practical and popular and will serve to bring before the eyes of the thousands of people a true educational picture of density of population, traffic and industry served by the Pennsylvania System. The exhibit will consist of models of New York City and surroundings, with the Pennsylvania System from the Mississippi River to the Atlantic Ocean and from Duluth to Norfolk; and two railroad stations, the Union Station at Washington and the proposed Union Station at Chicago. A unique motion picture auditorium of two Pennsylvania all-steel passenger coaches, wherein will be shown views of various journeys from the Western gateways of the Pennsylvania System to New York, will also be on exhibit.

The exhibit will be under the direction of George D. Dixon, vice-president in charge of traffic Pennsylvania Lines East of Pittsburgh, and D. T. McCabe, vice-president in charge of traffic Pennsylvania Lines West of Pittsburgh. H. T. Wilkins, special agent traffic department, has had direct supervision of the preparation of the exhibit and he will also supervise its installation and display.

Meeting of Central Electric Railway Association

The Autumn Meeting Which Was Held in Fort Wayne on Nov. 19-20, Was Reported in Part in Last Week's Issue—An Account of the Proceedings at the Second Day's Session Is Published, Together with Papers on Oxy-Acetylene Welding and on Interurban Headlights

In last week's issue of the ELECTRIC RAILWAY JOURNAL an account of the first sessions of the Fort Wayne meeting of the Central Electric Railway Association was published, and the last session held on Friday, Nov. 20, is reported in the following paragraphs. The meeting on Friday opened with President Schneider in the chair and more than eighty members in attendance. At a business session which was held prior to taking up the regular program, the association was informed that several boat lines operating on the lakes out of Cleveland, Ohio, had requested joint rates with the electric lines touching lake points. Upon motion, W. S. Whitney, general freight and passenger agent, Ohio Electric Railway, John F. Keys, general passenger agent, Detroit United Railway and President Schneider were appointed a committee to investigate the desirability of granting the request.

Following the transaction of business the regular program was opened with a paper by J. F. Layng, engineer of the General Electric Company, entitled "Selection of Railway Equipment." This was published in abstract in the Nov. 21 issue. W. E. Rolston, electrical engineer Chicago, Lake Shore & South Bend Railway, opened the discussion with an inquiry regarding the economical motor load factor. In response Mr. Layng stated that there were too many variables to permit its determination. He said that one must assume the worst condition on any line or any system and select a motor of sufficient capacity to do the work. To determine the worst condition, however, actual tests should be made to obtain best results. After these data are obtained the railway company's engineer should not include a factor of safety because all manufacturers take this into consideration in selecting a design to meet the conditions presented. If the safety factor is not included the first cost is materially decreased without affecting maintenance.

In reply to another inquiry Mr. Layng stated that the motor mounting shown in Figs. 5, 6, 7 and 8 of the diagram accompanying his paper, were not recommended by the manufacturers, but represented methods of mounting in actual service. This diagram was published on page 1159 of the ELECTRIC RAILWAY JOURNAL for Nov. 21. G. H. Kelsay, superintendent of power, Union Traction Company of Indiana, inquired regarding the current consumption of the motor mountings shown in Figs. 2, 3 and 4 as compared with that shown in Fig. 12 of the same diagram. In response Mr. Layng stated that the power saving obtained by the use of maximum traction trucks for two-motor equipments as compared with standard trucks was practically negligible. The efficiency of modern motors varied from 84 per cent to 88 per cent under full load, and there was little to be gained by the slight change in size necessary when a two-motor equipment was used instead of a four-motor equipment. The factor governing the selection of motor equipment should be wheel slippage rather than motor efficiency. The combined gear efficiency of a four-motor equipment also enters and tests have indicated that it is about the same as that for a two-motor equipment. On long-haul interurban lines wheel slippage was negligible. In referring again to the question of load factor, Mr. Layng stated that better economy could be obtained with a greater range of speed points in the control equipment.

R. N. Hemming, superintendent of motive power, Union Traction Company of Indiana, raised the question of whether it was more economical in train operation to mount motors on trail cars or to increase the size of the motor-car equipments, and Mr. Layng replied that the maximum economy would be obtained with trailers operated without motors. In explanation, he stated that in either case it would be necessary to have practically the same control equipment on both cars and that the application of motors to trail cars was purely a problem to be decided by the question of weight. It was also necessary to consider the question of dead mileage in operation. He suggested that the trailer weight could be further reduced by equipping them only with air brakes connected by train line to a compressor on the motor car. He stated also that motors which were suitable for trailer operation were also good for local service, and that this was a point deserving of serious consideration, since it was almost impossible to divorce local and limited service on most interurban lines. In view of this condition electrical equipment must be so selected as to be flexible enough to meet any operating condition. Following the discussion Mr. Layng exhibited some lantern slides showing the historical development of railway motors.

J. W. Esterline, president and general manager of the Esterline Company, next read a paper entitled "Interurban Headlights." This appears elsewhere in abstract form. Following his comprehensive treatment of this subject, the speaker stated that he had collected data to determine the cost of operating arc lamps and had found in a test of 5000 samples that the average power consumption for 4-amp, 550-volt lamps had been 2.25 kw per arc for a six-hour period. Figuring the difference in the cost of this energy as compared with that consumed by 100-watt incandescent lamps, he found that it represented 6 per cent on an investment of $6,000,000. The cost of maintaining incandescent headlights amounted to little more than the cost of replacing bulbs. To obtain the maximum life, however, it was necessary to select a lamp voltage which would conform to the maximum trolley voltage condition.

In reply to an inquiry regarding the fog penetrating qualities of the "Golden Glow" headlamp, the speaker stated that it was entirely due to the rate of vibration of the rays. The blue and violet rays, representing those with a high rate of vibration, were absorbed during foggy or rainy weather, while those of a longer wave length were not turned back. The question of short and long lengths of light waves was analogous to the short and long lengths of sound waves. For example, extremely high-pitched whistles did not carry as far as low-pitched whistles.

Mr. Hemming, of the Union Traction Company of Indiana, then spoke of the relative advantages of mounting headlamps on the hood or on the dash. Among other things he stated that it was costing his road approximately $8.10 per lamp per year for maintenance. In a recent test he found that he could see slightly farther with the headlamp in the hood than he could with it mounted on the dash. He also stated that he believed it was easier on the motorman's eyes to look under the rays of a lamp mounted in the hood than through the rays of a lamp mounted on the dash.

In discussing some of these points Mr. Esterline stated that the problem was purely one of eye efficiency and that it alone should determine the location of the lamp. It was also important that tests of this kind be made by continuous observation rather than by an observer whose eyes had not accustomed themselves to the conditions under which a motorman must operate his car at night. It was also brought out that the length of vision depended both on the reflector and the tilting of the lens. By reference to a diagram it was shown that eye efficiency increased with the angle of reflection, hence this in a way might account for the better results obtained by mounting the headlamps in the hood rather than on the dash.

H. S. Smith, engineer of the Prest-O-Lite Company, next read a paper entitled "Oxy-acetylene Welding." This paper appears below in abstract form. Various points relating to the application of this method of welding were brought out by Messrs. Cochran of the Ohio Electric Railway, and Hemming, Mitchell and Kelsay of the Union Traction Company of Indiana. It was stated that bonds with 2½-in. terminals were welded to the rail in three and one-half minutes, with a total labor cost of 10 cents. It was stated that the successful accomplishment of track welding and repairs was simply a question of determining the nature of filling-in material which would give the best result. Mr. Mitchell stated that he believed there was a good field for an iron bond or welded joint which would replace the present method of bonding. Mr. Cochran emphasized the fact that the bonding question was a very important one at this time, since copper bonds were costing approximately 40 cents per pound. If scrap copper could be used for this purpose instead of new, it would afford a means of making considerable saving. Following this discussion President Schneider announced that the annual meeting of the association would be held in Indianapolis, Feb. 25 and 26, 1915, the place of meeting to be decided upon by the committee having the convention arrangements in charge.

OXY-ACETYLENE WELDING

BY H. S. SMITH, THE PREST-O-LITE COMPANY, INDIANAPOLIS, IND.

Apart from the vital question of cost it is generally conceded that fusion produced by the burning of gases is preferable, for the purpose of welding, to the electric process. This is true over a wide range of work for the following reasons: When welding with the electric arc, an intense heat is concentrated at a single point, whereas with gas welding the heat of the flame can be brought at will to bear on the work surrounding the part to be welded, making it possible gradually to attain the desired welding heat. With electric-arc welding the light produced is so intense that the use of very dark glasses by the operator is imperative. This in itself makes for uncertain results, because the operator cannot see his work clearly. Again, unsteadiness on the part of the workman may cause an arc to be struck unintentionally, resulting in fusion or addition of metal where it is not desired. The electric arc is formed at the expense of atmospheric oxygen, and this indicates the possibility of chemical changes of an oxidizing character taking place in the molten metal, whereas with the gas process the welded part is always protected from the atmospheric oxygen by a shield of the products of combustion. Electric welding is suitable for filling in or welding comparatively simple parts but it cannot be used for complicated work, as is the case with the gas process. Probably the chief objection to electric welding is the fact that it is almost impossible to perform any subsequent treatment of the welded part. This is quite simple with the gas process, where the area surrounding the weld and the weld itself can be gradually annealed, thus removing internal strains and taking from the welded portion its hard and brittle character. Please do not understand me as being severely critical of the electric process. Electric welding has a large field wherein it can be employed advantageously and with better results than can be obtained with other methods of welding.

Experience with the oxy-acetylene welding process has shown that best results are arrived at when acetylene is delivered at the burner under pressure. In order to do this it is necessary to employ pressure generators, which have some serious objections, or to employ acetylene in dissolved form. In some cases the injector type of blowpipe is used. This enables acetylene to be supplied from generators which generate under low pressure, using excess pressure on the oxygen supply to provide power to suck in the acetylene and deliver the mixture of gas to the blowpipe nozzle at a suitable pressure. One volume of acetylene (C_2H_2) requires, theoretically, 2.5 volumes of oxygen to burn it to carbon dioxide and steam, but in actual practice it is found that, when both gases are delivered to the blowpipe under pressure, only 1.1 volumes of oxygen are required for each volume of acetylene. Injector-type blowpipes require 1.3 volumes to 1.5 volumes of oxygen to one of acetylene.

Acetylene, on issuing from the nozzle of a blowpipe into the flame, immediately splits up into its two constituents, carbon and hydrogen. The carbon burns with the oxygen supplied through the blowpipe to form carbon monoxide. It is this combustion that produces the white cone of the flame. The carbon monoxide later, in the close vicinity of the white cone, burns to carbon dioxide. The hydrogen contained in the acetylene cannot combine with oxygen at or in close vicinity to the white-cone flame, as the temperature at that point is about 6300 deg. Fahr. This is far beyond the dissociation temperature of steam, which is about 4000 deg. Consequently, the hydrogen passes away and only combines with the oxygen of the air after it has passed away from the hot part of the welding flame. The result is a zone of more or less free hydrogen surrounding the welding flame, and this is highly advantageous, as it tends to confine the heat and prevent oxidation of the metal.

For commercial purposes oxygen is manufactured either by what is known as the liquid-air process or the electrolytic process and it can be obtained comparatively pure from either class of plant. Any impurity in oxygen manufactured by the liquid air process is mainly nitrogen, and, while freedom from nitrogen is desirable, a slight percentage is not fatal to good welding of iron or steel. However, should the percentage of the nitrogen impurity exceed 1½ per cent the welds are apt to be porous, because of the absorption of the nitrogen by the molten metal. The purest possible oxygen should be procured for welding aluminum, copper or brass, as at high temperatures these metals have strong affinity for nitrogen. In the case of oxygen manufactured by the electrolytic process the only impurity will be hydrogen. Excess hydrogen will tend to reduce the flame temperature, but oxygen manufactured by this process is, as a rule, in a comparatively pure state.

Acetylene as employed for welding purposes to-day can be generated by the user at or near his shops by treating calcium carbide with water, or it can be procured in cylinders in the form of dissolved acetylene. At 30-lb. pressure and over acetylene in its free state is explosive. Between 15-lb. and 30-lb. pressure its action is somewhat uncertain. Therefore where users desire to have acetylene under pressure it is probably best to use dissolved acetylene. This is washed, dried and purified acetylene gas compressed into ordinary steel bottles or cylinders that have been previously filled with some porous substance, such as asbestos or charcoal, which is then saturated with acetone. Acetone is a liquid hydrocarbon that has the peculiar property of absorbing acetylene, and an acetone cylinder of 2 cu. ft. capacity will hold 20 cu. ft. of acetylene at 1-atmosphere pressure or 300 cu. ft. at 15-atmospheres pressure.

The strength of a weld made by the oxy-acetylene process is, as a rule, less than that of the original metal. A claim of 100 per cent weld strength is unsupportable. Practice has shown that for thin sheets up to say 3/16 in. in thickness, one can get a weld strength of 95 per cent, but that this figure falls to 85 per cent for 1-in. plates. However, where welding has to be carried out, there is generally no objection to adding a fillet of metal along the joint or using high-grade filling-in metal. In such cases the welded joint can be made to equal or exceed the strength of the rest of the work.

In order to insure successful results it is necessary that the work be carefully prepared before welding. The parts to be welded must be free from rust and grease. Sections over ⅛ in. in thickness must be beveled before welding. For thick work beveling from both sides is advantageous if feasible. Whenever welding is performed, internal strains are invariably set up in the metal due to expansion and contraction, and, in the case of cast iron, the tendency to crack will be greatly increased if the cooling of the metal after fusion is rapid or irregular. In all cases care should be taken in the selection of the proper size of blowpipe tip to be used on any particular job. As large a blowpipe tip as is possible should be used so that the metal is kept in the molten state as short a time as possible.

With those unacquainted with the process, the welding of cast iron appears to be more difficult to accomplish than work on steel or wrought iron, but such is not the case. Since it is generally necessary to work a weld in cast iron, it is indispensable that the line of welding should be constituted of the soft gray iron that contains graphitic carbon. Slow cooling or reheating after the welding is completed tends to bring about the precipitation of graphitic carbon and the production of a softer material. It is found that by employing silicon in the filling rod in the form of ferro-silicon, the iron combines with the silicon in preference to the carbon, allowing the carbon to take the form of graphite and thus facilitate the formation of gray iron. The presence of manganese has exactly the opposite effect. In order to get good workable welds there must be slow cooling after the welding is completed. The filling rod must contain a percentage of silicon, and there must be no manganese present.

The welding point of ordinary cast iron is lower than that of iron or mild steel and lower than the melting point of iron oxide; therefore, if any oxides are formed during the welding process they cannot be melted and blown away by the flame, as is the case where iron or steel is fused. Therefore, when welding cast iron, it is necessary to employ some flux to break down any oxides that are formed.

For cutting metals a special blowpipe is provided consisting of any oxy-acetylene blowpipe fitted with a central or following jet for oxygen only. The work that has to be cut is first heated up by means of the oxy-acetylene jet, and, as soon as it is raised to a temperature at which oxygen will ignite it, the separate oxygen jet is turned on and the metal at once burns away very rapidly. The oxygen simply has sufficient pressure behind it to blow away the oxide as it is formed, with the result that a clean, narrow cut can be made through plates up to 12 in. in thickness and over. The speed at which this work can be done is high, varying from 100 ft. per hour for metal ¼ in. thick to 12 ft. per hour for metal 12 in. thick, the oxygen consumed in this process varying from 0.50 cu. ft. per lineal foot run in ¼-in. plates to 50 cu. ft. in 12-in. plates. As an instance of the use to which the oxygen cutting tool can be put I might mention the cutting off of the heads of bolts and rivets which hold the coupler anchorage between the steel sills of 80,000-lb. capacity freight cars. The job usually takes three men ten hours. One man with a cutting torch can do it in forty-five minutes.

There is another important application of oxy-acetylene in the electric railway field, and this is the welding of copper bonds and rails. The Twin City Rapid Transit Company employs a twin cable bond with cast terminals, and it is claimed that a gang of three men can weld seventy-five of these bonds per day. The gas consumption is 2 ft. of acetylene and approximately 2 ft. of oxygen per bond. It has been suggested that the copper of the bond is oxidized when this process of applying it is adopted, but practice has shown that this is not the case if the weld is properly and rapidly made, special attention being taken to see that the welding flame is a neutral one. The oxy-acetylene blowpipe can also be employed for reapplying the solder type of bonds which have come loose.

INTERURBAN HEADLIGHTS

BY J. W. ESTERLINE, THE ESTERLINE COMPANY, INDIANAPOLIS

We have in our experience in the headlight business found a great many men who are inclined to judge the qualities of a headlight by its intrinsic brilliancy. The more blinding, dazzling and the more powerful its appearance at night, without any reference to its effect upon visibility and the efficiency of the eye, the better the headlight is believed to be, and many of our laws have been based upon a similar conception of the question of illumination.

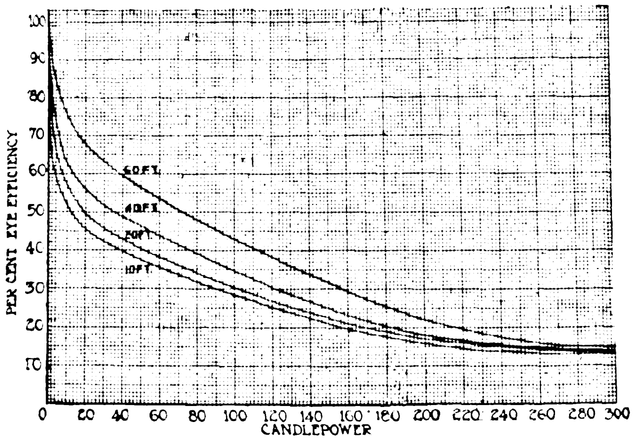
When we look at the human eye we see through the clear, transparent cornea a circular colored portion, the iris. In the center of the iris is an opening, the pupil. This opening has the property of enlarging itself or contracting, according to the amount of light striking the eye. Thus, when we pass from a dark room into a brilliantly-lighted room, the pupil almost instantly contracts. It is significant that the contraction in passing from darkness into bright light is accomplished almost instantly, whereas the enlargement in passing from bright light into darkness is accomplished comparatively slowly.

Close behind the pupil in the human eye lies the crystalline lens, whose function is, of course, similar to that of a lens in a camera. There is, however, this important difference in operation. The clearness of the image formed by the lens of a camera is maintained, whether the object is far or near, by changing the distance between the lens and the ground glass, or sensitized plate. Obviously, in the human eye such changes cannot be made. The clear focus of near or distant objects is therefore accomplished by changes in the curvature of the crystalline lens. Around the outside of the lens runs a ligament, and this ligament is attached to the ciliary muscle. By contraction or relaxation of the ciliary muscle a greater or lesser curvature of the lens is accomplished.

The crystalline lens is non-achromatic. When light having rays of all colors, as in the case of white light, is reflected from the object to the eye, the blue and violet rays are brought to a focus in front of the retina, and the red rays directed toward an imaginary focus behind the retina. The red, blue and violet rays serve, therefore, to blur the otherwise sharp image formed by the yellow rays on the retina.

Now, when the object is illuminated by monochromatic light, that is, by a light of a single color, the rays are brought to a sharp focus on the retina, and there is no blurring effect. In other words, the non-achromatic lens can adapt itself to any one color of light, but in the presence of light of all colors, combined in approximately the proportion of white light, it adapts itself to the yellow rays.

Research has conclusively established that monochromatic light enables detail to be distinctly seen at a lower intensity of illumination than when the object is viewed by white light. It has also been established that different colors of monochromatic light vary in their power to disclose detail. The power of disclosing maximum detail with minimum illumination seems to be possessed by a yellowish-green color, and we can see more distinctly with the same light, or equally distinctly with less illumination, if that light be of a greenish-yellow color.



CURVES SHOWING RELATION BETWEEN EYE EFFICIENCY AND CANDLE-POWER OF LIGHT AT VARIOUS DISTANCES

In considering the question of headlights, it must be borne in mind that the human eye when constantly subjected to an intense white light reflected from the road quickly loses its efficiency. In other words, the brilliancy of the light itself reflected back into the eye of the motorman soon lowers the efficiency of the eye to a point where the ability to see is less than it would be if the light were less brilliant. The lowering of the eye efficiency depends upon the total amount of light which enters the eye, and upon the angle with the line of vision at which each integral portion of light enters the eye.

The curves in the accompanying cut show the relation between the efficiency of the human eye and the intensity of light entering the eye along the line of vision. It will be observed that a very small intensity of light entering the eye along the line of vision materially cuts down the efficiency of the eye. When the intensity of the beam reaches 300 cp the efficiency has been tremendously reduced. These curves show clearly why, when a beam of several thousand candle-power shines directly into the eye, it is impossible for the driver of a car to see anything in his path, since an increase of from 20 cp even to 300 cp in the beam of light entering the eye lowers the efficiency from 70 per cent to 12 per cent. The curves also show that the efficiency of the eye is very little affected by the distance of the light source or light reflecting object from the eye.

Dr. C. P. Steinmetz has said: "The light which enters the eye is converted into heat, and if its power is considerable, it may be harmful or even destructive, causing inflammation or burns. This harmful effect is, assuming the same amount of visibility, greatest for those frequencies of light which have the lowest visibility or highest power equivalent. Hence, green and yellowish-green lights are the least harmful, the least irritating to the eye, as they represent the least power." The United States bureau of standards also recommends a yellow light as causing the least fatigue. The American Railway Master Mechanics' Association's committee on headlights reported that there was no apparent difference in the ability to see dummies with a given intensity of light, whether the source was oil, acetylene or incandescent lamps. However, with an arc lamp having 60,000 apparent beam candle-power, a dark dummy could be seen only 557 ft. away, but calculating from the visibility curve for oil, acetylene and incandescent lamps, the dummy should have been seen at the same distance with an apparent beam candle-power of only about 14,000. This effect could be attributed only to the predominance of short violet waves in the arc rays to which the eye did not readily respond.

In the type of headlight manufactured by the company with which the writer is associated, non-blinding effect and increased visuality is secured by altering the quality of the light given by the incandescent lamp, and by this means the coloring and irritating effects are greatly reduced without appreciably altering the illuminating qualities.

The colored glass lens that is used subtracts from the beam of light given by the incandescent bulb all of the rays above the green, i.e., the violet and the blue, and passes all of those colors below it, so that while the light given by the filament of the lamp itself is a brilliant white, the beam of light from the headlight is a greenish-yellow. Because of the fact that a beam of light from this type of lamp is soft, mellow and free from glare, it does not, at first sight, impress one as being as powerful as the striking, brilliant, dazzling rays from an arc lamp, but riding behind the lamp one is soon impressed with the detail with which objects can be observed, the entire freedom from tiring of the eyes, due to the quality and the steadiness of the light.

With a polished glass mirror reflector and a lamp of 100 watts burned at normal efficiency, these headlights enable the observer to distinguish ordinary objects at a distance of from 900 ft. to 1200 ft. without difficulty, whereas, objects of a light color, such as poles, station markers and persons in light clothing, can be seen from 1200 ft. to 1500 ft. On account of the variation of the intensity of the light with the voltage, the best results are obtained by operating the lamp with other tungsten bulbs. However, quite a number of roads maintaining a fairly uniform trolley voltage, say from 450 to 600, are using these headlights in series with resistances.

When operated in series with the tungsten lamps in the car, with the headlight bulb burning at normal intensity at normal trolley voltage, the operation of the headlight is very satisfactory even with fluctuating trolley voltages, and on numerous occasions tests have shown that it continues to give light at voltages at which arc lamps refuse to operate. On the steadiness of the light from an incandescent headlight little need be said, as the variation in illumination is limited to the fluctuation caused by the changes in trolley voltage, and there is entire absence of the constant flickering and shifting of the light, so common in an arc lamp.

In this type of headlight an incandescent lamp with a spherical bulb and a concentrated type of filament is used, since only that part of the filament at the focal center of the parabola is effective in producing the beam, the average life of this type of bulb when burned continuously at normal voltage being from 450 hours to 500 hours. The life is greatly increased with a slight reduction in voltage, and it is, therefore, important that the lamp is not burned above its normal rating.

Safety on Illinois Railways

Members of the Illinois Electric Railways Association Describe Their Methods

At the meeting of the Illinois Electric Railways Association held at the Auditorium Hotel, Chicago, Nov. 21, with President B. I. Budd in the chair, John Mallon, assistant general superintendent of transportation Chicago Elevated Railways, gave an illustrated talk on the safety and first-aid methods employed by his company. The speaker showed a number of lantern slides which are exhibited at the meetings of employees to illustrate the right and wrong ways of performing routine duties, following which a set of slides, designed to show the public how to avoid accidents, also was exhibited. He stated that Dr. H. A. Fisher, the company's surgeon, has a special squad of five trainmen who give demonstrations of first-aid work at points on the Chicago elevated system. They devote special instruction to local squads in each division so that, in turn, these squads may become proficient and themselves disseminate first-aid information. To encourage employees' interest in the "safety first" movement buttons are distributed among them, a monthly bulletin is issued giving safety hints and the men are called together at monthly meetings, when pictures are shown bearing on their work and offering suggestions for greater safety to themselves and to the public. First-aid boxes have been located about the elevated system where they may be reached readily in case of accidents.

In the discussion of "safety first" methods, which followed Mr. Mallon's talk, J. R. Blackhall, general manager Chicago & Joliet Electric Railway, Joliet, Ill., described his local campaign, in which "safety first" moving-picture films were exhibited at local theaters. With the co-operation of the superintendent various schools were closed, and the railway provided free transportation for the children to the center of the city where the picture shows are given. A number of interesting letters of appreciation have been received from members of these youthful audiences. Blotters bearing "safety first" advice also were distributed in the schools and business houses, and suggestions for the prevention of accidents were set forth in letters to local business men and to all owners of automobiles.

H. B. Adams, claim agent Aurora, Elgin & Chicago Railroad, said that about 80 per cent of all accidents were due to carelessness on the part of the employees or the public, while for the remaining 20 per cent the company was to blame. Mr. Adams described his campaign, in which he made "safety first" talks to school children, college students and members of local clubs. The net result of this was a reduction of about 50 per cent in the number of accidents. He also laid particular stress upon the value of interesting the children and in getting them to spread among their elders the maxim "Get on with the right hand; get off with the left."

F. E. Fisher, general superintendent Chicago, Ottawa & Peoria Railway, explained that the safety crusade must reach all branches of electric railway operations, and introduced W. F. Carr, his engineer of maintenance of way and of overhead construction, who furnished a number of safety hints. The public must be systematically educated, said Mr. Carr, and while advertising and printed text matter are effective, the most valuable instruction will be that given individually by employees; in the same way regulations contained in the book of rules are likely to be found not effective unless discussed and the points at issue emphasized. All accidents occurring on the Chicago, Ottawa & Peoria Railway are listed and described in detail for record. A merit and demerit system is also maintained, by which the meritorious acts and deeds of thoughtfulness in accident prevention are rewarded, while carelessness is correspondingly penalized. Mr. Carr advised against the policy of discharging men who have made mistakes, for, he declared, a serious accident for which a man is to blame leaves an indelible impression upon his mind and makes him a more careful and thoughtful operative in the future. If, on the other hand, the man is discharged, his place must be given to a new man, and it is possible that the lesson of safety may have to be learned all over again.

B. I. Budd, president Chicago Elevated Railways, declared that while it is easy to start "safety first" systems, the difficulty lies in following them up and getting the results which are so essential. He recommended the practice of giving credit for meritorious acts, although he cited an instance to show that unless care is taken this practice can be abused.

Marshall P. Sampsell, president Central Illinois Traction Company, Mattoon, Ill., stated that the safety department of a utility is one of the most important divisions of its work, and he urged that, if necessary to make retrenchments, other work be curtailed or dispensed with before that of the safety department. Mr. Sampsell recommended the appointment of a special safety agent to be responsible directly to the president of the corporation and urged that the latter official give due attention to the human side involved in the suggestions of his safety inspector.

E. J. Blair, electrical engineer Chicago Elevated Railways, described the attention being paid to the proper lighting of railroad yards by steam railroad companies. He suggested that this topic be considered thoroughly by the electric railways, which, better than any other utilities perhaps, are equipped to provide their yard facilities with cheap and efficient illumination.

Just before adjourning the meeting President Budd called attention to the work of scrap experts who are now engaged in campaigns among electric railways for the more advantageous disposal of scrap and refuse material. Analyses of the methods of collection and sale of scrap, said Mr. Budd, show that this material, extremely valuable in the aggregate, has been handled loosely and sold too cheaply. Owing to the incompleteness of the classification given it, the prices received fall far short of those which should be obtained. During present business conditions, President Budd urged a closer attention to the disposal of scrap material. Following the session the regular association luncheon was held in a room adjoining the convention hall. About fifty delegates were present at the meeting.

The trustees of the Rockefeller Foundation have decided to inaugurate an extensive investigation into the problem of industrial relations, and have secured the services of W. L. Mackenzie King, C. M. G., former Minister of Labor for Canada, as director of the investigation.

Meeting of American Railway Association

Proceedings and Reports of Committees at the Autumn Session in Chicago

The autumn session of the American Railway Association was held at the Blackstone Hotel, Chicago, Ill., on Wednesday, Nov. 18. There were present 210 members, represented by 180 delegates. At the opening of the meeting the executive committee reported that its attention had been called to the use of illuminated electric signs on the rear of passenger trains, and in connection therewith the committee adopted the following resolution: "The American Railway Association disapproves of the use of electric illuminated signs on the rear of passenger trains, by reason of the effect they have of concealing the essential indications of the standard marker signals and also because they absorb the light of other signals and have a tendency to divert the attention of the employees, whose duty it is to observe the signals which are essential in railway operation."

CHANGES IN STANDARD TIME OPPOSED

The committee on standard time presented a report covering its consideration of this subject, and resolutions were adopted by the association to the effect that it was the sense of the American Railway Association that the uniform standard time system, which had been in force since 1883, had proved its practicability and utility, and should be maintained in its integrity, and no essential departure should be made therefrom; and that when any proposition should be made for a change in the standard time of the whole or any part of a railway line a member of the American Railway Association the subject should be referred to the executive committee for consideration; and that the American Railway Association urged upon the roads which had recently adopted eastern time in place of central time that they return to the use of the uniform standard at the earliest practicable date.

The committee on transportation reported that it had now practically completed the revision of the standard code of train rules for single and double track, rules governing the movement of trains with the current of traffic on two or more tracks by means of block signals, rules governing the movement of trains against the current of traffic on two or more tracks by means of block signals, and additional rules for three or more tracks. Before presenting this to the association for adoption, however, it desired to give each member an opportunity to examine and formally to submit its criticism of the rules. As a result of the suggestions which it hoped to receive in reply, the committee expected to be able to present a complete report to the association at the session in May, 1915.

STANDARD FREIGHT-CAR DIMENSIONS

The committee on maintenance announced the result of the letter ballot, ordered at the previous session of the association, relative to the standard inside dimensions of box cars, as follows: (1) That the present standard inside dimensions of box cars, as adopted by the association on October 23, 1901, viz., 36 ft. in length, 8 ft. 6 in. in width and 8 ft. in height, should be adhered to, except in the construction of special equipment, such as automobile cars; (2) That special equipment should not exceed the inside dimensions of 40 ft. 6 in. in length, 8 ft. 6 in. in width and 9 ft. in height, with maximum outside dimensions of 9 ft. 2 in. in width at 13 ft. above the top of the rail; (3) That the Master Car Builders' Association be requested at the earliest practicable moment to design and adopt a standard frame for closed cars in accordance with the present standard inside dimensions of box cars.

Although a majority of the memberships of the association voted in favor of the three resolutions, the number of freight cars represented by such memberships was less than two-thirds of the freight cars owned and controlled by the members of the association. The resolutions therefore were not adopted.

The committee also presented a summary and compilation of data collected of clearances for switch stands, signal stands, platforms, platform shelters, mail cranes, water columns, coal chutes, water tanks, etc., and advised that the subject has been referred to the American Railway Engineering Association for its consideration and recommendation. The committee also included in its report a summary of the number of freight cars, passenger cars and locomotives reported equipped with safety appliances as required by the United States Safety Appliance Standards, July 1, 1914, as follows:

	Total Number in Service	Fully Equipped with Safety Appliances
Freight cars	2,510,214	1,204,454
Passenger cars	56,980	52,470
Locomotives	66,853	63,687

The joint committee on automatic train stops reported that since the adoption of the requisites of installation for automatic train control, approved by the association on May 20, 1914, no stop device that had been thoroughly and practically tested and had been demonstrated to comply therewith had come to the notice of the joint committee.

COMMITTEE ON ELECTRICAL WORKING

The committee on electrical working reported that the diagram of third-rail working-conductor clearances adopted by the association in May, 1912, had been under consideration by the sub-committee in joint session with sub-committees of the American Railway Engineering Association and American Electric Railway Engineering Association, with the view of establishing limiting rolling equipment clearances in the space close to the track rail, for permanent way structures or for other devices such as automatic train stops. These sub-committees had carefully investigated the question, and compiled information received from 183 railway companies as to existing encroachments of rolling equipment within the space under consideration. They had concluded that the third-rail clearance diagram could be extended towards the track rail without materially affecting interchange equipment. A recommendation was therefore adopted by the Association to revise the present standard, to provide for the prolongation of the line *EE-FE* of the standard diagram horizontally to within 6 in. of the gage line of the track. This provision would allow devices attached to the permanent way to project 2½ in. above the top of the track rail in the space between a point 19¾ in. distant from the gage line to a point 6 in. distant.

The committee also reported that it would now be desirable to provide for an extension of the "designing line," which in the diagram ended at a point 18¼ in. from the gage line 6½ in. above the top of the rail, to some point, say 7 in. from the gage line. However, the committee was unable at the present time to fix definitely the location of this extension. The matter had, therefore, been referred to the sub-committee for investigation and report at the next meeting of the association. Reference was made by the committee to its report of April 21, 1913, which covers four diagrams for overhead clearances and adds a fifth diagram for minimum clearances required for direct-current overhead-contact rails, where these are installed under permanent way structures. On the recommendation of the committee the association accepted these as recommended practice.

The committee reported further that in the spring of 1912 the association adopted, as recommended practice, specifications for overhead crossings of electric light and power lines. These specifications were subsequently adopted by the American Railway Engineering Association, the American Electric Railway Engineering Association, the National Electric Light Association and the American Institute of Electrical Engineers. The American Electric Railway Engineering Association in 1913 adopted a specification differing in some respects from the foregoing. This amended specification had been the subject of consideration by the sub-committee in conference with similar committees of the other associations, in order to effect the adoption of a standard specification by all bodies interested. Their joint report recommended the adoption of the American Electric Railway Engineering Association specification. As the committee indorsed this recommendation and the adoption of the new specification the association adopted the same as recommended practice.

The committee advised that the consideration of overhead crossings for telegraph and telephone lines had been referred to a sub-committee, which had been in conference with similar committees of the American Railway Engineering Association and the American Electric Railway Engineering Association. The sub-committee recommended the adoption of the telephone, telegraph and signal wire crossing specification prepared by the Association of Railway Telegraph Superintendents, with the exception of one paragraph relating to the minimum clearance of poles from railway tracks. The side clearance specified by the telegraph superintendents was not considered sufficient by the sub-committee, and it was recommended that the minimum clearance of poles be made to conform to that established for the transmission line crossing structures. The committee stated that this specification was intended to cover only cases where crossings of telegraph, telephone and other wires were over rights-of-way, and not for cases where it was desirable or necessary (especially where lines are to be electrified) to carry these crossings under tracks by insulated wire cables. It was considered of first importance to fix the conditions of safety for supporting structures and wires over rights-of-way. In the case of underground cable work, which in many cases, if not generally, was the preferred method of providing for low-tension wire crossings, the conditions presented were not of such immediate importance to the railways as in the case of overhead crossings. The specification which the committee offered had not been definitely acted upon by the engineering associations, but the committee thought it desirable to place on record at this time the essentials of a matter which was of immediate and increasing importance to the railroad companies, and the committee, therefore, offered the specifications for adoption as recommended practice of the association. The association took action accordingly.

The sub-committees appointed by the committee for further investigation of continued subjects were as follows: On third-rail working conductors and on overhead working conductor clearances—A. S. Baldwin, chief engineer Illinois Central Railroad Company; J. H. Davis, electrical engineer Baltimore & Ohio Railroad Company; E. B. Katté, chief engineer electric traction New York Central & Hudson River Railroad Company. As representatives of the committee on the national joint committee on specifications for wire and cable crossings—E. B. Katté, chief engineer electric traction New York Central & Hudson River Railroad Company, and J. H. Davis, electrical engineer Baltimore & Ohio Railroad Company.

USE OF JOINT INSPECTION BUREAUS RECOMMENDED

On the recommendation of the committee on relations between railroads a national form of weight agreement was approved. This covered in detail methods of light-weighing and marking freight cars. The committee reported that it had been advised that in official classification territory a uniform charge had been adopted of $2 for cars reconsigned en route and $5 on cars reconsigned at destination and that it understood that similar action was contemplated in other parts of the country. The committee also called attention to the joint interchange and inspection bureaus now in successful operation and recommended the extension of this plan to all important interchange points. Upon recommendation of the committee Rule 7 of the national code of car demurrage rules was amended in regard to demurrage charges on refrigerator cars.

In conclusion the association decided to hold its next meeting in Atlantic City on May 19, 1915.

Final Meetings of Railway Commissioners

Evils of Trespassing Discussed — Officers Elected — Next Meeting in San Francisco

A number of the papers and reports presented during the early sessions of the convention of the Association of Railway Commissioners were published in the issue of last week. The principal report of electric railway interest presented during the concluding sessions was that of the committee on grade crossings and trespassing of railroads. This report is signed by Commissioners Glasgow, Harlowe, Yates and Elmquist.

It states first that upon examining the reports compiled by different states on the subject the committee finds a great variation in method of tabulating these statistics, and it recommends the adoption of uniformity. It says the question of grade separation is becoming more important every year owing to the increased number of motorcycles and automobiles driven by people who have little regard for safety devices or for their own safety. The committee considers that no form of crossing protection equals the separation of grades, but recognizes that this solution is not applicable in all cases, not only on account of the expense involved but also because of the varying conditions obtaining in different cities and states. In some the topography of the country is such as to permit the separation of grades with little difficulty and at moderate expense. In others the contrary is the case. Nevertheless the committee believes that where conditions at all justify the separation of grade it should be effected. For the same reason it is impossible to suggest a uniform law on the subject, but it recommends that the different states should take up the matter and empower the commission of the state to install such protection as the conditions demand.

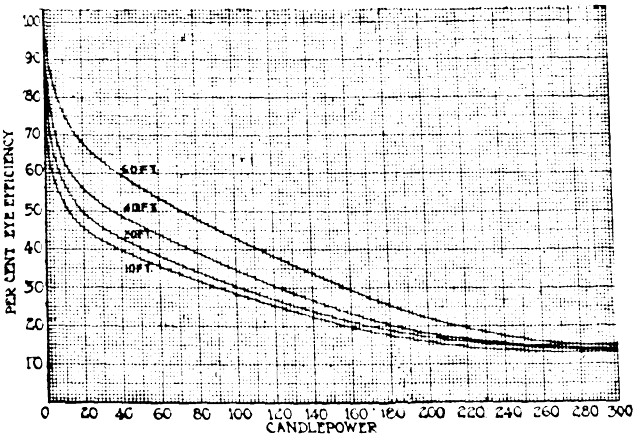
The committee presented some statistics in regard to trespassers killed and injured in the different states during the past three years. Owing to differences in the fiscal year it was impossible to obtain absolutely accurate figures, but those given are approximate. The totals showed that the number of passengers killed in 1911 were 3888; in 1912, 4208; in 1913, 4354. These figures show that the loss of life is increasing every year and that it equals in number that of passengers and employees combined.

The report points out that the "trespassers" were not the irresponsible people commonly referred to as tramps and hoboes, but were made up of farmers and

The crystalline lens is non-achromatic. When light having rays of all colors, as in the case of white light, is reflected from the object to the eye, the blue and violet rays are brought to a focus in front of the retina, and the red rays directed toward an imaginary focus behind the retina. The red, blue and violet rays serve, therefore, to blur the otherwise sharp image formed by the yellow rays on the retina.

Now, when the object is illuminated by monochromatic light, that is, by a light of a single color, the rays are brought to a sharp focus on the retina, and there is no blurring effect. In other words, the non-achromatic lens can adapt itself to any one color of light, but in the presence of light of all colors, combined in approximately the proportion of white light, it adapts itself to the yellow rays.

Research has conclusively established that monochromatic light enables detail to be distinctly seen at a lower intensity of illumination than when the object is viewed by white light. It has also been established that different colors of monochromatic light vary in their power to disclose detail. The power of disclosing maximum detail with minimum illumination seems to be possessed by a yellowish-green color, and we can see more distinctly with the same light, or equally distinctly with less illumination, if that light be of a greenish-yellow color.



CURVES SHOWING RELATION BETWEEN EYE EFFICIENCY AND CANDLE-POWER OF LIGHT AT VARIOUS DISTANCES

In considering the question of headlights, it must be borne in mind that the human eye when constantly subjected to an intense white light reflected from the road quickly loses its efficiency. In other words, the brilliancy of the light itself reflected back into the eye of the motorman soon lowers the efficiency of the eye to a point where the ability to see is less than it would be if the light were less brilliant. The lowering of the eye efficiency depends upon the total amount of light which enters the eye, and upon the angle with the line of vision at which each integral portion of light enters the eye.

The curves in the accompanying cut show the relation between the efficiency of the human eye and the intensity of light entering the eye along the line of vision. It will be observed that a very small intensity of light entering the eye along the line of vision materially cuts down the efficiency of the eye. When the intensity of the beam reaches 300 cp the efficiency has been tremendously reduced. These curves show clearly why, when a beam of several thousand candle-power shines directly into the eye, it is impossible for the driver of a car to see anything in his path, since an increase of from 20 cp even to 300 cp in the beam of light entering the eye lowers the efficiency from 70 per cent to 12 per cent. The curves also show that the efficiency of the eye is very little affected by the distance of the light source or light reflecting object from the eye.

Dr. C. P. Steinmetz has said: "The light which enters the eye is converted into heat, and if its power is considerable, it may be harmful or even destructive, causing inflammation or burns. This harmful effect is, assuming the same amount of visibility, greatest for those frequencies of light which have the lowest visibility or highest power equivalent. Hence, green and yellowish-green lights are the least harmful, the least irritating to the eye, as they represent the least power." The United States bureau of standards also recommends a yellow light as causing the least fatigue. The American Railway Master Mechanics' Association's committee on headlights reported that there was no apparent difference in the ability to see dummies with a given intensity of light, whether the source was oil, acetylene or incandescent lamps. However, with an arc lamp having 60,000 apparent beam candle-power, a dark dummy could be seen only 557 ft. away, but calculating from the visibility curve for oil, acetylene and incandescent lamps, the dummy should have been seen at the same distance with an apparent beam candle-power of only about 14,000. This effect could be attributed only to the predominance of short violet waves in the arc rays to which the eye did not readily respond.

In the type of headlight manufactured by the company with which the writer is associated, non-blinding effect and increased visuality is secured by altering the quality of the light given by the incandescent lamp, and by this means the coloring and irritating effects are greatly reduced without appreciably altering the illuminating qualities.

The colored glass lens that is used subtracts from the beam of light given by the incandescent bulb all of the rays above the green, i.e., the violet and the blue, and passes all of those colors below it, so that while the light given by the filament of the lamp itself is a brilliant white, the beam of light from the headlight is a greenish-yellow. Because of the fact that a beam of light from this type of lamp is soft, mellow and free from glare, it does not, at first sight, impress one as being as powerful as the striking, brilliant, dazzling rays from an arc lamp, but riding behind the lamp one is soon impressed with the detail with which objects can be observed, the entire freedom from tiring of the eyes, due to the quality and the steadiness of the light.

With a polished glass mirror reflector and a lamp of 100 watts burned at normal efficiency, these headlights enable the observer to distinguish ordinary objects at a distance of from 900 ft. to 1200 ft. without difficulty, whereas, objects of a light color, such as poles, station markers and persons in light clothing, can be seen from 1200 ft. to 1500 ft. On account of the variation of the intensity of the light with the voltage, the best results are obtained by operating the lamp with other tungsten bulbs. However, quite a number of roads maintaining a fairly uniform trolley voltage, say from 450 to 600, are using these headlights in series with resistances.

When operated in series with the tungsten lamps in the car, with the headlight bulb burning at normal intensity at normal trolley voltage, the operation of the headlight is very satisfactory even with fluctuating trolley voltages, and on numerous occasions tests have shown that it continues to give light at voltages at which arc lamps refuse to operate. On the steadiness of the light from an incandescent headlight little need be said, as the variation in illumination is limited to the fluctuation caused by the changes in trolley voltage, and there is entire absence of the constant flickering and shifting of the light, so common in an arc lamp.

In this type of headlight an incandescent lamp with a spherical bulb and a concentrated type of filament is used, since only that part of the filament at the focal center of the parabola is effective in producing the beam, the average life of this type of bulb when burned continuously at normal voltage being from 450 hours to 500 hours. The life is greatly increased with a slight reduction in voltage, and it is, therefore, important that the lamp is not burned above its normal rating.

Safety on Illinois Railways

Members of the Illinois Electric Railways Association Describe Their Methods

At the meeting of the Illinois Electric Railways Association held at the Auditorium Hotel, Chicago, Nov. 21, with President B. I. Budd in the chair, John Mallon, assistant general superintendent of transportation Chicago Elevated Railways, gave an illustrated talk on the safety and first-aid methods employed by his company. The speaker showed a number of lantern slides which are exhibited at the meetings of employees to illustrate the right and wrong ways of performing routine duties, following which a set of slides, designed to show the public how to avoid accidents, also was exhibited. He stated that Dr. H. A. Fisher, the company's surgeon, has a special squad of five trainmen who give demonstrations of first-aid work at points on the Chicago elevated system. They devote special instruction to local squads in each division so that, in turn, these squads may become proficient and themselves disseminate first-aid information. To encourage employees' interest in the "safety first" movement buttons are distributed among them, a monthly bulletin is issued giving safety hints and the men are called together at monthly meetings, when pictures are shown bearing on their work and offering suggestions for greater safety to themselves and to the public. First-aid boxes have been located about the elevated system where they may be reached readily in case of accidents.

In the discussion of "safety first" methods, which followed Mr. Mallon's talk, J. R. Blackhall, general manager Chicago & Joliet Electric Railway, Joliet, Ill., described his local campaign, in which "safety first" moving-picture films were exhibited at local theaters. With the co-operation of the superintendent various schools were closed, and the railway provided free transportation for the children to the center of the city where the picture shows are given. A number of interesting letters of appreciation have been received from members of these youthful audiences. Blotters bearing "safety first" advice also were distributed in the schools and business houses, and suggestions for the prevention of accidents were set forth in letters to local business men and to all owners of automobiles.

H. B. Adams, claim agent Aurora, Elgin & Chicago Railroad, said that about 80 per cent of all accidents were due to carelessness on the part of the employees or the public, while for the remaining 20 per cent the company was to blame. Mr. Adams described his campaign, in which he made "safety first" talks to school children, college students and members of local clubs. The net result of this was a reduction of about 50 per cent in the number of accidents. He also laid particular stress upon the value of interesting the children and in getting them to spread among their elders the maxim "Get on with the right hand; get off with the left."

F. E. Fisher, general superintendent Chicago, Ottawa & Peoria Railway, explained that the safety crusade must reach all branches of electric railway operations, and introduced W. F. Carr, his engineer of maintenance of way and of overhead construction, who furnished a number of safety hints. The public must be systematically educated, said Mr. Carr, and while advertising and printed text matter are effective, the most valuable instruction will be that given individually by employees; in the same way regulations contained in the book of rules are likely to be found not effective unless discussed and the points at issue emphasized. All accidents occurring on the Chicago, Ottawa & Peoria Railway are listed and described in detail for record. A merit and demerit system is also maintained, by which the meritorious acts and deeds of thoughtfulness in accident prevention are rewarded, while carelessness is correspondingly penalized. Mr. Carr advised against the policy of discharging men who have made mistakes, for, he declared, a serious accident for which a man is to blame leaves an indelible impression upon his mind and makes him a more careful and thoughtful operative in the future. If, on the other hand, the man is discharged, his place must be given to a new man, and it is possible that the lesson of safety may have to be learned all over again.

B. I. Budd, president Chicago Elevated Railways, declared that while it is easy to start "safety first" systems, the difficulty lies in following them up and getting the results which are so essential. He recommended the practice of giving credit for meritorious acts, although he cited an instance to show that unless care is taken this practice can be abused.

Marshall P. Sampsell, president Central Illinois Traction Company, Mattoon, Ill., stated that the safety department of a utility is one of the most important divisions of its work, and he urged that, if necessary to make retrenchments, other work be curtailed or dispensed with before that of the safety department. Mr. Sampsell recommended the appointment of a special safety agent to be responsible directly to the president of the corporation and urged that the latter official give due attention to the human side involved in the suggestions of his safety inspector.

E. J. Blair, electrical engineer Chicago Elevated Railways, described the attention being paid to the proper lighting of railroad yards by steam railroad companies. He suggested that this topic be considered thoroughly by the electric railways, which, better than any other utilities perhaps, are equipped to provide their yard facilities with cheap and efficient illumination.

Just before adjourning the meeting President Budd called attention to the work of scrap experts who are now engaged in campaigns among electric railways for the more advantageous disposal of scrap and refuse material. Analyses of the methods of collection and sale of scrap, said Mr. Budd, show that this material, extremely valuable in the aggregate, has been handled loosely and sold too cheaply. Owing to the incompleteness of the classification given it, the prices received fall far short of those which should be obtained. During present business conditions, President Budd urged a closer attention to the disposal of scrap material. Following the session the regular association luncheon was held in a room adjoining the convention hall. About fifty delegates were present at the meeting.

The trustees of the Rockefeller Foundation have decided to inaugurate an extensive investigation into the problem of industrial relations, and have secured the services of W. L. Mackenzie King, C. M. G., former Minister of Labor for Canada, as director of the investigation.

Meeting of American Railway Association

Proceedings and Reports of Committees at the Autumn Session in Chicago

The autumn session of the American Railway Association was held at the Blackstone Hotel, Chicago, Ill., on Wednesday, Nov. 18. There were present 210 members, represented by 180 delegates. At the opening of the meeting the executive committee reported that its attention had been called to the use of illuminated electric signs on the rear of passenger trains, and in connection therewith the committee adopted the following resolution: "The American Railway Association disapproves of the use of electric illuminated signs on the rear of passenger trains, by reason of the effect they have of concealing the essential indications of the standard marker signals and also because they absorb the light of other signals and have a tendency to divert the attention of the employees, whose duty it is to observe the signals which are essential in railway operation."

CHANGES IN STANDARD TIME OPPOSED

The committee on standard time presented a report covering its consideration of this subject, and resolutions were adopted by the association to the effect that it was the sense of the American Railway Association that the uniform standard time system, which had been in force since 1883, had proved its practicability and utility, and should be maintained in its integrity, and no essential departure should be made therefrom; and that when any proposition should be made for a change in the standard time of the whole or any part of a railway line a member of the American Railway Association the subject should be referred to the executive committee for consideration; and that the American Railway Association urged upon the roads which had recently adopted eastern time in place of central time that they return to the use of the uniform standard at the earliest practicable date.

The committee on transportation reported that it had now practically completed the revision of the standard code of train rules for single and double track, rules governing the movement of trains with the current of traffic on two or more tracks by means of block signals, rules governing the movement of trains against the current of traffic on two or more tracks by means of block signals, and additional rules for three or more tracks. Before presenting this to the association for adoption, however, it desired to give each member an opportunity to examine and formally to submit its criticism of the rules. As a result of the suggestions which it hoped to receive in reply, the committee expected to be able to present a complete report to the association at the session in May, 1915.

STANDARD FREIGHT-CAR DIMENSIONS

The committee on maintenance announced the result of the letter ballot, ordered at the previous session of the association, relative to the standard inside dimensions of box cars, as follows: (1) That the present standard inside dimensions of box cars, as adopted by the association on October 23, 1901, viz., 36 ft. in length, 8 ft. 6 in. in width and 8 ft. in height, should be adhered to, except in the construction of special equipment, such as automobile cars; (2) That special equipment should not exceed the inside dimensions of 40 ft. 6 in. in length, 8 ft. 6 in. in width and 9 ft. in height, with maximum outside dimensions of 9 ft. 2 in. in width at 13 ft. above the top of the rail; (3) That the Master Car Builders' Association be requested at the earliest practicable moment to design and adopt a standard frame for closed cars in accordance with the present standard inside dimensions of box cars.

Although a majority of the memberships of the association voted in favor of the three resolutions, the number of freight cars represented by such memberships was less than two-thirds of the freight cars owned and controlled by the members of the association. The resolutions therefore were not adopted.

The committee also presented a summary and compilation of data collected of clearances for switch stands, signal stands, platforms, platform shelters, mail cranes, water columns, coal chutes, water tanks, etc., and advised that the subject has been referred to the American Railway Engineering Association for its consideration and recommendation. The committee also included in its report a summary of the number of freight cars, passenger cars and locomotives reported equipped with safety appliances as required by the United States Safety Appliance Standards, July 1, 1914, as follows:

	Total Number in Service	Fully Equipped with Safety Appliances
Freight cars	2,510,214	1,204,454
Passenger cars	56,980	52,470
Locomotives	66,853	63,687

The joint committee on automatic train stops reported that since the adoption of the requisites of installation for automatic train control, approved by the association on May 20, 1914, no stop device that had been thoroughly and practically tested and had been demonstrated to comply therewith had come to the notice of the joint committee.

COMMITTEE ON ELECTRICAL WORKING

The committee on electrical working reported that the diagram of third-rail working-conductor clearances adopted by the association in May, 1912, had been under consideration by the sub-committee in joint session with sub-committees of the American Railway Engineering Association and American Electric Railway Engineering Association, with the view of establishing limiting rolling equipment clearances in the space close to the track rail, for permanent way structures or for other devices such as automatic train stops. These sub-committees had carefully investigated the question, and compiled information received from 183 railway companies as to existing encroachments of rolling equipment within the space under consideration. They had concluded that the third-rail clearance diagram could be extended towards the track rail without materially affecting interchange equipment. A recommendation was therefore adopted by the Association to revise the present standard, to provide for the prolongation of the line *EE-FE* of the standard diagram horizontally to within 6 in. of the gage line of the track. This provision would allow devices attached to the permanent way to project 2½ in. above the top of the track rail in the space between a point 19¾ in. distant from the gage line to a point 6 in. distant.

The committee also reported that it would now be desirable to provide for an extension of the "designing line," which in the diagram ended at a point 18¼ in. from the gage line 6½ in. above the top of the rail, to some point, say 7 in. from the gage line. However, the committee was unable at the present time to fix definitely the location of this extension. The matter had, therefore, been referred to the sub-committee for investigation and report at the next meeting of the association. Reference was made by the committee to its report of April 21, 1913, which covers four diagrams for overhead clearances and adds a fifth diagram for minimum clearances required for direct-current overhead-contact rails, where these are installed under permanent way structures. On the recommendation of the committee the association accepted these as recommended practice.

The committee reported further that in the spring of 1912 the association adopted, as recommended practice, specifications for overhead crossings of electric light and power lines. These specifications were subsequently adopted by the American Railway Engineering Association, the American Electric Railway Engineering Association, the National Electric Light Association and the American Institute of Electrical Engineers. The American Electric Railway Engineering Association in 1913 adopted a specification differing in some respects from the foregoing. This amended specification had been the subject of consideration by the sub-committee in conference with similar committees of the other associations, in order to effect the adoption of a standard specification by all bodies interested. Their joint report recommended the adoption of the American Electric Railway Engineering Association specification. As the committee indorsed this recommendation and the adoption of the new specification the association adopted the same as recommended practice.

The committee advised that the consideration of overhead crossings for telegraph and telephone lines had been referred to a sub-committee, which had been in conference with similar committees of the American Railway Engineering Association and the American Electric Railway Engineering Association. The sub-committee recommended the adoption of the telephone, telegraph and signal wire crossing specification prepared by the Association of Railway Telegraph Superintendents, with the exception of one paragraph relating to the minimum clearance of poles from railway tracks. The side clearance specified by the telegraph superintendents was not considered sufficient by the sub-committee, and it was recommended that the minimum clearance of poles be made to conform to that established for the transmission line crossing structures. The committee stated that this specification was intended to cover only cases where crossings of telegraph, telephone and other wires were over rights-of-way, and not for cases where it was desirable or necessary (especially where lines are to be electrified) to carry these crossings under tracks by insulated wire cables. It was considered of first importance to fix the conditions of safety for supporting structures and wires over rights-of-way. In the case of underground cable work, which in many cases, if not generally, was the preferred method of providing for low-tension wire crossings, the conditions presented were not of such immediate importance to the railways as in the case of overhead crossings. The specification which the committee offered had not been definitely acted upon by the engineering associations, but the committee thought it desirable to place on record at this time the essentials of a matter which was of immediate and increasing importance to the railroad companies, and the committee, therefore, offered the specifications for adoption as recommended practice of the association. The association took action accordingly.

The sub-committees appointed by the committee for further investigation of continued subjects were as follows: On third-rail working conductors and on overhead working conductor clearances—A. S. Baldwin, chief engineer Illinois Central Railroad Company; J. H. Davis, electrical engineer Baltimore & Ohio Railroad Company; E. B. Katté, chief engineer electric traction New York Central & Hudson River Railroad Company. As representatives of the committee on the national joint committee on specifications for wire and cable crossings—E. B. Katté, chief engineer electric traction New York Central & Hudson River Railroad Company, and J. H. Davis, electrical engineer Baltimore & Ohio Railroad Company.

USE OF JOINT INSPECTION BUREAUS RECOMMENDED

On the recommendation of the committee on relations between railroads a national form of weight agreement was approved. This covered in detail methods of light-weighing and marking freight cars. The committee reported that it had been advised that in official classification territory a uniform charge had been adopted of $2 for cars reconsigned en route and $5 on cars reconsigned at destination and that it understood that similar action was contemplated in other parts of the country. The committee also called attention to the joint interchange and inspection bureaus now in successful operation and recommended the extension of this plan to all important interchange points. Upon recommendation of the committee Rule 7 of the national code of car demurrage rules was amended in regard to demurrage charges on refrigerator cars.

In conclusion the association decided to hold its next meeting in Atlantic City on May 19, 1915.

Final Meetings of Railway Commissioners

Evils of Trespassing Discussed — Officers Elected — Next Meeting in San Francisco

A number of the papers and reports presented during the early sessions of the convention of the Association of Railway Commissioners were published in the issue of last week. The principal report of electric railway interest presented during the concluding sessions was that of the committee on grade crossings and trespassing of railroads. This report is signed by Commissioners Glasgow, Harlowe, Yates and Elmquist.

It states first that upon examining the reports compiled by different states on the subject the committee finds a great variation in method of tabulating these statistics, and it recommends the adoption of uniformity. It says the question of grade separation is becoming more important every year owing to the increased number of motorcycles and automobiles driven by people who have little regard for safety devices or for their own safety. The committee considers that no form of crossing protection equals the separation of grades, but recognizes that this solution is not applicable in all cases, not only on account of the expense involved but also because of the varying conditions obtaining in different cities and states. In some the topography of the country is such as to permit the separation of grades with little difficulty and at moderate expense. In others the contrary is the case. Nevertheless the committee believes that where conditions at all justify the separation of grade it should be effected. For the same reason it is impossible to suggest a uniform law on the subject, but it recommends that the different states should take up the matter and empower the commission of the state to install such protection as the conditions demand.

The committee presented some statistics in regard to trespassers killed and injured in the different states during the past three years. Owing to differences in the fiscal year it was impossible to obtain absolutely accurate figures, but those given are approximate. The totals showed that the number of passengers killed in 1911 were 3888; in 1912, 4208; in 1913, 4354. These figures show that the loss of life is increasing every year and that it equals in number that of passengers and employees combined.

The report points out that the "trespassers" were not the irresponsible people commonly referred to as tramps and hoboes, but were made up of farmers and laborers in the country and mechanics, business men and women and children in the cities. It says that in no other country are pedestrians permitted to make such common use of the railway right-of-way, and believes that this use could be greatly curtailed by demanding punishment of the violators of the law. The greatest hindrance in the past to enforcement of the law has been the unwillingness of the justices before whom the violators of the law are brought to treat the matter seriously. This can be corrected only by education and the building up of public sentiment.

The report also calls attention to the danger of diagonal crossings because of the apparent inability of the average driver of a vehicle properly to measure the distance to be traveled in making such a crossing or to gage the speed of the approaching train. It recommends that the commissioners receive authority to abolish such crossings and construct right-angle crossings, the expense to be apportioned between the railroad and the city, village or township. A proposed bill for punishment of trespassing was included in the report.

Three reports scheduled on the program were not presented, namely: "Powers, Duties and Work of Railway Commissioners"; "Railway Capitalization," and "Safety Appliances."

The following officers were elected by the commissioners for the ensuing year:

President, Clifford Thorne, of Iowa; first vice-president, Robert R. Prentiss, of Virginia; second vice-president, Max Thelan, of California; secretary, William H. Connolly, Washington, D. C., assistant secretary, James B. Walker, of New York.

San Francisco, Cal., was chosen as the meeting place for the next convention, which will open Oct. 12, 1915.

Meeting of Society of Chemical Industry

The Action of Manganese and Titanium in Rails and Other Commercial Steel Was Discussed

At a meeting of the Society of Chemical Industry, held in New York on Friday, Nov. 20, two papers were presented which dealt with the effects of different alloys on steel. One of these, entitled "Manganese Steel," was read by John H. Hall, consulting engineer, New York, who first outlined the early experiments with manganese. He explained that low-carbon manganese steel containing less than 8 per cent manganese was brittle and practically worthless. By means of graphs plotted between manganese content and carbon content he showed the results of experiments demonstrating that when the contents lay along the line drawn from 12 per cent manganese to 1.5 per cent carbon the resulting alloy steel was tough and strong. No valuable properties had been discovered in experiments which were made with very high manganese contents, or those of 30 per cent and over.

Mr. Hall states that manganese steel was characterized by a high coefficient of expansion, a lack of magnetic qualities, considerable brittleness when cast, a low fusing point and a very high tensile strength. Its hardness was peculiar, owing to a lack of response to Brinnel tests, this being due to the very low elastic limit of manganese steel in compression. It possessed, however, the ability to develop a surface hardness of extreme character under repeated blows, provided these were insufficient to wear away the hard skin as rapidly as it was formed. The resistance of all manganese steel to wear and abrasion was extraordinary and this accounted for its wide use where extreme wear and the presence of grit were encountered. With relatively high manganese contents, say 12 per cent, with 1.25 per cent carbon, the tendency to flow under pressure was increased. The steels with low manganese contents tended to flow less under pressure but were more brittle. It was this tendency to flow under loads that prevented the use of manganese steel for car wheels.

Manganese steel was produced by mixing molten ferromanganese and molten steel containing 1.25 per cent carbon, the use of any process of steel making being possible. The crucible process was, however, objectionable on account of the absorption of carbon from the graphite crucibles. With the open-hearth process the furnace had to be very small, and was not altogether desirable because it had to be run continuously, whereas foundries where manganese steel was used generally ran only in the day time. Small Bessemer converters were most convenient for manganese-steel manufacture on account of the low first cost and possibility of intermittent use.

The manufacture of manganese-steel castings invariably involved about 40 per cent of scrap. When the scrap castings were remelted by the Bessemer process the manganese was all lost, and the use of the electric furnace had been proposed for melting scrap, although it was not altogether desirable owing to its high cost. The electric furnace had also been proposed for melting the ferromanganese before it was added to the steel. This was quite a problem as the addition of cold ferromanganese would involve freezing of the steel, and the melting of the ferromanganese customarily had to be done in crucibles.

In discussing the commercial forms of manganese steel, Mr. Hall said that practically all of it was cast. Its great fluidity and low melting point helped the foundryman, but, on the other hand, its great shrinkage in cooling made it very likely that the castings would break. Annealing was generally used to prevent shrinkage strains, but the design of the casting was exceedingly important, and even with good pattern design the production of perfect castings was difficult. In the heat treatment the castings had to be brought up to the temperature of recalescence with great care and they could not be allowed to cool below this temperature to any considerable extent before quenching. As the temperature of the casting fell away from the proper temperature the treated steel would lose toughness, the heavier castings having less temperature leeway in heat treatment than the light ones. The heat-treating temperature was in the vicinity of 1000 deg. Cent. and, owing to the sudden quenching in water at this high temperature, breakage sometimes occurred. The design of casting was, therefore, important in this instance as well as at the time the molten metal was poured into the mold.

Mr. Hall stated that rolling manganese steel was a possibility and was accomplished in some instances. The major difficulty in the way of rolling was the very narrow range of temperature at which the metal could be worked. If manganese steel was rolled too cold it broke the rolls in the mill. If it was rolled too hot it tended to crumble.

In the discussion of the paper the matter of surface hardening under blows was brought up, and the effect of this quality in preventing the peening of railway crossings was commented on. It was stated that the surface hardening reached a maximum after a surface indentation of about 5 per cent. With crossings where the angle was such that the car wheel would acually jump, the wear was sometimes rapid enough to render negative the surface hardening effect, and the result was that a failure of the crossing took place from peening. It was stated that it was possible to caseharden steel with ferromanganese placed inside of the mold, but that this produced only a very thin skin of hard metal. The price of manganese-steel castings ranged between 7 cents and 18 cents per pound.

In answer to a question, Mr. Hall said that the presence of silicon, sulphur and phosphorus in the steel occurred, in general, in only small amounts and that they were of very little importance in manganese steel. With regard to results in service he spoke of rails on the Boston Elevated Railway which, when made of Bessemer steel, lasted six weeks, when made of open hearth steel lasted three months, and when made of manganese steel lasted two and one-half years. In the rolls for a stone crusher it was found that 6 per cent manganese was as good an alloy as 12 per cent manganese, but that either one wore ten times as long as rolls made of ordinary open-hearth steel.

EFFECT OF TITANIUM ON STEEL

A paper entitled "Titanium and Its Effect on Steel," by George F. Comstock, was then read. In this it was explained that the element titanium was widely distributed throughout the earth, although it was found nowhere in large quantities. It was invariably found in nature as an oxide, as it burned readily, its affinity for oxygen enabling it, when not in the form of an oxide, to rob molten steel of oxygen. In addition it had a very strong affinity for nitrogen. The compounds formed by the oxidation of titanium possessed stability to a very marked degree, the contrary being true of the pure element. The order of stability of the various forms were: oxide, nitride and carbide, the latter being the compound customarily used in manufacture. The carbide as a deoxidizer was practically as good as the pure element and was very much cheaper.

Titanium steel proper was not commercially made, the practical value of the titanium being its purifying effect. For this reason results equal to those obtained from the so-called titanium steel could be produced by the ordinary processes of manufacture provided these were sufficiently thorough. No changes in microstructure were effected by the presence of titanium. The actual titanium content found in commercial steel did not exceed 0.025 per cent. Titanium could be used in steel made by any process, but at the present time the demand for it existed mainly in the case of rails, so that it was used most frequently with the open-hearth process.

The introduction of the titanium was effected while the molten steel was being poured from the furnace to the ladle, the steel after the addition of the titanium being held in the ladle from three minutes to ten minutes. Thirteen pounds of the alloy called ferro-carbon-titanium (the equivalent of the carbide) were usually added per ton of steel, and the actual addition of the pure element approximated 0.1 per cent. The cost of the process added about 5 per cent to the price of the rail.

The process was purely one of oxidation, together with the cleansing effect of the titanium which acted as a flux for the silicates and other slags and made them rise to the top of the metal. Therefore, the advantages obtained from it were greater soundness of the metal and freedom from segregation. Blowholes, which were due to trapped bubbles of carbon monoxide in the molten metal as it "froze" or cooled, were also reduced, and though they were always present in low-carbon titanium steel they contained no slag and could be rolled out. The serious defect, segregation, was described as nothing but selective freezing, and in well-deoxidized steel the freezing took place quietly in the pasty mass of cooling metal, the carbon monoxide bubbles having been eliminated by the deoxidizing process. However, the deoxidation of steel usually involved extended pipes as an offset to the elimination of blowholes. Some failures in the prevention of segregation by titanium had been observed, but in such cases only very small amounts of titanium of the order of 0.005 per cent were found upon analysis, indicating that the steel had reached the ladle in a badly over-oxidized condition and that not enough titanium had been added to overcome it.

A number of tests were cited by the author to demonstrate the improvements effected by the use of titanium, of which the important ones were in the freedom from flaws. The tests applied largely to rails, one case being cited where a titanium rail on the Boston Elevated Railway showed 41 per cent less wear than the adjacent standard rails. It was also stated that titanium steel was used for axles to stop segregation and that its use in thin sheets was very effective, the sheets rolling exceptionally fine and smooth, and being well suited for galvanizing.

New A. I. E. E. Standardization Rules

Being a Summary of Some of the Notable Changes in the Railway Section of the 1914 Rules from the 1911 Rules

In last week's issue of the ELECTRIC RAILWAY JOURNAL, page 1152, attention was called to the fact that the finally-approved standardization rules of the American Institute of Electrical Engineers would go into effect on Dec. 1. A brief summary was there given of the principal final revisions which had been approved by the standards committee on Nov. 14. These among other changes had been made from the preliminary edition of the rules approved by the board of directors on July 10 and circulated in tentative form (green cover edition). In the following paragraphs are summarized, from the electric railway standpoint, some of the notable changes in the 1914 rules from the 1911 rules which they now supersede. This analysis is based upon the Dec. 1 edition which differs in important details from that of July 10.

In the old rules the only special attention given to electric railway apparatus was in a two-page section of the appendix, comprising a half-page on railway motor rating and the remainder on the selection of motors for specified service. At the time the old rules were adopted there was little unanimity of opinion regarding the whole subject of railway motor rating. In the new rules the sections relating to electric railway equipment, forty-eight in number, fill six pages, and a three-page appendix is devoted to supplementary matters relating to railway motors.

STANDARDS FOR ELECTRIC RAILWAYS

In the rules are given under the heading "Standards for Electric Railways" groups of sections under "Definitions," "Rating of Railway Substation Machinery" and "Conductors and Rail Systems."

Under the first heading are definitions of "transmission system" and "distribution system" practically identical with those given in the Interstate Commerce Commission standard classification of accounts for electric railways. A substation is next defined as "a group of apparatus or machinery which receives current from a transmission system, changes its kind or voltage, and delivers it to a distribution system."

In the rating of railway substation machinery particular attention has been given to intermittent loads, and the distinction between nominal and Institute continuous ratings is made. The former is the "Kva output at a stated power factor imput which, having produced a constant temperature, may be increased 50 per cent for two hours without exceeding the standard ultimate temperature rise. In the case of frequency-changers the power factor of the output shall also be stated.

"Machines in substations subjected to extreme fluctuations of load should be capable of carrying a load of twice their nominal rated load, for a period of five minutes, and should also be capable of carrying a load of three times the nominal rated load for one minute, without disqualifying them for continued service. These overloads shall be applied after a continuous run at nominal rated load." The continuous rating is that load, at 100 per cent power factor which a machine, fulfilling the general Institute specifications for strength, commuting qualities, etc., will carry continuously with a temperature rise not exceeding that specified in the following table:

TABLE OF HOTTEST-SPOT TEMPERATURES AND OF CORRESPONDING PERMISSIBLE TEMPERATURE RISES

Class	Description of Insulation	Highest Permissible Temperatures for Hottest Spot	Highest Permissible Temperature Rise of Hottest Spot Above 40 Deg. for the Purpose of Fixing the Institute Rating
A1	Cotton silk, paper and other fibrous materials, not so treated as to increase the thermal limit	95 deg. Cent.	55 deg. Cent.
A2	Similar to A1, but treated or impregnated and including enameled wire	105 deg. Cent.	65 deg. Cent.
B	Mica, asbestos or other material capable of resisting high temperatures, in which any Class A material or binder, if used, is for structural purposes only, and may be destroyed without impairing the insulating or mechanical qualities	125 deg. Cent.	85 deg. Cent.
C	Fireproof and refractory materials	No limit	

The sections on conductor and conductor systems define terms and specify essential details of contact rails, trolley and messenger wire or cable and classes of construction. The important dimensions specified are: 26 in. to 27 in. for third-rail gage; 2¾ in. to 3½ in. for third-rail elevation; 18 ft. for the height of the lowest point of a trolley wire under maximum conditions of sag unless local conditions prevent, and 21 ft. on trackage operating electric and steam railroad equipment and at crossings over steam roads. These dimensions were specified upon the advice of the American Electric Railway Engineering Association.

RATING OF RAILWAY MOTORS

As in the preceding sections the nominal and continuous ratings are distinguished. The nominal rating is as in 1911 except that it is specified in kilowatts and reference to a room temperature of 25 deg. Cent. is omitted. The continuous ratings are the inputs in amperes at which the motor may be operated for ½, ¾ and full voltages respectively without exceeding the following temperature rises when operated on stand test with motor covers and cooling system, if any, arranged as in service: Class of material A_2 (see preceding table), temperature rises of windings, by thermometer 65 deg., by resistance, 85 deg.; class of material *B*, 80 deg. and 105 deg. respectively.

OPERATING TEMPERATURE LIMITATIONS

In addition to the above stand test limitations the following permissible operating temperatures are specified: Class of Material A_2, maximum observable temperature of windings when in continuous service, by thermometer, 85 deg., by resistance, 110 deg.; class of material *B*, 100 deg. and 130 deg. respectively. For infrequent occasions, due to extreme ambient temperatures, it is permissible to operate at 15 deg. higher temperature.

Field control motor ratings are specified on the basis of performance with the operating field which gives the maximum motor rating.

MOTOR EFFICIENCY AND LOSSES

The specifications of efficiency determination are in form to permit easy checking of performance guarantees. The efficiency is determined from losses as follows.

Copper loss is calculated from resistance measurements corrected to 75 deg. Cent.

No-load core loss, brush friction, armature-bearing friction and windage are measured by operating the motor without gears and with the kind of brushes and brush pressure as in commercial service. With the field separately excited, such a voltage is applied to the armature terminals as will give the same speed for any field current as is obtained with that field current when operating at normal voltage under load. The sum of the losses mentioned is then the product of the counter-emf and the current.

Core loss in d.c. motors is separated from friction and windage losses above described by measuring the power required to drive the motor at any given speed without gears, by running it as a series motor on low voltage and deducting this loss from the sum of the no-load losses at corresponding speed. Or it may be obtained by separately exciting the field and driving the armature from a motor having known losses, and noting the difference in losses between driving the motor light at various speeds and driving it with various field excitations. Core losses in d.c. motors under load should be assumed as follows:

Per cent of input at nominal rating	200	150	100	75	50	25 and under
Loss as per cent of no-load losses	165	145	130	125	123	122

The brush-contact loss to be used in determining efficiency may be obtained by assuming that the sum of the drops at the contact surfaces of the positive and negative brushes is 3 volts.

The loss in gearing and axle bearings in single-reduction, single-geared motors varies with type, mechanical finish, age and lubrication. The following are given for comparison:

Per cent of input at nominal rating .	200	150	125	100	75	60	50	40	30	25
Losses as per cent of input .	3.5	3.0	2.7	2.5	2.5	2.7	3.2	4.4	6.7	8.5

OTHER RULES AND DATA

The last sections of the rules are devoted to definitions of terms relating to electric locomotives.

In the appendix relating to railway motors suggestions are made as to the data needed for selecting motors for specified service and for pre-determining the performance of a motor in service when it cannot be tested under service conditions.

The following average data as to mechanical losses, based on the results of many tests, are given as a basis for comparison:

Per cent of input at nominal rating . .	100 or over	75	60	50	40	30	25
Losses as per cent of input	5.0	5.0	5.3	6.5	8.8	13.3	17.0

These figures include axle bearing, gear, armature bearing, brush friction, windage and stray-load losses. They apply to single-reduction, single-geared motors.

The ordinance adopted by the City Council of Kansas City, Mo., requiring drivers of automobiles to dim their headlights was amended on Nov. 3 to include street cars. The ordinance will go into effect on Jan. 1.

Effect of Car-Wheel Diameters on Motors

SCRANTON, PA., Nov. 11, 1914.

To the Editors:

I beg leave to submit for the consideration of Messrs. Parks, Nottage and Foote, and of any others who may be interested in the question, the following theoretical consideration of the effect of car-wheel diameter on motors.

For a given car equipment, the tractive effect per motor which is used in overcoming the train resistance for motor, is

$$T = \frac{K}{D} T' \text{ lb.} \qquad (1)$$

in which K is a constant depending on the gear ratio and gear efficiency; T' is the net effective torque in pound-feet; and D is the diameter of the car wheel in inches.

Considering the total train resistance for a given set of conditions (weight, head-on cross-section and speed of car, grade, curvature and acceleration if starting), to be divided equally between all the motors on the car, irrespective of variations in the car-wheel diameters, we will suppose a two-motor equipment in which the wheels of truck No. 1 are D in. in diameter and those of truck No. 2 are $(D + d)$ in. in diameter. From equation (1) we then have for the respective motor-torques,

$$T'_1 = \frac{DT}{K} \text{ lb.-ft.} \qquad (2)$$

and

$$T'_2 = \frac{(D + d)T}{K} \text{ lb.-ft.} \qquad (3)$$

From these last two equations, we obtain

$$T'_2 = \left(\frac{D + d}{D}\right) T'_1 \qquad (4)$$

which indicates that the torque required of the motors on truck No. 2 (which has the large wheels) is $\frac{D + d}{D}$ times that required of the motors on truck No. 1.

For any electric motor, the theoretical torque, developed by the passage through the motor of a current I_a, is

$$t = 0.117 \Phi Z' I_a \text{ lb.-ft.} \qquad (5)$$

where Φ = the magnetic field flux per pole;
and Z' = a constant for a given motor, depending upon the number of poles, and the kind of armature winding.

(For a complete discussion of the foregoing equation, see Vol. I, Franklin & Esty's *Elements of Electrical Engineering*, page 99.)

In a series motor designed for electric railway service, the magnetic circuit is operated very nearly at the point of saturation, except at very light loads. Consequently, we may, with little error, assume that for all operating current values the magnetic flux per pole is a constant. Also, the net effective torque available at the pinion of the motor is less than that expressed in equation (5) by the amount of the torque required to overcome friction and other stray-power losses. Assuming that under the conditions existing we may neglect these losses, and that we may call Φ a constant, we may write, from (5),

$$T' = C I_a, \qquad (6)$$

where T' is the net effective torque as used in equation (1) and C is a constant equal to $0.117 \Phi Z'$. Writing variations of equation (6) for the torques of the two motors under consideration, and substituting the same in equation (4), we obtain

$$I_{a_2} = \left(\frac{D + d}{D}\right) I_{a_1}, \qquad (7)$$

where I_{a_1} and I_{a_2} are the motor currents for motors No. 1 and No. 2, respectively. The constant C for each motor torque is considered the same since the magnetic circuits are presumed to be nearly saturated for the operating current values, I_{a_1} and I_{a_2}.

Equation (7) indicates the relative values of the currents taken by the motors on the two trucks. The current taken by the motor geared to the large wheels is, of course, greater than that consumed by the motor geared to the small wheels. Thus, if on a two-motor car, motor No. 1, geared to 32-in. wheels, takes 80 amp under a certain set of conditions, motor No. 2, if geared to 33-in. wheels, will take $\frac{33}{32}$ times 80 amp, or 82.5 amp. This, of course, is a purely theoretical value, and, at that, is only an approximation. It would seem, however, that the increase in motor currents due to small differences in wheel diameters should not be sufficiently large to cause trouble.

The foregoing is offered, not as the "practical solution" desired by Mr. Foote in the ELECTRIC RAILWAY JOURNAL for Oct. 31, nor as an entirely correct and accurate technical consideration of the many complexities of the question. Rather, it is desired that this letter be part of the discussion suggested by Mr. Foote, and an indication of the peculiar points involved in a final solution.

Encouraging Railway Employees to Use Technical Books

FREE PUBLIC LIBRARY

NEW HAVEN, CONN., Nov. 23, 1914.

To the Editors:

The public library at New Haven has been making an effort to interest the employees of the local electric railway company in the books relating to their line of work. With the co-operation of J. K. Punderford, general manager of the company, we distributed through the chief motorman a hundred or more lists of books which we thought would be of value. These lists were also placed in the three carhouses. A special effort was made to reach new men. As a result, at the end of two weeks of effort our circulation of electric railway books was next to the highest of all classes for this department, whereas before it was practically negligible. Books that have been popular are Gutman's "Motorman and His Duties," Aylmer-Small's "How to Become a Successful Motorman," Harding's "Electric Railway Engineering" and Ashe and Keily's "Electric Railways." The ELECTRIC RAILWAY JOURNAL also has its devotees. There is a crying demand for practical books which we have tried to meet by supplying instruction books and bulletins of the General Electric and Westinghouse companies.

We call the attention of the men to the technological room in the library and to the fact that it is for their use free. Then when they come in and make themselves known we show them the books and pick out some new subject in railroading as a basis of conversation. Then we gradually lead up to the topic of their own work and thus overcome the embarrassment that is general on the occasion of the first visit to an institution of this sort. If, in the course of the conversation, no interest is manifested we try to locate some hobby, which usually crops out eventually. If it develops that a visitor entertains just a little fear of books and book knowledge and does not seem to be able to get information from books we endeavor to show him how to overcome this lack.

We cannot say that the demand for books has been as great as the number of electric railway employees would seem to warrant, because there are many difficulties confronting the "front-end" man who wishes to advance. The very fact that a man is seen with a book in his hand gives the impression that he is after an inspector's or starter's job and he is apt, like the teacher's pet among school children, to be looked down upon by his companions.

Summing up the results of our efforts to help the men it may be said: (1) That our circulation jumped in two weeks from lowest to next to highest for this department; (2) that we have a steady group of book users; (3) that all electric railway men here, from the general manager down, know that we have their interests in mind, and (4) that the men who come to the library are worth working for and that it is a good policy to help the one man in a hundred who wants to get ahead rather than to throw up our hands in despair because ninety-nine do not care to advance.

When convincing arguments can be presented to the men a great gain will have been made and we hope to persuade them to use books steadily. We have great hopes of interesting the new men who will be broken in in January. KENNETH C. WALKER,
Head Department of Technology.

Corrosion of Metals in Natural Soils

WORCESTER POLYTECHNIC INSTITUTE
WORCESTER, MASS., Nov. 24, 1914.

To the Editors:

I am very glad that Messrs. Scofield and Stenger decided to publish their paper on "Corrosion of Metals in Natural Soils," which appeared in the issue of the ELECTRIC RAILWAY JOURNAL for Nov. 14. This paper should be read with considerable interest by electric railway engineers, as it is one of the few definite contributions which we have on this subject.

It is undoubtedly true that under the proper soil and electrode conditions a considerable amount of self-corrosion can take place, enough at times to show the same magnitude of results as though the damage had been done by stray railway currents.

When self-corrosion can be shown to have produced such results as are shown by Messrs. Scofield and Stenger, the subject becomes a very live one to electric railway operators, as in many cases it should proportionately reduce the responsibility that pipe owners might attempt to fix on the electric railway company. The subject seems to have had a very careful study in Minneapolis, and we are to be congratulated that the officials of that company have seen fit to give us the results of their investigations.

ALBERT S. RICHEY,
Professor of Electric Railway Engineering.

The report of business done by the Public Service Commission for the Second District of New York for October shows an increase in the number of new cases filed with the commission. The commission disposed of seventy-six formal cases during the month, while eighty-seven new ones were submitted. This makes a total of 549 formal cases disposed of since March 16, 1914. A total of 106 informal cases was filed with the commission during the last month, and final disposition was reached in 129 old and new informal complaints. The total number of informal complaints disposed of since March 16 is 1216.

Fare Decision in Manchester, N. H.

Six Per Cent Return Allowed on Investment in Property—Depreciation Considered at Length

The Public Service Commission of New Hampshire has rendered a decision in the fare case which has been before it for several months. An abstract of the brief of the company in this case was published on page 88 of the issue of this paper on July 11. The commission orders the Manchester Street Railway to sell tickets to school children with full transfer privileges, for use on the way to and from school, at the rate of six tickets for 25 cents and twenty-five tickets for $1, dating from Dec. 1, 1914. Under the law the board was asked to investigate whether the company reasonably could be required to sell tickets at these rates and also whether the company could be required to sell tickets to the general public at these rates good before 8 a. m., between 11:30 a. m. and 1 p. m., and from 5 p. m. to 7 p. m. As to the school tickets, it was admitted that the number of those who would use them is comparatively small and that the establishment of this rate would not largely reduce the company's revenue. The other proposed reduction was dismissed by the board on the ground that it would prevent a reasonable return on the fair value of the company's property. An abstract of the decision is printed below.

To ascertain the value of the property, the commission employed the engineering firm of Sloan, Huddle, Feustel & Freeman, of Madison, Wis., the company being represented on this work by Hollis French, of Boston, Mass., its consulting engineer. Edwin F. Jones and Frank S. Streeter appeared as counsel for the company. The commission reached the sum of $1,599,728 as the cost of reproduction new of the physical properties and $1,154,253 as the cost new less accrued depreciation. The company's engineer agreed to the foregoing estimate of cost new except that he allowed $27,500 more for track and $19,200 more for depreciation. The variation was due to the use of current prices by the company, whereas the board held that a five-years' average is preferable as in the Berlin Electric Light Company case, 3 N. H., P. S. C. Rep. 174, 196. The capitalization, including $133,500 in notes outstanding, totals $1,402,750, and the cost of road and equipment as carried on the books for the year ending June 30, 1913, was $1,399,106. The correspondence between the cost of reconstruction new, the construction account and the amount contributed by the stockholders, is extraordinarily close. Making some allowance on the one hand for possible inadequacies in the construction account, and on the other for advances in construction costs and appreciation in land values, it appears that the property has been principally built up out of funds contributed directly by the stockholders, and that very little has been put into it out of earnings. This fact is extremely important in determining the amount upon which the company should be allowed to earn a return.

The board finds that the average dividend received upon the capital stock has been 5.839 per cent since 1889, and upon the actual investment of the stockholders 5.58 per cent, the averages being obtained by ascertaining the relation between the total amount paid in dividends and the total of the principal sums upon which those dividends were paid. The commission holds that the foregoing constitute at least an approximately fair return upon the value of the property. It holds that 6 per cent upon the fair value of the property constitutes a reasonable return on such a business as the Manchester Street Railway, occupying a monopoly in the transportation field in the large and growing city in which it operates.

(Population, 1910, 70,063.) President E. C. Foster testified that in his opinion a higher rate than 6 per cent is needed to attract street railway capital, but the board holds that 6 per cent in a street railway in a thriving New England city is as attractive as a 7 per cent return in a Southern property of similar size. The commission holds that it is immaterial how the return on the value of the property is divided between stock and bonds, and points out that if the capitalization were half in bonds at 5 per cent, 7 per cent could be paid on the stock to yield a fair return. The company has no bonded indebtedness, however. Except for the appreciation in land values, there has been during the greater part of the company's history no great discrepancy between the investment and the value of the property.

DEPRECIATION

The present depreciated value of the property, excluding appreciation in land values, is $1,050,000. There has, therefore, been a total depreciation of $450,000, of which $100,000 has been made good out of earnings, while the balance of $350,000 remains a loss to the stockholders unless it is in some way made good to them. The company's counsel claimed that the depreciation should not be taken into account so long as the service is not impaired, and that the cost of reproduction new is the true measure of the present fair value for rate-making purposes. This theory the board has several times considered and rejected (Manchester Gas case 4 N. H., P. S. C. Rep., 337, 405). It held that according to the United States Supreme Court there is no constitutional right to demand a return upon more than the present depreciated value of the property, but that justice may often require that a return be allowed upon a larger sum. In the Manchester Gas case, the utility during the full period of its existence had paid not only adequate but excessive returns on its investment and had also put into the property out of earnings an amount more than sufficient to make good its accrued depreciation. To allow a return upon the full undepreciated value of its property would have been to permit it not only to get the return upon its investment to which it was unquestionably entitled but also to capitalize and make the public forever pay a return upon what was in fact a depreciation reserve provided out of rates which the public had paid. Justice clearly did not require such action.

The present case presents an entirely different situation. The railway company, instead of paying to its stockholders more than an ample return and keeping its property good, and even adding to its value, out of its earnings, has barely paid a fair return in the form of dividends on the amount actually invested, and above that has been able out of its earnings to make good only $100,000 of the $450,000 depreciation which the property has suffered. Of the remaining $350,000 a part is offset by appreciation in land values, leaving $250,000 representing a clear loss to the stockholders as a result of the public service which they have performed, if they are for the future to be allowed a return only on the depreciated value of their property. Justice does not require that they should suffer this loss. In the general outcry against inflated capitalization there is never found a suggestion that a public service corporation, well planned and efficiently managed, should not be allowed a fair return upon at least the full amount of its bona fide investment. It has been unable to do so at the rates which it has charged and has suffered a substantial loss as the result of its operations. Justice requires that it have an opportunity to make that loss good.

Technically, depreciation should be made good out of earnings. But it is out of the question for this company to make good out of its earnings a loss of $250,000. It could only be done by increasing the rates. And an increase of the 5-cent fare in the city of Manchester is not seriously to be considered. Neither the company nor the public would desire it. The board, therefore, finds that justice to the company and to the public good alike requires that the deficiency in the present depreciated value of the property below the amount actually invested by the stockholders be regarded as a cost of developing the business, and as such added to the depreciated value to determine the present fair value of the property devoted to the public service, and that the company should hereafter be allowed to earn annually a fair return upon $1,402,750, the amount of its bona fide investment, which fair return is found to be 6 per cent, together with a sum sufficient to take care of the annual depreciation of the property. This valuation takes due account of all depreciation, including functional depreciation due to changes in the art and the discarding of obsolete plant and equipment. No consideration is given to working capital, because it does not appear that the company has any beyond its stores and supplies, totalling $32,527, and included in the engineers' valuation. The board finds that the expenditures of the company are in general normal and reasonable. The amount charged to maintenance of way and equipment is perhaps somewhat higher than the average, but it would not be in the public interest to lower the high standard of maintenance by curtailing expenditure.

POWER

The question of whether the cost of power is excessive received much study. The railway purchases power from the Manchester Traction, Light & Power Company, which owns its stock, at a price of 2.25 cents per kw-hr. of alternating current furnished. In 1913 it purchased 5,229,013 kw-hr. at a total cost of $110,979. The railway company converts the energy into direct current in a substation of its own which cost $128,000, and the operating expenses of which are about $20,500 per year, including interest on the investment. It appears on analysis that the street railway paid $7,439 more for its power than it would have paid had it been entitled to take it on a five-year contract under the Traction company's Schedule D. The board recognized that the street railway company has the first call on the power system, after the street lighting service, and as it overlaps the lighting peak in many of its rush-hour demands, necessitates the maintenance of steam plant capacity. The board finds that the price is not unreasonably high, although a slight overpayment may be made to the traction company.

CONCLUSIONS

The board's conclusion is that the operating expenses cannot be expected to decrease as time passes, but must be expected to increase, with growth of business. To determine the effect of the proposed reduction in rates a traffic count was made of rush-hour and other-period passengers for an entire week in January and July, 1913, counting separately all who rode on the cars before 8 a. m., from 11:30 a. m. to 1 p. m., and between 5 and 7 p. m., on week-days. It was found that 39.03 per cent traveled in these rush hours, the segregations being 13.205 per cent, 8.364 per cent and 17.634 per cent. It is estimated that the receipts would be reduced by $25,212 on the 1913 earnings basis if the rates were reduced for rush-hour riders and would prevent the earning by the company of a reasonable return upon the fair value of its property.

ASSOCIATION NEWS

JOINT COMMITTEE ON OVERHEAD AND UNDERGROUND CROSSINGS

The second meeting of this committee, which is still in the formative period, was held at association headquarters on Nov. 17. The first meeting was held on Sept. 30, and the third is scheduled for Dec. 16 at the same place. The following attended the meeting: Farley Osgood, Public Service Electric Company, chairman; G. W. Palmer, Bay State Street Railway Company, vice-chairman; R. D. Coombs, consulting engineer, New York, secretary; B. T. Anderson, Lackawanna Railroad; C. L. Cadle, New York State Railways; E. B. Katté (represented by deputy) New York Central Railroad; W. T. Oviatt, Narragansett Electric Lighting Company; P. H. Thomas, consulting engineer, New York, and L. S. Weld, Long Island Railroad. The committee discussed plans for its work and organization. It will eventually consist of about twenty representatives of all interests involved in overhead or underground crossing matters. Eventually suggested specifications will be prepared and submitted to the engineering public for criticism. The committee hopes also to be in a position to give advice on crossing problems when requested to do so. The new committee is the outgrowth of a committee of the National Electric Light Association on overhead construction formed in 1911 and subsequently enlarged into a joint committee by the addition of the chairmen of similar committees of other associations.

MEETING OF THE DENVER TRAMWAY COMPANY SECTION

The twenty-first monthly meeting of the section was held on Nov. 19, William M. Casey presiding. The following officers were elected: President, C. B. Wells, superintendent of transportation; vice-president, George L. Rice, superintendent Southern division; secretary-treasurer, H. G. Mundhenk, stenographer transportation department, and director for two years to fill the vacancy created by the expiration of Mr. Wells' term, A. N. Evans, engineering department.

The feature of the meeting was a series of talks by delegates to the Atlantic City convention of the association. Those who spoke at length were John A. Beeler, G. W. Dolezal, W. C. Swisher, E. L. Rice and W. H. Seip. Messrs. Casey, Adams and others took part in the discussion. The attendance at the meeting was 120.

R. H. INGERSOLL ON TELEPHONE DISPATCHING

In our issue for Nov. 21, page 1165, the recent Denver Company Section paper on the above subject by R. H. Ingersoll, chief dispatcher, was mentioned. In this paper the author stated that the dispatching of streets cars on city lines by telephone is the result of an inspiration that came just twenty-five years ago to C. K. Dunham, one of the early superintendents of what is now the Denver City Tramway. He gave interesting details of the work of his department, stating that it requires fifty-four telephones on thirty circuits operated by five men. He compared the dispatching system to the human brain, the driving, directing and controlling element. In the Denver Tramway it is a veritable clearing house for detail. Almost every department touches elbows with the dispatcher at some angle of its work. For example, a track greaser may find stones in the same switch day after day. He reports this to the dispatcher, who notifies one of the company's special officers. Again, the track repair gang and line repairmen keep the dispatcher notified of their whereabouts so that an emergency track or line trouble may be brought to their attention promptly. In case of sudden load, the dispatcher notifies the power house in time to prepare for it, as when heat is to be turned on as indicated by signal from the dispatcher's office. The superintendent of rolling stock provides the dispatcher with a list of cars, plows, sweepers, etc., distributed among the carhouses. He frequently calls upon trainmen for reports as to the condition of sand boxes at the ends of the line. In Denver the conductor pays his motorman and himself every night, keeping the record of the time given the car, trip by trip, by the dispatcher, so that the dispatcher's sheet is the record of every trainman's time for the day.

All of the above matters are incidental to real dispatching. When all cars are reporting on time, the work of dispatching is not difficult, for by long practice the schedules are memorized and the time can be given and put down quickly. The test of the dispatcher comes when nothing is on time. More important than figuring time is the judgment he displays. He must be a good guesser of what the conditions are and what each crew can and will do under those conditions. A dispatcher should have good street car sense combined with an ability to understand conditions and figure the best way out of his difficulties quickly.

The telephone dispatching system affords the superintendent the greatest facility for keeping in touch with every detail of the operation of cars. The flexibility of the car service and the rapidity with which it enables the dispatcher to adjust the headway on any line, are the strongest points in favor of this telephone system. In every city the travel demands the addition of extras in the morning and late afternoon, and by the telephone system the dispatcher can put out and withdraw such trippers without confusion, equalizing the spaces between the regular cars as fast as such extras are put out or withdrawn. Any congestion caused by accident or blockade also may be adjusted without difficulty in the same manner. There is a regular method of pulling down the lines at night, as the load or travel drops off; but if the dispatcher finds that the travel on any line is such as to require increased service, he may hold the full quota of cars, and if necessary use cars which are not needed on other lines. In this way, through the agency of but one or two men, who are alive to the needs of the patrons on all lines, the service is reduced to a minimum.

The use of the telephones employed in this service should be restricted by the dispatcher to those who in their line of duty are interested in the movement of cars, and when the use of the telephone is so limited a certain respect attaches to the messages transmitted and the tendency for small talk is discouraged. This small talk not only keeps someone else from getting in touch with the dispatcher, but it breaks down the wall of respect which should surround the dispatcher's office.

Mr. Ingersoll's paper provoked a lively discussion, and the men who are in contact with the dispatching system gave illustrations of its working and enthusiastically supported the speaker's contention.

The plan of piling the snow along the curb line as is done in Montreal is to be followed by the New York railways during the coming winter, except that in New York a new type of sweeper with an out-board broom will be used instead of the out-board plow of Montreal. The difference is obviously necessitated by the practical absence of sleighs in New York, a circumstance which makes it necessary to remove all snow from the street surface rather than to leave a coating of a few inches.

Equipment Defects—Control Connections —III—Changing Motors from Series to Parallel

BY C. W. SQUIER, E. E.

With straight rheostatic regulation the control connections are comparatively simple as it is necessary only to arrange the circuits, as already described in a previous issue, and provide the means for decreasing the resistance of the circuit. When a series-parallel grouping of the motors is desired, however, it is necessary to provide contacts for making the transition from series to parallel. The control connections then become more complicated.

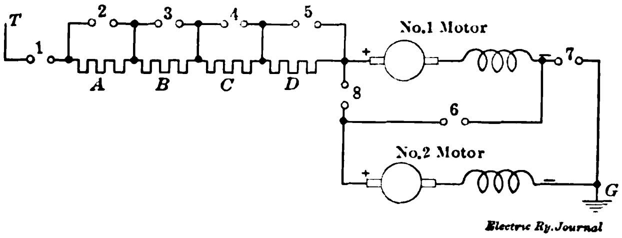

FIG. 7—CIRCUIT DIAGRAM FOR TWO MOTORS

Let us consider what steps are necessary to change the connections of two motors from series to parallel. By referring to Fig. 7, the circuit diagram for two motors, we see that two motors are connected in series by connecting the positive side of No. 1 motor to line through the regulating resistance, the negative side to the positive terminal of No. 2 motor, and the negative terminal to No. 2 motor to ground. To change this to the parallel connection it is necessary to open the circuit between the negative side of No. 1 motor and the positive side of No. 2 motor, and connect the positive side of No. 2 motor to line and the negative side of No. 1 motor to ground. The sequence by which this change or transition is carried out has led to what are called respectively the "open circuit" and the "short-circuited motor" methods.

Open Circuit Transition

If, in making the change from series to parallel, we first open the connection No. 6 between the motors, the circuit through both motors is opened so that power will be entirely shut off for a short interval. If the positive side of No. 2 motor is then connected to line by closing contact No. 8, and the negative side of No. 1 motor to ground by closing contact No. 7 at the same time, the change from series to parallel will be completed. This procedure, because the circuit is opened for a short interval, is called the "open circuit" method and is that used with the General Electric Company's Type L controllers. In order to distribute over several sets of contacts the arcing caused by opening the circuit, the circuit is opened at several points at once as at contacts No. 1 and No. 6 in the diagram mentioned. This arrangement provides several so-called series breaks and reduces the burning due to arcing at each point.

Fig. 8 shows a simplified diagram for an open-circuit controller. It is seen that in passing from the last series point to the first parallel point that the circuit is opened at the *T*, 15 and *E* contacts, and when closed again additional resistance is cut in to limit the current per motor to the accelerating value. This controller has five series and five parallel points and is designed to use five groups of parallel regulating resistance. One of this controller's disadvantages is the sudden jerking in the operation of the car when passing from series to multiple because the current is entirely shut off from the motors and the acceleration is stopped momentarily and then suddenly applied. This is uncomfortable to passengers and also throws an additional strain on the equipment. Another disadvantage is the burning of the contacts. The accelerating current is the largest that a controller has to handle under ordinary conditions, and as this type of controller has to open this maximum-current at every operation, it burns more than some other types.

Short-Circuited Motor Transition

Referring again to Fig. 7, if in making the change from series to parallel part of the regulating resistance is reinstated in the circuit by opening contacts Nos. 3, 4 and 5 after having been cut out for full series operation, and immediately following this the negative side of No. 1 motor is connected to ground by closing contact No. 7, we have No. 2 motor short-circuited. The next step in the transition is to open contact No. 6 and then close No. 8. This connects the motors in parallel with resistance groups *B*, *C* and *D* in the circuit. This way of changing the motors from the series to the parallel combination is termed the shunted motor or short-circuited motor method, and its sequence of connections is intended to overcome the stated disadvantages of the open-circuit method. Its disadvantage however, com-

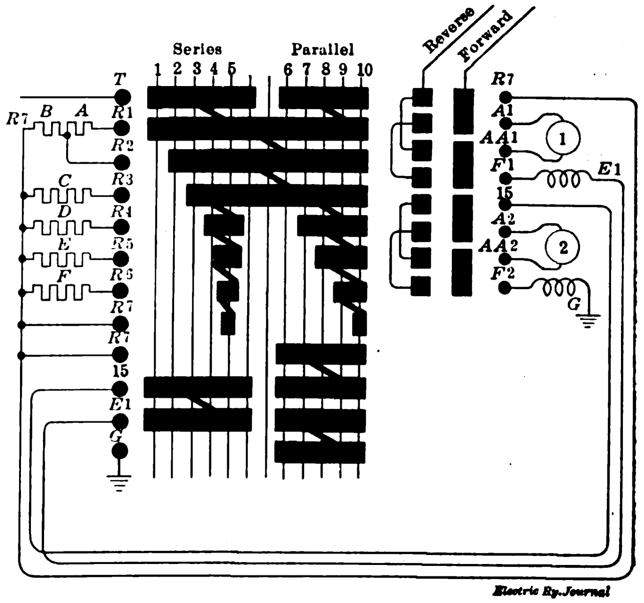

FIG. 8—CONNECTIONS FOR CONTROLLER WITH OPEN CIRCUIT TRANSITION

pared with the open-circuit method, is that a sudden rise in voltage is liable to occur on the first motor because that motor is in circuit for a short time with the resistance that is afterward used with both motors. Short-circuit transition changing from series to parallel is embodied in the design of the General Electric Company's Type K controllers. Fig. 9 shows a simplified diagram for the K-11 controller. This controller has five series and four parallel points and uses four groups of series regulating resistance.

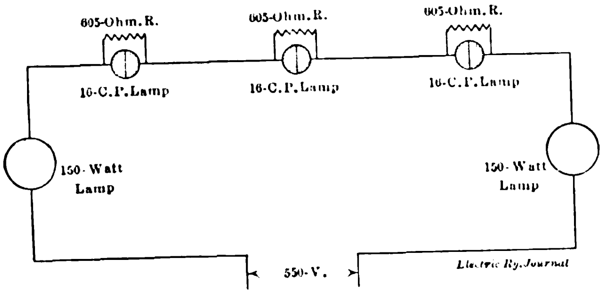
Shunt Resistances Used to Operate Signal and Lighting Lamps on One Circuit

BY J. G. KOPPEL, ELECTRICAL SUPERINTENDENT OF BRIDGES SAULT STE MARIE, MICH.

On a swing bridge used by an interurban electric railway, it was recently necessary to wire up both the navigation signals lamps and the illuminating lamps from the 600 volts d. c. traction circuit. The three signal lamps comprise one at each end and one at the center of the bridge, all of 16-cp rating. For illumination at each bridge end, however, one 150-watt lamp was chosen. The latter two lamps are so arranged that the operator may see the end rails from his cabin, which is located above the track at the center of the bridge.



Electric Ry. Journal

SHUNT RESISTANCES IN USE TO OPERATE SIGNAL AND LIGHTING LAMPS ON A RAILWAY CIRCUIT

To save conduit and labor in placing all lamps the two 110-volt, 150-watt lamps were wired in series with the three 110-volt, 16-cp lamps to form one circuit on the 600-volt line. However, attention was called to the point that the 150-watt lamps alone would not work in series with the 16-cp lamps. The trouble was overcome by placing a 605-ohm ½-amp resistance in shunt with each 16-cp lamp, as shown in the accompanying diagram. In operation this circuit has proved very satisfactory.

A Serviceable Coal Shovel for Car Stoves

BY J. N. GRAHAM, MASTER MECHANIC ROCKFORD (ILL.) & INTERURBAN RAILWAY

A good serviceable fire shovel for cars using stoves is very easily made from scrap to be found around any railway shop. The blade of the shovel is made from pieces of 16-gage dash iron, cut as shown in the accompanying diagram, and then bent so that the corners come together. The handle can be made of any scraps of ½-in. or ⅝-in. round iron flattened at the end to permit riveting to the blade, or it can be made of pieces of flat iron if the latter are not too heavy. These shovels will give better satisfaction than most of the shovels that can be bought and their cost is about the same. We used these shovels last winter with good results.

CAR STOVE SHOVEL MADE BY THE ROCKFORD & INTERURBAN RAILWAY

Comparative Merits of Motor Bearings

BY R. H. PARSONS, ELECTRICAL FOREMAN

Varied opinions are held as to the use of bronze versus iron-shell and axle bearings, some being greatly in favor of bronze and others still clinging to iron. In this article is it intended to set forth a few points for and against each, as both have their advantages.

The iron bearings consist of a heavy shell of cast or malleable iron, and in some instances of cast steel with a heavy lining of babbitt. The cast shell is cheap, the malleable a little more expensive and more durable, and the cast steel is still more expensive and more lasting, but it has the disadvantage of warping with heat, especially when babbitting. The iron-shell bearing is found to a great extent in the older type motors for which they are perhaps more economical because the conditions for accuracy and uniformity are unfavorable.

The bronze bearing includes a composition of 84 per cent copper, 12 per cent tin, 3.5 per cent zinc and 0.5 per cent lead, with a much thinner wall, lined with a light coating of babbitt. This bearing has come into almost general use in modern motors and, as built for them with all parts machined, standardized and fitted accurately, they give excellent results.

Generally speaking, the advantages found in the bronze bearing are many. An important one is that very little babbitt is necessary; and if by heating or by neglect the bearing is worn through the babbitt, the bronze makes a good wearing surface for the shaft. No harm is done, therefore, unless the wear is sufficient to allow the armature to strike the pole pieces. An iron-shell bearing, however, requires quite a thickness of babbitt to guard against this danger, for if the babbitt wears through the shaft would be running on iron. Since the inner side of these shells is made rough purposely to grip the babbitt, the result would not be good.

But the main point in favor of a bronze bearing is in the babbitting. It is a simple matter to tin the inside of a bronze bearing. Then when the babbitt is poured it adheres to the bronze to make a perfectly tight lining. On the other hand, it is difficult if not impossible to make the babbitt tight in an iron shell.

Even when much care is used in babbitting iron shells, as by heating them before pouring the babbitt, it will often be found that the cooled babbitt is loose in the shell. Again, the babbitt sometimes appears tight following the boring and installation, yet it will be found loose after running a short time. It may not be loose enough to rattle, but not much of a crevice is needed to permit the leakage of oil, and thus make an opportunity for a hot bearing.

Some wear between the outside of the bearing and the inside of the motor shell or housing is bound to come. A bronze bearing will take the greatest wear itself, saving the motor, but if the bearing is of iron the motor housing will be worn appreciably after a time, although the bearing will receive some wear, too. This is a point to be considered, as bearings are a small item as compared to paying $18 for a new housing for a box-frame motor, $175 upward for new shells, or reboring old shells at $15 or more each to take larger bearings. The reboring of shells itself is not an expensive job, but involves so much other work that the cost is often considerably increased. Shells must be stripped, fields and armatures overhauled, new dowels or keyways fitted for bearings, and new bearings of a larger size purchased, upon which follow the reassembling of the motor and the labor of removing from and replacing in the car. The cost depends on how much and how thoroughly this work is done. A special machine costing $500 to $600 is also necessary for the work. Hence, if bronze bearings will help extend the life of the shell or housing, they are well worth consideration.

The question of space often counts to a great extent in the choice of bearings. If the space is small the use of iron bearings would be impracticable because the lining necessarily would be thin, would be difficult to make and keep tight, and would be a source of danger from wearing through. This objection would apply to new motors where space would determine the size, or where it might be decided to use larger axles or armature bearings than those for which the motors were designed. In such instances bronze bearings could be used to advantage.

The first cost of the bronze bearing is about three and one-half times the cost of iron bearings, and under the same conditions the life of the iron bearing would be about double. The iron bearings will last say 600,000 miles while the outside wear will make it necessary to scrap the bronze bearing after a service of 300,000 miles, depending on the condition of the motors in which they are used. Against this the scrap value of the bronze bearing is as much as 10 cents to 14 cents per pound, depending on individual conditions, while the scrap value of the iron bearing is practically nothing.

The cost of babbitt enters also into any comparison because the iron bearing requires much more babbitt. This condition demands that a much larger stock of babbitt be kept on hand and continually turned over, thus giving greater opportunities for losses.

OTHER BEARINGS

Some roads have adopted non-babbitt bronze bearings for all motors, the bronze being made to certain specifications while the manufacturer contracts to take back the scrap at a value per pound probably 50 per cent lower than the original cost. In this way the bearing cost after the original installation would be the difference between the first cost and the scrap allowance. However, one point clear in this proposition is that if the bearing is not rebabbitted it must be turned into scrap when the bearing surface has worn enough to give the armature shaft vertical play. The limit would probably be 1/16 in. Therefore, for this 1/16-in. wear the bearing must be paid for at a rate of about 12 cents per pound for the whole bearing. The redeeming feature of this proposition is the entire elimination of the cost of babbitt, the labor for handling same, etc. This plan of handling the bearing problem has been taken up in a few places, but its success is not yet assured enough to encourage general adoption.

One or two roads have adopted to some extent cast-iron bearings without any lining, and these have been found to give some degree of satisfaction. While running a steel shaft against a cast-iron bearing undoubtedly would be successful for light service, assuming abundant lubrication, the result in case of heating would be far worse than with either a bronze or cast-iron babbitted bearing. Such a bearing would be very apt to freeze to and cut the shaft badly, would tend to destroy the dowel pins or keys, and would lead to the skidding and flattening of the wheels.

A solid babbitt metal bearing has been used by a few companies, but the results obtained are questionable.

Ball bearings for railway motors are being tried out in many places, but they have not yet reached that stage where they will supplant the ordinary oil bearing. For standard cars their saving in friction is not great enough to be a deciding point in their favor, while the lubrication of modern plain bearings has reached a degree of efficiency that does not make it necessary to use ball bearings just for the protection of the armature. However, the use of ball bearings in the motors of automobile and storage battery cars has proved that they are practicable in other respects than energy saving as they allow a closer design of the motor, permit less clearance of pole pieces and give a superior wear which keeps the gears, pinions and brushholders in better alignment. In general, ball bearings for motors fitted for plain bearings involve special designs and installation costs of $60 to $100 for motors of say 60-hp capacity. Their excellent service in storage-battery motors warrants the extra cost for the self-propelled car, but their advantages for larger motors of standard cars are not so decisive. Motors originally designed for the use of ball bearings would not necessarily cost much more on account of special design, but the price of ball bearings themselves is four or five times the cost of bronze bearings, and their life, without repairs, would not be longer if as long as that of a bronze bearing.

Effect of Impact Resulting from Flat Wheels

A test is being conducted by the mechanical engineering department of Purdue University, Lafayette, Ind., to determine the effect of the impact resulting from flat wheels. These tests cover flat spots of various sizes on wheels carrying definite loads and running at definite speeds. It has been found that an imperfect wheel with a 3-in. flat spot strikes the track with an impact of 104,000 lb. when the car is going 16 m.p.h. and is carrying a load of 20,000 lb. It was also found that under similar conditions a flat spot only 1½ in. in length produced a blow of 20,000 lb., and the impact for spots 2 in. long was 25,000 lb. A standard freight car was mounted in the test laboratory and special apparatus, including an instrument which photographed the magnitude of the blows, was employed to collect test data.

ASSOCIATION NEWS

JOINT COMMITTEE ON OVERHEAD AND UNDERGROUND CROSSINGS

The second meeting of this committee, which is still in the formative period, was held at association headquarters on Nov. 17. The first meeting was held on Sept. 30, and the third is scheduled for Dec. 16 at the same place. The following attended the meeting: Farley Osgood, Public Service Electric Company, chairman; G. W. Palmer, Bay State Street Railway Company, vice-chairman; R. D. Coombs, consulting engineer, New York, secretary; B. T. Anderson, Lackawanna Railroad; C. L. Cadle, New York State Railways; E. B. Katté (represented by deputy) New York Central Railroad; W. T. Oviatt, Narragansett Electric Lighting Company; P. H. Thomas, consulting engineer, New York, and L. S. Weld, Long Island Railroad. The committee discussed plans for its work and organization. It will eventually consist of about twenty representatives of all interests involved in overhead or underground crossing matters. Eventually suggested specifications will be prepared and submitted to the engineering public for criticism. The committee hopes also to be in a position to give advice on crossing problems when requested to do so. The new committee is the outgrowth of a committee of the National Electric Light Association on overhead construction formed in 1911 and subsequently enlarged into a joint committee by the addition of the chairmen of similar committees of other associations.

MEETING OF THE DENVER TRAMWAY COMPANY SECTION

The twenty-first monthly meeting of the section was held on Nov. 19, William M. Casey presiding. The following officers were elected: President, C. B. Wells, superintendent of transportation; vice-president, George L. Rice, superintendent Southern division; secretary-treasurer, H. G. Mundhenk, stenographer transportation department, and director for two years to fill the vacancy created by the expiration of Mr. Wells' term, A. N. Evans, engineering department.

The feature of the meeting was a series of talks by delegates to the Atlantic City convention of the association. Those who spoke at length were John A. Beeler, G. W. Dolezal, W. C. Swisher, E. L. Rice and W. H. Seip. Messrs. Casey, Adams and others took part in the discussion. The attendance at the meeting was 120.

R. H. INGERSOLL ON TELEPHONE DISPATCHING

In our issue for Nov. 21, page 1165, the recent Denver Company Section paper on the above subject by R. H. Ingersoll, chief dispatcher, was mentioned. In this paper the author stated that the dispatching of streets cars on city lines by telephone is the result of an inspiration that came just twenty-five years ago to C. K. Dunham, one of the early superintendents of what is now the Denver City Tramway. He gave interesting details of the work of his department, stating that it requires fifty-four telephones on thirty circuits operated by five men. He compared the dispatching system to the human brain, the driving, directing and controlling element. In the Denver Tramway it is a veritable clearing house for detail. Almost every department touches elbows with the dispatcher at some angle of its work. For example, a track greaser may find stones in the same switch day after day. He reports this to the dispatcher, who notifies one of the company's special officers. Again, the track repair gang and line repairmen keep the dispatcher notified of their whereabouts so that an emergency track or line trouble may be brought to their attention promptly. In case of sudden load, the dispatcher notifies the power house in time to prepare for it, as when heat is to be turned on as indicated by signal from the dispatcher's office. The superintendent of rolling stock provides the dispatcher with a list of cars, plows, sweepers, etc., distributed among the carhouses. He frequently calls upon trainmen for reports as to the condition of sand boxes at the ends of the line. In Denver the conductor pays his motorman and himself every night, keeping the record of the time given the car, trip by trip, by the dispatcher, so that the dispatcher's sheet is the record of every trainman's time for the day.

All of the above matters are incidental to real dispatching. When all cars are reporting on time, the work of dispatching is not difficult, for by long practice the schedules are memorized and the time can be given and put down quickly. The test of the dispatcher comes when nothing is on time. More important than figuring time is the judgment he displays. He must be a good guesser of what the conditions are and what each crew can and will do under those conditions. A dispatcher should have good street car sense combined with an ability to understand conditions and figure the best way out of his difficulties quickly.

The telephone dispatching system affords the superintendent the greatest facility for keeping in touch with every detail of the operation of cars. The flexibility of the car service and the rapidity with which it enables the dispatcher to adjust the headway on any line, are the strongest points in favor of this telephone system. In every city the travel demands the addition of extras in the morning and late afternoon, and by the telephone system the dispatcher can put out and withdraw such trippers without confusion, equalizing the spaces between the regular cars as fast as such extras are put out or withdrawn. Any congestion caused by accident or blockade also may be adjusted without difficulty in the same manner. There is a regular method of pulling down the lines at night, as the load or travel drops off; but if the dispatcher finds that the travel on any line is such as to require increased service, he may hold the full quota of cars, and if necessary use cars which are not needed on other lines. In this way, through the agency of but one or two men, who are alive to the needs of the patrons on all lines, the service is reduced to a minimum.

The use of the telephones employed in this service should be restricted by the dispatcher to those who in their line of duty are interested in the movement of cars, and when the use of the telephone is so limited a certain respect attaches to the messages transmitted and the tendency for small talk is discouraged. This small talk not only keeps someone else from getting in touch with the dispatcher, but it breaks down the wall of respect which should surround the dispatcher's office.

Mr. Ingersoll's paper provoked a lively discussion, and the men who are in contact with the dispatching system gave illustrations of its working and enthusiastically supported the speaker's contention.

The plan of piling the snow along the curb line as is done in Montreal is to be followed by the New York railways during the coming winter, except that in New York a new type of sweeper with an out-board broom will be used instead of the out-board plow of Montreal. The difference is obviously necessitated by the practical absence of sleighs in New York, a circumstance which makes it necessary to remove all snow from the street surface rather than to leave a coating of a few inches.

Equipment and Its Maintenance

Equipment Defects—Control Connections —III—Changing Motors from Series to Parallel

BY C. W. SQUIER, E. E.

With straight rheostatic regulation the control connections are comparatively simple as it is necessary only to arrange the circuits, as already described in a previous issue, and provide the means for decreasing the resistance of the circuit. When a series-parallel grouping of the motors is desired, however, it is necessary to provide contacts for making the transition from series to parallel. The control connections then become more complicated.

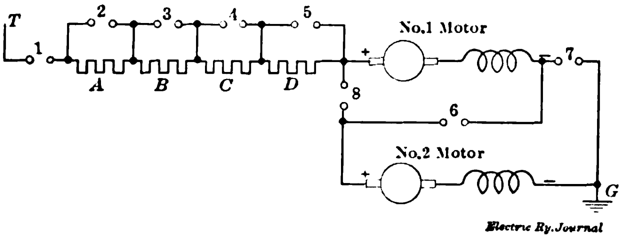

FIG. 7—CIRCUIT DIAGRAM FOR TWO MOTORS

Let us consider what steps are necessary to change the connections of two motors from series to parallel. By referring to Fig. 7, the circuit diagram for two motors, we see that two motors are connected in series by connecting the positive side of No. 1 motor to line through the regulating resistance, the negative side to the positive terminal of No. 2 motor, and the negative terminal to No. 2 motor to ground. To change this to the parallel connection it is necessary to open the circuit between the negative side of No. 1 motor and the positive side of No. 2 motor, and connect the positive side of No. 2 motor to line and the negative side of No. 1 motor to ground. The sequence by which this change or transition is carried out has led to what are called respectively the "open circuit" and the "short-circuited motor" methods.

OPEN CIRCUIT TRANSITION

If, in making the change from series to parallel, we first open the connection No. 6 between the motors, the circuit through both motors is opened so that power will be entirely shut off for a short interval. If the positive side of No. 2 motor is then connected to line by closing contact No. 8, and the negative side of No. 1 motor to ground by closing contact No. 7 at the same time, the change from series to parallel will be completed. This procedure, because the circuit is opened for a short interval, is called the "open circuit" method and is that used with the General Electric Company's Type L controllers. In order to distribute over several sets of contacts the arcing caused by opening the circuit, the circuit is opened at several points at once as at contacts No. 1 and No. 6 in the diagram mentioned. This arrangement provides several so-called series breaks and reduces the burning due to arcing at each point.

Fig. 8 shows a simplified diagram for an open-circuit controller. It is seen that in passing from the last series point to the first parallel point that the circuit is opened at the *T*, 15 and *E* contacts, and when closed again additional resistance is cut in to limit the current per motor to the accelerating value. This controller has five series and five parallel points and is designed to use five groups of parallel regulating resistance. One of this controller's disadvantages is the sudden jerking in the operation of the car when passing from series to multiple because the current is entirely shut off from the motors and the acceleration is stopped momentarily and then suddenly applied. This is uncomfortable to passengers and also throws an additional strain on the equipment. Another disadvantage is the burning of the contacts. The accelerating current is the largest that a controller has to handle under ordinary conditions, and as this type of controller has to open this maximum-current at every operation, it burns more than some other types.

SHORT-CIRCUITED MOTOR TRANSITION

Referring again to Fig. 7, if in making the change from series to parallel part of the regulating resistance is reinstated in the circuit by opening contacts Nos. 3, 4 and 5 after having been cut out for full series operation, and immediately following this the negative side of No. 1 motor is connected to ground by closing contact No. 7, we have No. 2 motor short-circuited. The next step in the transition is to open contact No. 6 and then close No. 8. This connects the motors in parallel with resistance groups *B*, *C* and *D* in the circuit. This way of changing the motors from the series to the parallel combination is termed the shunted motor or short-circuited motor method, and its sequence of connections is intended to overcome the stated disadvantages of the open-circuit method. Its disadvantage however, com-

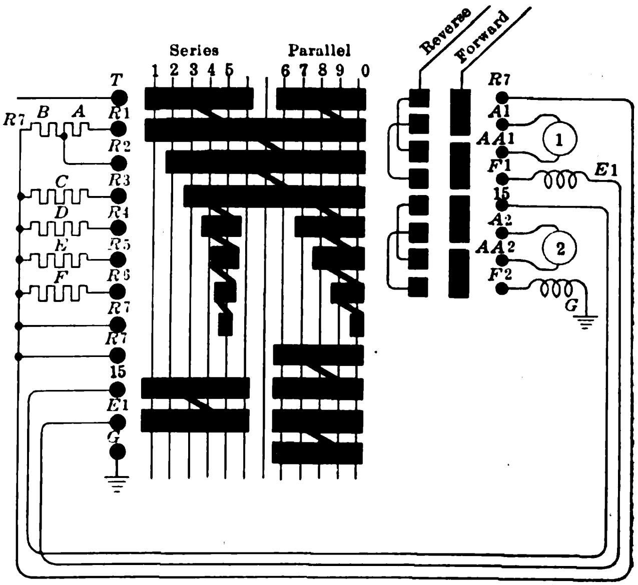

FIG. 8—CONNECTIONS FOR CONTROLLER WITH OPEN CIRCUIT TRANSITION

pared with the open-circuit method, is that a sudden rise in voltage is liable to occur on the first motor because that motor is in circuit for a short time with the resistance that is afterward used with both motors. Short-circuit transition changing from series to parallel is embodied in the design of the General Electric Company's Type K controllers. Fig. 9 shows a simplified diagram for the K-11 controller. This controller has five series and four parallel points and uses four groups of series regulating resistance.

Comparative Merits of Motor Bearings

BY R. H. PARSONS, ELECTRICAL FOREMAN

Varied opinions are held as to the use of bronze versus iron-shell and axle bearings, some being greatly in favor of bronze and others still clinging to iron. In this article is it intended to set forth a few points for and against each, as both have their advantages.

The iron bearings consist of a heavy shell of cast or malleable iron, and in some instances of cast steel with a heavy lining of babbitt. The cast shell is cheap, the malleable a little more expensive and more durable, and the cast steel is still more expensive and more lasting, but it has the disadvantage of warping with heat, especially when babbitting. The iron-shell bearing is found to a great extent in the older type motors for which they are perhaps more economical because the conditions for accuracy and uniformity are unfavorable.

The bronze bearing includes a composition of 84 per cent copper, 12 per cent tin, 3.5 per cent zinc and 0.5 per cent lead, with a much thinner wall, lined with a light coating of babbitt. This bearing has come into almost general use in modern motors and, as built for them with all parts machined, standardized and fitted accurately, they give excellent results.

Generally speaking, the advantages found in the bronze bearing are many. An important one is that very little babbitt is necessary; and if by heating or by neglect the bearing is worn through the babbitt, the bronze makes a good wearing surface for the shaft. No harm is done, therefore, unless the wear is sufficient to allow the armature to strike the pole pieces. An iron-shell bearing, however, requires quite a thickness of babbitt to guard against this danger, for if the babbitt wears through the shaft would be running on iron. Since the inner side of these shells is made rough purposely to grip the babbitt, the result would not be good.

But the main point in favor of a bronze bearing is in the babbitting. It is a simple matter to tin the inside of a bronze bearing. Then when the babbitt is poured it adheres to the bronze to make a perfectly tight lining. On the other hand, it is difficult if not impossible to make the babbitt tight in an iron shell.

Even when much care is used in babbitting iron shells, as by heating them before pouring the babbitt, it will often be found that the cooled babbitt is loose in the shell. Again, the babbitt sometimes appears tight following the boring and installation, yet it will be found loose after running a short time. It may not be loose enough to rattle, but not much of a crevice is needed to permit the leakage of oil, and thus make an opportunity for a hot bearing.

Some wear between the outside of the bearing and the inside of the motor shell or housing is bound to come. A bronze bearing will take the greatest wear itself, saving the motor, but if the bearing is of iron the motor housing will be worn appreciably after a time, although the bearing will receive some wear, too. This is a point to be considered, as bearings are a small item as compared to paying $18 for a new housing for a box-frame motor, $175 upward for new shells, or reboring old shells at $15 or more each to take larger bearings. The reboring of shells itself is not an expensive job, but involves so much other work that the cost is often considerably increased. Shells must be stripped, fields and armatures overhauled, new dowels or keyways fitted for bearings, and new bearings of a larger size purchased, upon which follow the reassembling of the motor and the labor of removing from and replacing in the car. The cost depends on how much and how thoroughly this work is done. A special machine costing $500 to $600 is also necessary for the work. Hence, if bronze bearings will help extend the life of the shell or housing, they are well worth consideration.

The question of space often counts to a great extent in the choice of bearings. If the space is small the use of iron bearings would be impracticable because the lining necessarily would be thin, would be difficult to make and keep tight, and would be a source of danger from wearing through. This objection would apply to new motors where space would determine the size, or where it might be decided to use larger axles or armature bearings than those for which the motors were designed. In such instances bronze bearings could be used to advantage.

The first cost of the bronze bearing is about three and one-half times the cost of iron bearings, and under the same conditions the life of the iron bearing would be about double. The iron bearings will last say 600,000 miles while the outside wear will make it necessary to scrap the bronze bearing after a service of 300,000 miles, depending on the condition of the motors in which they are used. Against this the scrap value of the bronze bearing is as much as 10 cents to 14 cents per pound, depending on individual conditions, while the scrap value of the iron bearing is practically nothing.

The cost of babbitt enters also into any comparison because the iron bearing requires much more babbitt. This condition demands that a much larger stock of babbitt be kept on hand and continually turned over, thus giving greater opportunities for losses.

OTHER BEARINGS

Some roads have adopted non-babbitt bronze bearings for all motors, the bronze being made to certain specifications while the manufacturer contracts to take back the scrap at a value per pound probably 50 per cent lower than the original cost. In this way the bearing cost after the original installation would be the difference between the first cost and the scrap allowance. However, one point clear in this proposition is that if the bearing is not rebabbitted it must be turned into scrap when the bearing surface has worn enough to give the armature shaft vertical play. The limit would probably be 1/16 in. Therefore, for this 1/16-in. wear the bearing must be paid for at a rate of about 12 cents per pound for the whole bearing. The redeeming feature of this proposition is the entire elimination of the cost of babbitt, the labor for handling same, etc. This plan of handling the bearing problem has been taken up in a few places, but its success is not yet assured enough to encourage general adoption.

One or two roads have adopted to some extent cast-iron bearings without any lining, and these have been found to give some degree of satisfaction. While running a steel shaft against a cast-iron bearing undoubtedly would be successful for light service, assuming abundant lubrication, the result in case of heating would be far worse than with either a bronze or cast-iron babbitted bearing. Such a bearing would be very apt to freeze to and cut the shaft badly, would tend to destroy the dowel pins or keys, and would lead to the skidding and flattening of the wheels.

A solid babbitt metal bearing has been used by a few companies, but the results obtained are questionable.

Ball bearings for railway motors are being tried out in many places, but they have not yet reached that stage where they will supplant the ordinary oil bearing. For standard cars their saving in friction is not great enough to be a deciding point in their favor, while the lubrication of modern plain bearings has reached a degree of efficiency that does not make it necessary to use ball bearings just for the protection of the armature. However, the use of ball bearings in the motors of automobile and storage battery cars has proved that they are practicable in other respects than energy saving as they allow a closer design of the motor, permit less clearance of pole pieces and give a superior wear which keeps the gears, pinions and brushholders in better alignment. In general, ball bearings for motors fitted for plain bearings involve special designs and installation costs of $60 to $100 for motors of say 60-hp capacity. Their excellent service in storage-battery motors warrants the extra cost for the self-propelled car, but their advantages for larger motors of standard cars are not so decisive. Motors originally designed for the use of ball bearings would not necessarily cost much more on account of special design, but the price of ball bearings themselves is four or five times the cost of bronze bearings, and their life, without repairs, would not be longer if as long as that of a bronze bearing.

Effect of Impact Resulting from Flat Wheels

A test is being conducted by the mechanical engineering department of Purdue University, Lafayette, Ind., to determine the effect of the impact resulting from flat wheels. These tests cover flat spots of various sizes on wheels carrying definite loads and running at definite speeds. It has been found that an imperfect wheel with a 3-in. flat spot strikes the track with an impact of 104,000 lb. when the car is going 16 m.p.h. and is carrying a load of 20,000 lb. It was also found that under similar conditions a flat spot only 1½ in. in length produced a blow of 20,000 lb., and the impact for spots 2 in. long was 25,000 lb. A standard freight car was mounted in the test laboratory and special apparatus, including an instrument which photographed the magnitude of the blows, was employed to collect test data.

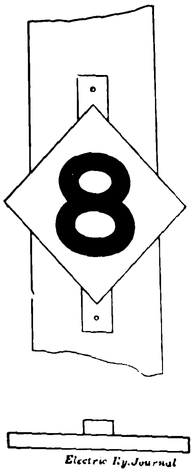
Standard Way Signs Approved by Connecticut Public Utilities Commission

In the inspection of electric street railway lines operated in the State of Connecticut, the Public Utilities Commission found that no uniform system of signs governing the operation of cars had been adopted by the various companies. The commission believes that this lack of uniformity creates confusion on the part of the general public desiring to board or alight from cars and in some cases it may be a possible element of danger. It therefore approved on Oct. 27 as of Oct. 1, 1914, a standard for station, stop, speed limit, slow, warning and whistle signs, as shown in the accompanying drawings. The commission orders and directs the use of such signs by all electric street railway companies operating in the State of Connecticut not later than April 15, 1915. The details of each sign follow:

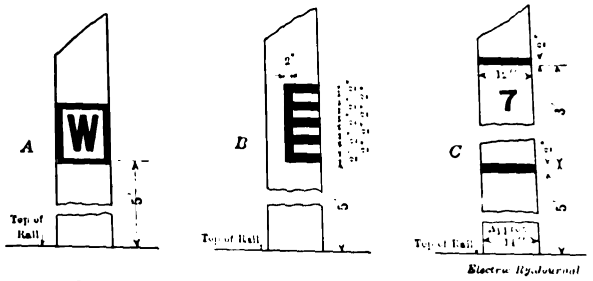
Stop—Face red, letters black, back black.

Slow—Face yellow, letters black, back black.

Whistle—White field, black band, black letter.

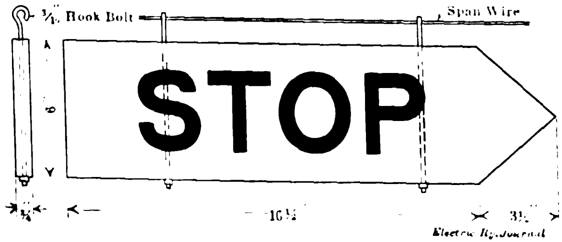


SPEED LIMIT SIGN



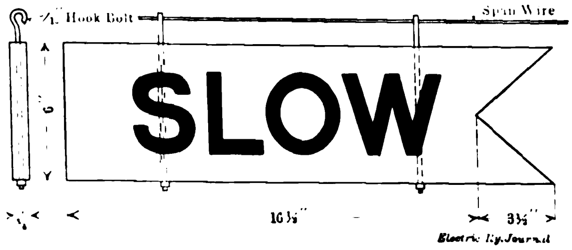
WHISTLE, WARNING AND STATION SIGNS

Speed limit—Face yellow, figures black, back black. Dimensions: Vertical diagonal of board, 13 in.; horizontal diagonal of board, 12 in.; thickness of board, 7/8 in.; height of figures, 6 7/8 in.; nailing strip, 17 in. x 2 in. x 7/8 in.; distance from top of rail to sign, 5 ft.



STOP SIGN

Warning—White bars on black field; four poles away, four bars; three poles away, three bars; two poles away, two bars; one pole away, one bar.

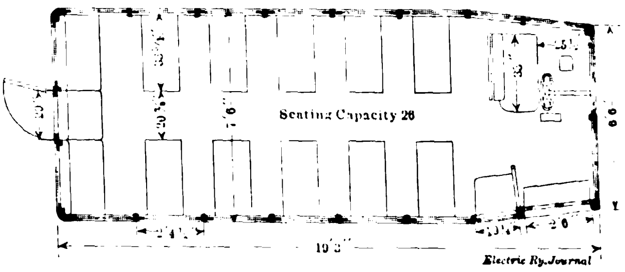


SLOW SIGN

Station—White band, black rings, black figure.

Cleveland Motor Bus for Traffic Development

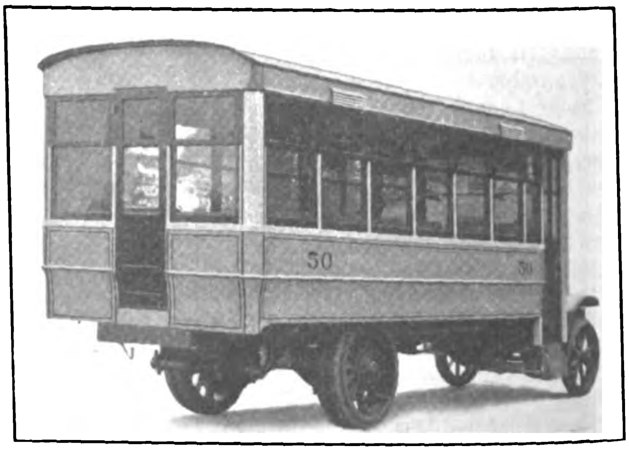
The Cleveland Railway, in acceding to a recent demand for an extension of its lines into a sparsely settled suburban district, substituted motor omnibuses for track and cars. After surveying the territory from which the demand for an extension came, the company had decided that a track extension could not be operated profitably. On the other hand, if some form of transportation service was rendered, it was quite certain that the territory would develop rapidly and soon reach a point where a street railway service could be furnished at a profit. The installation of the motor bus instead of the street car satisfied the community, and even if operation is at a slight loss, or expenses only are made for the time being, the change in policy represents a saving.



CLEVELAND MOTOR BUS—GENERAL PLAN

Three buses were put in operation on Sept. 1, two of which are used in regular service and one is kept in reserve. Since they have been in operation only a short period, complete operating data are not available. The earnings have averaged 24 cents per bus-mile; the platform expense for twenty-six seated passengers has been 30 cents per hour, or about 6 cents per bus-mile. These buses are used in two suburban districts, one in East Cleveland and the other in South Brooklyn, a suburb of Cleveland. The schedules cover an approximate half-hour service.

An exterior view and a floor plan of one of these buses are shown in the accompanying illustrations.



CLEVELAND MOTOR BUS—EXTERIOR VIEW, SHOWING NORMAL NEAR-SIDE ENTRANCE AND EXIT AND EMERGENCY REAR EXIT

A double folding door at the front right-hand corner provides entrance and exit to the body. This door is operated from the chauffeur's seat. The mechanism which opens and closes the door also raises and lowers the step. An emergency door at the center of the rear end of the bus is fitted with a mechanism to permit opening by the passengers. The general dimensions of the body are as follows:

Length over corner posts	19 ft. 3 in.
Width over sills and panels	7 ft. 3¼ in.
Width over posts	7 ft. 6 in.
Center to center of side posts	2 ft. 4½ in.
Height from top of floor over roof	7 ft.

The body is built with an oak bottom framing reinforced with structural steel channels, and the body framing is of ash. Heat is furnished by four Garrison heaters, connected to the engine exhaust and provided with valves for regulation. Four Perry ventilators are also fitted into the letterboard, two on each side of the bus. Two lamp circuits, one over the center of each row of cross-seats, have sockets for 6 cp and 8 cp lamps. These circuits are connected to a storage battery installed at the chauffeur's seat, and to a generator mounted on the chassis. The body is also equipped with hand straps and push-button buzzer system. These buses were designed and built by the G. C. Kuhlman Car Company, Cleveland, Ohio.

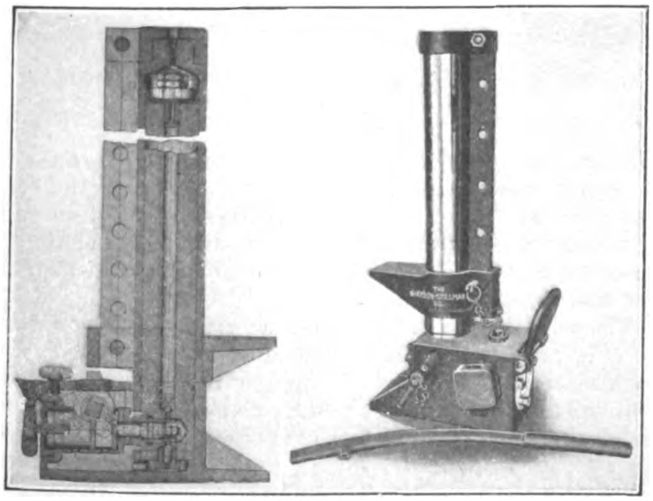
Hydraulic Emergency Jack

The Watson-Stillman Company, New York, has just brought out a new type of hydraulic jack. Primarily the design was intended as an emergency jack for electric railway use, but it will be welcomed by any shop or factory where lifting work is performed. As shown in the accompanying cuts, the following unusual features are embodied in this jack.

The claw can be moved vertically and adjusted to the most convenient height and, with the cylinder, can be swung in a complete circle without changing the position of the jack or of the pump level.

The cylinder is the moving part of the jack instead of the ram, as in the ordinary jack, thus allowing the pump mechanism to stay in a fixed vertical position and permitting the working parts of the jack to be made simpler and more compact.

The piston is packed with leather rings; the valves are of the ball type, and all passages are made so large that the construction is practically foolproof.

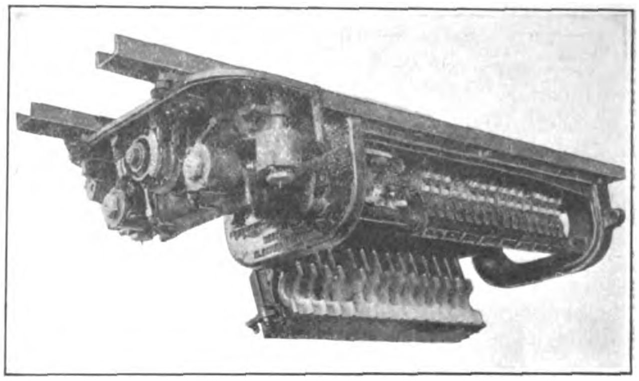


HYDRAULIC EMERGENCY JACK IN SECTION AND COMPLETE

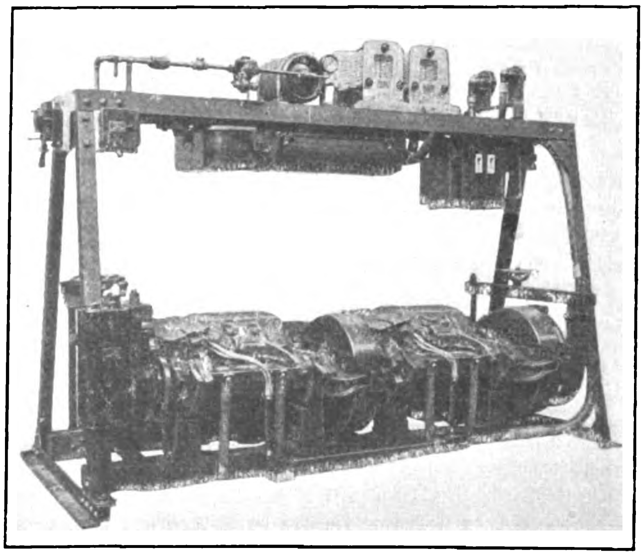
The release of the pressure is by a key operating a small needle valve. Again, while the operating lever is but 18 in. long one man weighing 125 lb. can obtain the maximum pressure with but slight effort. The lever is made curved in shape and the socket has a hole in each of its four sides to allow convenient operation from practically any position. These jacks are operated with a special oil, which, besides acting as a lubricant, prevents rust on working parts, avoids freezing and does not injure the packings. These jacks are now built in 5 and 10-ton sizes with a ram stroke of 10 in. They are guaranteed to stand a 50 per cent overload without detrimental effect to any of their parts.

Unit Switch Control for Platform Type Controllers

To get the many advantages of remote control and yet utilize the existing platform controllers, a very satisfactory pneumatically operated device known as the PK head was brought out some time ago by the Westinghouse Electric & Manufacturing Company for attachment to a standard platform or K type of controller. The head is controlled from the master controller mounted on the platform, thus making possible the mounting of the K controller horizontally under the car with the head attached. A line switch also mounted under the car acting as a circuit breaker and containing two individual unit switches opens the main circuit, thus removing all heavy current-carrying parts from the platform. In the case of double-end control one of the K controllers is removed from the car entirely.



K-TYPE CONTROLLER AS MOUNTED UNDER THE CAR



VIEW OF UNIT SWITCH CONTROL COMPLETE ON EXHIBIT RACK

The essential feature of this equipment is the PK pneumatic operating head which consists of air cylinders with pinion and rack mechanism which rotate the K control drum notch, governed entirely and accurately by the motorman who manipulates the master controller on the car platform.

The apparatus possesses the very decided advantage of introducing a time element in the drum rotation or progress of the K controller. In other words, while it may be rotated or advanced to full series or multiple as rapidly as any operating condition demands, it advances to these positions with a reasonable and desirable time element. This makes it impossible for a motorman deliberately to abuse the equipment. The K controller is employed merely as a commutating switch with a closed circuit, bringing in and cutting out the various resistance steps, but through the cycle of series-parallel operation the drum does not make or break the main circuit. In this way wear and tear on the contacts are eliminated and the danger of welded contacts is removed. This "making" and "breaking" is cared for by the auxiliary two-unit line switch previously mentioned.

The equipment is designed to operate on a maximum air pressure of 70 lb. but will operate at a minimum of 50 lb. of compressed air obtained from the brake system. The master controller is small and compact, and controls the movement of the PK head and consequent acceleration of the car. It is operated, as far as the motorman is concerned, like a type K controller, so that no special instructions are necessary. The line switch, in connection with an overload trip mounted on one of its end frames, takes the place of the usual car circuit breaker. In case of overload or short-circuit the overload trip relay opens the two switches of the line switch and thus cuts off power. Whenever the overload trip operates the line switches cannot be closed again until the trip has been "reset" by moving the control switch to the "reset" position, first placing the master controller in the "off" position, thus preventing abuse by closing the circuit breaker with the type K controller on any running position. When two or more cars are coupled in a train, the PK head on each will operate simultaneously under the direction of the selected master controller in the train.

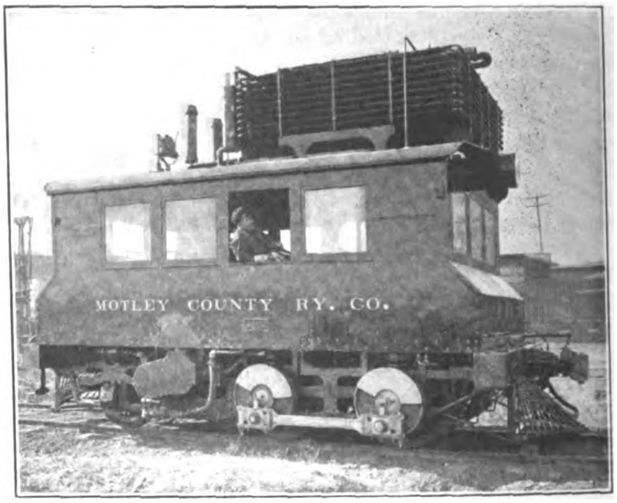
After exhaustive tests on trial equipment this type of control was selected by the Third Avenue Railway, New York, as it successfully met the demands of equipment space limitations and insured perfect safety to passengers. It is also used on 125 cars of the New York City Railway's Broadway division, which has unquestionably the hardest street railway service in the United States.

Gasoline Switching Locomotive for Motley County Railway

The Motley County (Tex.) Railway recently purchased a 300-hp gasoline switching locomotive from the McKeen Motor Car Company, Omaha, Neb. The locomotive made the trip from Omaha to Matador, Tex., under its own power. It is used in freight and switching service between Roaring Springs Junction on the Quanah, Acme & Pacific Railway and Matador, Tex. This locomotive has a tractive effort of 12,000 lb. at 6 m.p.h. The motorman's position in the center and on the right side of the locomotive with an uninterrupted view in all directions, together with the air-reverse control, is far superior to the steam locomotive for signal observation owing to the absence of boiler and tender. Of the general features only the cab resembles the 200-hp locomotives built by the McKeen Motor Car Company, the 300-hp design being in the 0-4-2 class.

The frames are of cast steel and the driving wheels 42 in. in diameter. The usual locomotive spring suspension with equalizers is used. The engine bed is a steel integral casting which forms an efficient brace and reinforcement in tying together one side frame to the other. The all-steel cab covers the entire length of the locomotive frame between the bumper beams and is so bolted to the frames and buffer beams as to add very materially to the strength of the locomotive. The headlights are operated by acetylene. The straight air brake is used on the locomotive, which has a Gregory brake valve to permit the operation of automatic brakes on the train.

The diameter and stroke of the 300-hp six-cylinder engine is 11 in. and 15 in. respectively. Its general design and details correspond to the manufacturer's latest model (foolproof) Type C engine, which is notable for increased water circulation around valves and cylinder heads; tungsten steel valves; piston triple rings; special compound hardened cams; faultless magneto; water-jacketed intake pipes; inclosed flywheel, crankcase and camshaft, water and air pumps driving mechanism; combination splash and automatic lubricating system; gears of herringbone type. Among the new characteristics is the use of two exhaust pipes, which extend through and above the roof. The engine has an air-reversing mechanism which adds materially to the convenience and ease of the motorman. Two 5-in. air compressors are attached to the engine crankshaft, in addition there is an auxiliary air compressor in the cab for emergency service.



GASOLINE SWITCHING LOCOMOTIVE USED BY MOTLEY COUNTY RAILWAY

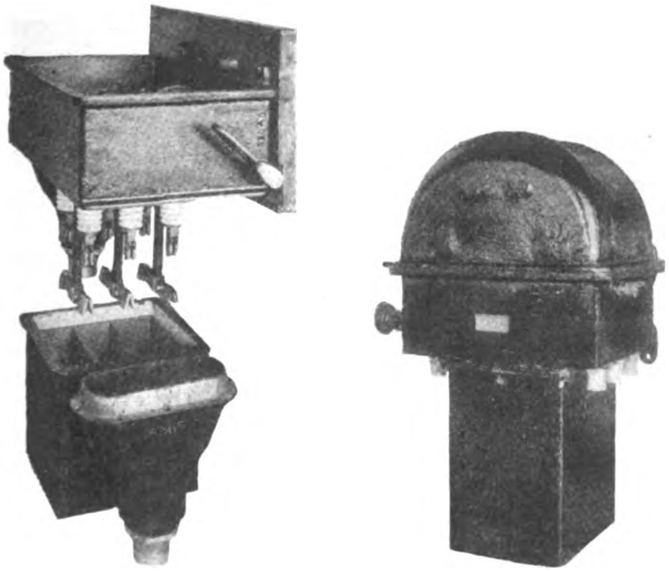
The ends of the front or main driving axle and rear driving axle have counterbalance crank disks which are connected by side rods. The power transmission, pneumatically operated, is effected by means of a sprocket on the crankshaft, through a Morse chain to a sleeve working free on the rear driving axle and is then transferred through a multiple disk friction clutch, from which it is delivered by a Morse chain to the forward driving axle where, by another clutch, the power is either magnified by a series of gears to produce heavy tractive effort and high torque for starting purposes, or is delivered direct to the driving wheels. By thus magnifying the torque of the internal combustion engine great starting effort is obtained for this style of locomotive. At the same time when the locomotive is once in motion, higher economy is obtained by cutting out the gears and operating the direct connection. The general dimensions of this locomotive follow:

Driving wheels, diameter		42 in.
Driving wheelbase	4 ft.	8 in.
Total rigid wheelbase	12 ft.	0 in.
Length over bumper beams	19 ft.	6 in.
Length between pulling faces of couplers	22 ft.	5½ in.
Length over all	22 ft.	11½ in.
Height, rail to top of exhaust pipe	13 ft.	3 in.
Height, rail to top of cab	10 ft.	8 in.
Width over cab	9 ft.	8 in.
Width over cab eaves	10 ft.	0 in.
Center to center of frames	6 ft.	9⅛ in.

Oil Switches for Manhole Service

Two new types of manhole oil switches for mounting on flat vertical surfaces have recently been developed by the General Electric Company. One of the switches is for operating by hand and the other by a solenoid, which is an integral part of the switch. They can be used in locations where there is danger of flooding.

In the hand-operated switch there are two bell chambers through which run the leads to and from the switch. This chamber is of the usual construction and, after the leads are connected to the switch terminals, is filled with an insulating compound and made air tight. The bell chambers, as well as the oil vessel and cover, are cast iron. They are bolted to the cast-iron switch frame, the joints being made watertight by gaskets. The operating handle is outside the frame and can be operated by a hook from the entrance to the manhole. The shaft handle passes through a stuffing box.



MANHOLE OIL SWITCHES FOR HAND AND SOLENOID OPERATION RESPECTIVELY

The solenoid-operated switch as a rule is operated from the central station by the usual control switch located in the station. The mechanism is especially simple, the plunger of the solenoid being connected direct to the crosshead attached to the operating rods. The switch solenoid uses current only while the switch is in the act of closing or opening by means of the tripping coil. The switch is held closed by a catch, which allows the switch to open by gravity when the catch is thrown out of position either by the trip coil plunger or by a small tripping lever located outside the switch frame.

Both hand and solenoid-operated switches have an indicator, which can be seen from the top of the manhole and shows whether the switch is open or closed.

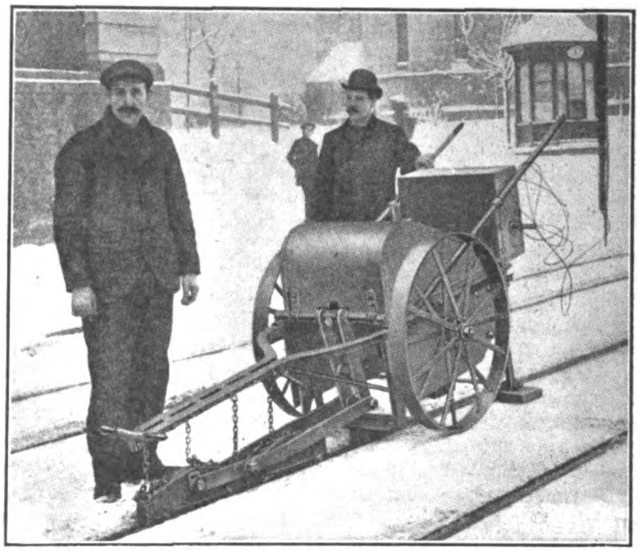
Transite backing has been found a good insulation for the supports of controllers, motors and starting boxes mounted on the steel columns or other metal structures of electric railway shops.

A Light Rail Filing Machine

A light, portable rail filing machine for filing cupped rail joints, corrugations and other rail-head defects has recently been introduced by the U. S. Metal & Manufacturing Company after extended use abroad. A view of this machine as actually used at Trondheim, Norway, is reproduced herewith.

Stress is placed by the builder on the tilting feature which permits bringing the file plane to bear upon and to be raised from the rail in such simple fashion that the work can be undertaken while the cars are running.

The frame of the machine is supported upon two iron wheels. The driving motor and gear are mounted upon the frame. The motor acts by means of a driving rod upon a two-armed swinging lever, on the lower end of which the thrust rod for the file plane is mounted. On the frame a lifting arm or boom projects toward the front, on which arm the file planes are suspended by means of chains. At the rear of the wheels are two supports which can be raised or lowered. If the supports are lowered the rear of the machine is raised and the boom tilted toward the rail in accordance with the bearing surface pressure required upon the file planes.



PORTABLE GRINDER IN USE AT TRONDHEIM, NORWAY

Extra weights can be attached to the file planes when hard rails are to be filed. The starting box and tool box are located at the rear of the machine, between the handles. Either files or carborundum may be employed in filing the rails.

The maximum stroke of the file planes is approximately 19 in.

Boston Subway Entrances and Exits

The Boston Finance Commission has recommended to Mayor Curley that the size of the Cambridge subway entrances and exits on Tremont Street, Boston, be reduced in height and length, subject to the approval of the Boston Transit Commission and the Boston Elevated Railway. The board recommends that the entrance be rebuilt to conform to the type of stairway covering in use at Central Square, Cambridge, and that the escalators be changed to a uniform design. In advices received from the Boston Transit Commission the finance board was informed that the exposure of the escalators to the weather is undesirable on account of injury to the machinery and interference with operation, but the latter board is of the opinion that the size of the coverings can be further reduced without danger to the service.

News of Electric Railways

RICHMOND FRANCHISE GRANT

Company Desires Thirty-Year Grant—Fare Readjustment Asked—Arbitration of Disputes Suggested

As previously noted in the ELECTRIC RAILWAY JOURNAL the Virginia Railway & Power Company, Richmond, Va., has submitted to the City Council a petition and draft of an ordinance under which it offers to surrender its various franchise grants and accept a thirty-year blanket franchise in their place. The present grants have thirteen to fifteen years to run. In its letter of transmissal to the Council the company says that it is to the interest of both the city and the company that the company be granted the right to occupy the streets upon clear and definite terms with one grant covering the whole territory and that the provisions of the grant be as liberal as consistent with the public interests and the retention of proper control and supervision over the streets to the end that the service may be rendered at the lowest operating cost. The company says that the varying dates of expiration of the existing franchises will be a source of embarrassment to the city and that they are already causing inconvenience to the company in perfecting financial arrangements and in the administration of its properties.

The company has prepared a form of ordinance which it is believed will accomplish the results desired. This ordinance is merely a rough draft, in which the effort has been made to conform as far as possible to the provisions of existing ordinances, the idea being to have the draft ordinance as presented constitute a basis for discussion and consideration by the proper committee and by the Council.

The only mortgage lien upon the properties of the company in Richmond is the mortgage of the Virginia Railway & Power Company, dated July 1, 1909, given to secure an issue of $15,000,000 of bonds. Under this lien the company is authorized, with the consent of the trustees, to surrender its franchises and accept in lieu a new grant. Property recited in detail in the draft which the company proposes to transfer and convey to the city is at present valued in excess of $1,000,000. Under existing conditions the company is required to grant a 5-cent straight fare, sell six tickets for 25 cents, provide tickets good between 6 a. m. and 7 a. m. at 2½ cents each and furnish tickets to pupils attending schools and colleges at 2½ cents each. As a result of these rates and the system of transfers in vogue a passenger can ride from any point in the city to practically any other in the city or its suburbs for 4 1/6 cents and at certain hours of the day for 2½ cents. The average fare for passengers carried is 3 cents.

After reciting briefly the conditions under which the rates of fare were fixed and referring to the cost of labor in the various departments of the company for 1914 as compared with 1896 and 1900, the company says:

"It follows from these figures that if the rates of fare fixed in the franchises granted in 1896 and 1900 were reasonable and just, they must be unreasonable and unjust to the company at the present time, when the average length of haul per passenger has practically doubled through growth of suburban territory, and the cost of everything entering into the transportation has increased in excess of 50 per cent, while the rate of fare per passenger carried has actually decreased."

The ordinance submitted by the company suggests no rate of fare. The statement is made that it is hoped that the fares may be fixed upon a basis which will be just not only to the company but enable it to finance its requirements upon a basis favorable to the public and to the public service. It is suggested that provision be made for the readjustment of fares from time to time as changed conditions may require. The company was required under its franchise to pay to the city in 1913 in taxes a total of $179,076, or an amount equal to interest at 4 per cent for the year on approximately $4,500,000. In addition the company sustained a loss on account of the special 2½-cent fare in the morning. In short, the company paid the city in direct taxation and in charges for the benefit of the public an amount in excess of 12 per cent on its gross railway earnings within the city. In addition to this it is required to pay the State franchise tax and the federal income tax. The total taxes and licenses paid by the company in all jurisdictions for the year ended June 30, 1914, was $308,111, which is an increase of $33,522 over the preceding year. This increase is continuing for the present year at the same ratio.

It is suggested that in addition to the payments for paving and repairing the new ordinance provide a tax upon gross receipts in lieu of all other charges. Arbitration is suggested as the method best suited to disposing of such questions as may present themselves for settlement under the grant.

THE CLEVELAND RAPID TRANSIT FRANCHISE

Lack of a quorum is believed to have prevented the Council committee of the whole at Cleveland, Ohio, from going on record in favor of the amended franchise ordinance of the Cleveland Rapid Transit Company on Nov. 20. Councilman Gahn advocated a plan of fixing the purchase price for the city by arbitration. Mayor Baker opposed this plan and said further that a bond to guarantee the beginning of work on the subway within a specified time, suggested by Dr. Charles S. Howe, the president of Case School of Applied Science, would be of little value. He suggested that the ordinance be so amended as to require the expenditure of a certain amount on construction each year. Data collected by City Engineer Hoffman showed that the cost of building the tunnel would be about $551,179 per mile of single track.

At the meeting of the committee on Nov. 18 Dr. Howe charged the company with dilatory tactics and suggested that it be compelled to give a bond of $1,000,000 to insure its commencing work on the subway within the prescribed time. W. R. Hopkins, president of the company, said:

"We not only have not asked for favors, but have rendered a great public service in working out the subway plans. The general idea that we are nursing along something valuable is tragic, it is so untrue. The moment the city indicates that it does not want a subway system, I am ready to quit."

Allen T. Burns, head of the Cleveland foundation survey, suggested that the city retain the right to allow other companies to use the subway. Mr. Hopkins agreed to have this section of the ordinance rewritten. During the debate Mr. Hopkins stated that the idea of building a subway was Tom L. Johnson's and that Mr. Johnson had asked him to go into it as a citizen. He drafted the original ordinance. Everything in relation to the matter has been open and those interested in the amended ordinance may secure any information desired. Now, however, it is his desire, if the city wants the subway, to go before financiers with as nearly a unanimous vote of Council as possible, that they may know that Cleveland really wants faster transportation.

At a meeting of a number of business men with O. C. Barber, Barberton, Ohio, in the law offices of Goulder, Day & White, a proposition to build a freight subway under East Fifty-fifth street to connect the lake front with the upper Cuyahoga Valley was discussed.

SUBWAY LABOR TROUBLES

The Public Service Commission for the First District of New York has adopted the plans and form of contract and began advertising for bids, to be received and opened on Dec. 11, for the construction of Section No. 4 of Routes Nos. 4 and 36, that part of the new Broadway subway in Manhattan extending northerly under Seventh Avenue from Fifty-first Street to a connection with the crosstown part of the line in Fifty-ninth Street.

During the week ended Nov. 21 the Oscar Daniels Company, contractors for Section No. 1 of Route No. 18, suspended work on that contract on account of an acute situation which had arisen in regard to the employment of aliens on the work. The New York labor law provides that on public works no non-citizens shall be employed. Recently the Bricklayers and Masons' Union made complaint to the Public Service Commission that various contractors on the new subways were violating the labor law in this and other particulars, and on Nov. 12 sent letters to several contractors notifying them of such violations and demanding immediate compliance with the law. As the law provides for the forfeiture of a contract in case its provisions are violated, as well as for punishment for misdemeanor, the Daniels Company felt unwilling to take the risk which a continuance of work might bring, especially as a large number of its employees were not citizens. Accordingly, it announced the suspension of work. Meanwhile the Public Service Commission and the subway contractors generally are giving serious consideration to the situation, with the hope that some means may be found to continue work on all contracts. Various contractors have informed the commission that they regard it as impossible to get a sufficient number of American citizens to carry out their contracts, especially in excavation work. A complaint by John Gill, business agent of the Bricklayers and Masons' Union, against the Dock Contractor Company, alleging violation of the labor law, is pending before the commission.

RAILWAYS UNITE AGAINST MAIL RATE LEGISLATION

The Western Association of Short Line Railroads was organized in San Francisco on Nov. 16, when thirty representatives of short-line railroads in California, Arizona, Nevada and Idaho met to consider their common interests in the proposed reduction of rate of payment for carrying United States mail, and their dealings with the Interstate Commerce Commission. It was agreed that all of the smaller railroads in California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, Utah, Nevada, Arizona and New Mexico should be asked to join the association. Officers elected at the meeting were: D. M. Swobe of the McCloud River Railroad, president; L. G. Cannon of the Nevada Northern Railroad, first vice-president; D. L. Bliss of the Lake Tahoe Railroad, second vice-president; C. M. Oddie of the Nevada Central Railroad, secretary,

The directors are: For three years—D. M. Swobe of the McCloud River Railroad, R. K. Minson of the Arizona & New Mexico Railroad, L. G. Cannon of the Nevada Northern Railroad. For two years—D. L. Bliss of the Lake Tahoe Line, E. N. Heigho of the Pacific & Idaho Northern Railroad, and C. M. Oddie of the Nevada Central Railroad. For one year—R. M. Cox of the Nevada-California-Oregon Railroad, E. O. Burns of the San Diego & Southeastern Railroad, and a representative to be chosen from the Oakland, Antioch & Eastern (Electric) Railway. The committee which is to make the contest for fair payment for carrying the mails, even to sending a representative to Washington, consists of R. M. Cox of the Nevada-California-Oregon Railroad, L. G. Cannon of the Nevada Northern Railroad, C. M. Oddie of the Nevada Central Railroad, E. N. Heigho of the Pacific & Idaho Northern Railroad, and O. W. Lehmer of the Yosemite Valley Railroad. This committee was instructed to oppose actively the Bourne bill and the Moon bill, pending in Congress, either of which will reduce the payments to the small roads by from 25 per cent to 65 per cent.

WESTERN MASSACHUSETTS TRANSPORTATION HEARINGS CLOSED

Final hearings were concluded at Boston, Mass., on Nov. 24 by the commission on transportation in western Massachusetts, which is to report to the Legislature by Jan. 15 next upon possible means of electric railway and highway development in the Berkshire district. L. S. Storrs, C. Q. Richmond and others discussed electric railway conditions in the region west of the Connecticut River and pointed out the possibilities of supplementary service between local electric railways and steam roads. The commission will confer with the Public Service Commission and with other railroad officials before drafting its report.

PLANS FOR RENEWING TOLEDO NEGOTIATIONS

It is expected that Henry L. Doherty, chairman of the board of directors of the Toledo Railways & Light Company, will be in Toledo during the week commencing Nov. 23 to review with his attorneys the tentative franchise recently submitted by the franchise committee.

The proposed franchise is said to contain many of the provisions of the draft prepared by Mr. Doherty early in the negotiations and also some of those offered by the Toledo Citizens' Franchise Association. Under it the company would operate at a straight 3-cent fare for one year, under a commissioner appointed by the city. At the end of that time the fare would be fixed for a term of five years, based upon the experience of the year and the value of the property, as fixed by appraisers named by the city. The fare would then be revised every five years thereafter, if necessary. The committee proposes to allow the company a 6 per cent return on its investment.

Copies of the new franchise will probably not be distributed widely until the various points at issue are thoroughly threshed out at conference between the committee and the company officials. The points upon which the company and city have already agreed will probably not be taken up again. The committee has announced its readiness to resume negotiations at any time.

NEW SEATTLE SALE OFFER

The receivers of the Seattle, Renton & Southern Railway, Seattle, Wash., have offered to sell to the city the portion of the line within the city limits for a consideration of $200,000 in municipal railway bonds, bearing interest at the rate of 4½ per cent, and 20 per cent of the gross earnings of the property for a period of twenty-eight years. The maximum price fixed by the receivers in excess of the $200,000 bonds is $1,300,000. The original offer of the company was to sell for $1,600,000, including the initial payment of $200,000 in bonds, and an annual payment of $1,400,000, or 25 per cent of the gross earnings, for a period of twenty-five years. The Council rejected this offer but decided to submit the proposition to the voters. Corporation Counsel Bradford advised that if the voters refused the proposition the receivers could then go into the courts in the event of a condemnation case with the city, and argued that the city has estimated the value of the line at $1,600,000. The resolution of Councilman Dale, asking the city legal department to request the King County Superior Court to order the sale of the Renton line has been referred to the corporation counsel. The new offer of the company to sell will probably be referred to the Council committee of the whole.

Cost of Electrifying Steam Roads at Cleveland.—E. P. Roberts, smoke inspector, has completed a report of his investigation of the cost of electrifying the steam roads within the city limits of Cleveland, Ohio, and places his estimate between $20,000,000 and $30,000,000. The investigation was undertaken at the request of the City Council.

Third Bay State Arbitrator Chosen.—District Attorney Joseph C. Pelletier of Boston, Mass., has been chosen as the chairman and third member of the board of arbitration which will investigate wages on the Bay State Street Railway. Hearings will begin at Boston on Dec. 17. The company will be represented by Henry E. Reynolds, assistant general manager, and the employees' union by James H. Vahey.

Boston Elevated Employees and Military Duty.—As a result of the service required by the Massachusetts militia at the Salem fire last summer, the Boston Elevated Railway is taking a military census of its employees. Each man with military affiliations is asked to file a blank giving the essential features of his connections so that the company will have definite information as to possible requirements in emergencies which demand the use of troops. A number of employees who were on duty at the Salem fire were not only not hindered in their duties by the company, but were paid in full for time away from Boston in addition to their militia compensation.

Trial Run of New York Municipal Car.—On the afternoon of Nov. 24 a most successful trial run of the first New York Municipal Railway Corporation car was made in Brooklyn for a party of guests including the following: Messrs. Wood (Commissioner), Wilder and Whiston of the Public Service Commission for the First District, New York; Messrs. Hedley and Doyle, Interborough Rapid Transit Company; Messrs. Hazelton and Brinckerhoff of L. B. Stillwell and J. V. Davies of Jacobs & Davies. These gentlemen were chaperoned by Col. Williams and Messrs. Menden, Huff, Meneely, Gove, Siebert, Van Cott, Dempsey, Bullock and other representatives of the New York Municipal Railway Corporation and Brooklyn Rapid Transit System.

Possible Change in the Ohio Public Utilities Commission.—As a result of the recent election in Ohio Edward M. Fullington, former state auditor, and E. L. Lampson, former speaker of the House of Representatives, have been announced as aspirants for the position occupied by E. W. Doty on the Public Utilities Commission of that State. His term expires on Feb. 1, while the terms of the other two members of the commission expire in February, 1917, and February, 1919, respectively. Governor-elect Willis, however, has announced that no appointments will be announced until he has taken office. Mr. Doty is a Republican, but was appointed by Governor Cox at the request of Mayor Baker of Cleveland, both Democrats.

Electrification Urged.—A movement has been inaugurated by the Caldwell Commercial Club, of Caldwell, Idaho, to secure the electrification of the Wilder branch of the Oregon Short Line, extending from Caldwell to Wilder, a distance of approximately 11 miles. It is understood that the Short Line is willing to lease the property for a long term of years to responsible parties and an effort will be made by the Caldwell, Wilder, Greenleaf and Homedale commercial organizations to interest the Caldwell Traction Company in the plant. It is estimated that the cost to electrify the branch and to complete the extensions planned, together with the purchase of additional equipment and the erection of substations, will approximate $100,000.

East Boston Tunnel Toll Situation.—At the request of Mayor Curley of Boston, Mass., John A. Sullivan, corporation counsel, has written all holders of East Boston tunnel bonds, asking them to release the city from its pledge on the face of the bonds that the whole amount of the 1-cent tunnel tolls from passengers on the cars of the Boston Elevated Railway running in the tube shall be used to pay the principal and interest of the bonds. The letter pointed out that if the pledges are waived the city can appropriate $125,000 annually for the foregoing requirements until 1922. The act under which the appropriation is permitted was adopted by a referendum vote at the last Boston city election. There has been a general desire to abolish the 1-cent tolls, which impose a 6-cent fare upon residents of East Boston using the Boston Elevated Railway system, and to transfer the liabilities met by them to the general tax levy. If the bondholders release the city no alteration in fare received by the Boston Elevated Railway will result, as the company has turned over the tolls to the city.

A. N. Brady's Holdings.—The value of the estate of the late Anthony N. Brady is placed at $77,042,443 by Charles M. Friend, personal tax appraiser of Albany County, who filed his report in the surrogate's court at Albany, N. Y., on Nov. 19. Mr. Brady's holdings are particularly interesting on account of the prominent part which he played in public utility affairs. His interest in the Brooklyn Rapid Transit Company consisted of 22,029 shares appraised at $1,935,798. In addition he held $2,385,000, par value, of Brooklyn Rapid Transit 4 per cent bonds appraised at $2,101,383, and $152,000 of Norfolk & Portsmouth Traction Company 5 per cent bonds appraised at $124,196. His holdings of Interborough-Metropolitan common stock amounted to 7392 shares appraised at $116,424. The 1150 shares of Delaware, Lackawanna & Western Railroad stock which Mr. Brady owned were appraised at $221,375. His largest holdings of industrial securities were in tobacco corporations. He held 32,344 shares of American Tobacco common, valued at $6,792,240; 12,844 shares of American Tobacco new preferred, valued at $1,155,960, and 288,335 shares of British American Tobacco, Ltd., valued at $5,190,030.

PROGRAMS OF ASSOCIATION MEETINGS

Pennsylvania Street Railway Association

The Winter meeting of the Pennsylvania Street Railway Association will be held at the Board of Trade Building, Harrisburg, Pa., on Dec. 8 and 9. The meeting will be called to order on Dec. 8 at 1:30 p. m. C. L. S. Tingley, president of the association, will read his address and an address will be made by Prof. Emory R. Johnson of the Public Service Commission of Pennsylvania. This will be followed by the presentation of the report of Henry M. Stein, secretary and treasurer of the association. The session will then be concluded with the following program of papers and reports:

Presentation of problems referred to in the "Question Box," William A. Heindle of the Southern Pennsylvania Traction Company.

Paper, "The Latest Developments in Street Railway Equipment," by W. R. Steinmetz of the Westinghouse Electric & Manufacturing Company.

Report of the committee on preparing and filing rates and tariffs to be presented by C. B. Fairchild, Jr., chairman, statistician with the Philadelphia Rapid Transit Company.

The program for the session on Dec. 9, which will convene at 9:30 a. m., follows:

Paper, by H. S. Swift, treasurer of the West Penn Traction Company. Subject to be announced.

Discussion of "Question Box" problems.

Paper, "Efficiency Through Conservation of Time in Interurban Traffic," by E. C. Spring of the Lehigh Valley Transit Company.

Report of committee on uniform crossing agreement, of which R. P. Stevens is chairman.

Report of committee on height of car steps, of which H. H. Crowley is chairman.

Address by Dr. John Price Jackson, Commissioner of Labor and Industry.

Report of nominating committee and election of officers.

There will be a dinner at the Harrisburg Club on the evening of Dec. 8 for members and their guests.

National Civic Federation

The annual meeting of the National Civic Federation will be held on Dec. 4-5 at the Hotel Astor, New York. On Friday, following the annual address of President Low, there will be fifteen-minute reports from the chairmen of the various departments, including August Belmont on provision for a model uniform workmen's compensation law, John Hays Hammond on the results of an inquiry throughout the country as to the business situation and its effects upon unemployment this winter, and William R. Willcox on the growth of employers' welfare work. On Friday afternoon Prof. J. W. Jenks will review present-day tendencies toward the substitution of governmental action for private enterprise. Ex-Governor Stubbs of Kansas, and Ex-Senator Jonathan Bourne of Oregon, will open the discussion on the question "Shall the Government Own and Operate the Railroads, Telegraph and Telephone Systems and Municipal Utilities?" Ex-Governor Stubbs will take the affirmative and Ex-Senator Bourne the negative side of the question as it relates to railroads, and Congressman David J. Lewis and Dr. Frederick C. Howe will present the affirmative sides respectively of the question as it relates to telegraph and telephone systems and municipal utilities. The negative side of the two latter subjects will be taken up by speakers yet to be named.

The session on Saturday morning, Dec. 5, will be devoted to the question of social insurance. George W. Perkins, chairman of the department, will preside. There will be a report of the commission sent to Europe by the Federation in the early summer to study sickness and unemployment insurance and old-age pensions. At the close of this session there will be a luncheon under the auspices of the workmen's compensation department at which will be discussed problems arising in connection with the operation of the workmen's compensation acts now in force in twenty-five states.

The afternoon session on Saturday will be devoted to the consideration of the questions of our preparedness for war and our duties under the Hague conference.

Financial and Corporate

ELECTRIC RAILWAY EARNINGS

Figures of Representative Railways for September Show a Slight Decrease in Earnings on Account of War and General Business Conditions

The figures for gross and net earnings of electric railways in the United States for the month of September, 1914, in comparison with the same month of the previous year, as calculated by the ELECTRIC RAILWAY JOURNAL, show that the present business situation in this country brought about by the European war and by internal conditions has caused a slight aggregate decrease in earnings. This has not been widespread, however, as the accompanying table will show. This table, compiled from returns from fifty-three representative electric railways well divided geographically and also well differentiated as regards city, city and suburban, and interurban service, indicates that all sections and classes of lines secured increased gross and net earnings during the month in question, with the exception of the city lines in the East, the city and suburban lines in the South and the city lines in the Central section. Owing to the lack of monthly reports from Western companies it is impossible to report fully for these in September, but the returns from two companies in the Northwest testify to the fact that the business depression felt there for some time was still in progress.

Of the fifty-three companies examined, twenty-nine showed decreases in gross earnings for September, 1914, as compared to September, 1913, and twenty-seven companies suffered decreased net earnings. Of the twenty-three city lines covered by the table, thirteen showed decreases; of the sixteen city and suburban lines, eight showed decreases, and of the fifteen interurban lines, eight showed decreases—in most cases in both gross and net. Two companies, a city and an interurban line in the South, reported decreased gross revenues but increased net revenues. The total decrease in gross earnings for all the companies examined was 1.40 per cent, which was divided as follows over the four sections of the country: East, 0.93 per cent; South, 0.19 per cent; Central, 0.04 per cent; West, 7.7 per cent. If the figure for the West is eliminated on account of unequal returns the total decrease in gross earnings for the remaining sections is about 0.87 per cent. The aggregate net earnings decreased 2.24 per cent, which amount was made up by a 2.46 per cent decrease in the East, a 2.2 per cent increase in the South, a 0.64 per cent decrease in the Central section and a 13.1 per cent decrease in the West. Without the two Northwestern lines, the aggregate net earning decrease was 1.24 per cent.

The 0.93 per cent decrease for the Eastern companies was largely the result of a decrease of 1.4 per cent for large metropolitan lines. Of the seven city lines examined, only three showed increases. Increases were reported for city and suburban lines, however, amounting to 3.8 per cent, while the Eastern interurban lines had an aggregate increase in gross receipts of 1.9 per cent, only one line seeming to have been affected by conditions leading to metropolitan decreases. The total decrease in net earnings for the Eastern lines was 2.46 per cent, which was brought about in spite of a 9.4 per cent increase for city and suburban lines and a 5.7 per cent increase for interurban lines by a decrease of 4.1 per cent for metropolitan lines.

The best showing in the South was made by the city lines with a reported increase in gross earnings of 2.9 per cent and in net earnings of 8.2 per cent. Although interurban lines in Texas secured an increase of 0.5 per cent in gross earnings and 5.7 per cent in net earnings, there was an aggregate decrease of 0.19 per cent in gross earnings caused by a decrease of 2.5 per cent for city and suburban lines in Kentucky, Tennessee, Florida, Georgia and Virginia. Moreover, the 2.8 per cent decrease in net earnings on this class of lines in these states was sufficient to lower the aggregate net earning increase to only 2.23 per cent.

The most satisfactory record for September in the Central section was held by interurban lines as a class, which had an increase in gross earnings of 2.7 per cent and in net earnings of 2.9 per cent. A closer examination of this figure, however, shows that of the six interurban lines covered, five showed decreases in both gross and net earnings, but this condition was remedied in the aggregate by the large increase in gross and net earnings on a large system in Illinois. The gross earnings of city and suburban lines increased 0.5 per cent and the net earnings 0.6 per cent. Four of the six city lines reporting suffered decreases, giving a total decrease in gross earnings of 1.5 per cent and in net earnings of 3.3 per cent and reducing the aggregate showing for the Central section to a 0.04 per cent decrease in gross earnings and a 0.64 per cent decrease in net earnings. The city line decrease was lowered by a substantial increase in gross and net earnings for a large company in the milling district.

The above figures of course prove nothing conclusive in regard to the entire industry on account of the comparatively small number of reports. If monthly reports were obtainable from all electric railways it might be shown that a smaller percentage of the companies had suffered decreases in both gross and net earnings during September. On the other hand, the showing might be worse. Part of the industry has undoubtedly been affected by the present business decline, mostly through the closing down of industrial plants and the subsequent cutting off of traffic by employees. Yet in view of the facts that public utilities are more immune to business depression than are industrials or steam railroads, and that the slight losses now felt should be quickly recovered in the expected business revival, the outlook is by no means discouraging.

TABLE SHOWING PERCENTAGE OF INCREASES OR DECREASES IN GROSS AND NET EARNINGS OF FIFTY-THREE REPRESENTATIVE ELECTRIC RAILWAYS FOR SEPTEMBER, 1914 AND 1913

	East	South	Central	West
City Lines:				
Gross	1.4 d	2.9	1.5 d	...
Net	4.1 d	8.2	3.3 d	...
City and Suburban Lines:				
Gross	3.8	2.5 d	0.5	7.7 d
Net	9.4	2.8 d	0.6	13.1 d
Interurban Lines:				
Gross	1.9	0.5	2.7	...
Net	5.7	5.7	2.9	...
Aggregate:				
Gross	0.93 d	0.19 d	0.04 d	...
Net	2.46 d	2.23	0.64 d	...

NOTE—The letter d denotes decrease.

COLUMBUS AND GRAND RAPIDS COMBINATIONS

The consolidation of the Columbus Light, Heat & Power Company with the Columbus Railway, Power & Light Company is assured, as more than two-thirds of the outstanding stock of the two concerns has approved the plan, which was noted in the ELECTRIC RAILWAY JOURNAL of Nov. 14. Steps will be taken immediately to complete the merger of the properties. The stockholders of the Columbus Light, Heat & Power Company will receive what they originally demanded, one share of series "A" preferred for one share of their preferred, and one share of series "B" preferred for one share of their common. It is expected that the consolidation of the two companies will be completed before the close of the year. This action will bring all the lighting, power and heating properties in Columbus into one concern.

The Consumers' Power Company, which is controlled by the Commonwealth Power, Railway & Light Company through complete stock ownership, has applied to the Michigan Railroad Commission for authority to merge the following eleven companies, all of whose stocks and bonds are owned by it: Flint Electric Company, Pontiac Power Company, Saginaw Power Company, Bay City Power Company, Consumers' Power Company (Michigan), Economy Power Company, Au Sable Power Company, Central Power Company, Commonwealth Power Company, Grand Rapids-Muskegon Power Company and the Grand Rapids Edison Company. This merger, which is similar to the previous combination of the gas interests of the Commonwealth Power, Railway & Light Company, will result in making the Consumers' Power Company of Maine an operating instead of a holding company and will effect economies in administrative expenses and taxes, particularly the federal corporation tax. It is stated that the capitalization of the Consumers' Power Company of Maine will not be increased by the merger, the $13,930,000 of bonds of the companies being all deposited as collateral for the first lien and refunding 5 per cent bonds of the Maine company. Bonds of the latter company have been issued to a total of $12,936,000, (including $610,000 to be presently issued), $2,724,000 additional are held in escrow to take up additional bonds and a further amount is reserved for extensions.

D. E. Pomeroy, vice-president of the Bankers' Trust Company, New York, has been elected a director of the Commonwealth Power, Railway & Light Company, succeeding Benjamin Strong, Jr., resigned.

ANNUAL REPORT

Spokane & Inland Empire Railroad

The comparative statement of income, profit and loss of the Spokane & Inland Empire Railroad, Spokane, Wash., for the years ended June 30, 1913 and 1914, follows:

	1914	1913
Operating revenues:		
Freight	$310,930	$336,813
Passenger	483,192	565,703
Street railway system	541,618	550,046
Other revenue	195,910	164,219
Total	$1,531,650	$1,616,781
Operating expenses:		
Way and structures	$257,284	$226,161
Equipment	134,931	179,958
Traffic	21,759	24,935
Conducting transportation	497,006	512,139
General and miscellaneous	151,724	157,322
Total	$1,062,704	$1,100,515
Net operating revenue	$468,946	$516,266
Taxes accrued	150,000	147,000
Operating income	$318,946	$369,266
Other income—miscellaneous	3,840	4,936
Gross income	$322,786	$374,202
Deductions:		
Interest on funded debt	$238,513	$241,542
Interest on unfunded debt	214,427	210,190
Miscellaneous	425	999
Total	$453,365	$452,731
Deficit	$130,579	$78,529

The operating revenues of the company decreased as follows during the year: Interurban freight, $25,883, or 7.7 per cent; interurban passenger, $82,551, or 14.6 per cent, and street railway system in Spokane, $8,428, or 1.5 per cent. The interurban passenger decrease is attributed partly to the withdrawal of the Alan race meet on the Coeur d'Alene division, but mostly to the general business depression. Other revenue, mainly from the sale of power, increased $31,691, or 16.1 per cent, giving a total decrease of 5.3 per cent. Operating expenses for way and structures increased $31,122, or 13.8 per cent, but other expenses showed the following decreases: Equipment, $45,027, or 25 per cent; traffic, $3,175, or 12.7 per cent; conducting transportation, $15,133, or 3 per cent, and general and miscellaneous, $5,598, or 3.6 per cent. The total decrease amounted to 3.4 per cent. The net operating revenue decreased $47,320, or 10.1 per cent. Taxes accrued increased $3,000, but the gross income decreased $51,416, or 13.9 per cent, and the deficit increased $52,049, or about 70 per cent. The operating ratio increased from 68.07 to 69.38, and the ratio of taxes to operating revenue increased from 9.09 to 9.79.

During the year the total expenditures for additions and betterments amounted to $152,487. The annual report calls attention to a heavy profit and loss charge of $558,255, in which connection it recalls that, effective July 1, 1914, the Interstate Commerce Commission ordered that all electric railways accrue depreciation on equipment but granted permission to carriers who had not set up reserves for accrued depreciation during the life of the equipment to charge to profit and loss that portion of the actual loss from depreciation equitably assigned to the period prior to July 1, 1914. A charge of $483,010 was made, therefore, to bring the depreciation up to date. In the future regular monthly charges to operating expenses will be made in accordance with the uniform system of accounting for electric railways prescribed by the commission.

Regarding general conditions in the Northwest, the report states that the lumber trade remains quiet, and the growing automobile competition is affecting the company's passenger business. The tributary country, however, is steadily developing and the crops are very satisfactry. With a continued decrease in the cost of operating the property and the promise of better conditions, the outlook is favorable.

The total interurban mileage of the company is divided as of June 30 into 176.684 miles for main line, 18.225 miles for second track and 42.472 miles for yard tracks and sidings. In a similar manner the mileage of the city traction lines in Spokane is made up of 35.535 miles for main line, 12.087 miles for second track and 5.569 miles for yard tracks and sidings.

READJUSTMENT PLAN IN IDAHO

The Priest committee of holders of the first and refunding mortgage bonds of the Idaho-Oregon Light & Power Company, which is controlled by the Idaho Railway, Light & Power Company, Boise, Idaho, in a recent circular letter said that the foreclosure sale of the lighting property is set for Dec. 1 at Boise. While a considerable number of creditors' actions are still pending to have claims paid ahead of the mortgage, the status of these has been in part decided so that their relation to the plan can be dealt with. The committee's action in setting aside the validity of $718,000 of bonds has been decided in its favor, and an additional $107,000 of bonds, in a suit not yet decided, is conceded to be held by the railway only as collateral for possible claims up to $24,400. There are $2,494,000 of valid outstanding bonds entitled to participate in the proceeds of the sale, and of these more than 83 per cent are deposited with the committee.

The committee states that it is necessary to provide a substantial amount of cash to take up the receivers' certificates, to pay whatever claims may be allowed as preferred, to pay unassenting bondholders, cost of foreclosure and the like, and to make adequate provision for future development. It is planned to authorize several new security issues after the foreclosure sale. These include, first, $5,000,000 of first mortgage twenty-year gold bonds with interest at 6 per cent or such less rate as may be from time to time determined on successive issues, of which it is proposed to issue at once an estimated maximum of $800,000 to provide cash for the reorganization and for immediate needs. An additional $513,000 is reserved to retire divisional bonds at or before maturity; $637,000 is applicable to capital requirements under certain restrictions and the remaining $3,000,000 is afterward issuable for not more than 80 per cent of the cost of future additions. There will also be authorized $3,500,000 of general mortgage bonds at 3 per cent interest for the first five years and 6 per cent thereafter, of which an estimated amount of $2,100,000 is to be immediately issued to provide for all the bonds participating in the reorganization. The bonds will be held under a closed mortgage when the reorganization is complete. Cumulative 6 per cent preferred stock will have a total present estimated issue of $283,500 issuable to reimburse the holders of the present first and refunding mortgage bonds for $135 of interest unpaid. Non-cumulative 6 per cent preferred stock of a present estimated issue of $616,500 will be issued to provide $400 for each bond participating in the reorganization, and other issues will be made only for cash or property. There will be an authorized issue of $5,000,000 of common stock.

For each first and refunding mortgage bond participating in the reorganization, it is proposed to issue $1,000 of general mortgage bonds, about $135 of cumulative 6 per cent preferred stock, $400 of 6 per cent non-cumulative preferred stock and $800 of common stock, or a total of $2,335. The committee, however, reserves the right to modify the plan under certain restrictions.

The Krech committee of holders of the first and refunding mortgage bonds in a circular letter dated Nov. 16 objected to the above plan on account of the following reasons: (1) Doubt as to the accuracy of estimated net income; (2) insufficient provisions for immediate cash requirements; (3) continuance of destructive competition; (4) probable sale of property at auction at a price to give the bondholders the actual value of their bonds; (5) liens against bonds deposited with Priest committee aggregate more than 10 per cent of par value, and (6) failure of the committee to file a certificate of its cost, expenses, etc. It is stated that the estimate of the Priest committee is $2,060,000 for the value of the property, against which are underlying liens of $513,000 and proposed new issues of prior lien bonds, $800,000; general mortgage bonds, $2,100,000; preferred stock, $900,000 and common stock, $5,000,000. The Krech committee assumes that the property will not sell for more than $2,000,000. This committee states that the real cause of present conditions is too much power and too few customers, while the Priest committee asserts that the growth of business has been steady and substantial in spite of the general business depression in the Northwest, and desires to make adequate provision for future development.

Alabama Traction, Light & Power Company, Ltd., New York, N. Y.—Suits have been filed in the courts of Chilton and Shelby Counties, Ala., against the Alabama Power Company, the stock of which is owned by the Alabama Traction, Light & Power Company, for alleged damages aggregating more than $500,000 on account of the big lake created by the dam along the Coosa River.

American Public Service Company, New York, N. Y.—The gross earnings of the American Public Service Company for the twelve months ended July 31, 1914, were $397,672. The operating expenses and taxes totaled $260,224, leaving net earnings of $137,448. Bond interest paid and accrued amounted to $68,793, giving a balance for the period of $68,654. The above gross earnings and operating expenses and taxes compare with respective amounts of $369,285 and $248,341 for the twelve months ended Dec. 31, 1913. The American Public Service Company through its constituent companies operates various electric light and power, ice, water works and gas properties, mostly in Texas, as well as the Marshall (Tex.) Traction Company.

Androscoggin Electric Company, Lewiston, Maine.—The Androscoggin Electric Company, recently formed by the consolidation of the Lewiston & Auburn Electric Light Company and the Portland & Lewiston Interurban Railroad (organized as the Portland, Gray & Lewiston Railroad), as noted in the ELECTRIC RAILWAY JOURNAL of Oct. 31, has filed a mortgage to the United Safe Deposit & Trust Company, Portland, Maine, as trustee, to secure not to exceed $5,000,000 of first and refunding mortgage 5 per cent bonds, dated Oct. 26, 1914, and due on Oct. 1, 1934, without option of earlier redemption. The present issue is to be $1,800,000, of which $1,200,000 is reserved to retire at or before maturity the same amount of first mortgage 5's of the Lewiston & Auburn Electric Light Company, due on June 1, 1939, but callable at 105. The additional bonds are reserved for 80 per cent of the cost of future extensions. The officers of the new company are as follows: President, William T. Cobb, Rockland, Maine; secretary-treasurer, Julius Parkhurst, Lewiston, Maine; directors, William T. Cobb, Rockland, Maine; Maynard S. Bird and Hugh J. Chisholm, Portland, Maine; Harold Libbey and A. A. Libbey, Lewiston, Maine.

Christchurch (New Zealand) Tramway.—The revenue account of the municipally operated Christchurch Tramway for the year ended March 31, 1914, showed gross earnings from operation of £137,567 and operating expenses of £76,668. After deducting £25,683 for interest, £2,734 for sinking fund and £27,389 for reserve funds and allowing for £1,718 of rates from special areas there remained a net surplus of £6,810. The earnings increased £3,286, or less than 2½ per cent, but the operating expenses decreased £3,081. The operating ratio of 55 per cent is the record for Australasia. The saving came from keeping the service within stricter limits. the number of car-miles run being 2,162,769 (including 89,777 of extensions) as compared to 2,125,566 in the previous year. It is announced that the work of electrifying the North Beach line will soon be completed.

Georgia Railway & Electric Company, Atlanta, Ga.—The Georgia Railroad Commission has authorized the Georgia Railway & Electric Company to issue $160,000 of refunding and improvement mortgage forty-year 5 per cent sinking fund gold coupon bonds to cover expenditures made from Jan. 1 to June 30 for extensions and betterments.

Interurban Railway & Terminal Company, Cincinnati, Ohio.—At the recent annual meeting of the Interurban Railway & Terminal Company C. H. Worthington, C. J. Williams, Charles M. Leslie, M. Ackerman, A. F. Maisch and J. M. Hutton were chosen as members of the board of directors. The following officers were elected: C. H. Worthington, president; Charles M. Leslie, vice-president; C. J. Williams, secretary-treasurer, and Frank Dinsmore, general counsel.

Lehigh Traction Company, Hazelton, Pa.—The Lehigh Traction Company, which defaulted June 1 on the semi-annual interest on its first mortgage bonds, will again fail to make payment on Dec. 1, according to a letter to bondholders from N. C. Yost, treasurer of the company. Instead of paying the interest the company transmits an offer from Alvan Markle, president, to purchase the December interest coupons for his personal account if presented on or before Jan. 1. Mr. Markle made such a proposition in regard to the June coupons, which was accepted by virtually all the bondholders upon the recommendation of the protective committee. This protective committee is now advising bondholders that it will not recommend the acceptance of the purchase offer in the case of a second default. The company states that it has just resumed operations after an eight months' strike, and although the traffic is approaching its normal volume, the demands of operation require that all resources be utilized in that direction. The company under terms of the mortgage is allowed six months' grace before legal action can be taken on default.

Melbourne Tramway & Omnibus Company, Ltd., Melbourne, Australia.—The report of the Melbourne Tramway & Omnibus Company for the year ended June 30, 1914, shows tramway receipts of £766,426, an increase of £15,335, and omnibus receipts of £1,793, a decrease of £265, or total receipts of £768,219, an increase of £15,070. After paying maintenance expenses of £69,184, salaries of £29,177, wages of £264,904, interest of £74,250, dividends of £192,000, and other miscellaneous items, the company had left a balance of £152,006. From this the directors propose to pay a final bonus on the stock of £96,000, leaving £56,006 to be carried forward. The tramways carried 91,438,777 passengers during the year, and the omnibuses 430,008, a total of 91,868,785 and an increase of 2,016,022 over the previous year.

Mexico Tramways, Mexico City, Mexico.—For the calendar year 1913, the earnings of the Mexico Tramways from traffic amounted to approximately $3,266,734 in gold and miscellaneous earnings totaled $61,077, giving total earnings of $3,478,811. Operating and general expenses amounted to $1,190,175, maintenance expenses $370,806, taxes $56,016, giving gross profits from operation of $1,861,815. Rentals and fixed charges to subsidiary companies under leases, less amounts received as interest and dividends on securities held, amounted to $279,437, leaving a balance of $1,582,378 to be transferred to the profit and loss account at the head office in Toronto. After adding the balance from the previous year of $1,462,928, and deducting current expenses and fixed charges amounting to $1,473,419 and four quarterly dividends at the rate of 7 per cent, there was left a balance for the year of $1,382,967. The operating ratio for the year was 46.48 per cent compared to 47 per cent in 1912. At the end of 1913 the tramway system comprised 213.5 miles of single track, of which 204.087 miles were operated by electricity and 9.445 miles by mules. The total cash passengers carried during the year was 94,397,044.

Northern Electric Company, Chico, Cal.—A. Bonnheim, chairman of the protective committee of eight recently appointed by the convention of bankers to devise a feasible plan for the protection of the Northern Electric Railway and its creditors, denies that there is any intention of selling the company to the Atchison, Topeka & Santa Fé or any other concern. Stockholders believe that the road can be put on a sound financial basis in two years under proper management. The line has been earning $200,000 yearly above traffic expenses, but this sum did not cover the interest charges.

Portsmouth Street Railroad & Light Company, Portsmouth, Ohio.—All of the outstanding first mortgage ten-year 5 per cent bonds of the Portsmouth Street Railroad & Light Company have been called for payment at 102 and interest on Jan. 1 at the Bankers Trust Company, New York.

Public Service Corporation, Newark, N. J.—The Public Utilities Commission of New Jersey has authorized the Public Service Gas Company, a subsidiary of the Public Service Corporation, to increase its outstanding capital stock from $10,000,000 (all owned by the Public Service Corporation) to $10,750,000.

Southern Pacific Company, San Francisco, Cal.—The Southern Pacific Company has filed an application with the California Railroad Commission, asking authority to issue $1,170,000 of equipment trust certificates. The money is to be used for the purpose of purchasing the following equipment: twenty passenger locomotives, ten switching locomotives, fifty steel passenger coaches, twenty-two electric motor coaches and two electric motor combination coaches and express cars. The equipment trust certificates will mature in ten equal instalments.

West End Street Railway, Boston, Mass.—At the annual meeting of the stockholders of the West End Street Railway on Nov. 24 it was voted to increase the capital stock by the issuance of 13,000 shares, par value $50. The proceeds are to be used to pay the Boston Elevated Railway for the cost of additions and improvements made to the property during the year. The retiring directors were re-elected.

DIVIDENDS DECLARED

Citizens' Traction Company, Pittsburgh, Pa., $1.50.

El Paso Electric Company, El Paso, Tex., preferred (No. 25), 3 per cent; quarterly, 2¼ per cent, common.

Manhattan Bridge Three-Cent Line, Brooklyn, N. Y., quarterly 1½ per cent.

Northern Ohio Traction & Light Company, Akron, Ohio, quarterly, 1¼ per cent, common.

Rochester Railway & Light Company, quarterly, 1¼ per cent, preferred.

Washington Railway & Electric Company, Washington, D. C., quarterly, 1¼ per cent, preferred; quarterly, 1¾ per cent, common.

Wisconsin-Minnesota Light & Power Company, Eau Claire, Wis., quarterly, 1¾ per cent, preferred.

Traffic and Transportation

DECISION IN CONNECTICUT FARES AND SERVICE CASE

Commission Rates Safety Ahead of Good Service and Rules on Fares

The Connecticut Public Utilities Commission has issued its finding in the case of the petition of citizens of Meriden alleging inadequate service and unreasonable rates. The finding follows in part:

"On that part of the complaint relating to service, the commission is unable to find from the testimony any grounds for belief that conditions in Meriden are materially inferior to those on other divisions of the Connecticut Company system of equal importance. A certain amount of overcrowding undoubtedly exists here as at other places during the so-called rush hours and this is, to some extent, excusable on account of the nature of street railway traffic, the demands upon the company's equipment fluctuating. Safety is paramount in street railway operation, good service follows next in line of importance and every reasonable effort should be made to handle the passenger traffic expeditiously and comfortably at all times. Occasional failure to meet exceptional demands is not a justification for a general order requiring better or more frequent service.

"The Connecticut Company has not so failed except in a few instances on the Middletown line, and assurances were given that within a short time the company intended to revise the schedule on this line. As to the other matters of service, notably the lack of double-truck cars and flat wheels on some of the cars, the company had already remedied conditions by the installation of four additional serviceable cars, had improved conditions as to flat wheels whenever complaint had been made and was disposed to make further improvements now that specific attention had been called to certain cars. Under the foregoing conditions the commission does not feel warranted in issuing a formal order to the respondent on matters of service.

"On the question of rates between the towns of Meriden and Middletown, and Meriden and Wallingford, the commission is of the opinion that the petitioners have not justified their request for a reduction of the rates by a granting of transfers in the first case, and by reduction from 15 cents to 10 cents in the other case. In neither of these instances, taking into consideration the transfer privileges on the Wallingford line, does the average rate of fare appear to vary much from 1½ cents per mile, and the commission would not feel warranted, on the showing made, in declaring that rate excessive.

"If there are any special conditions which would take these cases out of the general rule, they were not presented for our consideration. This is true also on the question of whether the company should sell twenty-five tickets for $1. Most of the petitioner's witnesses testified, as they naturally would, that such a practice would be very desirable, but no facts were presented on which we would feel justified in ordering the company to take such a step. We do not consider that the sale of tickets at this rate in one city of the State, under the conditions presented at the hearing, constitute an unfair discrimination against Meriden or any reason for a further extension of the policy in the absence of a showing that the ordinary unit of 5 cents is an unreasonable charge for the service rendered in each case where such a unit is now the basis of the company's fare.

"We find, however, that the fare from Meriden Center to Archer's Corner is unreasonable. On the line via Cook Avenue, the charge is now 10 cents for a ride of 2.16 miles and via Hanover Street 10 cents for a ride of 2.83 miles, or at the rate of approximately 4.6 cents per mile in the first case and 3.5 cents per mile in the second case. So radical a variation within the city limits from the normal average rate per mile may well be considered as discriminatory against the district served and warrant some change in zone limits to secure a better equalization of rates. The present zones on the Meriden-Wallingford line are so constituted that passengers to Archer's Corner pay two fares for a trip of 2.16 miles by the shorter route and 2.83 miles by another route. If the first zone limit were shifted to Archer's Corner or to the city line, a few hundred feet further, the company would still receive in excess of 1½ cents per mile for this distance. Without passing at this time on the question of whether or not a local rate of 1½ cents per mile is fair both to the company and public, as a general practice, it is the opinion of the commission that in this case, at least, an extension of the zone would result in a more equitable rate than the one now in effect.

"For the foregoing reasons, we hereby order and direct the Connecticut Company to alter its fare zone limits in the city of Meriden so that on and after Dec. 1, 1914, no fare in excess of 5 cents shall be charged or collected for a single ride between Archer's Corner and the railroad station in the center of the said city of Meriden by either of the present routes in either direction."

"SAFETY FIRST" IN TOLEDO

The city of Toledo, Ohio, has a safety league organized by the Commerce Club with a score of prominent Toledo business men as members. This league has already engaged a woman teacher to start the work of giving "safety first" talks in every schoolroom in Toledo, in both public and parochial schools. The talks will be augmented by the moving picture "The Price of Thoughtlessness," which will be shown in every room. The Toledo Railways & Light Company has been able to secure a small moving-picture machine that does not require a booth and yet fulfils all requirements of "safety first." At the close of the talk the teacher who has been retained to carry on the work will distribute "safety first" buttons to all the children. Some 60,000 of these buttons have been contributed by the Toledo Commerce Club. They are all numbered and some of them have duplicate numbers, so that if one boy finds another boy with the same number on his badge each will get $1 on presentation of the button to the Commercial Club. This will stimulate the wearing of the button.

The Toledo Safety League plans also to reach all the parents by giving illustrated talks in the evening to all the parents' clubs in all the schools as well as before other clubs and lodges and societies. As a member from the Toledo Railways & Light Company on the safety league E. R. Kelsey is delivering these talks with the moving-picture films already referred to and some 100 traffic slides of various kinds. Further to stimulate interest in the safety work the league secured H. L. Brownell, supervisor of safety of the Chicago Surface Lines, to talk to all the public and the parochial school teachers and show them the films and slides used by that company. The league has also arranged to have Marcus A. Dow, supervisor of safety for the New York Central Lines, present at a general safety meeting.

On Nov. 22 the Newsboys' Association had a safety meeting at which more than 1000 boys were in attendance. Commodore Gunckel, father of the newsboy movement, said it was the finest meeting the newsboys had ever had. Buttons were distributed and a safety film shown.

The safety committees within the company itself are so thoroughly organized in the different carhouses that several times the chairman of the committee at one of the carhouses has reported to the manager of railways that his carhouse had gone twelve or thirteen days without an accident. Although the work has just got a good start a marked decrease in the number of accidents has already been shown.

COPPER INSTEAD OF NICKEL FARE ZONES

The Public Service Commission of Indiana on Nov. 21 granted the petition of the Union Traction Company of Indiana, filed several months ago by Arthur W. Brady, president, to establish on its lines a 1-cent or "copper" zone instead of the present 5-cent or "nickel" zone as a basis for its passenger tariffs. The company is authorized to file with the commission a new schedule of passenger tariffs, which will put into effect on its lines in Indiana rates practically approximating 2 cents a mile for the distances actually traveled; provide a minimum fare of 5 cents; give due consideration to competitive fares, lowering its fares to correspond in such circumstances; sell commutation tickets in books of twenty round trips at the rate of 1¼ cents a mile, and discontinue the sale of round-trip tickets at amounts less than two full fares. It is believed by the Union Traction Company officials that many inequalities in the fares now existing will be eliminated by the new "copper zone" system. The order of the commission provides that fares shall be computed as follows:

"At the rate of 2 cents a mile for the distance actually traveled, as nearly as practicable, a half mile at 1 cent each to be taken as the unit. In the case of fractional miles from 0.75 (regarded as 0.8) of any mile to 0.24 (regarded as 0.2) of the next mile, both exclusive; fractions shall be disregarded, and the intervening whole mile regarded as the distance. In the case of fractional miles from 0.25 (regarded as 0.3) of any mile to 0.74 (regarded as 0.7) of the same mile, both inclusive, the fractional distance shall be regarded as ½ mile, and the total distance shall be taken as the number of whole miles and one-half. For instance, any distance from 5.3 miles to 5.7 miles, both inclusive, shall be regarded as 5.50 miles, and any distance from 5.8 miles to 6.2 miles, both inclusive, shall be regarded as 6 miles. The minimum fare shall be 5 cents, and due consideration shall be given to competitive mileage of steam or other electric railroads. The fares for children between five and twelve years of age shall be at the rate of 1 cent a mile, computed in the method above outlined."

LOUISVILLE "TROLLEY TOPICS"

Trolley Topics, the publication for distribution among employees of the Louisville (Ky.) Railway, has made its appearance. It is a small bulletin of eight pages and is devoted to the interests of the company's employees. In the foreword the purpose of the publication is set out as follows:

"With this issue *Trolley Topics* makes its first appearance and extends greetings to each employee in all departments.

"It is essentially a paper of and for the employees of the Louisville Railway and the Louisville & Interurban Railroad, and has been conceived in the interest of those having at heart the welfare, prosperity and advancement of our company and our fellow employees, and in the effort to attain for our patrons the best and safest street car service in the country.

"Through the medium of *Trolley Topics* it is hoped to promote efficiency, to bring all departments into closer harmony, to suggest improvements and betterments to the service, to engender co-operation, to become better acquainted, to please all and offend none."

One of the departments in future will be a questions and answers section.

COURT DECISION IN REROUTING CASE

The Supreme Court of Nebraska has overruled the motion of the Lincoln Traction Company for a rehearing in the Herpolsheimer case. This action of the court makes effective the decision of the District Court which prevents the company from further abandoning any lines of the old Citizens Street Railway without permission of the Railroad Commission. The District Court decision, now effective, requires the company to put the College View high line cars back on Twelfth Street and to run the high line cars every twenty minutes. These cars now run every thirty minutes. The court says:

"We have not decided in this particular case that the defendant company cannot establish new lines of service upon such streets as the city may permit, nor that it cannot initiate necessary changes in the management of its business. It is not essential that every minor change in the conduct of the traffic, or in the service rendered, or in other matters of detail concerned with the operation of the line should be preceded by an application to the Railroad Commission for permission to make the change. The opinion does not so hold. The point decided is that the company cannot make such changes in the routing of its cars as the evidence in this case shows were made or contemplated, without first obtaining the approval of the commission."

The company has since applied to the State Railway Commission for a temporary order permitting the continuation of the present routing until a hearing can be had by the commission. The application sets forth that the company will require ninety days to secure special tracks required by the change; that an additional operating expense of $6,500 will be entailed, and that it has in hand petitions from patrons affected favoring the present service. It requests permission to control the routing of its cars. Two of the commissioners were out of town when the application was filed, and the request for a temporary order cannot be considered until all three are present.

AUTO BUS COMPETITION IN LOS ANGELES

There has recently been an enormous increase in the number of privately-owned automobiles that solicit "fares" at 5 cents each on the streets of Los Angeles. The automobiles are operated chiefly during the rush hours and have so considerably affected the earnings of the street railways that there has been much discussion on the question of passing some ordinance to regulate their operation. The first definite step in this direction was taken on Oct. 11 when the Board of Public Utilities of Los Angeles submitted a statement to the City Council calling attention to the fact that, obviously, the motor bus business should be regulated in some manner. The city's legal department has stated unofficially that the city can regulate the motor buses by requiring them to run on regularly stated routes and on a definite time schedule, but the city's right to require the filing of indemnity bonds, it was stated, would have to be established. Early in November the city had issued a total of 842 permits to chauffeurs for operating cars in passenger service. Of this total about 650 were operating on regular runs and taking 5-cent fares. A great many privately-owned automobiles are, however, being used by the public during the rush hours and at other times, for which no licenses have been issued, and the number of these is increasing daily. Some automobiles even make regular runs to near-by suburban points and charge 5 cents for the ride that costs 10 cents on the electric line.

The public utilities committee of the city of Los Angeles announced that it would hold a public hearing on Nov. 27 at which the question of regulating the auto bus business of that city would be discussed.

Fare Increase Under Advisement.—The South Carolina Railroad Commission has taken under advisement the application of the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., to increase its rates on its line in that State from 1 cent to 2 cents a mile.

Steam Passengers Transferred to Electric Line.—The Quincy, Omaha & Kansas City Railroad (steam) has put into execution its plan of transferring its Kansas City passengers and their baggage to the Kansas City, Clay County & St. Joseph Railway (electric) at Avondale in Clay County. This action is taken to avoid the expense of bringing passengers into the new Union Station in Kansas City.

Increase in Fare Asked in Kansas.—Alleging that the cost of operation has increased to such an extent since the 2-cent fare went into effect that railroads cannot maintain first-class passenger service at a profit, all the railroads doing business in Kansas have filed with the Public Utilities Commission applications for the restoration of 3-cent fares. A hearing probably will not be had until the new commission assumes office after Jan. 1, 1915.

Chicago Surface Lines Aid Red Cross.—Acting on the permission granted by Mayor Harrison and the Chicago City Council, the Chicago Surface Lines gave to the Red Cross for use in the European War Relief work a check for $2,000. Since the city was entitled to a part of the income from the lines it was necessary to get its sanction. Leonard A. Busby, president of the company, states that the contribution was made and charged to the Chicago Surface Lines individually and was made upon the unanimous request and approval of the executive committee.

"Tricky" Patrons.—A letter was addressed to the editor of the Topeka *Capital* recently in which the writer expressed the opinion that it would be interesting to know how many people are "victimized" a week by the Topeka Railway paying out in change Canadian dimes in place of American dimes. To the letter as published in the *Capital* the editor appended this note in the usual parentheses: "Patrons should examine their 'change.' We do not imagine the street railway company imports Canadian money. If it pays such coins out they are coins that tricky patrons have already passed to the company."

New Interurban Fares.—The New York State Railways, Syracuse, N. Y., has filed with the Public Service Commission of the Second District of New York, effective on Dec. 15, 1914, new joint one-way fares from Canastota, Chittenango, Clark Mills, Hecla, Kirkville, Manlius Center, Syracuse, Utica, Vernon and Wampsville to destinations on the New York, Ontario & Western Railroad. All fares are advanced 2 cents to Durhamville and Kenwood, 3 cents to State Bridge and Valley Mills, 4 cents to Stockbridge, 5 cents to Fish Creek and Munns, 6 cents to North Bay, 7 cents to Pratts and White's Corners, 8 cents to Jewell and Morrisville, 9 cents to Eaton, 10 cents to Cleveland, 11 cents to Randallsville, 13 cents to Earlville, 15 cents to Smyrna, 17 cents to Sherburne Four Corners, 18 cents to Galena, and 21 cents to Norwich.

Increase in Freight Rates.—The Indianapolis, Columbus & Southern Traction Company, which operates between Louisville and Indianapolis over the connecting Insull lines, is preparing to put into effect the 5 per cent increase in freight rates which have been allowed by the Interstate Commerce Commission. On May 28 the commission, acting at the instance of Louisville shippers, instructed the railway to establish through and joint freight rates between Louisville and points in Indiana, including Indianapolis. The present order is a sequel and will apply to merchandise in less than carload lots, taking the first, second, third and fourth-class rates. Existing class rates are 18 cents, 16 cents, 14.5 cents and 11 cents a hundred to Indianapolis, and under the order the rates will be 18.9 cents, 16.8 cents, 15.2 cents and 11.5 cents, while rates to intermediate points will be advanced proportionately.

Hocking Valley Railroad Case.—Arguments of counsel for the Hocking Valley Railroad and the Public Utilities Commission of Ohio were heard by the Supreme Court on Nov. 18 in the appeal from an order of the commission requiring the company to maintain electric railway service between Wellston and Hamden. The company claims that the line is no longer profitable and that an outlay of $25,000 will be required to put the road in shape to continue service. The commission contended that because a unit of a system is not profitable that fact does not furnish a reason for the abandonment of the unit so long as the whole system is profitable. It further stated that the company cannot at will withdraw a service which it had educated the people to use and depend upon in their daily activities and business. The company offered to maintain steam train service in place of the electric service, but the commission refused to accept this change.

I. T. S. Prizes Awarded.—The Illinois Traction System, Peoria, Ill., has announced the winners in the annual contest among the various substations for the best kept station. The substations are divided into two classes, those with agencies and those without agencies. First prize for the best kept substation with an agency was awarded to Union, a station about 15 miles north of Lincoln. Second prize was awarded to Fithian, which is between Champaign and Danville. The first prize for the best kept substation without an agency was awarded to Verden, which is located south of Springfield. Second prize was awarded to Anderson, which is north of Carlinville. System card passes for the agents and substation attendants constituted the first prize in both instances. Division card passes for the agents and the substation attendants were awarded as the second prize in both cases. About forty substations on the line participated in the contest.

Heavy Municipal Railway Traffic.—On Oct. 8 there was an aviation exhibition at the exposition grounds in San Francisco and the attendance was about 40,000. The municipal railway has two lines running direct to the grounds. Only seventy-nine cars were in commission on the municipal system to maintain service on all five lines, but the crowds were handled satisfactorily and without delay. The receipts on the several lines on Oct. 8 were as follows: "A" line (Geary Street, Market Street and Tenth Avenue) $1,004; "B" line (Ferries to Ocean, via Market and Geary Streets) $1,223; "D" line (Ferries to exposition grounds, via Van Ness Avenue) $914; "E" line (Union Street line, Ferries to Presidio) $1,242; "H" line (Potrero Avenue and Van Ness Avenue) $481. By the time the exposition opens the municipal railway will have 197 cars in service and will have added to the system the California Street and the Stockton Street and Columbus Avenue lines.

Ruling Regarding Free Transportation.—The Railroad Commission of Pennsylvania having been requested to express its opinion upon the question whether a railroad, street railway or other transportation company may lawfully grant free passes to charitable organizations, has ruled as follows: "As we have heretofore had occasion to point out, in connection with similar questions relative to the subject of free transportation, the constitution of the commonwealth, in Article XVII, Section 8, expressly provides, that: 'No railroad, railway or other transportation company, shall grant free passes, or passes at a discount, to any person except officers or employees of the company.' So long as this prohibition remains as it now stands in the constitution, the commission is powerless to hold that free transportation may be issued to a charitable organization for charitable purposes, however much we might otherwise be in accord with a public policy which would permit of such free transportation in this class of cases."

Passengers to Determine Rerouting.—The rerouting due to the opening of the new union station at Kansas City, Mo., has met with sufficient objection in only one instance to cause any possibility of a change to arise. This case is that of the Independence line, which was rerouted to enter the business district three blocks south of its former course. The board of control is planning a unique system of disclosing the facts as to the logical routing. Cards will be printed with blanks on which passengers from Independence and vicinity will indicate their destination in Kansas City. These cards will be handled by Metropolitan Street Railway or board of control employees, who will ascertain the facts from the passengers, the inspectors noting also the point at which the persons board the cars. The suggestion that the passengers on the Independence cars vote as to their preferences in routing was rejected because business interests or associations might influence the vote and the result would not indicate the logical route for the traffic.

Pacific Electric Railway Offers Prize.—The Pacific Electric Railway, Los Angeles, Cal., has announced a contest for the selection of a name and symbol for the new personally conducted trolley trip which it proposes to launch Jan. 3, 1915. The trip will be different from anything the company has ever operated, taking the tourist through the fruit districts of Pomona, Upland, Alta Loma, Etiwanda, Fontana, Rialto, San Bernardino, Riverside and Redlands. The company will pay $50 in cash to the first person sending in a name and symbol selected by the judges as the most appropriate for this trip. A prize of $25 will be awarded for the second best selection of name and symbol. Like the Old Mission, Triangle and Balloon route trolley trips, the new trip will afford to the tourist access to many points of interest through the southern part of the State, but still is different from them in many respects. The trip will start from the Pacific Electric station, Los Angeles, at 9 a. m. The return from Redlands will be made at 4:30 p. m., arrival at Los Angeles being scheduled for 7:30 p. m.

Safety Movement on Evansville Railways.—The first six months of operation of the "safety first" movement on the Evansille (Ind.) Railways has just been completed. In celebration of this occasion the outgoing members of committees banqueted the incoming members. Two local safety committees, one for each division of this company's lines, are appointed every six months. Regular meetings are held each month, when action is taken on all suggestions sent in by employees. These suggestions are then forwarded to the general safety board, comprised of department heads and the chairmen of the local committees, who finally approve or reject them. The membership of each committee is such that it will furnish an avenue through which any employee can make suggestions. Each employee is requested to make these suggestions to the committee member with whom he is most closely in touch, and he need not confine the suggestions to matters pertaining only to his department. In connection with the suggestions offered and their value, it is interesting to note that during the first six months' period eighty-seven suggestions were offered. From this number the local committees and the general board approved seventy-four.

Personal Mention

Mr. **V. M. Combes** has resigned as claim agent of the Kansas City-Western Railway, Leavenworth, Kan.

Mr. **Louis P. Howe** has been elected president of the Keene (N. H.) Electric Railway, to succeed Mr. Charles Warren.

Mr. **Gideon Adams** has been appointed roadmaster on the Atlantic & Suburban Railway, Pleasantville, N. J., to succeed Mr. George Dixon.

Mr. **E. Lewis** has been appointed roadmaster on the Exeter, Hampton & Amesbury Street Railway, Exeter, N. H., to succeed Mr. J. Raney.

Mr. **A. Carroll** has been appointed roadmaster of the Southwestern Traction & Power Company, New Iberia, La., to succeed Mr. A. Heflin.

Mr. **H. Aldrich** has been appointed superintendent on the Claremont Railway & Light Company, Claremont, N. H., to succeed Mr. T. A. Clark.

Mr. **Glenn M. Averill** has been elected president of the Cedar Rapids & Marion City Railway, Cedar Rapids, Iowa, to succeed Mr. J. F. Porter.

Mr. **A. M. Baldwin** has been elected treasurer of the Central California Traction Company, San Francisco, Cal., to succeed Mr. Walter Arnstein.

Mr. **A. L. McAllister** has been appointed auditor of the Southern Illinois Railway & Power Company, Harrisburg, Ill., to succeed Mr. C. R. Scott.

Mr. **W. O. Demoss** has been appointed master mechanic of the Wilmington & Philadelphia Traction Company, Wilmington, Del., to succeed Mr. J. W. Gerke.

Mr. **A. S. Henry** has been appointed superintendent of the Lockport division of the International Railway, Buffalo, N. Y., to succeed Mr. J. W. Andrews.

Mr. **H. U. Wallace**, vice-president and general maanger Western Light & Power Company, Boulder, Col., is now in charge of purchases, succeeding Mr. J. W. Ryall.

Mr. **P. L. Saltonstall** has been elected treasurer of the Manchester Traction, Light & Power Company, Manchester, N. H., to succeed the late S. Reed Anthony.

Mr. **Shelton E. Martin** has been elected secretary of the Third Avenue Railway, New York, N. Y., and affiliated companies, to succeed Mr. Frederick J. Fuller.

Mr. **H. J. Parks**, master mechanic of the Alton, Granite & St. Louis Traction Company at East St. Louis, Ill., has had his jurisdiction extended to cover the Alton City lines.

Mr. **Charles Witzel**, purchasing agent of the Third Avenue Railroad, New York, N. Y., has succeeded Mr. H. I. Sutherland as purchasing agent on the Yonkers (N. Y.) Railroad.

Mr. **Frank Martin** has been appointed chief engineer of the power station of the Trenton & Mercer County Traction Corporation, Trenton, N. J., to succeed Mr. De Witt Smith.

Mr. **M. Heffner** has been appointed superintendent, purchasing agent and master mechanic of the Allentown & Reading Traction Company, Allentown, Pa., to succeed Mr. W. J. Bear.

Mr. **P. E. Seddon** has been appointed secretary, treasurer and purchasing agent of the Pittsburgh, Harmony, Butler & New Castle Railway, Pittsburgh, Pa., to succeed Mr. S. H. Waddell.

Mr. **C. M. Leslie**, formerly claim agent of the Interurban Railway & Terminal Company, Cincinnati, Ohio, has been elected vice-president of the company to succeed Mr. Warren Bicknell.

Mr. **T. D. Dugan**, formerly chief dispatcher of the Dayton, Covington & Piqua Traction Company, West Milton, Ohio, has been appointed assistant superintendent, to succeed Mr. A. C. Kelsey, resigned.

Mr. **Matthew C. Brush**, vice-president of the Boston (Mass.) Elevated Railway, has been nominated a member of the executive committee of the Alumni Association of the Massachusetts Institute of Technology.

Mr. **C. J. Williams**, formerly assistant secretary and auditor of the Interurban Railway & Terminal Company, Cincinnati, Ohio, has been elected secretary-treasurer of the company to succeed Mr. James M. Hutton.

Mr. Mortimer G. Gould has been elected president of the Lima-Honeoye Light & Railroad Company, Lima, N. Y., to succeed Mr. D. M. Lewis, who continues with the company as secretary, general manager and purchasing agent. Mr. Gould also acts as chief engineer of the company.

Mr. Michael Connor, who has been superintendent over all of the line of the Illinois Traction System between Danville and Decatur, has been made superintendent from Danville to Urbana, with headquarters in Danville. Mr. Bert Snyder will be superintendent from Champaign to Decatur with headquarters in the latter city.

Mr. Delos F. Wilcox, for six years head of the franchise bureau of the Public Service Commission of the First District of New York, has been appointed first deputy commissioner of water supply, gas and electricity of New York to succeed Mr. F. T. Parsons, resigned. Since last summer Mr. Wilcox has been working on an appraisal of the private water supply plants in Queens which the city expects to buy or condemn.

Mr. Charles W. Mullen, Bangor, has been nominated as the third member of the new Public Utilities Commission of Maine by Gov. William T. Haines, the nomination of ex-Congressman S. W. Gould, Skowhegan, having failed of confirmation by the Governor's Council. Mr. Mullen and Mr. Gould are both Democrats. Mr. Mullen was graduated from the University of Maine in 1882 and was largely responsible for developing the important water power at Millinocket and took the lead in the development of the Great Northern Paper Company. He has also been identified with other large business projects in Maine. He was twice Mayor of Bangor, and has served one term in the Maine House and one in the Senate. He has twice been a Democratic candidate for Congress.

Mr. W. S. Henning, who has been appointed general manager of the Southwestern Traction & Power Company, New Iberia, La., began his railway career in 1898 as resident engineer in charge of track, railway, bridges and buildings on the Houston & Texas Central Railroad at Ennis, Tex. He continued in this capacity until 1902. He then accepted a position as construction engineer on the Southern Pacific Company's branch lines in Matagorda County, Tex. From 1903 to 1906 he was engineer of maintenance of way of the Galveston (Tex.) City Railway, covering the period during which the grade of the city was raised. From 1906 to 1912 he was engaged in construction work for the Southern Pacific Company in Louisiana. In 1912 he was appointed chief engineer of the Southwestern Traction & Power Company.

Mr. W. H. Davidson has been appointed auditor for the receivers of the Columbus, Delaware & Marion Railway, Columbus, Ohio, to succeed Mr. A. F. Elkins, who, as previously noted in the ELECTRIC RAILWAY JOURNAL, resigned some time ago to accept an appointment as accountant in the division of valuation in the Interstate Commerce Commission, with headquarters in Chicago. Mr. Davidson is thirty-three years of age. Before accepting the appointment to the Columbus, Delaware & Marion Railway he was connected with steam railroads. He resigned from the United States weather bureau service in March, 1906, to accept a position in the accounting department of the Gulf, Colorado & Santa Fé Railway at Galveston, Tex. In September, 1907, he resigned from that company to become connected with the office of the auditor of the Hocking Valley Railway at Columbus, Ohio, and continued with that company in the auditing department until he was appointed to succeed Mr. Elkins with the Columbus, Delaware & Marion Railway.

Mr. Oscar T. Crosby, who resigned as president of the Wilmington & Philadelphia Traction Company, Wilmington, Del., two years ago, has just returned to this country from a trip abroad, during which he traveled in Spain, Algeria, Tunisia, Egypt, Turkey, India, Borneo, Ceylon, the Federated Malay States, Java, Borneo and Japan. Mr. Crosby returned to the United States through China and Russia by the Trans-Siberian Railway. He was in Pekin when war was declared, but did not find it difficult to pass through Russia, Finland, Denmark, Germany and Holland. His trip in Turkey and Borneo was off the usual lines. In Turkey he drove about 600 miles, following the Euphrates River from Aleppo to Bagdad and Babylon, and then crossed the Persian Gulf to India. In Borneo he took a trip through unexplored country, visiting Dyaks who had never before seen a white man. He was able to do this through the courtesy of the Dutch officials, who loaned him a small steamer by which he ascended one of the unfrequented rivers, and later used small boats rowed by native Malays.

Mr. Harry B. Weatherwax has been elected vice-president of the various electric railways controlled by the Delaware & Hudson Company. The properties with which Mr. Weatherwax will be connected in addition to his present duties with the Delaware & Hudson Company are the United Traction Company, Albany, N. Y., Hudson Valley Railway, Troy & New England Railway and Plattsburg Traction Company. There will be no change in the organization of the various companies. Messrs. Reynolds, Hewitt and Barber retain all their authority. Mr. Weatherwax will represent Mr. C. S. Sims, vice-president of the Delaware & Hudson Company, in connection with all electric railway matters, thereby relieving Mr. Sims of many details which he has handled in the past. Mr. Weatherwax was formerly chief clerk to Mr. W. J. Mullin, general traffic manager of the Delaware & Hudson Company, and later was appointed industrial agent of the company. Last year he was elected vice-president of five subsidiary corporations of the Delaware & Hudson Company.

Mr. Ray W. Reynolds has resigned as manager of the Springfield (Mass.) Street Railway, to become general manager of the Mesaba (Minn.) Railway. Mr. Reynolds took the position of manager in Springfield when he succeeded the late George F. Reed, who died suddenly on Jan. 10, 1914. At the time of his appointment he was secretary and general manager of the Hartford & Springfield Street Railway, with headquarters at Warehouse Point, Conn., having been appointed to that position on Aug. 1, 1912. Mr. Reynolds was born in Mattoon, Ill., in 1882 and was graduated from the Armour Institute of Chicago in 1900. He then spent two years in the electrical engineering department of Purdue University at Lafayette, Ind. His first work in the electric traction field was with the old Indianapolis & Northern Railway, which is now a part of the system of the Terre Haute, Indianapolis & Eastern Traction Company. He worked through all of the departments and was appointed superintendent in 1905. In 1907 he became connected with the Chicago, South Bend & Northern Indiana Railway at South Bend. At one time he was also in charge of the Southern Michigan Railway. In 1910 Mr. Reynolds was elected vice-president of the American Light & Water Company, Chicago, and placed in charge of the construction work. He supervised the building of electric lighting stations and hydroelectric developments which this work called for until August, 1912. From this position he came East to accept the place made vacant by the resignation of Mr. H. S. Newton, then manager of the Hartford & Springfield Railway.

Mr. L. A. Magraw, who, as noted in the ELECTRIC RAILWAY JOURNAL of Nov. 14, was appointed general manager of the Macon Railway & Light Company, Macon, Ga., was born in Springfield, Mass., on May 7, 1883. He attended the public schools at Waterbury, Conn., and was graduated from the Worcester Polytechnic Institute in 1905. He then entered the test department of the Crocker-Wheeler Company, with which he remained two years. During part of this time Mr. Magraw was instructor at Sibley College, Cornell University. In 1907 he entered the employ of the Westinghouse Electric & Manufacturing Company as erecting engineer at Philadelphia, and during his connection with the company at that place he supervised the installation of many steam turbine plants throughout Pennsylvania. In 1909 Mr. Magraw was transferred to the engineering department of the Westinghouse Electric & Manufacturing Company, and as resident engineer at Charlotte, N. C., he was active in the development of high-tension apparatus and supervised the installation of one of the first outdoor substations carrying 110,000 volts. In 1911 Mr. Magraw was appointed chief engineer of the Central Georgia Power Company and in January, 1912, he became chief engineer of the Central Georgia Transmission Company and had charge of the construction of a number of substations, distributing and high-tension lines in north-central Georgia. In March, 1912, he was appointed chief engineer of the Macon Railway & Light Company and began the reconstruction of the distribution lines, feeders and overhead trolley in the city of Macon and also supervised the construction of a number of cars. In January, 1913, he was appointed general manager of the Central Georgia Power Company and Central Georgia Transmission Company, and in October, 1914, he was appointed general manager of the Macon Railway & Light Company.

Mr. Herbert M. Flanders, engineer of maintenance of way of the Springfield (Mass.) Street Railway and other lines controlled by the New England Investment & Security Company, has been appointed general manager of the Springfield system, to succeed Mr. Ray W. Reynolds, who has resigned to accept the position of general manager of the Mesaba (Minn.) Railway. Mr. Flanders will become manager on Dec. 1, when the resignation of Mr. Reynolds becomes effective. Ever since his graduation from the Massachusetts Institute of Technology in 1900 Mr. Flanders has been constantly in railroad work. He was born in Haverhill, Mass., in 1876, and received his education in that city and in Malden, Mass. After his course at the Massachusetts Institute of Technology Mr. Flanders was employed by the Boston & Maine Railroad, but soon left this position to engage in the construction of the electric railway in Portsmouth, N. H. When the road was finished, two years later, he remained to take charge of the work of eliminating grade crossings. Later he took up the work of surveying new routes for electric railways and assisted in laying out the Boston & Haverhill and the Boston & Worcester electric lines. He was appointed engineer of maintenance of way for the Houston (Tex.) Electric Railway in 1906 and a year later he went to Fort Worth, Tex., as chief engineer of the Northern Texas Electric Railway. After eighteen months with this company he returned to Massachusetts as roadmaster of the Newton Street Railway. He went to Springfield in 1909 as roadmaster for the Springfield and Berkshire systems when the latter system was under the direction of the New England Investment & Security Company. On Dec. 1, 1913, he was appointed engineer of maintenance of way of the Springfield Street Railway and on Nov. 21 he was selected as manager of the system.

H. M. Flanders

OBITUARY

Douglas S. Martin, who relinquished his position on the editorial staff of the *Electrical World* in August to enroll in the forces of Great Britain, has succumbed to shrapnel wounds received at the battle of Messines on the Belgium border. Mr. Martin was graduated as an electrical engineer from the Central Technical College, London, England, and was formerly editor of the *General Electric Review*. After resigning from that paper he engaged in electrical work in the Far West and on returning East joined the editorial staff of the *Electrical World*. Mr. Martin was twenty-seven years of age. He was a brother of Mr. T. C. Martin, secretary of the National Electric Light Association.

John Murphy, formerly general superintendent of the Pittsburgh (Pa.) Railways, died on Nov. 24 at Orlando, Fla., after a long illness. Mr. Murphy settled in Pittsburgh about thirty years ago. He entered electric railway work under the late William J. Burns with the Second Avenue Traction Company, Pittsburgh. Later he became superintendent of that company. When the West End Traction Company was merged with the Second Avenue company he was placed in charge of both systems and when the Pittsburgh, Allegheny, Manchester and Pleasant Valley lines were absorbed he was appointed general superintendent of all of them. He was subsequently appointed general superintendent of the Pittsburgh Railways and retained that position until Feb. 1, 1909, when he retired on account of ill health. Mr. Murphy is survived by a widow, three sons and three daughters.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

FRANCHISES

Tucson, Ariz.—The Tucson Rapid Transit Company has received a twenty-five-year franchise from the Council in Tucson.

***Searcy, Ark.**—The Searcy & Kensett Transportation Company, represented by H. E. Hill, has received a franchise from the Council to build an electric railway in Searcy and extend it to Kensett, 4 miles. Application for a charter will soon be made by this company.

***Jacksonville, Fla.**—The Port Commissioners with a formal request received the approval of the County Commissioners recently to cross all highways, streets and byways in Duval County with the proposed railway line from the new dock site to the connecting lines of the railways in Jacksonville.

Boston, Mass.—The subway extension to Everett and to Malden is supposed to be completed next February, but the work has not been begun. An extension of time is asked for by the Boston Elevated Railway on the ground that there has been unforeseen delay in the dredging of Mystic River.

***St. Louis, Mo.**—The introduction of an ordinance to permit the city of St. Louis to construct the loop at the western approach in conjunction with the work of completing the free bridge is being seriously considered by city officials. With the repeal of the Southern Traction franchise for such a loop there is no immediate prospect of one being constructed otherwise. Andrew Scully, a member of the House of Delegates, said recently he is contemplating introducing such an ordinance. He said he had consulted railroad experts and they advised him that the cost would be about $30,000 a mile. The loop, he said, would include about 3 miles of track, and he estimated it could be built with an appropriation of about $100,000.

Newark, N. J.—The Public Service Railway has received nine franchises from the Board of Public Works to be utilized in connection with the proposed terminal in Newark.

La Salle, N. Y.—The International Railway has received a franchise from the Council in La Salle over the right-of-way of the old Buffalo, Thousand Islands & Portland Railroad in La Salle.

Milwaukie, Ore.—The Portland & Oregon City Railway has again asked the Council for a franchise in Milwaukie. Some time ago Steven Carver, the promoter of the line, withdrew the franchise for some changes, and it was recently submitted at a meeting of the Council, the route having been agreed on. Considerable grading on the line south of Milwaukie to Oregon City has been done, and also on the branch projected toward Clackamas and Logan. It is announced that work will be begun on the section in Milwaukie as soon as the franchise has been granted.

Seaside, Ore.—The Council has granted an extension of time on the franchise received by O. W. Taylor two years ago. The extension was granted with the agreement affixed that the rights of the franchise are to be transferred to the new electric line now proposed between Astoria and Seaside. The possession of this franchise has been sought by those promoting the new line. [E. R. J., Nov. 14, '14.]

Harrisburg, Pa.—The Harrisburg Railways has received a franchise from the Council to extend its lines to the plant of the Middle Car Company in Harrisburg.

Montreal, Que.—The Montreal Council has passed a by-law allowing the Montreal & Southern Counties Railway to extend its tracks across McGill Street to Youville Square in Montreal, with the object of extending its terminals. The city stipulates that it will take no legal responsibility, this clause being inserted in view of the contract of the city with the Montreal Tramways Company, whose lines run along McGill Street. The work is to be commenced before Jan. 1 and completed in six months.

Corpus Christi, Tex.—The Texas Southern Electric Company has received a franchise from the Commissioners' Court of Nueces County to build an electric railway from Corpus Christi to Bishop, 35 miles.

Dallas, Tex.—The Metropolitan Street Railway has asked the Council for a franchise to use the Dallas Consolidated Electric Street Railway tracks on Main Street in Dallas.

TRACK AND ROADWAY

Birmingham-Tuscaloosa Railroad & Utilities Corporation, Birmingham, Ala.—As a result of an agreement with the City Council this company will begin work at once on the electrification of the Tuscaloosa Street Railway.

Tucson (Ariz.) Rapid Transit Company.—Plans have been made to build an extension north on Stone Avenue to the city limits and beyond the city line to Pastime Park. Another line will be built from the present terminus of the line at Third Street and Park Avenue, north on Park Avenue to the Speedway and east on the Speedway about 1 mile. The south side loop in Tucson will also be constructed at once.

Fresno (Cal.) Interurban Railway.—Work has been begun by this company on the 2-mile section of its line from Fresno Avenue, Fresno, via the Normal School to Gould Colony. It is reported that a 12-mile line of the company from Barton's vineyard to Centerville will be constructed on the main line to Clovis. John McCaffery, manager.

Pacific Electric Railway, Los Angeles, Cal.—Work has been begun by this company on its 8-mile line between Arlington and Corona. Shearer & Company, Los Angeles, were awarded the contract for the construction of the line.

San Francisco (Cal.) Municipal Railway.—Extensions of this railway in San Francisco on Columbus Avenue and through the new Fort Mason tunnel are now ready to be placed in operation. Bids for the construction of the California Street line, 2.07 miles in length, have been called for by the Board of Works for Dec. 2. In addition to the Church Street line, for which several alternate plans are now being compared, other extensions under consideration are as follows: Out Market Street from Kearny to Tenth Avenue; from the present park terminus through the park to the Sunset district; from the Stockton Street line across Market Street and south to the Southern Pacific depot.

Iowa Railway & Light Company, Cedar Rapids, Ia.—Right-of-way has been acquired by this company on both sides of river trackage in Cedar Rapids and plans are being made to connect this company's lines with the lines of the Waterloo, Cedar Rapids & Northern Railway. This is part of a plan to spend $500,000 on improvements of its lines in Cedar Rapids.

***Caldwell, Idaho.**—The Caldwell Commercial Club and several other organizations are considering plans to secure the electrification of the Wilder branch of the Oregon Short Line extending from Caldwell to Wilder, 11 miles. J. H. Lowell, Caldwell, is interested.

Fox & Illinois Union Railway, Aurora, Ill.—Plans are being considered by this company to extend its line, now being constructed from Yorkville to Morris, on to Dwight. H. H. Evans, president. [E. R. J., Nov. 1, '13.]

Decatur, Sullivan & Mattoon Traction Company, Mattoon, Ill.—This company has increased its capital stock from $4,000,000 to $5,000,000. This action was taken at the annual meeting of the stockholders held in Mattoon. The directorate was increased from nine to twelve. John G. Throde, Mattoon, and M. L. Deck and G. A. Stadler, Decatur, were elected directors for the long term and H. H. Temple and A. Spitler, of Mattoon, for the short term. Officers were elected as follows: J. A. McFall, Mattoon, president; George B. Fidler, Mt. Zion, vice-president, and John G. Throde, Mattoon, secretary and treasurer. The company plans to build an electric railway from Decatur through Sullivan to Mattoon, a distance of about 50 miles. [E. R. J., Nov. 29, 13.]

City Railway, Mount Vernon, Ill.—Work has been begun by this company on its 4-mile line in Mount Vernon. Its repair shops will be located in Mount Vernon and it will operate three cars. Capital stock, authorized, $40,000. Capital stock, issued, $40,000. Officers: Louis G. Pavey, Mount Vernon, president and general manager; Earl Green, vice-president; C. C. Baldwin, Mount Vernon, secretary and chief engineer, and J. B. Emerson, Mount Vernon, purchasing agent. [E. R. J., April 4, '14.]

Evansville & New Harmony Traction Company, Evansville, Ind.—Surveys have been completed between Evansville and New Harmony and bond sales in the communities along the right-of-way are meeting with more success than had been anticipated, and it is announced that construction will be begun by this company in the spring. The line will eventually be extended to Mount Carmel, Ill. [E. R. J., Sept. 19, '14.]

Arkansas Valley Interurban Railway, Wichita, Kan.—This company has been authorized to use the Hutchinson Interurban Railway tracks in Hutchinson and will soon build an extension from Halstead to Hutchinson.

South Covington & Cincinnati Street Railway, Covington, Ky.—Preliminary arrangements are being made by this company for the extension of the Ft. Mitchell line to Erlanger.

Kentucky Southwestern Electric Railway, Light & Power Company, Paducah, Ky.—It is reported that this company expects soon to begin construction of its projected line from Paducah to Murray, Ky., 58 miles. A power house, three substations, carhouses, 1800-ft. trestle and several smaller ones, etc., will be required. The grade will run to about 2 per cent on the maximum with 8-deg. maximum curvature, with about 1,000,000 cu. yd. of material to be handled.

Bay State Street Railway, Boston, Mass.—This company is asked to consider the feasibility of the construction of a new line from Montello to South Weymouth, via Cary Hill and West Abington.

St. Paul Southern Electric Railway, St. Paul, Minn.—This company has placed its line between Hastings, Neb., and St. Paul, Minn., in operation.

St. Paul (Minn.) Street Railway.—This company is asked to consider plans for an extension of its Dale Street and Forest Street line to Ocean Street in St. Paul.

Metropolitan Street Railway, Kansas City, Mo.—Engineers have plans for this company by which it will be possible to rebuild the Central Avenue Bridge, as per the plans of the Kaw Valley Drainage Board, without interfering with wagon service over the structure or street cars on the second deck, thus avoiding the necessity for rerouting cars' during the construction period.

United Railways Company of St. Louis, St. Louis, Mo.—Plans are being considered by this company to build a new system of loops in the downtown district of St. Louis. Several other lines will be extended 3 miles or more. Broadway in North St. Louis will be tapped by two crosstown lines, the Jefferson and Taylor lines.

***Corona, N. Y.**—Plans are being considered to build an electric line from the terminus of the dual subway line at Corona to the Vanderbilt property at Lake Success. It will be double track and will cross the meadows and Flushing Creek by a viaduct and bridge, thence it will extend east parallel with the North Hempstead Road and north of the Black Stump Road and the proposed Grand Central Boulevard. W. K. Vanderbilt, Jr., is said to be interested.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—During the next few months this company plans to reconstruct about 2 miles of track in Erie.

Jamestown, Westfield & Northwestern Traction Company, Jamestown, N. Y.—Surveys are being made by this company for a line south of the present tracks in Westfield from below the canning factory up to the Lake Shore station. It will also build a switch at the station.

Manhattan & Queens Traction Corporations, New York, N. Y.—An extension down Sutphin Road to the corner of Pacific Street and Rockaway Road in Brooklyn is being contemplated by this company.

Yonkers (N. Y.) Railroad.—Work has been begun on the substitution of a double track for a single one in New Main Street, one of the principal business streets of Yonkers. The improvement will greatly facilitate the operation of the three lines serving the eastern portions of the city.

Oklahoma (Okla.) Railway.—As soon as financial backing has been obtained this company will begin work at once on a 15½-mile extension from Oklahoma City to Guthrie.

Stark Electric Railroad, Alliance, Ohio.—Within the next few months this company plans to make improvements at the eastern terminus of its interurban line into Salem.

Cleveland (Ohio) Railway.—The new Warner Avenue extension from Broadway and Miles Avenue, 1 mile south, has been completed and will probably be placed in operation on Dec. 1.

Ohio Valley Traction Company, Portsmouth, Ohio.—The officials of this company, after a meeting in Portsmouth on Nov. 19, announced that the greater part of their bonds, amounting to $500,000, has been sold and that work on the traction line between Portsmouth and Ironton, Ohio, will be begun early in the spring.

Toronto (Ont.) Civic Car Lines.—Work has been begun on the construction of the Bloor Street West civic car lines in Toronto.

Toronto, Ont.—Messrs. E. A. Walberg and John F. Hansen have asked the Board of Control for permission to lay a civic car line on Manor Street or some other cross street in North Toronto, to provide a service for the employees of the Canada Wire & Cable Company in Leaside. The line would connect with the proposed civic car line on Mount Pleasant Avenue. The deputation said that the city could take over the line when it was required in connection with the civic system. The applicants were asked to put their proposal in writing and it will be considered along with the other proposed car lines, for which Comptroller Church wants to submit a $1,000,000 by-law.

Berks & Lancaster Railway, Lancaster, Pa.—The contract for the construction of 6½ miles from Kleinfeltersville to Womelsdorf has been awarded to J. A. Vandergrift Company, New York. This line will connect with the lines of the Ephrata & Lebanon Railway. This new line is the connecting link between the lines of the Ephrata & Lebanon Railway and the Reading and Lancaster lines.

Oxford, Cochranville & Parkersburg Electric Railway, Oxford, Pa.—This railway project has been abandoned.

Pittsburgh, Harmony, Butler & New Castle Railway, Pittsburgh, Pa.—This company has opened its new bridge over the Beaver River, near Ellwood City. The structure is 1250 ft. long, 82 ft. high and 29 ft. wide, and cost $160,000. It spans the tracks of the Pennsylvania Railroad lines, the Beaver River and the tracks of the Pittsburgh & Lake Erie Railroad.

Pottstown & Phoenixville Railway, Pottsville, Pa.—Work still continues on the extension of this company's line from Sanatoga to Linfield. The section of the line from Miller's Bridge, ½ mile below Sanatoga, to Linfield, a distance of 2½ miles, will be placed in operation in December. Within the next ten days the contract for the extension from Linfield to Spring City will be awarded.

Titusville (Pa.) Electric Traction Company.—This company contemplates some important extensions in the near future. Address W. J. Smith, manager, for definite information.

Tennessee & Kentucky Interurban Electric Railway, Nashville, Tenn.—Surveys are being made by this company from Jellico, for a distance of 16 miles, through the coal and timber fields located in northern Tennessee. [E. R. J., July 25, '14.]

Beaumont (Tex.) Traction Company.—This company is asked to consider plans to extend its line south from Beaumont to the refinery of the Magnolia Petroleum Company.

Dallas, Tex.—Work has been begun on the extension of the Southern Methodist University line from the terminus, near Mockingbird Lane, to the campus. The contract for the line has been awarded and the route will be via the Highland Park line, transferring at Abbott Avenue and Euclid Avenue in Dallas. This is part of a plan to build an electric line from the Southern Methodist University to the terminus of the Dallas Consolidated Electric Railway by the Southern Methodist University. [E. R. J., Aug. 8, '14.]

*__San Angelo, Tex.__—Plans are being considered to build an electric railway to connect San Angelo, Bronte and Robert Lee.

Texas City (Tex.) Street Railway.—An extension to the passenger pier at the foot of Eighth Street in Texas City will soon be built by this company.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis.—This company is asked to consider plans to double track its line on Downer Avenue between Hartford Avenue and Edgewood Avenue in Milwaukee.

SHOPS AND BUILDINGS

Iowa Railway & Light Company, Cedar Rapids, Ia.—At a cost of approximately $80,000 this company has acquired property at and in the vicinity of the northeast corner of Fourth Avenue and Second Street in Cedar Rapids on which it plans to build a new passenger station. The company also plans to build a large freight terminal on the west side of the river at Ninth Avenue.

Kentucky Southwestern Electric Railway, Light & Power Company, Paducah, Ky.—During the next few months this company plans to build its new carhouses in Evansville.

Worcester (Mass.) Consolidated Street Railway.—Plans are being made by this company to build a new freight depot upon the site of the Geary carhouse in Adams Street, which was burned a few years ago.

Kansas City (Mo.) Railways.—The board of control has been granted an extension of time on its report on the selection of a site for an interurban railway station. The board's report would be a recommendation, the selection resting with the City Council. The recommendation probably will be made early in December.

Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company, Minneapolis, Minn.—This company's paint and repair shops at Nicollet Avenue and Sixtieth Street, Minneapolis, were destroyed by fire on Nov. 19. Three of the company's gasoline cars were destroyed. The roundhouse and office building near by were saved. The loss is estimated to be about $50,000.

Mesaba Electric Railway, Virginia, Minn.—This company has opened its new carhouses and offices just east of Mountain Iron. The company is moving into the new quarters from the temporary frame building that was erected after the fire a year ago. In that fire the carhouses and plant of the company were destroyed. The new buildings which have been erected cost $28,000.

Ohio Electric Railway, Cincinnati, Ohio.—Work has been begun by this company on the new freight and passenger station at Fort McKinley, stop No. 7.

Lehigh Valley Transit Company, Allentown, Pa.—Plans are being considered by this company to build a new freight station at Marshall and Markley Streets in Norristown.

POWER HOUSES AND SUBSTATIONS

Danbury & Bethel Street Railway, Danbury, Conn.—This company has installed a new 600-kw, 2300-volt turbo-generator, two 200-kw rotary converters and one 300-kw converter in its power house in Danbury.

Kentucky Southwestern Electric Railway, Light & Power Company, Paducah, Ky.—Plans are being considered by this company to soon build a new power plant and three substations.

Ithaca (N. Y.) Traction Corporation.—Two 300-kw, three-phase, sixty-cycle, 1200-r.p.m., compound-wound, self-starting rotary converters; two 300-kva, three-phase, sixty-cycle, 2200-volt, high tension to rotary volts low tension O. I. S. C. transformers, and one six-panel switchboard will soon be installed by this company at its power house in Ithaca. The apparatus was ordered from the Westinghouse Electric & Manufacturing Company.

Empire United Railways, Inc., Syracuse, N. Y.—This company has recently purchased two 400-kva transformers for installation in the substation of the company which is located at Port Byron.

Cleveland, Youngstown & Eastern Railroad, Cleveland, Ohio.—Two 300-kw, 600-volt, direct-current, three-phase, sixty-cycle, 1200-r.p.m., compound-wound alternating-current self-starting rotary converters and one five-panel switchboard for the above will soon be installed by this company at its power plant in Cleveland. The apparatus has been ordered from the Westinghouse Electric & Manufacturing Company.

Nashville Railway & Light Company, Nashville, Tenn.—This company has awarded a contract for installing a 500-kw motor generator set in a new substation which has been built in Nashville.

Manufactures and Supplies

ROLLING STOCK

Buffalo & Depew Railway, Buffalo, N. Y., is completing two snow plows in its own shops.

Northwestern Pacific Railroad, San Francisco, Cal., has converted seven of its 57-ft. 3-in. interurban trail coaches into double-end motor coaches.

Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company, Minneapolis, Minn., lost three of its gasoline cars in a fire which destroyed the repair shop and paint plant of the company at Nicollet Avenue and Sixtieth Street on Nov. 19.

Yuma Valley Railway, Arizona, through the United States government department of reclamation service, has purchased one 55-ft. all-steel, 200-hp seventy-five passenger gasoline motor car from the McKeen Motor Car Company, Omaha, Neb.

TRADE NOTE

Mathias Klein & Sons, Chicago, Ill., tool manufacturers, have perfected and are now marketing an improved Klein Haven's clamp adapted for handling plain or stranded wire or cables up to ¾ in. in diameter. The particular feature of construction is the addition of a swing latch which engages with a stud on the lower jaw, thus centralizing the pressure on the cross-bolt, which is strongly made of turned machined steel. The body and handle of this clamp are made of steel forging and the eccentric of hardened tool steel.

ADVERTISING LITERATURE

National Tube Company, Pittsburgh, Pa., has issued a folder describing male and female "Kewanee" union.

Ohio Brass Company, Mansfield, Ohio, has issued a folder illustrating the features of its Type C section insulator.

Prepayment Car Sales Company, New York, N. Y., has issued a folder entitled "The Melting Pot" in regard to prepayment platforms.

W. W. Lindsay & Company, Philadelphia, Pa., contracting engineers, have issued a booklet containing illustrations of new construction work built by the company, which include, among others, a view of the handsome power house of the Charleston (S. C.) Consolidated Railway & Lighting Company, and the carhouses of the Springfield Railway and the People's Railway, Dayton, Ohio.

Hess-Bright Manufacturing Company, Philadelphia, Pa., has issued a series of sheets on its ball bearings for various uses. Sheet 101 describes vertical mountings on shafts without shelters; Sheet 102, standard mountings for horizontal and vertical ball bearing electric motors; Sheet 103, ball bearings as applied to turbine pumps; Sheet 106, ball-bearing live-tail centers, and Sheet 107, ball-bearing lathe heads.

Continental Fibre Company, Newark, Del., has issued a catalog describing its insulating products, vulcanized fiber, "Bakelite-Dilecto" and "Continental Bakelite" for insulation of armatures, brakeshoes, dynamos, motors, magnetos, transformers, railway signals, high-tension cable conduits and track insulation, in connection with electric track circuit signals. The peculiar characteristics of each of these materials is explained in detail, together with their fields of usefulness. Although manufactured primarily as insulating materials, their physical qualities render them adaptable to a wide range of mechanical applications.

Dayton Fare Recorder Company, Dayton, Ohio, has issued a folder describing its computing fare recorders for city and interurban railways, which are designed to dispense with figure drudgery in fare collecting and accounting and also to avoid the inevitable mistakes and losses that go with it and to provide, instead, printed records of the fare receipts fully itemized, computed and summarized ready to be delivered at the receiver's window when the conductors make settlement. No clerical work either by conductors or receiving clerks is required to determine the amount of fare collected. The folder contains a reproduction of a printed record produced from a twelve-fare interurban recorder, which illustrates the principle of double registration and recording used on all recorders of the different sizes.

H. Edsil Barr, Erie, Pa., engineer and manufacturer, has issued a folder describing and illustrating his pneumatic light forging hammer for machine shops. As illustrations in the catalog show, this hammer is similar in appearance to a steam hammer and operates on the same plan—by the use of pressure in a suitable cylinder to lift and throw the ram. The hammer consists of a heavy anvil or die block, cast solid and with provisions for bolting down. Cast with the anvil is a heavy box frame or housing strongly reinforced inside and supporting the cylinder. In the cylinder operates the piston which drives the ram or hammer head, and the movement of the ram is controlled entirely by the operator who presses the foot lever, thus operating the valve, which admits air under pressure to the cylinder.

Drew Electric & Manufacturing Company, Indianapolis, Ind., has issued a 107-page catalog, No. 3, describing its complete line of electric railway, light and power materials. These materials include clinch gears, splicing gears, line suspensions, trolley frogs, trolley switches, tunnel approaches, trolley crossings, section insulators, motorman's safety mirrors, pole sleeves, telephone jack boxes, night car stop signals, pipe insulators, hangers, strain insulators, turnbuckles, flexible brackets, high-voltage insulators, cross-arm supports, Garton-Daniels lightning arresters and choke coils, anchor rods, machine bolts, galvanized iron and steel wire, lamp sockets and other miscellaneous tools. At the end of the catalog are useful tables and data governing the selection of wire according to weight, diameter, resistance and other physical properties, and also tables for selecting iron pipes as poles. An illustration shows one of the largest and most intricate pieces of overhead construction on the lines of the Indianapolis Traction & Terminal Company at Illinois and Washington Streets in the city of Indianapolis, supplied by this company. The intersecting streets at this point are 90 ft. wide. The width of the streets requires the supporting wires to be very long, thus making the maintenance and proper alignment very difficult. As this point is the central transfer junction in the city and in the heart of the conjested downtown district, uninterrupted movement of cars is important to both the company and the public. A total of 3724 regular, and about fifty to seventy-five special, cars pass under this equipment every twenty-four hours. The average renewal of material in this particular case has been two and three-quarters years, during which time nearly 4,000,000 car passings occurred. The back of the catalog contains a convenient index for referring to the materials described.

LABOR QUESTIONS IN CLEVELAND

Having been informed by the director of public service that the City Council of Cleveland, Ohio, cannot dictate working hours and conditions on the Cleveland Railway, George R. Davies, president of the branch of the Amalgamated Association in that city, has intimated that the officers of the company will be prosecuted under section 9007 of the general code, which is intended to insure eight hours' rest out of the twenty-four for all railroad men on interurban and street railroads. This section provides that on a railroad more than 30 miles long or interurban or street railway more than 4 miles long, men who have worked fifteen consecutive hours shall not be permitted to go on again until they have had at least eight hours' rest, except in case of accident. Very few, if any, men are called upon to work fifteen consecutive hours. Mr. Davies blames the schedules more than he does the officials of the company for what he terms poor conditions.

The Cleveland Railway will pay $600 of the expenses of the recent arbitration proceedings between it and the men. Attorney Charles Higley, representative of the company, will receive $500 and A. B. Thompson, the third arbitrator, $200. Judge Willis Vickery, selected by the men, will not present a bill. The union organization will pay the remainder of the amount.

The City Council yielded to the plan of collecting funds in the fare boxes of the cars on Nov. 25 for the benefit of the Associated Charities, which has a deficit of some $30,000. The average of the receipts for Sunday, Monday and Tuesday of the week will be taken as the portion for the company on Wednesday. Whatever sum above this amount is found in the boxes will be donated to the charitable organization.

Vol. XLIV NEW YORK, SATURDAY DECEMBER 5, 1914 No. 23

IMAGINARY "SAFETY FIRST"

A recent examination of a certain new shop which has been heralded as the safest of its kind in the state, disclosed a most contradictory condition of affairs. The shop has an employees' safety committee which meets regularly to discuss the cause and cure of every accident, and the company apparently is willing to follow any suggestions that will reduce hazard to its workmen. When the mill room was shown to a visitor, a great deal of pride was taken in exhibiting the sheet-iron housings and screens that had been put up to inclose the belting of some tools, yet, strange to say, other belts and chain-driven tools near by carried no such protective devices at all. The floor was littered with boards and blocks in every possible direction, a ladder had been left in a decidedly dangerous position against the wall, and across a passageway, overhead, a loose board was bridging the space between a window sill and a roof truss ready to Zeppelin the innocent visitor. Aside from these major dangers were such minor ones as brushing off a circular saw which hung from a post with a looseness akin to nonchalance, or April-fool kicking into a pile of shavings that might cover a piece of metal with more inertia than is good for toe comfort. We say nothing of the fire danger. If this is the best that the company and the committee can accomplish for "safety first" it would be well for the members to stick to their regular jobs and hire a German Hausfrau of the good old kind to do some real house-cleaning.

KEEPING THE SUBSTATION ATTENDANT BUSY

On an interurban road the substation attendant has a lonesome job at best, and if he is energetic he is constantly seeking something to keep him busy. Generally his sole duty is to attend to the substation equipment if it is away from a station stop, but even at the way station his duties as ticket agent are not arduous. In any event, the attendant's salary forms a large proportion of the substation's operating cost. For this reason many roads have made it a practice to hire as cheap a man for this position as is consistent with the duties he has to perform. There is considerable difference of opinion regarding this practice, however, and in an effort to keep down the station operating cost some roads have given the attendant other duties to perform. On the Chicago, South Bend & Northern Indiana Railway each substation attendant is supplied with forms for a certain type of field and armature coils and a stock of wire with which he is expected to keep the storeroom supplied with a sufficient stock of coils for all repairs. These coils are merely wound and pressed into shape at the substations, and when a sufficient number have accumulated they are sent to the shop where they are dipped, baked and turned into stock. This practice has enabled the company to employ a higher priced and, consequently, a better qualified substation attendant, without increasing the cost of operation. The idea of keeping the substation attendant engaged is an excellent one, particularly when a portion of his time may be charged to other work. On the larger systems, where the number of coils for repairs would be insufficient to keep all attendants constantly employed, the installation of a machine lathe or other equipment for finishing various kinds of small castings or manufactured repair parts would attain the same end.

PUBLICITY AND PUBLIC SERVICE COMMISSIONS

In the special convention issue of the Electric Railway Journal devoted to public relations a chapter treated of publicity methods of public utilities, a topic closely related to the main subject. In the present issue is a view of publicity from another angle, that of the public service commission. A commission, we believe, has a duty to perform in enlightening the public and assisting in a correct understanding of the problems of the public utility companies. Owing to its intimate relations with the companies within its jurisdiction it has the knowledge, and owing to its impartial position its statements will be accepted by the public more readily than those from an interested party. It is thus possible for a commission to serve the utility and the public at the same time. The editorial study which led to the preparation of the article referred to impressed us with the fact that the commissions desire to perform this function to the satisfaction of both interested parties. "Commission News" is coming to be a more and more conspicuous feature in the public press. As an example of this and without wishing to detract in any way from the credit due the other commissions, we may properly direct special attention to the successful efforts being made by the New York State Commission for the First District to keep the public informed and interested in the subway work in progress in New York City. In addition to the methods mentioned in the article, numerous others are in use. Near each of the numerous surface structures in New York, such as loading cranes, engine houses, etc., necessary in connection with the underground work, are neatly-lettered signboards, placed by the commission, containing information intended to satisfy the natural curiosity of the populace. Exhibits of an instructive character have been set up on property condemned for subway purposes but not needed for immediate use. As a result of these and other measures the people of the city are following the work with interest and appreciation.

"POISONING THE WELLS"

A curious, and we are sure to the committee on public relations very unexpected, objection has been made to a part of its program by "a journal of opinion," publication of which has just begun under the title of the *New Republic*. As to the Code of Principles, it is admitted that "it is an able, and, on the whole, a moderate document." But the *New Republic* condemns the recommendation that public education be attempted by means of the "formation of a committee of prominent technical educators to promote the formulation and teaching of correct principles on public service questions in technical and economical departments of American colleges, through courses of lectures and otherwise."

The objecting editor assumes that by "correct principles" are meant the Code of Principles, and that it is proposed to secure the teaching of this code very much as the first-grade pupil is taught the multiplication table or as the law student is compelled to memorize the seven exceptions to the rule in Shelly's case. We hasten to reassure the alarmed critic, whose fears for the purity of the well-springs of knowledge would perhaps be justified if he had correctly understood the American Electric Railway Association proposals as to educational propaganda. The Code of Principles does not attempt to lay down the lines upon which technical and economic education shall be conducted, although its declarations might well be brought before and be debated by students who may some day have to deal with the actual economic problems affecting a great industry in whose status the public is deeply concerned. Furthermore, it must be assumed that the "committee of prominent technical educators" would be able to preserve their students from contamination in case railway emissaries should attempt to mislead them in the way suggested.

A criticism such as the one to which we have referred, based upon complete misunderstanding, would not be deserving of comment if it did not represent what may be a general misconception. For this reason it is well, perhaps, that the objection should have been made definitely and specifically. It should be answered just as definitely and specifically so that the purpose of the American Electric Railway Association and of its committee on public relations shall be clearly understood by all.

Without regard to the wording of the recommendation to which criticism is made—and when examined with any care it is evident that it is not a proposal that railways shall invade the schoolroom with advocacy of special interests—there was an aim embodied in this recommendation which is not only wholly defensible but extremely desirable from every point of view. It is this: that the teacher and student of economics shall have practical as well as theoretical experience. No student in a technical course in any of our universities expects to be able to acquire the knowledge to fit him for his chosen profession by the study of books only. The civil engineer must have practice in the field, preferably in actual construction; the electrical engineer must study the application on a large scale in central power stations of the forces whose laws he is studying; the medical student must have access to the hospitals and to the clinics of the best practicing surgeons, and so through all of the other courses. More and more, effort in technical education is being directed toward bringing the student into contact with existing conditions and to enable him to combine his teaching in theory with that gained in the laboratory of actual experience. The same principle applies, of course, to the instructors. The most successful teachers in engineering, as well as in medicine and surgery, are those who give part of their time or have given a large part of their time to practical work in their chosen fields, who are in intimate touch with and participate in the work of the technical associations engaged in this kind of research and who conduct their study of the science in which they are engaged outside as well as inside the college walls.

We believe that the same rules should apply to a thorough prosecution of the study of railway economics. The best laboratory of economics, so far as the railways are concerned, for both the student and the instructors, is the railways themselves. In fact, it would seem as if the need for this contact with actual conditions was even more important in the field of economics and sociology than in that of engineering or medicine, because the principles in the former studies are less capable of expression by laws or mathematical formulas and are more dependent on the human element. No professor of economics, however jealous of his prerogatives or however devoted to his text-books, ought to object to the invitation to use this laboratory, to make original investigation and to listen to the men who are running the railroads.

That is all that has been proposed or contemplated by the public relations committee. It is a sound proposal; it will result in better education, and we hope to see it carried out. Criticism based upon misconception or hostility will not hurt if no other end is being sought than a fair opportunity for discussion and exposition and for the broadening of education by the addition of practical to theoretical teaching.

When a railroad commission bill was before the Pennsylvania Legislature some years ago, an amendment was offered to the effect that no one should be eligible for appointment on the commission who had ever been connected with or employed by a railroad company. Too narrow a prohibition, declared a sarcastic legislator, who suggested that the bill be made to read that no one who knew anything about railroads should be on the commission. If anyone wishes to argue that this is a good rule to apply to education in economics, let him make the most of it. Such an argument will soon fall with the weight of its own absurdity.

DECREASE OF FARE DENIED

The decision of the Public Service Commission of New Hampshire in the Manchester fare case, a report of which was published in our last issue, is one of the encouraging symptoms of reasonable treatment of utilities and as such deserves comment. The issue nominally was the sale of cut-rate tickets during the rush hours and practically involved the fair return which an electric railway company ought to be allowed upon its investment. To the unthinking man on the street a concession of six tickets for a quarter or twenty-five tickets for a dollar during the hours of heavy traffic does not seem very much, especially when, to his mind, the profits ought to be greater at those times because of the crowded cars. When, however, it is shown by experience that the cost of operation is greater at those hours, that during that time 40 per cent of the passengers travel, and that a cut of substantially 25 per cent was proposed, the severity of the measure becomes apparent. In very few lines of business could a 25 per cent cut in prices be endured without imminent peril of bankruptcy, even if such reduction affected only 40 per cent of the goods. Of course, a number of city railway companies do actually sell six tickets for a quarter and occasionally twenty-five for a dollar, and come out whole, but such instances are nearly always under exceptionally favorable traffic conditions, where the earnings per car-mile reach a highly satisfactory figure.

The final ruling of the commission was that the road was entitled to earn 6 per cent on a sum which was practically the full book value of the property, that is upon the actual sum total of its investment. The depreciated value of the property was recognized as considerably less than this, but the commission took the very rational view of the case that, inasmuch as no excessive dividends had been paid, the difference between the depreciated value and the investment might properly be considered as a legitimate cost incurred in developing the business. In other words, in getting the company on its feet and performing public service during the years since it started, at the present rate of fare the concern has not been able fully to make good the depreciation as it has occurred from the multifarious causes which affect such properties. The company was therefore allowed a 6 per cent return on the full amount of its real investment, to which sum was added sufficient allowance for taking care of future depreciation. This puts it up to the company to provide for depreciation, as has been the custom in one form or another under many commission rulings.

We believe that all who have had anything to do with the raising of money for public utility properties or the investment of capital in them will agree that the allowance made by the commission is not large, especially when one considers the uncertainties of going into the business twenty-five years ago. Indeed, the commission admits this when it points out that this percentage would amount to 7 per cent on the stock and 5 per cent on the bonds if the capitalization was equally divided between these two classes of securities. The commission also pleads in extenuation of its low rate that the company has a monopoly in a thriving New England city of 70,000 inhabitants, where capital for good local investments is presumably as cheap as in any other part of the country, and that in the South, for example, the same rate would not hold.

On the whole, the decision is most encouraging, especially when taken into consideration with the decision of the Massachusetts Board in the Middlesex & Boston case, because it exhibits a trend of opinion among commissions that public utility rates must be such as to put the business on a stable investment basis, even if the rates have to be raised. This is the principal point for which public utility operators are striving. With this principle established, the percentage of return which will enlist new capital to extend existing systems and develop new enterprises is a minor question and one which can be determined only by comparison with the rates of return which are offered by other commercial enterprises in the same locality. Commissions, in general, are coming year by year to a much more reasonable view of utilities than was had at first, and to-day any company which comes in to a question of fare rates with clean hands as regards its capitalization and expenses of operation may be reasonably certain in most states of getting fair play. Sometimes commissions may seem to bear somewhat severely upon the company, but their decisions are much less to be feared than the operation of local politics.

STEEL CAR CONSTRUCTION PROBLEMS

If steel cars could be so simplified or standardized as to make the absorption of the expense for jigs, templets and dies a minor consideration rather than one of prime importance, the construction cost would be so reduced as to make the general use of steel a foregone conclusion. The prominence of this problem is forcefully emphasized elsewhere in this issue in an article describing the new pressed steel cars for the Chicago Elevated Railroad. In the illustrations a few of the jigs and templets are shown, and when it is considered that these are merely examples of more than a thousand similar ones it becomes easy to realize the importance of standardization. While it is possible to adapt to other cars the ideas developed in preparing these jigs, all but a few of the special devices must be cast aside when the order is completed. This is not only an economic waste which the car manufacturer must anticipate, but one for which the purchaser must pay. How much simpler, yet more economical and practical, would be the purchase of car bodies in the same manner as automobiles! If this could be done, the expense for the costly but necessary construction facilities could be spread over the manufacturers' annual output, and under the existing competitive conditions the purchaser would reap the benefit in decreased cost.

To the same end attention may well be called to the practical considerations that are involved in car design, so-called because the choice of certain members is based largely on experience rather than upon any theoretical calculations. Such considerations include the impact loads involved by unusual buffing or collisions, and the extent to which the maximum bending moment should be assumed to be increased to provide against the effect of shocks caused by sudden depressions in the track. A great variety of opinions may be obtained from car designers regarding either of these questions, yet there is no doubt that the adoption of some simple standards in this regard is practicable. Certainly such a move would be a long step toward the ultimate solution of the important problem of reducing the cost of steel car construction.

THE NEW A. I. E. E. STANDARDIZATION RULES

After many months of effort the standards committee of the American Institute of Electrical Engineers has put the finishing touches upon the revised set of standardization rules, and they are now practically ready for distribution in pamphlet form. The new rules became effective on Dec. 1. The completion of this work is a cause for congratulation to the Institute and to the electric railway industry, for it provides a codification of existing electrical practice. It is now up to the industry to study, digest and apply the information. Institute sections and branches, railway association sections and other agencies for the dissemination of information could well devote attention to the subject in early meetings.

The preparation of rules intended to exert influence in the direction of standardization of electrical apparatus was the result of a topical discussion on the standardization of generators, motors and transformers which took place at Institute meetings held in 1898. A committee then appointed prepared rules which were adopted at the 1899 convention. These rules were revised in 1902, 1907 and 1911 to accommodate them to the rapidly-developing electrical art, and the present revision is the work of a large and representative committee appointed in 1913. These rules aim to define the nomenclature of electrical engineering, to specify reasonable performance for electrical apparatus and to suggest methods of testing or calculation by which actual performance can be checked against specifications. One of the principal effects of the rules will be to enable purchasers of equipment to write definite specifications which will put all manufacturers upon the same basis in bidding.

Their scope is limited to electrical qualities or to those directly or indirectly affecting such qualities. While the accuracy of this statement may be questioned upon casual examination of some of the rules, a deeper study will show their relevancy. For example, third-rail positions are specified and this, at first sight, appears to be a trespass upon the railway field. They were included, however, because the position of the rail affects the design of the insulator. The scope of the rules is further limited by commercial and economic conditions. They would fail of their purpose if they were made academic and theoretical. While they are designed to appropriate the best from existing practice and to point out the lines of progress, they must depend for their usefulness upon the strength of their appeal to the manufacturer and the user of electrical equipment. That they have made such an appeal is evidenced by the extent to which the "Institute rating" of this or that device has come to be recognized as a standard of reference at least, if not a standard of perfection. The manner in which the standards committee is endeavoring to feel the pulse of the industry is indicated by the letter from W. A. Del Mar, chairman of the sub-committee on railway standards, published elsewhere in this issue. Mr. Del Mar's committee had prepared a tentative section on the maximum input of railway motors, but both the sub-committee and the full committee felt that further information on the subject is necessary before the adoption of a definite rule is warranted. It is the great carefulness thus typified which gives to the rules such a high standing in the profession.

The new edition of the rules is larger than the last one, requiring more than twice as many pages. This is partly due to improved typographical arrangement and partly to amplification of text. The division into main sections is as follows: Definitions of a general nature, and standards for electrical machinery, for wires and cables, switches and other circuit control apparatus and for electric railways. Appendices are devoted to railway motors, illumination and photometry, standards for telephony and telegraphy, bibliography of electrical standardization literature, and horse-power and kilowatt. An ample index is provided. In each main division the important terms are defined and the limitations of operating conditions are specified with the intention of making clear what is wanted rather than how it is to be obtained. In other words, the rules do not go into design details nor do they take up definitions which do not affect the user of electrical apparatus. The railway section abstracted in the last issue of this paper is typical of the general plan.

While the standardization rules can only be suggestive it is obviously to the interest of every maker and user of electrical apparatus to know and use them. This applies particularly to the individual engineer who wishes to express his knowledge in exact terms. One who says or writes "resistance" when he means "rheostat" or "resistor," or who forgets himself so far as to connect a "reactance" in a circuit instead of a "reactor" is no student of the rules. We can possibly excuse the man who synchronizes a "rotary converter" instead of a "synchronous converter" for he has not confused a thing with the property which it possesses as has the other fellow. He has, however, used a term not very logical because there are at least four kinds of rotary converters in addition to the one to which he referred. The use of specific terms rather than general ones makes for clarity and mutual understanding, and this paper, for one, will use its influence, as far as practicable, in carrying out the suggestions of the new standardization rules.

PROTECTION OF EQUIPMENT TRUSTS

The recommendations of the committee on equipment trusts of the Investment Bankers' Association of America, whose report was abstracted in the issue of this paper for Nov. 21, should be interesting to electric railway officials. Equipment trusts securities were, it is true, first issued by steam railroads and have been more extensively used by them than by other carriers, but the facts that since 1904 the Hudson & Manhattan Railroad, the International Traction Company, the Philadelphia Rapid Transit Company, the United Railways & Electric Company, the United Railroads of San Francisco and the Fort Wayne & Northern Indiana Traction Company have issued equipment trusts and that within the last three weeks the Staten Island Midland Railway and the Southern Pacific Company have made applications for authority to make such issues for electric rolling stock, indicate that electric railways to some extent favor this form of borrowing.

Obviously, the prime reason why more electric railways at present do not have equipment trusts is that such issues are based upon cars and other operating necessities that are usually purchased from earnings or from the proceeds of bond sales under general mortgage liens. There are instances, however, when such methods are impracticable or inadvisable. For example, while the purchase of a few cars each year or so may be easily handled from the current cash resources, the acquisition of twenty-five, fifty or one hundred cars might prove too serious a drain upon working capital and necessitates the spreading of the expenditure over the earnings for a series of years. Then again, even if the company were free through the possession of a limited open-end mortgage to float additional bonds covering new car purchases, or if, restricted by closed mortgages, it should desire to open new issues for such purposes, existing market conditions or diminished credit accompanying comprehensive rehabilitation proceedings might make such a step inadvisable. Under such conditions the equipment trust is a most useful and economical device.

It may be almost axiomatic to say that equipment trust certificates, of all obligations, should be surrounded by the most perfect safeguards. The Investment Bankers' committee complains, however, that lately the railroads have been showing a growing looseness in the responsibilities that are the backbone of such securities. Under the equipment trust plan a railway is obligated not only to provide for the safety of the equipment trust investor by properly instituting and preserving his first lien on the rolling stock but also to maintain the property in proper operating condition. Yet it seems that many steam railroads have been receiving equipment before recording the agreement, thus giving the equipment trusts under the after-acquired-property clause of general mortgages only a junior lien on the rolling stock. The indentures, too, have lacked the specific agreements that would enable the trustee to keep informed regarding the condition of the equipment and to declare a default for lack of proper maintenance and replacement. These points can be cleared up by the adoption of the indenture clauses and forms of periodic reports to the trustee suggested by the committee. Railways should welcome any attempted legitimate oversight on the part of trustees and not show any reluctance to submit maintenance reports or to restore lost or damaged rolling stock, for only in this way can there be permanently secured to equipment trusts the attractive investment character heretofore held. Their excellent record thus far as regards defaults has perhaps led to an exaggerated sense of security, but with changing conditions in the railway field it is vitally important that all interests concerned unite to remedy any existing neglect of regular oversight over such issues.

THE ELECTRIC RAILWAY AS A CITIZEN

The participation of electric railways in the civic life of towns in their territory is something very different in nature and effect from that form of pernicious political activity known as "lobbying." As an undertaking which has invested large amounts of money for fixed and movable property and which pays correspondingly large sums for taxes, the electric railway has a legitimate interest in all that will further the prosperity of its habitat. That interest, of course, is best displayed through the personality of a local manager who has ample authority to be the embodiment of the company's citizenship rights and duties. A study of what electric railway companies are doing in the smaller cities discloses that many managers do take a commendable part in civic work. To illustrate: Several companies on one or two occasions have permitted women to serve an afternoon and morning as fare collectors, under the guidance of the regular conductors, with the understanding that all collections in excess of the regular fares were to be applied to the children's or other charities; another set the example of encouraging home manufactures by organizing a "buy at home" club among its own men; a third has built up a mid-week shopping travel from the outlying towns by working out a fare-rebate scheme with the local merchants; and any number of properties have freely given display to the work of "clean-up day," anti-tuberculosis and other organizations concerned with social problems. Activities of this kind meet with much praise from various influential elements in turn and will not be forgotten when the railways ask something for themselves.

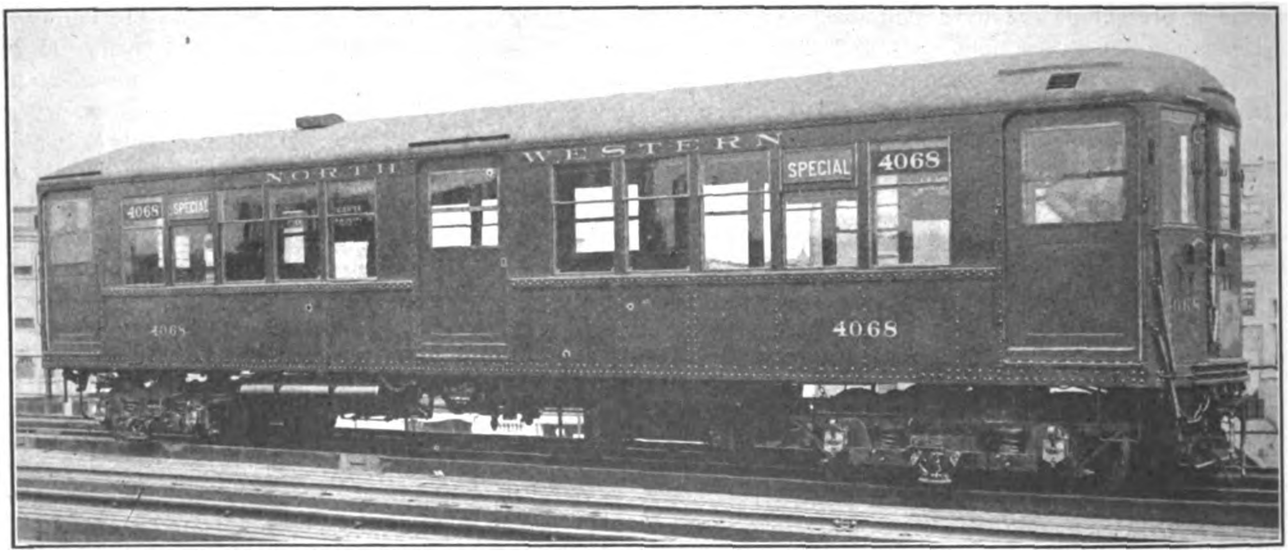
It is characteristic that the railways which do the things described are organized to allow the manager a large degree of initiative. On the small isolated property the manager is the master in any event. However, those companies which operate in whole groups of towns must be careful so to organize their departments that centralization of engineering and purchasing functions will go hand in hand with ample freedom for the local traffic managers. The latter should be far more competent to judge the merits of certain forms of co-operation with the public than a distant and often unsympathetic central bureau.

Pressed-Steel Cars for the Chicago Elevated

A Summary of the Reasons for Choice of Materials and Dimensions, Also the Considerations Which Governed the Size and Arrangement of the Members in the Body Framing

In December, 1913, the Chicago Elevated Railroads placed an order for 128 pressed-steel trailer and motor cars, and took an option for twelve months for an equal number of cars of the same design. The principal features of these cars were described in the ELECTRIC RAILWAY JOURNAL for Jan. 10, 1914. In the following paragraphs the reasons which governed the design and dimensions of these cars and materials used in their construction will be discussed.

As mentioned in the earlier article, the necessity for additional rolling stock was brought about by the increased capacity of the Chicago Union Loop. A slight remodeling of the structure accompanied by through routing of all north and south-bound cars over the Northwestern and the South Side Elevated lines, made it possible to add 500 cars per hour to the existing schedules which had been limited to 700 cars per hour. While the through routing of cars enabled the elevated lines to take advantage of a portion of this increased capacity with the rolling stock on hand, thereby partially offsetting the loss incident to the inauguration of universal transfers throughout the elevated system, additional rolling stock was necessary to obtain full advantage of the increased capacity.



CHICAGO STEEL CAR—VIEW SHOWING EXTERIOR OF COMPLETED CAR

Primarily, the size of the order justified the purchase of pressed-steel cars as the most economical from an operating standpoint. Moreover, it was desirable to obtain a fireproof car weighing no more than the existing rolling stock, which was of composite construction. By the use of steel pressings, properly designed, it was believed that the maximum strength per pound of weight would be attained, while the finished car would weigh no more than those of composite construction. Steel pressings also offered a car structure having fewer joints and fewer rivets than would be possible to obtain with commercial shapes. The side sill and cross-bearer connections are typical of this. If commercial sections had been used, cutting and fitting for each cross-bearer would have been necessary, after which a connection angle would have been required. The connection of the pressed-steel cross-bearer to the side sill requires only the rivets necessary to fasten the flange of the bearer to the side sill. Thus approximately one-half the number of rivets needed with commercial shapes accomplish the same result. It necessarily follows that a reduction in the number of pieces and joints, as well as in the number of rivets, should decrease the cost of fabrication and should also reduce the cost of maintenance. Also in this case there was a sufficient number of cars to make the use of pressings economical, since so large an order could easily absorb the cost of jigs, templets and dies.

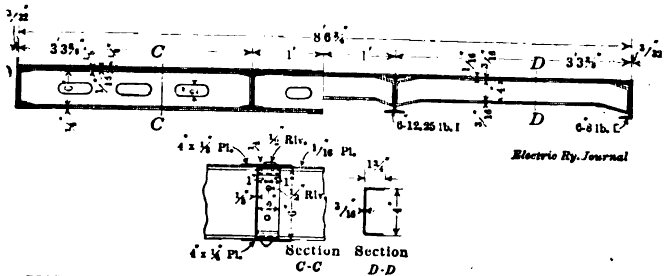
In order to give an idea of the relative cost of the Chicago Elevated Railroads' pressed-steel cars as compared with a number of steel passenger cars now in use on other roads, Table I is shown. This was taken from the article describing the 1914 New York Municipal car. The basis used for the unit figures for the Chicago car is a total capacity of 150 passengers, of whom fifty are seated.

TABLE I.—COMPARATIVE COSTS
Various Steel Passenger Cars

Type of Car	Total Cost Completely Equipped	Cost per Passenger Seat	Cost per Passenger Capacity Seated and Standing	Cost per Lineal Foot
A	$12,236.97	$169.95	$46.00	$175.98
B	18,500.00	260.56	99.46	287.09
C	13,000.00	250.00	84.41	253.25
D	14,500.00	329.54	93.54	300.00
E	12,500.00	284.09	80.64	258.62
F	14,000.00	318.18	76.92	268.91
New York Municipal Car	15,000.00	166.68	55.55	223.88
Chicago Elevated Car	11,000.00	220.00	73.33	229.17

CONSIDERATIONS GOVERNING DIMENSIONS

In the preliminary investigations clearance studies made on the various divisions of the Chicago elevated system soon developed the fact that but very slight changes could be made in the dimensions of the new car over those already standard in existing rolling stock. The following principal over-all dimensions of the new cars were therefore adopted:



C
D
C
D
6-12.25 lb. I
6-8 lb. E

Section D-D
Electric Ry. Journal

CHICAGO STEEL CAR—DETAILS OF MAIN AND INTERMEDIATE CROSS-BEARERS

Distance between centers of trucks	33 ft. 8 in.
Length of car body on center line over end plate	48 ft.
Length of car body over corner posts	37 ft. 10 in.
Extreme width of car over window sills	8 ft. 8 3/16 in.
Width of end-door opening	3 ft. 8 in.
Width of center-door opening	4 ft.
Height of car from top of rail to top of roof	12 ft. 3½ in.

A careful survey of the curve clearances demonstrated that it was praticable to increase the car length 5 in. over the maximum length of existing equipment, but that the over-all width had to remain the same, being limited by platform clearance. It was possible, however, to take advantage of the all-steel construction and increase the interior width of the car 2 in. by reducing the thickness of the sides. The change from the monitor to the arched-roof type of car was made possible only by maintaining the same letterboard height as on existing equipment. This was required to clear station canopies, while the center height of the arched roof was limited only by the curvature necessary to give an attractive appearance to the car roof.

In connection with the choice of over-all dimensions, a rather unusual consideration entered, namely, that these new cars will meet the clearance limitations in any other city where cars of this type are in use. This cautionary measure had the effect of making the equipment trust notes more attractive to purchasers, since it would be possible to dispose of these cars to other companies in case any contingency should arise demanding their sale as second-hand equipment. The inclusion of these clearance considerations, although unusual, represents the thoroughness with which every phase of the car's design was considered.

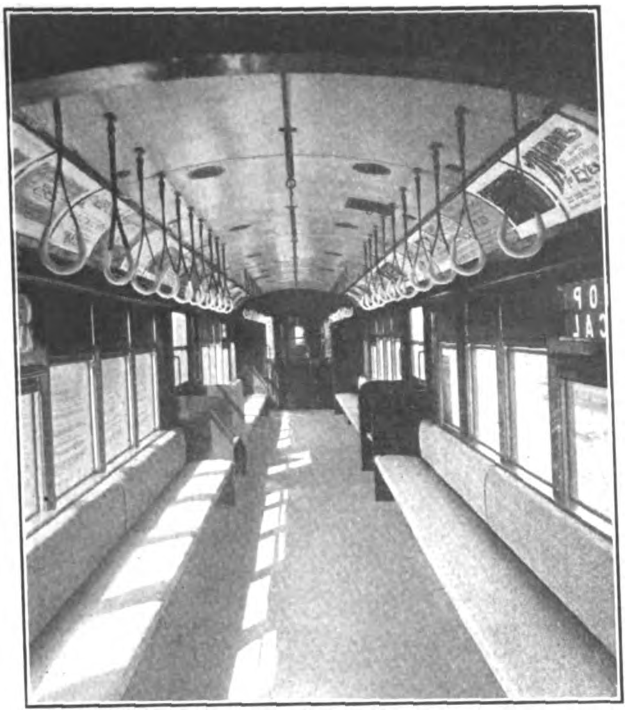
CHICAGO STEEL CAR—DETAILS OF SIDE FRAMING



CHICAGO STEEL CAR—INTERIOR VIEW

materially reduces the length of station stops and increases the capacity of track and station facilities. As these rush-hour periods are short and occur between 7 and 9 o'clock in the morning and between 5 and 6:30 o'clock in the evening, the problem of general arrangement of the car resolved itself into one of door location and width. Moreover, the loading problem during rush hours has been made more difficult since the Northwestern and South Side cars have been through-routed, because it is necessary for passengers using these roads to board and alight at one-half as many stations as were used when all cars were looped in the downtown district.

To reduce the boarding and alighting time, three doors in place of two on each side were adopted, the three-door cars being intended for operation in the same trains. After a test of the various styles and sizes of openings now in use on existing rolling stock, varying from 24 in. to 46 in. in width, as well as consideration of doors as wide as 60 in., it was decided to make the two end-door entrances 44 in. wide, and the center-door entrance 48 in. wide. Each of these entrances is fitted with a sliding door operated by the Burdette-Rountree pneumatic device. Three of the doors are operated by each guard from a niche in the vestibule, except in the case of a two-car train, where the conductor handles four doors.

The choice of longitudinal seats practically was a foregone conclusion when it was decided to use the three doors. The length and width of the car were considered to prohibit the satisfactory use of cross-seats, since they would not increase the seating capacity but would form a barrier to free movement in the aisles. The seating capacity of the older equipment varies from forty-four to fifty-two. In the new cars the four longitudinal seats in the car provide space for forty-four passengers, and folding seats across the sliding center doors furnish six additional seats, making a total of fifty when the center doors are not in use.

CHOICE OF MATERIALS

Before the company decided to adopt hand straps, which were finally used in these new cars, various arrangements of stanchions, together with horizontal hand rails, were investigated on several old cars. As a result of this study, it was decided that the stanchion, in any form, was not of sufficient advantage over the hand strap to warrant its adoption. The locations of the hand straps finally adopted provide for one attached to each roof carlin just outside the line of the longitudinal seats and at a height of 5 ft. 8 in. from the floor line. This conclusion was reached after a study had been made of the various heights and locations of hand straps on existing rolling stock with particular reference to the question of complaints of passengers in this regard.

In the selection of the upholstering only rattan was considered. The bottom of the seat is approximately standard, the seat back is of a half-oval section with the larger diameter near the top. This section was selected so that passengers could lean back without striking their headgear against the window posts. At the same time they must assume a posture in which their feet will not block the aisle.

The choice of finishing and insulating materials in the car was largely governed by two considerations, namely, to obtain a fireproof finished car as well as one which was thoroughly insulated against extremes of heat, cold and noise. Conforming with these requirements, a composition fireproof floor was adopted, which combined the necessary qualities of resilience, safety and resistance to wear. This flooring is laid over No. 22 gage galvanized Chanarch sheets, giving it a maximum depth of 1 in. In order to insulate the floor against temperature variations, the Chanarch is laid on ½-in. wood furring strips at the sills and upon a ½-in. fiber insulation or Flaxlinum between sills. This kind of insulation was also used in the car sides and roof, and on the inside of the steel sheathing.

Since some of these cars have been in service, it has been found that the metallic sound incident to steel cars has been entirely eliminated by this method of insulation. Another precaution taken to provide against temperature extremes was to design the steel pressings so that no metal was exposed to both the exterior and interior of the car, except the brass sashes. All steel members which extend into the interior of the car are covered with agasote. In fact, the entire inside finish is agasote, except a few panels in the vestibule, the steel molding covering the agasote joints and the mahogany window stools.

CHICAGO STEEL CAR—INTERIOR VIEW OF BODY, READY FOR FINISH

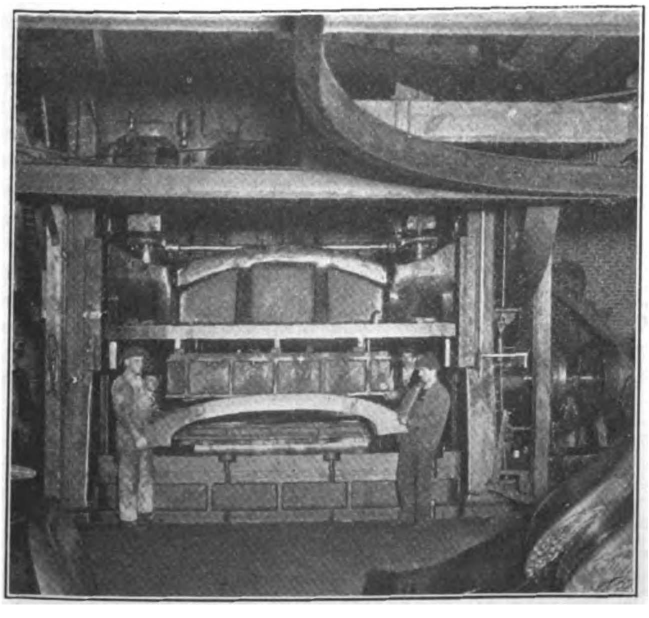
As mentioned in the previous article, an electric heating system was adopted. It was furnished by the Consolidated Car-Heating Company. A combination mechanical and automatic exhaust ventilation system was adopted with air intakes at the floor under the heaters and exhaust outlets at the roof. These are respectively the Auto Utility and the Railway Utility exhaust ventilators installed in conjunction with the Cooke vacuum ventilating system. The interior finish is imitation mahogany with brass sashes and curtain stops. The curtains were furnished by both the Railway Supply & Curtain Company and the Curtain Supply Company, Chicago.

CHARACTER OF DESIGN

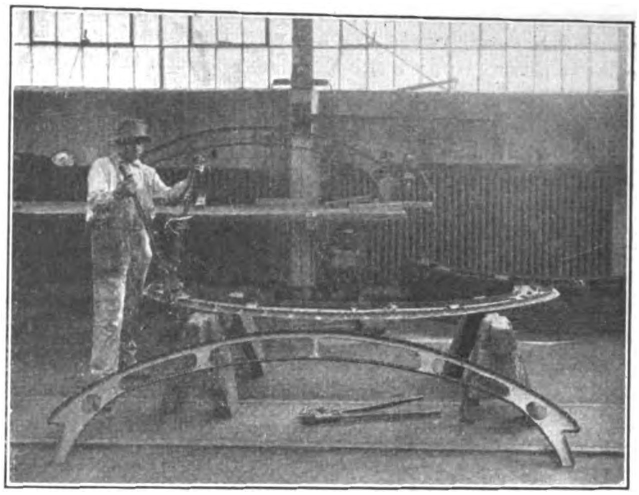
In preparing the general design it was decided that the car sides should be treated as riveted trusses with the side sill forming the bottom cord or tension member and the combination letterboard and deck plate forming the top cord or compression member. The body corner posts, center door posts and window posts, in conjunction with the belt rail and side sheathing, were to serve in the place of diagonal members, to carry the horizontal components of all stresses in the car side framing. This permitted the adoption of a floor system which served merely as a means for transferring the floor loads to the side trusses, and to absorb the pulling and buffing stresses incident to the rapid acceleration and retardation of multiple-unit train operation. The roof carlins and sheathing were so designed that they would tie the trusses together securely and at the same time assist in absorbing the torsional strains coming to the car body.

LOADS ASSUMED

In order to determine the maximum stresses to which the car structure would be subjected, it was assumed that the maximum standing and seated load was 150 passengers, weighing 140 lb. each, or a total of 21,000 lb. The weight of a car body which would safely carry this passenger load and equipment, as well as provide a structure sufficiently rigid to meet operating conditions, was estimated at 35,600 lb. The distribution of this weight was 27,860 lb. between bolsters and 7740 lb. outside the bolsters, the total including all electrical and air-brake apparatus which was attached to the finished car body. In addition to providing for these loads in normal operation, the end of the car, or that portion outside the bolsters, was designed to resist a total weight of 28,500 lb. This precaution was taken to provide against such contingencies as partial telescoping in a collision, the assumed additional load being approximately one-half that of another fully-loaded car.



CHICAGO STEEL CAR—FORMING CARLINS IN LARGE POWER PRESS



CHICAGO STEEL CAR—PUNCHING HOLES IN FLANGE OF CARLIN

PRACTICAL CONSIDERATIONS

Past experience with cars on the elevated railroads' lines indicated the necessity of having the equivalent of two 6-in. channels and two 6-in. I-beams in the underframe to supply the necessary rigidity and to absorb buffing and pulling strains. Accordingly, the side sills have been made of 6-in. 8-lb. channels in continuous lengths between end sills, reinforced with ⅜-in. pressed steel modified-channel sections under the end and center doors. The two center sills, consisting of 6-in. 12¼-lb. I-beams, are each continuous from end sill to end sill. These are also reinforced by ⅜-in. pressed-steel sections extending from the end sills over the bolsters, and they provide for the partial telescoping condition. The end sills are 6-in. 8-lb. channels, reinforced on the outside by Hedley anti-climber buffer plates of rolled steel. The insides of the end sills are reinforced by steel castings riveted between the center sills and serve to transfer buffing stresses. The end of the subframe is further stiffened with a 3/16-in. top cover plate and a ¼-in. bottom cover plate and these, in connection with the reinforced end sills, tend to distribute the stresses proportionately to the subframe members.

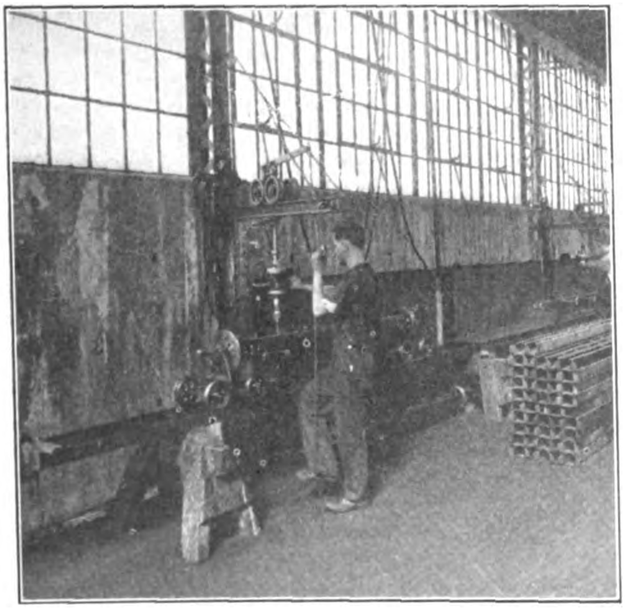
Another member of which the selection was based principally upon convenience for connections was the deck plate. This is a continuous 3½-in. x 2½-in. x ¼-in. angle, to which are connected all the posts, the carlins, the letterboard and the roof sheathing. The letterboard is a 3/32-in. x 9-in. plate, reinforced above the windows with 1-in. angles. Simplicity and convenience in the connections of all of these members to the deck plate were considered of prime importance. Actually, the fiber stress due to the maximum bending moment in the member is quite low. While it might have been possible to have used a smaller section as the deck-plate member, or even to have gone so far as to have eliminated it altogether, such a course would have entailed connection difficulties, weakened the car against side-swiping, and only have saved 380 lb. in the total car weight. In other words, here was a question of design largely dependent upon low fabrication cost, as well as upkeep economy.

Another practical consideration entering into the design was the size and spacing of the window and panel posts. Cut and try methods were largely used in arriving at the most economical section as all panel window posts were considered at one time, each having to transmit its proportion of the stresses between the deck plate and the bottom sill.

The size and spacing of the window posts, which are 3/32-in. pressed-steel U-sections, were so chosen as to give a standard commercial size of glass in the sashes and at the same time leave space for the sliding door pockets without the maximum car load exceeding the allowable fiber stress. The type of window post employed also furnished a light construction, made riveting more convenient, as well as simplified the attachment of the weather stripping, the sash and curtain stops, the insulation material and the agasote finish.

CHOICE OF SHEATHING AND ROOF MEMBERS

The choice of thickness of side sheathing, which is 3/32-in. cold-rolled, patent-level sheets 36½ in. deep, was not dictated by the consideration of the stresses to which it would be subjected, but by experience and operating considerations. It was believed that a thinner plate would dent too easily, or that slight short-circuits or exposure to corrosion would be more likely to cause extensive damage. In other words, the roof and side sheathing, the water table over the belt rail and the letterboard were employed only as inclosures for the framing. It was believed, however, that all of these tended to reduce the fiber stress in the members to which they connected, but this was considered merely as an extra factor of safety. At points where the car framing could be exposed it was finished, thus at these points eliminating the necessity for interior or exterior sheathing.



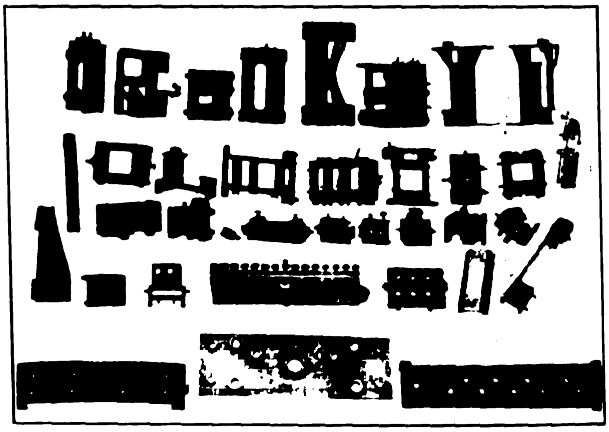
CHICAGO STEEL CAR—REVOLVING BOX JIG FOR DRILLING HOLES IN POSTS

Side sheathing and letterboard plates were purchased in standard commercial lengths and necessitated the use of a single joint with a cover plate between the center door and each end door. The roof sheathing, which is Toncan metal, was selected as the result of an actual test, and its thickness, which is 1/16 in., was governed by its ability to support a man between carlins without undue buckling. Other considerations entering into the choice of the roof sheathing were resistance to corrosion and the rivet bearing areas. The roof sheets were purchased in lengths which would reach transversely from letterboard to letterboard.

The carlins are of a standard design, especially adapted to the operating conditions governing the design of this car. This carlin section was believed to furnish an economical metal distribution, and at the same time weighed only 7 lb. Two designs are used; namely, a principal carlin which connects to the post and deck plate, and an intermediate carlin which connects to the deck plate between posts. Except at the ends and center of the car, the carlin spacing is 16¾ in.

REDUCING COST BY DUPLICATION

While the use of pressed-steel shapes permitted the selection of lighter sections than could be purchased in standard structural-steel shapes, the economies from a cost standpoint lie principally in the number of duplicate sections. Bearing this in mind, the number of pressed-steel sections and structural shapes was reduced to the minimum consistent with reasonable weight in order to obtain full advantage of the consequent reduction of die costs, as well as general simplicity in design. To this end, only one size of I-beam, two sizes of channels and seven different angles were used in the entire car. Steel pressings were standardized in the same manner, similar pressings being used for different purposes as far as practicable. The posts between windows, which were spaced at 2-ft. 9½-in. intervals, are of duplicate sections, being 3⅜-in. x 3½-in. U-sections, pressed from 3/32-in. metal. These posts are riveted to the top of the side sill and between the legs of the angle deck plate, both of which are securely riveted to the roof carlins. All of the posts between windows were made of the same length, being



CHICAGO STEEL CAR—SOME OF THE JIGS USED IN THE CONSTRUCTION

TABLE II.—COMPARATIVE WEIGHTS OF VARIOUS TYPES OF STEEL AND COMPOSITE CARS

	Type of Construction	Length Over Buffer	Over-all Width	Weight Complete, Pounds	Total Area	Seating Capacity	Pounds per Seated Passenger	Pounds per Square Foot Floor
Chicago Elevated Railroads	Steel (1914)	48 ft. 0 in.	8 ft. 8 3/16 in.	70,500	415 ft.	50	1410	170.0
Chicago & Oak Park Elevated Railway	Wood (1909)	47 ft. 1¾ in.	8 ft. 8 3/16 in.	70,300	404 ft.	48	1462	174.0

Pennsylvania Railroad (Newark Service)	Steel (1911)	48 ft. 0 in.	8 ft. 10½ in.	72,500	427 ft.	44	1648	169.5
Hudson & Manhattan Railroad	Steel (1910)	48 ft. 2 in.	8 ft. 10¼ in.	74,100	429 ft.	44	1682	172.6
New York, Westchester & Boston Railway	Steel (1912)	70 ft. 4 in.	9 ft. 9¼ in.	120,000	687 ft.	72	1667	174.5
Long Island Railroad	Steel (1910)	64 ft. 5¾ in.	9 ft. 11½ in.	104,400	642 ft.	72	1450	162.0
New York Municipal Railway	Steel (1914)	67 ft. 0 in.	9 ft. 9 in.	85,000	653 ft.	90	945	130.2
Boston Elevated Railway (Subway Service)	Steel (1912)	69 ft. 2½ in.	9 ft. 6 in.	85,900	657 ft.	72	1192	130.6

so designed as to reduce the number of operations required to form them.

Owing to the very great savings in the cost of fabrication that were effected by the simplification and standardization of shop operations a few of the jigs and templets that were designed for the construction of these cars are shown in the accompanying illustrations. A group of them shown in one of the halftones indicates the extent to which the laying out of drill-press work was eliminated. In addition the jig and machine used in drilling the intermediate posts are shown.

It will be noted that this jig is mounted on a carrier and is arranged to revolve so that the holes may be drilled in all four sides of the post without necessity for changing the position of the work after it has once been fastened in the jig. A view is also shown of the apparatus used for punching carlins. This consists of a substantially-built templet arranged so that the holes may be punched with a hand punch without the necessity for laying out the work and without need for skill on the part of the workman. It is estimated that more than 1000 jigs and templets entered in the construction of these cars. One of the illustrations shows the unusually large power press employed in forming the roof carlins and posts. This measures 12 ft. between uprights and is of 1000-tons capacity, making it capable of handling the widest carlin and the heaviest and longest car post used in the construction of electric railway cars.

METHOD OF ABSORBING BRAKING STRAINS

Accelerating and braking stresses transmitted from the trucks to the car body are transferred directly by the body bolster to the center sills. The body bolster, which was described in the ELECTRIC RAILWAY JOURNAL of Jan. 10, 1914, is composed of two soft-steel plates with a steel separator casting. This casting performs two functions, namely, it serves as a separator for the top and bottom plates of the bolster, and also as a housing for the draft springs. The distribution of accelerating and braking strains is somewhat unusual, requiring a bolster of special design, and it is believed that this one will eliminate overturning under the severest braking conditions. The adoption of this particular type of bolster is the result of experience with existing rolling stock. In case of a severe collision the draw-bar support is arranged to yield and allowed to drop slightly. This brings the anti-climbers into contact, and they absorb the remainder of the blow without further damage to the draft rigging.

WEIGHT COMPARISON

In order to give an idea of the relative weights of the Chicago Elevated Railroads' pressed-steel car when compared with other steel cars the comparative weights of various types have been tabulated and are shown in Table II on page 1238. While the method of calculating the weight per seated passenger is in common use, it is believed that the computations of weight per square foot of floor area will also have reference value. In arriving at the figures for total floor area the over-all width was multiplied by the over-all length in each case.

These cars were designed by the mechanical department of the Chicago Elevated Railroads under the supervision of H. A. Johnson, master mechanic. The order for the bodies was placed with the Cincinnati Car Company, for the trucks with the Baldwin Locomotive Works, for the motors with the General Electric Company, and for the control with the Westinghouse Electric & Manufacturing Company.

Need of Knowledge on Public Utility Questions

Oscar T. Crosby was the principal speaker at a dinner at the Chamber of Commerce in Youngstown, Ohio, on Nov. 19. Among other things he said:

"It is important that the general public should know what were the motives that led investors to put their money into public utilities fifteen or twenty years ago and why there is now confusion. It is important that the public should know that an old and familiar principle of control is no longer applicable and that a new principle can be enunciated which will be a notice to the public as well as to investors concerning the returns which may be made out of such business. It is also important that definiteness should be reached in order that good fellowship will be reached. A vast amount of dangerous class feeling has been engendered because public utility officials have thought it necessary to resist many of the efforts at public control and because spokesmen for the public have denominated as criminal acts which were commonplace of the common law, consecrated by a thousand years of custom.

"For a time public utility officials enjoyed the power which in regulated society must be taken from them. But somebody had to administer. We now run the risk of placing a power vast almost beyond imagining in the hands of men who may be patriotic, but who, like the rest of us, need principles for their guidance. Probably not many in this audience could give the names of the members of the Interstate Commerce Commission. Yet these gentlemen, by a stroke of the pen, can wave a billion dollars from one side to the other of the public utilities of this country and must make determinations so important as almost to pass understanding. The President himself, except by some act like plunging us in war, could not so seriously affect the wealth of millions of our fellow-citizens as can these gentlemen, whose names you do not know.

"Let us, as citizens, urge upon our legislative bodies that they should enunciate principles which shall be as nearly as possible automatic in these matters. We do not want Solomons who shall cut the body in two and kill it so much as we want compassionate judges who will really determine by known principles the proper guardianship of the child."

New Road in Tampico, Mexico

Vice-Consul Thomas H. Bevan, of Tampico, Mexico, reports that construction work has been in progress for more than six months on a new railroad connecting Tampico with the oil fields in Panuco. The road is being built by the Tampico & Panuco Valley Tramways, Ltd., a British corporation, under the direction of Edward Dixon.

The railroad will be 25 miles in length, just one-half the distance between Tampico and Panuco by the River Panuco. It will connect with the Tampico-Mexico City Short Line at Tamos, State of Vera Cruz, and use the National Lines bridge over the Panuco River. Another branch will run down the Vera Cruz bank of the river, where a tide-water terminal will be built with racks to load crude oil to ocean-going steamers. The officials of the road plan to transport oil from Panuco to Tampico for less than one-half the present cost of transporting it down the river by barge.

Notwithstanding the political unrest of the country, construction work on this road has been going ahead steadily, and the officials of the company are hopeful of opening the road to traffic during the latter part of the coming year.

Publicity Work of Public Service Commissions

This Article Contains a Detailed Summary of the Publicity Methods of the New York (First and Second Districts), Pennsylvania and Massachusetts Commissions

By its very nature the public service commission is a news center, for on one side it has access to facts regarding public utilities and on the other, as a public institution, it is looked to by the public as a source of accurate information. In its issue of Oct. 10 the ELECTRIC RAILWAY JOURNAL published an account of publicity methods on a number of electric railway properties. It has been suggested that this article might be supplemented by another regarding the publicity methods of several commissions and data have been secured first hand on this subject. No attempt has been made to cover the whole field in this case, as there would necessarily be a great deal of repetition if the work of all commissions were described.

THE NEW YORK COMMISSION FOR THE FIRST DISTRICT

While the fundamental purpose of the law creating the public service commissions of New York State, passed in 1907 under the administration of Charles E. Hughes as Governor, was regulation of the activities of the public service corporations, the members of both commissions and the Governor felt that if the commissions were to carry out their work to the best advantage access should be made easy for the public to data regarding the companies which previously had been obtained in many cases only with great difficulty.

William R. Willcox, the first chairman of the commission for the first district, from his experience as postmaster of New York and park commissioner, had become thoroughly convinced of the advantage of the fullest publicity with respect to measures in the public interest, and in adopting a similar policy for the commission was seconded by the other members of the commission and by Travis H. Whitney, the secretary, who continues in this capacity.

As soon as the members appointed to the commission by the Governor had perfected their organization, means were sought for bringing to the notice of the public the details of the affairs of the corporations under the jurisdiction of the commission. The position of assistant secretary was created, and to this officer was delegated the work of making the proceedings of the commission available for the newspapers and the public.

The first assistant secretary in charge of this was a practical newspaper man, J. O. Hammitt, who in January, 1908, resigned to accept the secretaryship of the Citizens' Union, and is now chief of the bureau of fire prevention of New York City. He was succeeded by James Blaine Walker, the present assistant secretary, a man long engaged in newspaper work, under whom the elaborate and effective system now in use has been developed in all its details. The commission is not concerned with the amount of space given to its doings by the newspapers. The purpose which actuates it is merely to insure a proper understanding on the part of the public of the work before the body. The design is obviously not advertising, but full publicity. The commission meets formally twice a week, and in addition holds hearings on questions effecting service, rates, etc., which are open to the public. Immediately after each formal meeting Mr. Walker goes over the matters considered by the commission and prepares a story upon it for the newspapers. Twenty-four copies of this are manifolded and distributed to the news agencies and the newspapers. In the case of a special development at any public hearing Mr. Walker obtains a transcript of the most important part of the proceedings for the newspapers directly after the conclusion of the hearing. The full transcripts of the public hearings, covering in most cases many typewritten pages, are available to the public and the newspapers about two days after the hearing. Mr. Walker's purpose in digesting the work of the commission for the papers is that the news may appear promptly after the meetings and be absolutely accurate.

At the end of each week a bulletin is prepared covering in abstract the work of the commission for the week. This is sent to more than 200 daily and weekly newspapers in the State and to a few outside. It is also sent to a selected list of technical and trade papers. The digest contains only what is considered worth while from the newspaper standpoint. It is sent out in mimeograph form and has been used for some time past as the basis of the commission news which appears weekly in the department "News of Electric Railways" in the ELECTRIC RAILWAY JOURNAL.

Whenever the commission finds that there is a widespread interest in a given part of its work a special pamphlet is distributed. One of the most persistent demands made upon the commission is for copies of the laws which govern the actions of the commission. These are the rapid transit act, the public service commissions law and the general railroad law. Thousands of copies of these statutes are distributed annually from the office of the commission. The annual reports of the commission to the State Legislature, consisting usually of three large volumes which contain all the orders of the commission, are sent free to all citizens of New York State who apply for them. A small charge is made to citizens of other states. To meet the demand of those who desire the decisions of the commission more promptly, a monthly publication, *Reports of Decisions of the Public Service Commission*, is issued. A nominal charge of 25 cents a month, or $2 a year, is made for this to cover the cost of printing.

During the current year the publication of a monthly magazine known as the *Public Service Record* was begun. In this magazine technical engineering articles on rapid transit work are featured, as well as matters concerning the regulation work and the personnel of the commission. A particularly interesting department is a summary at the end of each issue prepared by the engineering department and showing the status of the work on the various subway sections which are under contract. These are of especial value to the contractors who desire to follow this work in detail. Every month or two the story of the progress made in subway construction is prepared by Mr. Walker in the shape of a newspaper article, from the detailed reports as they appear in the *Public Service Record*. While these stories are concerned very largely with statistics, the facts are presented so as to attract and hold the attention of the reader, and as the stories are necessarily long they are usually made available for the daily papers on Monday morning, when the pressure upon the columns is not so great as on other days. The subscription price of the *Public Service Record* is 50 cents a year and there are more than 100 subscribers. The edition is 3000 copies, of which 2400 are required for circulation in the organization.

In connection with the dual subway now under construction two very useful booklets have been issued. The first of these was brought out in September, 1912, before the contracts for the subway were let. This booklet told what was planned in the way of subway construction. The first printing was 5000 copies. In June, 1912, this booklet was revised and elaborated and 15,000 copies have been printed up to the present time. An edition of 5000 copies in abridged form is now on the press. This booklet gives in great detail and with elaborate illustrations a summary of the design and construction of the new subway system. Another important pamphlet was prepared by Mr. Walker after the commission had been at work for four years. This was designed especially to tell what had been accomplished in that time. This was issued in September, 1911. The edition was 5000 copies. It has long been out of print. The first pamphlet issued by the commission, in 1909, described briefly the jurisdiction and work of the commission.

The annual report of the commission, which goes to the Legislature in January, is prepared by Mr. Walker, who also makes a summary of it for release to the press when the report is filed, namely, on the second Tuesday in January. One thousand copies of this are printed on one side of the paper so that it can be easily edited and given out to compositors in short "takes," if necessary, so as to facilitate putting the matter into type. It goes to all press associations and to the local papers.

A very effective means of publicity is offered to members of the commission in frequent opportunities of making public addresses. Commissioners and members of the staff are often invited to address public bodies, and wherever it is possible they accept such invitations and take advantage of the opportunity thus presented to bring the problems before the commission to the attention of the public. Not so long ago Mr. Walker himself, in the course of a tour in connection with his work, made several addresses reviewing the work of the commission. This tour took him to a number of cities in the East, among them Philadelphia and Baltimore. The address which he made in Baltimore was delivered at the solicitation of a local civic association during the time that the Maryland Legislature had under consideration the matter of creating the present Maryland Public Utilities Commission. The members of the engineering staff also have done excellent work in connection with the propaganda of publicity by preparing and delivering in various parts of the city illustrated lectures dealing more particularly with the problems that are confronted in the present rapid transit work.

Another very important phase of Mr. Walker's work has to do with contracts for subway construction. A great many inquiries are received regarding these contracts, of which there will ultimately be eighty-three, and Mr. Walker has been intrusted with the work of taking care of inquiries along these lines.

The commission subscribes to a press clipping bureau which is instructed to clip for it items on all public utility matters from New York City papers and papers throughout the State. These clippings were first filed according to date, but some time ago the plan of classification according to subject was adopted. Under this method there is a more consistent arrangement of all material dealing with any particular development. For instance, in case of a bond application by a company, all of the clippings in regard to the application, the hearing and the action by the commission are segregated and pasted in a section of the clipping ledger especially set aside for that particular development. The information so far published in regard to the work of the commission in the newspapers is practically all contained in sixteen large, loose-leaf ledgers, the first of which was started on the inception of the commission.

THE NEW YORK COMMISSION FOR THE SECOND DISTRICT

The Public Service Commission for the Second District of New York, familiarly known as the "up-State commission," causes to be prepared in newspaper form reports of all orders issued, hearings held, investigations made and complaints lodged with the commission.

In giving publicity to its proceedings it has been the effort of this commission to get away from the "press agent" idea. Avoiding every tendency to advertise the commission or its activities or to exploit individuals or prejudice proceedings, the "bulletins" which are prepared for the press are devoid of anything but the strict news value of the items of which they treat, without technical or involved expressions.

Regulative, investigatory and judicial as are the functions of the Public Service Commission, its activities are so divided among open sessions, informal conferences, investigations and general correspondence that it has proved practically impossible for an outside newspaper man adequately to cover its activities without aid from the commission. It is merely this aid which the commission's publicity work aims to supply. At the head of each bulletin is the following statement: "This is not a formal or official statement by the commission, but merely a news summary for the convenience and aid of newspaper men."

All of the important dailies in the State maintain resident correspondents at the Capital, in addition to the bureaus of the four press associations. The commission's bulletins are turned over to these men. Bulletins concerning definite localities are mailed to the papers published there, large and small. Bulletins of general interest usually find mention on the press associations' wires and are mailed throughout the State to supply matter for editorial comment, or news to the smaller papers which do not use the press associations. So far as possible no matter is forwarded to any editor unless it is certain that he can find some legitimate news use for it.

Matters of technical interest, such as rate regulation, setting standards of service and corporate capitalization, are mailed to trade and financial publications. The bulletins of the commission are usually published in the utmost good faith and with a display of proper respect for the judgment of the commission.

In preparing bulletins the quasi-judicial character of the commission is not forgotten. No attempt is ever allowed to discourse on the merits of a case except where testimony or the formally written or publicly expressed opinion of the commission or a commissioner may be properly quoted.

THE PENNSYLVANIA COMMISSION

The Public Service Commission of the Commonwealth of Pennsylvania gives full publicity to its opinions, rulings and orders and to the various complaints that are filed affecting public service. The actions of the commission are published in pamphlet form and sent not only to the parties directly interested, but to hundreds of persons in Pennsylvania and other states who desire to be informed as to the commission's work.

All complaints of a legitimate character, and the answers to the complaints, are made public immediately after they have been received, so that the public is practically familiar with the features of a case from the time it is filed until the commission disposes of it.

The law under which the commission operates provides for the posting of tariffs by utilities and the filing of them in the office of the commission. The posting of tariffs, which means the displaying of charges, is a feature of publicity that is bound to benefit the public, because it enables those who pay the tolls to determine whether or not the rates assessed conform to those sanctioned by the commission. So important is this feature of publicity considered that the commission has divided the State into districts, and the office of every utility coming within the jurisdiction of the commission is visited for the purpose of ascertaining whether any public service company has neglected to post a tariff corresponding with that filed in the office of the commission. A check of this kind is essential for the effective operation of the tariff bureau.

All hearings before the commission are public, but there is a provision in the act that empowers the commission, when it shall determine it to be necessary in the interest of the public, to withhold any facts or information obtained during the progress of any investigation. For instance, the reports of the investigator of accidents are not open to public inspection except by order of the commission, and are not admissible in evidence in damage suits.

Concerning petitions for public convenience, valuation, etc., the commission arranges the time and place for public hearing on such petitions, of which notice, in the form prescribed, shall be given by the petitioner, by publication, once a week, for two weeks. The last of these publications shall be at least five days preceding the date of hearing and in a newspaper published in the municipality where the principal office of the applicant is located, or, if there is no newspaper published in this municipality, in a newspaper published at the county seat of the county in which the office is located. A sample notice is given below:

FORM OF NOTICE TO BE PUBLISHED FOR CERTIFICATE OF VALUATION

Notice is hereby given that application will be made to the Public Service Commission of the Commonwealth of Pennsylvania under the provisions of the Public Service Company Law, for a certificate of valuation, by the..........................., which proposes to issue...................................

A public hearing on this application will be held in the rooms of the commission at Harrisburg on the..........day of..........
19...., at..........o'clock, when and where all persons interested may appear and be heard, if they so desire.

The effect of the operation of these regulations is that every community and individual is given an opportunity of knowing when matters concerning their interests are to be heard before the commission, and if they so desire they may file protests.

The requirements of the commission as embodied in its rules of practice are of such a character that no complaints are made that the proceedings are of a "star chamber" kind, and even the unsuccessful applicant feels that he has been accorded a full and fair opportunity to present his case.

THE MASSACHUSETTS COMMISSION

The Massachusetts Public Service Commission has no department of publicity, nor is any member of the staff specifically charged with the task of constantly informing the people regarding the progress of its work. The policy of the board and that of its predecessor, the Massachusetts Railroad Commission, is and was that of the open door. The docket, hearings, and all formal proceedings of the commission are as open to the public as are the courts; full co-operation with representatives of the press and of the public at large is a conspicuous feature of the office practice; and seekers for information from members of the board or their subordinates are encouraged to press inquiries without restriction.

On questions of import within the State and on matters involving federal relations the chairman occasionally states his views for the benefit of the public, setting forth the conditions as they appear to the head of the board without attempting to forecast official action or to commit his colleagues to opinions not expressed by them. These utterances, in the form of newspaper interviews or statements, are widely read for their interpretative value. They do not interfere with the giving of an interview by any single commissioner desiring to set forth his views informally upon any matter. Circumstances naturally govern the giving of interviews of this sort. They are commonly brought forth by an expressed desire on the part of the public to ascertain the views of the board upon matters of legislative interest, upon occasions when it is desirable that public sentiment shall be informed as to conditions within or outside the jurisdiction of the commission, or when possible changes in the policy of the State with respect to its transportation interests are under discussion. The expert knowledge of the commission is in this way turned effectively to account as an educative force, in addition to the material furnished the public in the formal findings of the board.

At the offices of the commission, 1 Beacon Street, Boston, a complete file of recent findings, orders and decisions is maintained on a counter immediately accessible to the public upon entering. Withdrawals from this file are forbidden, but extra carbon copies of important and of many minor pronouncements of the board are frequently typed and filed on a bulletin board from which withdrawals may be made by newspaper men and other interested parties. Bulletins of forthcoming public hearings are not posted on the wall, as in some commission offices, but a diary of all hearings whose dates have been set is kept in the general office and is open for consultation at any time by anyone interested. Docket books in which entries of each petition are inscribed as rapidly as they are received, are likewise available for public examination, together with the original petitions and all papers bearing upon the case as filed by the board and the parties in interest. A large writing table is provided in the general office for the convenience of persons consulting the commission's papers. On the counter of the general office are also maintained the latest time-tables of the railroads in the East, with various directories, copies of legislative bills of the current or last session, and frequently copies of special reports of the board as issued by the State printer and for which a large demand may exist.

Verbatim reports of the hearings in disputed or other important cases are filed in typewritten form by the commission in the docket folder of each corresponding case, and these are always open to public inspection during office hours. As a rule a single bound copy of the proceedings accompanies each case in which contesting parties appear before the board, or in which financial points are involved of which it is desirable that a full record shall be available.

The Massachusetts Gas & Electric Light Commission, which has jurisdiction over the companies suggested in the title of that board, files a typewritten stenographic report of every case given a public hearing, but the large number of uncontested matters brought before the Public Service Commission have, up to the present, rendered it desirable to confine the stenographic record to cases of what might be called major importance. Pole and location matters, for example, involve no dispute in many cases, and the board holds the view that the cost of stenographic reports in such instances is unwarranted. In the case of a new and important line seeking a location against opposing interests or associated with extensive engineering and legal developments, the record naturally would be complete. All exhibits and data filed in cases are equally at the disposal of the public.

Full stenographic reports of inquests are maintained and are available to all, as are the returns of companies reporting to the board. As a rule, representatives of the daily press in Boston call once or twice a day at the commission's offices to consult the order board and docket, to attend various hearings, or to confer with the staff. Frequently if an important finding is to be issued the reporters on the dailies represented at the Capital are notified by telephone. A liberal policy is followed with respect to advance copies of special reports and of the annual report to the Legislature. The reports of the hearings in the Boston dailies are usually highly abbreviated, and the stenographic record, which reaches the office several days after the hearing, in most cases is obviously of little use to reporters on daily papers.

The annual report of the commission is issued in two volumes, the first covering a summary of the operations of the companies under the board's supervision during the last fiscal year, with a general discussion upon the state of the transportation industry within the commonwealth, the text of orders, decisions, findings, etc., and the second containing the full returns of all companies reporting to the board. The 1913 report consisted of a first volume of 561 pages and a second of 1142 pages. The first volume is printed in paper-bound form early in January each year for submission to the incoming Legislature, and copies of this volume are available at the office for the asking. Cloth-bound copies of the entire report are distributed later in each year.

The appropriations of the Legislature have thus far enabled the commission to furnish copies of its reports to applicants at its offices and through the mails without charge for the volumes themselves, but the demand for these publications has attained such proportions in recent years that the cost of mailing or of expressage has had to be considered and is now usually charged to the recipient except in cases of distribution of publications through official or library channels. Copies of the case records are not supplied directly by the commission, and as these sometimes run to several thousand pages in important sets of hearings, the board does not have them printed. They may, of course, be copied *ad libitum* by the interested party or his representative. Since the commission occupied its present offices a library including many valuable publications bearing upon transportation and the regulation of public utilities has been established on the premises, and this is open to responsible persons having an interest in the work of the commission.

As in most boards of this kind, an immense amount of informal work is handled by the commission and its staff through the various departments, notably in connection with complaints regarding railroad, street railway, telephone or telegraph service. These matters and the correspondence of the board, reports of inspectors, and other work within the organization, obviously are not listed for public examination, nor is the public expected to attend conferences among the board's membership. It is the general policy of the commission, however, to set forth the reasons for its decisions in cases at issue, so that the public may know as far as possible the channels by which the conclusions were reached. The cordial co-operation rendered by the commission and its staff to information seekers from all parts of the world entirely offsets, in the judgment of those experienced in dealing with the board and its employees, the absence of any formal publicity organization.

Effect of Automobiles on Interurban Transportation

Competition with Automobiles Is Being Felt by Interurban Electric Railway Operators

In a recent issue of this paper some interesting figures showing the effect of automobiles on city travel were presented by Robert W. Toll, chief engineer Denver Tramways. A traffic count was made in Denver of the passengers in automobiles entering and leaving the business portion of the city for an average day, and it was found that if the same number of people had used the street cars they would have paid $437,372 annually in 5-cent fares.

Reports from a number of interurban lines indicate that they also are suffering from automobile competition, but whether this competition will be permanent or whether it will practically disappear, as in the case of the bicycle, is hard to say. Perhaps the most conspicuous evidence of the large number of automobiles now in use in the country districts is shown at different county fairs held during the past month or two. In the past, most of the attendants from a distance to the average county fair came by the electric cars. Now anyone who attends such a fair is impressed by the large number of automobiles parked near the grounds. In the case of one county fair held within the last few months in the Central States it was found that the attendance this year was considerably greater than last year, but the receipts of the electric railway companies operating cars to the park were less by between 25 and 40 per cent. In another case the railway company reported a decrease of $9,000 between 1914 and 1913, and it was roughly estimated that at least two-thirds of the decrease was due to automobile travel.

Accident Reduction on the Northern Pacific Railway

The Northern Pacific Railway Company has had in operation for some time a "bureau of efficiency," the purpose of which is to reduce accidents on the system. During the first six months of 1914, as compared with a similar period of 1913 before the bureau was organized, the number of deaths due to operating accidents has been reduced by 73 per cent. This work has been done through the operation of numerous educational plans, and a special representative spends three-quarters of his time on the line observing physical conditions at stations, trestles and shops. Suggestions are received from employees on special cards provided for the purpose, of which more than 2500 were turned in during 1913. Of these, nearly 90 per cent contained suggestions or complaints which were reasonable and of practical benefit.

A Neglected Principle of the "Safety First" Movement

The Writer Emphasizes the Importance of the Proper Selection of Trainmen—The Ability of the Employment Agent to Judge the Applicant Is the Key to the Situation—Instances Are Cited

BY C. J. FRANKLIN, CONSULTING EXPERT PUBLIC UTILITIES, PORTLAND, ORE.

Since the inception of the "safety first" movement each succeeding year has witnessed a wider application of its principles. Occupying its full share of public attention and receiving serious thought in all lines of business, there has been no movement throughout the history of public service development to equal it in popular approval. Its appeal is to humanity. Originally, this movement took the form of an educational campaign confined to the company's employees and trainmen, later extended to embrace the public schools, and now we attempt to reach the public through whatever mediums prove favorable. The slogan "Safety First" we now understand to embrace any and every form of accident prevention within the company organization or outside of it, and properly so.

THE ACCIDENT SITUATION—PLAN OF ATTACK

The accident situation has been attacked at a number of different points, chief among which have been:

Car design looking to safer operation,
Safety devices,
Improved conditions at crossings, curves, stations, etc.,
Educational work with the public,
Educational work with the trainman,

coupled with which have come improved types of equipment, better track and roadway conditions, etc.

Although these points may not have been approached in the order given, they easily represent the plan of attack thus far.

THE NEGLECTED PRINCIPLE

Observation and study of conditions on many railway properties during the past twenty-five years has amply confirmed a conviction, formed in the early days of the writer's experience, that the real cause of accident growth lies deeper than is commonly thought.

In enlarging upon this conviction my aim is to bring out certain points which have not been regarded as seriously as their importance merits, with the end in view of assisting, in a small way, in this great work of safety. The gratifying results so far obtained are duly appreciated and the means used fully indorsed, but I believe there is still another step to be taken, in conjunction with those outlined, which will lead as nearly to the elimination of accidents as may be consistently expected.

This step is so fundamental that, as soon as it is mentioned, a majority of officials will consider it well looked after in their own organization, but the writer ventures to suggest that many an official, upon applying the simple tests outlined elsewhere in this paper, will find conditions he little dreamed existed.

In a word, sufficient care is not exercised in selecting trainmen or in choosing the man who selects them.

THE WORKING ORGANIZATION

The character and efficiency of the working organization reflects success or failure according to its standard. The character of an organization is measured by that of the individuals of which it is composed. Hence it is clear that by improving the individual we improve the organization. The application of this principle to the safety movement is found partly in the efforts toward the training and education of the trainman, and in this direction a great deal is accomplished, but no one who has studied this question will deny that a large part of the effort is wasted on poor material and, unfortunately, it takes some little time to find this out.

It goes without saying that the best possible organization is desired, and it would seem clear that the right way to begin is by selecting the best men available. If we would eliminate that proportion of accidents within the power of the crew to avoid, why not attack the cause rather than attempt by training to regulate the effect?

Unquestionably the fallibility of the human element is the greatest factor in accident study—more important than equipment, track, safety devices, etc. It ramifies to every fiber of the organization—no branch of operation can escape its consequences. In transportation expense alone, platform cost is by far the largest item.

Toward the training of these men we spend thousands of dollars—toward their selection, comparatively nothing.

Educational work will, of course, improve the efficiency of a man even though he is unfitted for the work, but he cannot be expected to compare favorably with a properly selected and properly trained man.

The accident record invariably registers the selection of men not fitted for the duties of service, and the educational work is increased in proportion. A mahogany table cannot be produced from a piece of fir, neither can a competent trainman be produced by any course of training if the man is not mentally and physically qualified for development.

SYSTEMS OF EMPLOYMENT

Generally speaking, the system of employing motormen and conductors to-day is a gradual improvement of the method used in the old horse car days. The idea then was to keep the runs filled and the cars moving. The character of the trainman did not count for much as long as he could do the work.

On small systems, and on a great many large ones, the selection of the future trainman is placed in the hands of the superintendent of transportation. This official has hundreds of details to attend to and is not in a position, even if qualified, personally to look after the employment with the degree of care it should have. This is as much so on a small system as on a large one, albeit the remedy is not so readily found on the small road.

A number of the large properties have endeavored to relieve the superintendent of this employment work by appointing a superintendent of employment, employment agent, or official with some such title, whose duty it is to attend to all employing. On some properties this official does not have absolute authority. He is supposed only to interview applicants, weed out the undesirables and pass the remainder to the superintendent for examination and approval. Usually this employment officer is recruited from the ranks, possibly from the inspectors or dispatchers, or perhaps from the platform men. His method of selecting men is naturally in line with that of the superintendent. He follows the beaten path, not realizing the serious possibilities of his work.

Aside from the hours set apart for interviewing applicants, other duties are pressed upon him which soon occupy a large share of his attention. Examination of applicants is hurried to gain time for other work, and ultimately these examinations become superficial and purely mechanical.

If a man has ability to read and write, appears physically sound and within age limits, he stands every chance of being put to work, depending on how badly the company needs men at the time. The application blanks are filled in and the required number of references given. These references are supposed to be written to and the replies used to test the applicant's record. Often men are put to work before all their references are communicated with. Perhaps only one reference has replied, and the man goes to work on probation with the understanding that if other references are not satisfactory he cannot continue in service. Once in service, unless something out of the ordinary brings him to the attention of the superintendent or the employment officer, the man is practically lost sight of. If the remaining reference letters do not arrive, his attention is probably not called to it providing he has kept out of trouble. Whatever weak points he may develop are not known to the employment officer. He does not follow the man up. If he hears nothing from him, he considers he has made a good selection.

A CASE IN POINT

Conditions of this kind are not extreme or exceptional. They are of common occurrence on a majority of properties. I know of one case where the man was employed and retained in service with only one of some five or six references heard from and that one very unsatisfactory—"considered the man unreliable and would not re-employ"—the remaining references were never heard from. The man was passed by the employment officer and the superintendent and was ultimately involved in a serious accident.

It might be said that this case is an exception, but it occurred on a large property which considered its system about as good as could be attained; investigation along the lines mentioned above developed numerous cases of like character, not all of which as serious but enough so to convince any one of the inefficiency of the employment system. Similar cases have been found by the writer on properties having what appeared to be a very elaborate and exhaustive system of employment where it seemed that the greatest care was being used, but thorough investigation disclosed the utmost neglect.

You naturally ask why these lax conditions continue to exist. Ask the general manager of any railway for an outline of his employment system. He probably cannot do more than tell you in a very general way. The details he does not attempt to remember, and it is not expected that he keep constantly in mind every detail of his road.

This is the very point I wish to emphasize. In common with many other matters, this has been regarded as not of sufficient importance for the general manager to look into, but as something to be left to subordinates.

A SIMPLE TEST

By way of impressing presidents, general managers and other high officials with the seriousness of these claims, I would suggest that some morning, without warning, they drop into the office of the employment officer and take from the files at random some twenty folders supposed to contain complete records of a like number of trainmen—their applications, references, clearances, etc. These should be sufficiently complete to bring the man's record down to date. Examine each case personally and satisfy yourself whether your road is in the class mentioned.

As a further test, call for complete papers, records of employment and subsequent record of trainmen involved in the last twenty serious accidents and see if you consider that sufficient care was exercised in the selection of these men.

Ask the claim agent about it. There is no one on the property who comes into closer contact with the men, particularly those who fall down, than the claim agent. His opinion is worth considering.

THE REMEDY: SYSTEM 40 PER CENT—MAN 60 PER CENT

Now a word concerning the remedy for this condition. I am not advocating any particular system of employment. This is a matter for the management. However, there is this to consider. The system of employment and training will represent about 40 per cent of the remedy and the man selected to do the employing represents the remaining 60 per cent. The system can accomplish little without the right man.

There are few more important positions in the entire organization of a railway than that of employment officer. The requirements of service to-day are not those of fifteen years ago; they demand a higher type of trainman. He has something more to do than drive a horse or mule. Into his care are entrusted the safety of thousands of lives and an expensive equipment. He represents the company before the public. His conduct is the company's conduct, and by it the company is judged. He can make friends or enemies for his company. His duties are manifold.

The selection of men for this work is a duty not to be entrusted to one who thinks lightly of its importance. Before all else the employment officer should realize the serious possibilities of his work. Errors of judgment on his part can become far-reaching. They may cost his company thousands of dollars and often involve loss of human life. Responsibility for many accidents, apparently resting with the trainman, can, as a matter of fact, be traced directly to the employing officer. I have in mind an instance of this kind which occurred on a large property where a trainman became involved in a more or less serious accident. He was called before the superintendent for examination. The superintendent was astonished to find the man almost utterly lacking in intelligence—wholly unfit for the duties of motorman or conductor. He could hope for nothing other than strictly common labor. The superintendent could not lay the blame at the trainman's door, yet he could not understand how the man passed inspection. On this particular road the employment system was considered to be most efficient, and the superintendent had the greatest confidence in his employment officer, regarding him as an especially capable man. As a matter of fact, the officer was not fitted for his position, while the superintendent himself had not studied him enough to realize this.

QUALIFICATIONS OF AN EMPLOYMENT OFFICER

The really successful employment officer possesses qualifications peculiarly necessary for his duties. He is a man of keen observation and deliberate judgment, has analytical ability of a high order, is approachable and possesses the faculty of putting men at ease. He is always a student of men, of human nature. Rather slow to form conclusions, his judgment will be found well supported by observed facts. He knows the qualifications necessary for the position he is about to fill, and before he passes his man as approved, the qualifications are checked off, one by one, deliberately and accurately, with the result that he delivers a superior grade of human material to the operating department for development. Thus given something really capable of development, the careful course of training now found on our modern roads could produce remarkable results.

Ability to judge men is rare. There are many superintendents and other executives who are capable operating men but lack the qualifications peculiar to a successful employment officer. For this very reason many an employment department is inefficient; it cannot be otherwise when organized and controlled by one who is not fitted for the work.

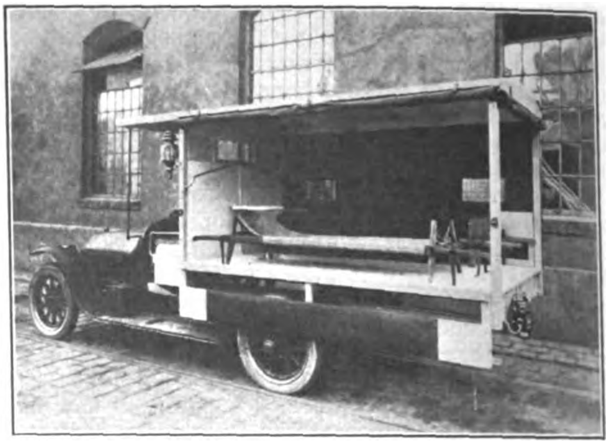
THE FOUNDATION OF SAFE OPERATION

I do not wish to convey the impression that simply by the exercise of proper care in selecting trainmen all accidents will be avoided. Neither do I mean to say that one can determine, when employing a man, whether he is going to have an accident or not. But I do insist that the foundation of accident prevention lies here, in the selection of the man; that the employing officer should be a high-class man especially qualified for this work rather than a graduate trainman, inspector or what-not who does not realize, and often cannot be made to realize the importance of his duties; that if the same proportionate amount was expended in the employment department that is now spent for training and educational work, it would constitute the best paying investment on the property.

The Vienna Tramways and the War

BY LUDWIG SPÄNGLER, DIRECTOR VIENNA MUNICIPAL TRAMWAYS

When Austria declared war against Servia toward the end of July, 1914, the partial mobilization of the Austro-Hungarian army affected the personnel of the Vienna Municipal Tramways but slightly. At that time, in fact, not more than 800 out of 12,000 employees were called to the colors. In the course of the later mobilization orders, however, we have lost 4650 men, of whom 3100 were in platform service. At the same time the government excused 2500 of our older men from army duty in order that the street railway service might be maintained. By calling upon men who had already been pensioned and by the more intensive efforts of the men who had been left behind, we were actually able, with a 45 per cent reduction in the staff, to handle the 25 per cent increase in business which occurred immediately after the heavy mobilization period. This extra business was handled also with a reduction in car mileage, the consequence being an increase in the number of standees.



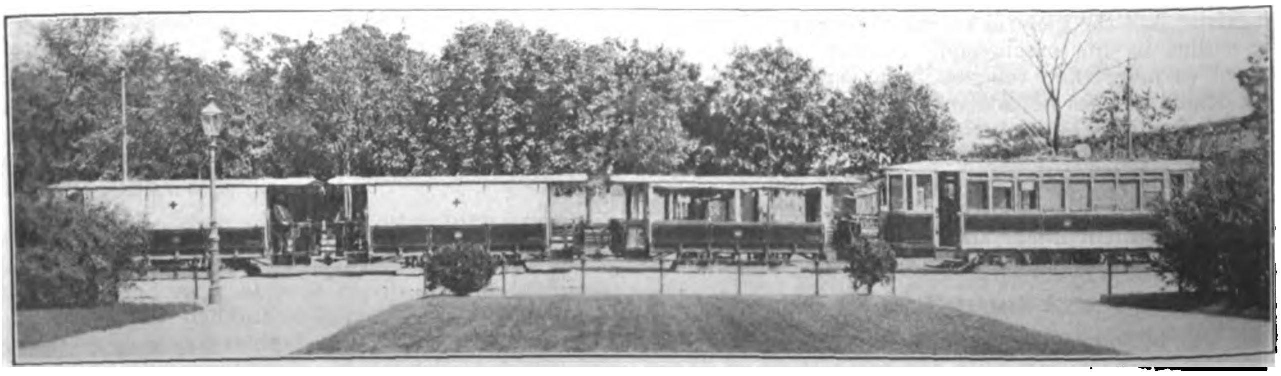
AN AUTO-TAXI IN HOSPITAL SERVICE

The instruction of new employees was taken up so quickly that by the end of October we had in hand 2800 men, of whom 1275 were for transportation service. At this time (November) the car mileage is 15 per cent less than just before the war, and the gross earnings for October were 9 per cent below those of October, 1913. Part of the reduction in earnings, however, is due to the great amount of free riding granted to soldiers. In fact, we are now carrying about one-seventh of our passengers free. Vienna life is now assuming its normal aspect, and with the opening of the theater and concert season we expect that traffic will pick up again.

Another problem which the Vienna Municipal Tramways has had to face because of the war is the great increase in freight transportation, due to the fact that the army authorities commandeered so many horses and auto trucks. Thus we are supplying a part of Vienna with all of its milk, garden and farm produce in connection with neighboring interurban railways. The electric railway is also used very extensively by the army to transfer supplies from large local warehouses to the steam trunk lines which lead to the battlefields. Another class of freight service is the transportation of excavated material from foundations for buildings.

The transportation of wounded soldiers from the steam railroad stations to the Vienna hospitals is carried out chiefly via electric railway. Ordinary cars are used for those men who can stand or sit, but in addition we have converted cars to enable them to carry cots and stretchers. A large part of the wounded men are transported in auto-taxis, the bodies of which have been replaced by special bodies containing two hospital equipments of the type illustrated.

The dependents of the employees who have enlisted are, of course, granted a certain allowance by the gov-



MOTOR CAR HAULING THREE TRAILERS IN RED CROSS SERVICE ernment in accordance with the law. The Vienna Municipal Tramways has also set aside a further allowance for these families, in addition to which voluntary contributions are made by the employees who have remained on the system. The latter have also raised a sum of $10,000 for the Red Cross and similar funds.

In view of the hoped-for increase in traffic after the war we have ordered 135 motor cars and 125 trailers. The order was given at this time to save the workmen of the car builders from unemployment. It is interesting to add that these cars are being built at the prices that obtained before the outbreak of the war.

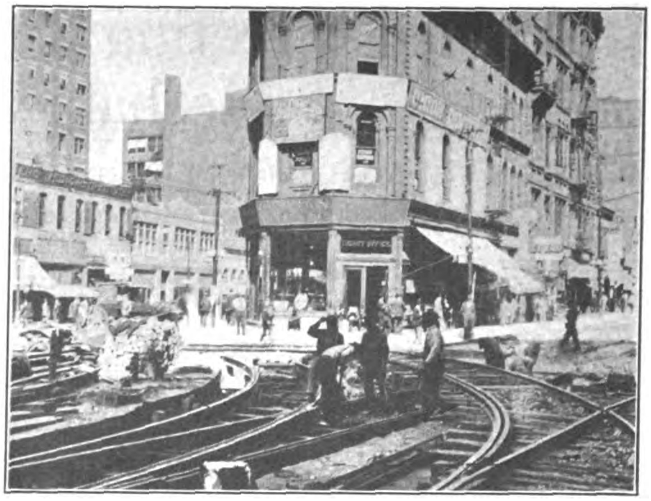
(EDITORS' NOTE: A report received from Eugen Eichel, editor *Elektrische Kraftbetriebe und Bahnen*, who was a recent visitor to Vienna, states that Mr. Spängler is congratulating himself on having storage-battery buses in service, as all of his gasoline buses have been taken for military purposes.)

Reconstructing Both Tracks at Once

The Metropolitan Street Railway, Kansas City, Mo., during the autumn was permitted to reconstruct both tracks simultaneously on Main Street between Ninth and Twelfth Streets, which is one of the busiest sections of the city. During this period all vehicular traffic except the car service was suspended. As the railway company had estimated that by tackling both tracks at once the job could be carried out in thirty days instead of sixty days, this unusual procedure was permitted by the Board of Public Works and approved by the merchants of the city. Work was begun on Sept. 1, but heavy rains delayed completion about two weeks. Despite the confused state of the highway the merchants did not suffer seriously, as passengers from the cars were landed from temporary T-rail tracks close to the curb or to plank platforms.

On Main Street the cable had been abandoned in 1903 and the track reconstructed with 9-in. 106-lb. center-bearing rails. The concrete beam foundation then used had been installed without much disturbance of the old cable construction. The tops of the yokes had been cut off to secure enough depth for the concrete beams, and the cableway was filled with broken stone as a bed for the new pavement.

TRACK RECONSTRUCTION ON MAIN STREET, KANSAS CITY



CONSTRUCTION OF TRACK UNDER WAY AT NINTH AND MAIN STREETS, KANSAS CITY

When the present work was undertaken all of the old cable construction that did not interfere with the new track work was left undisturbed, but excavation to a depth of 6 in. was made for fresh concrete under the new ties. No new rails were installed, as those in service had been placed two or three years ago. The paving between the rails and for 18 in. outside of the rails is of Wisconsin granite cut for ¼-in. joints with cement grout, the blocks being bedded on a mixture of sand and cement. The rest of the street paving is of creosoted wooden blocks.

Gasoline Cars of Curacao Tramways

The quaint little town of Curacao, in the Dutch West Indies, boasts what is perhaps one of the smallest street railway systems in the world. The total length is about 1½ miles of narrow gage, single track. The rolling stock consists of but two cars. These cars, however, form the interesting part of the equipment.

Each car is propelled by a six-cylinder 60-hp gasoline engine, which is mounted in the forward part of the body. The radiator is in the dashboard of the car, as shown. The engine may be controlled from either end of the car through a system of chains. After covering about half the distance, the passenger is handed a transfer and is requested to take the car ahead. Then car No. 1 goes back to the starting place while No. 2 takes the passengers to the end of the line. The line is owned and operated by the Curacao Motor Tramway Company, Joseph Cardoze, director.

Annual Meeting of American Society of Mechanical Engineers

At the New York Meeting Held on Dec. 1-4, Many Subjects Were Discussed, Among Them Being Snow Removal, Factory Floors, the Elimination of Seams in Steel and the Hardening of Tool Steel

The annual meeting of the American Society of Mechanical Engineers was opened in New York in the evening of Tuesday, Dec. 1, with the address of the president, which was followed by the report of the tellers of the election of officers, John A. Brashear, of Pittsburgh, being elected president for the ensuing year. After this a reception was held by the society for the president-elect and the president.

President James Hartness, in his address, pointed out that the world of mechanism had become so intricate and complex that it had grown beyond the grasp of any single individual. Each one must be content to comprehend only a small part, and only by selecting the character and limiting the amount of material that is taken into the individual mind could the best results be accomplished. The engineer should devote a part of his time to the care and study of his thinking machine instead of devoting it all to the mechanical device created by that thinking machine. The mind should not be overloaded with data to the exclusion of thoughts of an initiative character. Man was a creature of habit to an extent that rendered this characteristic a dominant one, and the most efficient use of mind and body demanded a scheme of life that permitted each one to take advantage of this fact.

At the business meeting which was held on Wednesday morning the reports of the council and standing committees were presented. Among the latter was a progress report of the committee on standard steam boiler specifications, and this brought out an extended discussion regarding details of the report which lasted through the morning session and was finally adjourned until later in the day. At the adjourned session for discussion of this report the entire printed revision of the specifications, exclusive of the proposed model license law, was taken up section by section, and a number of suggestions were accepted by the committee, which is to make a further report at a later meeting.

Following the business session on Wednesday morning, a paper entitled "Floor Surfaces in Fireproof Buildings" was read by Sanford E. Thompson, in which the author advocated the use of the granolithic floor with a ground surface owing to its low first cost and high wearing qualities. In the discussion which followed considerable support developed for the wooden floor and also for the asphalt block floor because of the objections of operatives to stone floors of all kinds. The coldness and hardness of the latter sometimes even produced temporary lameness.

Among the other papers on Wednesday afternoon was the report of a test of the friction losses in the universal joint by P. F. Walker and W. J. Malcolmson. In this it was found that with loads above, say, 50 per cent of the rated capacity of the joint the efficiency was constant and above 95 per cent in all cases where the angle of inclination was less than 9 deg. The use of forks in the same plane was found to give an efficiency from 2 per cent to 3 per cent higher than with forks at 90 deg.

SNOW REMOVAL

At the snow removal conference which was held in Philadelphia on April 16 and 17, 1914, a committee on resolutions was appointed. In its report, which was read before the American Society of Mechanical Engineers at the public service session on Thursday, it was stated that the problem confronting the public officials is the removal of snow in the shortest time and in such a manner as not to interfere with traffic, and at a minimum cost. Therefore, when using the method of scraping, shoveling into trucks or cars and hauling to dumps, the length of haul becomes a most important factor. The utilization of sewer manholes for dumps, and of the sewer system to carry the material away, is the most economical method which can be devised, as it reduces the hauling to a minimum. However, the authorities in charge of the sewer systems have, as a general thing, apprehensions regarding the use of the sewer as a snow carrier.

Nevertheless the bureau of sewers in New York City made experiments during the winter of 1914 which seem to prove that, within certain limits, such apprehensions are ill-founded. Their results indicate that snow may be dumped by wagons into sewers having a flow of 10 cu. ft. per second or more. Pan scrapers can be used where the flow is at least 3 cu. ft. per second and the velocity is greater than 1½ ft. per second. Shoveling can be done where the flow is at least 2 cu. ft. per second and the velocity more than 1½ ft. per second. Under ordinary circumstances if the flow is sufficient to carry snow away, melting will occur within 300 ft. when the temperature is 60 deg. Fahr. Gas and chemical combinations in the sewers have little effect on the rate of melting. Two cubic yards per minute is the maximum rate at which snow can be shoveled into a 24-in. manhole. Tidal sewers can be used to advantage only when the tide is low. Siphon sewers can be used as well as the ordinary type.

Where difficulty is experienced with an insufficient flow in the sewers, or where the flow decreases or stops, the water plug may be opened in the drainage area of the sewer above the manhole in use, until the volume of water is sufficient to carry off the snow, but it has been found most efficient to construct water jets in the manholes into which the snow is dumped. The problem of getting the material into the manholes in the least time with the least interference with traffic opens up a field for the consideration of a special form of manhole to be used satisfactorily for this purpose. Both Pittsburgh and St. Louis use a special form of manhole.

As a result of the experiences and views which had been expressed at the conference and which had since come to its attention, the committee recommended that: (1) The plan of organization and the system to be employed for snow removal should be worked out in advance of the snow season. (2) The work of removal should commence as soon as the snow had covered the pavements and the indications pointed to the continuance of the storm. This principle is successfully followed by street railways in the removal of snow from their track space and by some cities. (3) The carrying capacity of the sewer system should be utilized as far as possible to get the snow away from the streets. (4) When practicable, the work should be performed directly by the municipality by day labor. (5) Co-operation should be sought with the traction companies and use made of adjustable plows and sweepers to open roadways adjacent to street railway tracks at the time that the work of clearing the tracks is being carried on. (6) Effort should be made to obtain the co-operation of the public and to instruct the householders in the method of the removal of snow from private premises. (7) The police force of the city should co-operate with the street cleaning force and the services of patrolmen as inspectors should be utilized as far as possible. (8) A standing committee should be appointed to collect data and report upon such methods or apparatus as may be presented to it. Further, a conference should be held next spring for an interchange of experiences in handling the removal of snow during the winter of 1914 and 1915, and to make further recommendations.

OTHER PUBLIC SERVICE SESSION PAPERS

In a paper entitled "Training for the Municipal Service in Germany," Clyde Lyndon King cited the success of the German nation in commerce and industry through the diminution of economic waste. Specific training was provided for men in all occupations, however mean, and the influence of preparation of men for governmental positions and the preference shown to such men was believed to be a contributing cause.

A paper on the design and operation of the Cleveland municipal electric light plant, by Frederick W. Ballard, stated that the new station, which went into operation July 20, 1914, was the largest central station to be built by a municipality in this country. It was intended not only to supply electric current for street and commercial lighting, but also for power users. The rates which were being charged for service ranged from $0.03 per kw-hr. maximum to $0.01 per kw-hr. minimum. This station had a capacity of 25,000 kw and at present carried one-fifth of this load. The decision to build it was the result of experience since 1906 with a small station of 1500-kw capacity which had made the remarkable record of having acquired from the earnings of the plant itself more than one-half of its total value in eight years.

In the design of this station several new and radical features had been introduced. These were as follows: The use of motor-driven auxiliaries exclusively throughout the plant; the use of large boiler units with high steam pressure; the use of economizers of much greater capacity than ordinarily installed; a new arrangement of coal-handling apparatus; the use of both forced and induced draft with practically atmospheric pressure in the combustion chamber; the automatic control of furnace conditions; the simplicity of the piping layout, due to motor-driven auxiliaries, and the use of an auxiliary steam turbine for driving the auxiliary motors, this turbine being supplied with a jet condenser whose cooling water was fed into the economizers.

PROFESSIONAL SESSION

In describing a series of tests on "Chilled Iron Crane Wheels," at the professional session on Thursday F. K. Vial stated that the vertical load to be carried on any chilled iron wheel was not limited by the capacity of the wheel, but by the carrying capacity of the rail. The bearing power of chilled iron was far in excess of that of a steel rail, and, therefore, might be neglected when considering maximum vertical loads. Under equal loads, the depression in the rail was inversely as the diameter of the wheel. The larger diameter of wheel made a larger area of contact, which reduced the pressure per square inch. On a new A. S. C. E. rail the safe maximum limiting load for a 12-in. wheel was 23,000 lb., and for a 33-in. wheel, 38,150 lb. If the top of the rail was flat, and 2 in. wide, the limiting load on 12-in. wheels was 78,300 lb. and on 33-in. wheels 130,000 lb. Owing to the depression in the rail caused by wheels with extremely heavy loads a 24-in. wheel required 25 per cent more power than a 33-in. wheel and a 16-in. wheel required 68 per cent more power than a 33-in. wheel.

A paper on the mechanical elimination of seams in steel products, notably steel rails, by Robert W. Hunt, outlined the result of an investigation of the subject by T. H. Mathias, assistant general superintendent of the Lackawanna Steel Company, who determined that the most certain way of getting rid of seams was to remove that portion of the metal which contained them. The primary causes of seams existed in the ingots and probably were incident to the casting of the ingots. The surfaces of ingots displayed disk-like apertures, due to entrapped air, which in rolling could easily be elongated into dangerous seams. It was demonstrated that the surfaces of the ingots were decarburized to the extent of eight to ten points carbon and to a depth of 5/16 in., a condition which must be detrimental to the finished product. In a new process to overcome these difficulties the removal of the surface metal was effected by a hot sawing or milling operation during the process of rolling. The ingot was first reduced to a point where the product is 75 per cent finished, in the form of a partially shaped bar 60 ft. long, when it was entered between two pinch rolls with the flange side up and forced between two milling saws. Metal was removed from the top and bottom of the bar, the main object being to eliminate the seams from the central portion of the bottom of the rail which had been found to be the starting point of the well-known moon-shaped failures, and also to remove seams from the top or bearing surface of the head of the rail.

HARDENING TOOL STEEL

In a paper considering the "Factors in Hardening Tool Steel," by John A. Mathews and Howard J. Stagg, Jr., it was stated the position of the critical temperature for carbon steel was fairly constant but was affected to a variable degree by the addition of alloys. For practical hardening the critical temperature must be exceeded by a fairly good margin, at least 25 deg. Fahr. to 50 deg. Fahr., depending on the size, shape, mass and composition.

The time of heating is as important as the temperature to which the steel was heated. At least two dangers must be avoided. First, if the heating is too fast, a uniform temperature does not exist throughout the mass being heated. Second, grain size depends, among other variables, upon temperature and time above the critical temperature. If a piece is held above the critical range for an abnormally long time, the crystals may grow to such an extent that on quenching, the abnormal grain size is retained and the result is a weak, if not cracked, piece. Quick heating in a furnace considerably hotter than the correct hardening temperature is bad practice.

Pure water has a fairly constant quenching rate up to a temperature of 100 deg. Fahr., where it begins to fall off. At 125 deg. Fahr., the increase in time required for cooling is very marked. Brine solutions have a quicker rate of cooling and are more effective at higher temperatures than water. Where water at 70 deg. Fahr. cooled the test piece in 60 seconds, the brine solutions cooled it in 55 seconds. Oils are slower in their quenching powers than water or brine solutions, but the majority of them have a much more constant rate of cooling at higher temperatures than water or brine. Owing to the slower quenching rates of large pieces it is necessary to heat large sections hotter than small ones in order to produce the same amount of hardness. In a certain case it was found that a 3/16-in. round bar would harden at 1395 deg. Fahr., while a ¾-in. round bar should be heated to 1450 deg. Fahr.—a difference of 55 deg. The following table was given to show the decrease of hardness in tempering, expressed in per cent of the original hardness:

100 deg. Cent.	2.5 per cent	400 deg. Cent.	70.0 per cent
200 deg. Cent.	14.0 per cent	500 deg. Cent.	87.5 per cent
300 deg. Cent.	41.0 per cent	600 deg. Cent.	97.5 per cent

Regarding the effect of time on drawing the temper the authors stated that standard ½-in. round A.S.T.M. test pieces, which were quenched from constant temperature and the temper drawn in some salt bath at constant temperature after varying intervals of time, gave the following results:

Elastic Limit	Maximum Strength	Elongation	Reduction	Brinell Hardness	Time Interval, Minutes
228,750	260,137	2.5	....	425	8
201,125	214,562	11.6	45.4	390	20
175,000	183,187	12.0	49.35	340	40

The tendency of steel is to become spherical by repeated quenchings. Changes of forms are conditioned by the original proportions of the piece quenched, by its chemical composition, by the temperature from which it is quenched, and within certain limits by the time of heating. Hardness, brittleness, change of form and liability to crack, generally speaking, increased with the carbon content and the temperature and time of heating. Nevertheless, constant conditions give constant results.

Regarding furnaces and methods of heating the authors said that the fuel used is immaterial so long as the following points are considered: The furnace and hearth should be of sufficient size so as not to be affected materially in temperature by the introduction of the parts to be hardened. It should heat at a uniform rate and should be of uniform temperature over its entire hearth. It should be run under neutral, or reducing, conditions. A good rough test for this is the introduction of a piece of wood or paper upon the hearth. If the paper (or wood) burned, the atmosphere was oxidizing. If it charred, it was reducing or neutral. The temperature control must at all times be exact. A blacksmith's fire is satisfactory under good handling but the difficulty is that for constant work it is too exacting on the operator and requires too many manipulations to secure uniform and continuous results.

CLINKERING OF COAL

Lionel S. Marks in a paper on "The Clinkering of Coal" pointed out that the matter of clinkering ought to be taken care of when contracts for coal are made, and that it has been frequently suggested that specifications ought to include the melting temperature of the ash as indicating the clinkering characteristics of the coal. The only method that seems to be available for measuring both melting temperature and viscosity is the Seger cone method or some modification of it. If the cone is placed horizontally projecting over the edge of its support, the indications are more satisfactory, though far from perfect. Laboratory tests of coal ash by this method indicate that coal ash with a fusing temperature lower than 2500 deg. Fahr. give much trouble, while an ash with a fusing temperature above 2550 deg. Fahr, gives but little trouble. The fusing temperature between these limits cannot be taken as a criterion of the tendency to clinker. A further indication may be obtained from the appearance of the melted cone and the range of temperatures between initial and final bending of the cone. The coals which give most trouble were those of which the ash cones show a very liquid constituent and a small range of temperatures between initial and final bending.

Economics of Electric Railway Distribution

H. F. Parshall Discusses the Effects of Spacing and Capacity of Substations Upon Operating Results

At the Nov. 17 meeting of the British Institution of Civil Engineers, H. F. Parshall, consulting engineer, London, delivered a paper on the effects of spacing and capacity of substations upon operating results. In this he gave the results of an elaborate study based largely upon data of operating costs of the Central London Railway. The author's principal conclusions follow:

With the given energy consumption per unit of length of line that follows from a given train movement, the capacity of the substations increases directly with the distance between them. The energy loss in distribution conductors of a given section varies with the cube of the distance between substations. The cost of attendance is within wide limits independent of the size of the substation. The cost of the plant per kilowatt falls off with the size of the units, but the maintenance and renewals per kilowatt are more or less constant. With rotary-converter substations and a working voltage of 600, and for certain assumed average conditions of train weight, speed and energy consumption the most economical substation spacings are 8½ miles, 5½ miles and 3¼ miles for train services of six, twelve and twenty-four trains per hour respectively. For a working voltage of 1200, the substation spacings are 11 miles, 7½ miles and 5 miles respectively, while when 2400 volts is adopted the most economical substation spacings are 16 miles, 12 miles and 8½ miles for the three train services respectively. With the present arrangement of rotary-converter substations, there is little advantage in a higher voltage than 2400 for the track conductor. The economy of higher voltages is shown to be approximately the same whatever the train service. As between 600 volts and 1200 volts there is a saving of 14 per cent in the total annual costs of the distribution system; as between 1200 volts and 2400 volts there is a further saving of 7 per cent or 21 per cent as between 600 volts and 2400 volts. If the working voltage is further increased to 3600 there is a decrease in total annual expenditure on substation and overhead conductor equipment of only 3 per cent, which will be less than the additional cost of the rolling stock.

For single-phase distribution at 5000 volts the most economical substation spacings are 31 miles, 24 miles and 16 miles for train services of two, three and six trains per hour respectively. At 10,000 volts single-phase, the most economical substation spacings are 45 miles, 34 miles and 26 miles for the same three train services respectively. With three-phase distribution at 5000 volts the most economical distances between substations are 38 miles, 31 miles and 18 miles for the same respective train services. In most of these last cases, however, the economical distance between substations thus determined is greater than would be permissible in practice from considerations of both traffic operation and voltage drop. Further, in the case of single-phase operation, the lower pressure of 5000 volts is found to be the most economical for certain services and the higher pressures of 10,000 volts, 12,000 volts and 15,000 volts in vogue on the Continent are explained by considerations of voltage drop.

The Louisville & Northern Railway & Light Company, New Albany, Ind., one of the southern Indiana Insull lines, has begun to use newspaper space in advertising its service. Recent issues of the Louisville papers have carried display advertisements suggesting Sunday afternoon trips to Silver Hills, a natural park west of New Albany.

The "Safety First" Movement on the Chicago, Ottawa & Peoria Railway

W. F. Carr Outlines His Experience in "Safety First"—Much Tact Necessary in Handling Men

In his paper, read at the November meeting of the Illinois Electric Railways Association, W. F. Carr, engineer of maintenance of way of the above-named railway, outlined the results of his experience in the "safety first" movement. He stated that at first the employees suggested plans for reducing accidents involving money expenditure. They had to be shown that the movement is one requiring co-operation between workmen and operators. In this period of retrenchment it is discouraging to have a man suggest the expenditure of money to offset his blunders. Many of the suggestions received had to be carefully analyzed for, while the men making them are familiar with their own particular surroundings they observe only the phase of the situation which affects themselves.

Mr. Carr emphasized that considerable tact is necessary in disposing of suggestions and stated that the attempt was made to correct the viewpoint of the men when this was in error. He stated that the company endeavors to impress the fact that most present-day employers of labor have surrounded their employees with fairly safe working conditions but that the public needs education on safety matters. Employees can call attention courteously to risks incurred by the public and can advocate laws to compel the public to be careful. The employees of the company have been instructed to show their friends the benefits of laws imposing heavy penalties for trespassing upon railroad property; and to stop cars, if time permits, to call the attention of parents to the dangers of the practice of allowing children to play on the tracks.

In the operation of the railway attention of employees is directed to the following safeguards in the respective departments: Transportation department; air brakes should be properly applied; cars should not be bumped in coupling; moving cars should not be boarded; cars should be kept in safe operating condition; unsafe blocks should not be passed without orders; cars should head into and back out of sidings; cars should be stopped for boarding or alighting passengers; cars should be flagged in backing over highway crossings; drop switches should not be used; cars should be coupled by means of the draw-bar handle; trainmen should be sure that switches and derails are open or closed, and they should keep their heads inside the cab or vestibule; explosives should bear stamps and be handled according to safety rules; the loading of freight cars should be balanced; alighting passengers should be warned of the presence of a trailer when such is used; passengers should be kept out of vestibules; disputes with passengers should be avoided; passengers should be ejected only at stations; window guards should be kept in position; aisles should be kept clear, and passengers should be required to keep their feet off the car seats.

Equipment department: Safeguards should be installed on all machinery; defective ladders, grab irons, running boards and couplers should be repaired promptly; car repairers and inspectors should place blue flags or lights when working on cars; headlight plugs should be carefully examined and repaired; car pits should have foot planks across them; electric welders should be shielded when in operation; machinery should be inspected before using, and first-aid stations should be placed in the shops.

Power department: Operators only should be allowed in the machine rooms of stations; apparatus should be guarded by signs calling attention to danger; first-aid stations should be placed at every substation; C.E.R.A. rules for safety in operating a.c. apparatus should be enforced, and the pulmotor for resuscitation kept at the dispatcher's office in Ottawa should be used when needed.

Track and roadway department: Fire department should be notified when tracks are excavated in city streets; lights and flags should be used to guard excavations in streets; brush and hedge fences and buildings on right-of-way should be cut down or moved back to afford a better view; highway crossings should be kept in condition to avoid breaking of vehicles; track should be carefully patrolled for defects; careless loading of tools and material on hand and push cars and unauthorized use of hand cars should be prohibited; hand cars run after dark should be provided with white lanterns in front and red lanterns behind; the attaching of hand cars to moving trains and their use on main track in foggy weather should be prohibited; highway crossing signs, fences and gates should be kept in repair as a warning and barricade against trespassers.

Bridge and building department: Bridges should be thoroughly inspected at least once every quarter for defects; holes in station platform and floors should be immediately repaired; buildings should be inspected once each month; combustible matter that would cause fire should be removed, and all fire-fighting apparatus should be tested monthly and insurance inspection reports filled out.

In addition to the above rules Mr. Carr stated that, under the direction of the overhead lines and signals departments about 16 miles of block signals have been installed by the company, five crossing bells have been installed at highway crossings, instructions have been issued to linemen to examine all poles before climbing, poles have been moved back to afford safety to trainmen at sidings, "Rymco" overhead trolley switches have been erected at all meeting points and C.E.R.A. rules for the care of high-tension, a.c. lines have been adopted and enforced.

In stations agents have been ordered to report immediately all defects in floors, flues, wiring, etc., in and about buildings, to report and temporarily repair inequalities liable to trip passengers, to avoid leaving trap doors open and to give immediate attention to greasy or slippery steps.

Cost of Service as Basis for Rates

At a meeting of the Western Economic Society in Chicago on Nov. 13, Halford Erickson, of the Railroad Commission of Wisconsin, presented a paper on "The Cost of Service as a Basis of Rate-Making." In this paper Mr. Erickson said that the courts have generally held that rates, to be reasonable, must yield revenues sufficient to cover operating expenses, including a fair return on the fair value of the property used and useful in serving the public. Although this would indicate that the cost of service should be the basis of rate making, there are other theories as to the proper basis of rates.

Utility service may be furnished upon the following bases: (1) Free of charge to all consumers; (2) to cover current operating expenses with no allowance for capital investment; (3) to cover all current cost, including capital cost, or (4) at a rate to yield the greatest possible net return. Each of these four bases is permissible under certain circumstances. The first is for those utilities which a sound public policy dictates should be used by all. An example is the public schools. The second is applicable where the service should be supplied to all on equal terms, regardless of the quantity of use. An example is the postal service. Both 1 and 2 imply public ownership, and a meeting of the capital or operating cost by taxation. The third basis may be used by a utility either publicly or privately owned. The fourth basis applies chiefly to utilities which furnish services in competition with one another.

Mr. Erickson argued in favor of the cost of service basis, which is coming into constantly greater use in railroad work. Even most manufacturing plants, whose prices are based on the fourth principle, have established cost accounting systems to assist in fixing prices. It is practicable to determine approximately the basis of cost of freight and passenger operation in railroad service, although many of the expenses vary with different units, such as the train-mile, train-hour, etc. It would still be permissible, also, to continue a freight classification, with different rates for different commodities, because the interests of all are best preserved by such a discrimination.

The "cost basis" for rates would require the valuation of properties, but Mr. Erickson thinks that when such a valuation has once been made it will not be hard to keep it up, nor would these valuations cause constant fluctuations in the rates, as is sometimes claimed.

Papers on Public Utility Valuation

J. W. Alvord Outlines Scope of Science of Valuation—J. H. Gandolfo Favors Actual Cost as Equitable to All Parties

At a meeting of the American Society of Civil Engineers on Nov. 18 two papers dealing with public utility valuation were presented. One was by John W. Alvord on the subject of "Fundamental Principles of Public Utility Valuation," and the other by J. H. Gandolfo on the subject of "The Valuation of Public Utility Property." The following abstracts of these papers are made from the *Proceedings* of the society for October.

CONTENTS OF MR. ALVORD'S PAPER

The paper by Mr. Alvord was undertaken as a consequence of the voluminous discussion of his prior paper on "The Depreciation of Public Utility Properties as Affecting Valuation and Fair Return," presented on Dec. 17, 1913. To Mr. Alvord's mind this discussion indicated a greatly increased interest in valuation matters, but at the same time, on the part of many engineers, a lack of a clear perception of the fundamental principles involved in such work. His paper, therefore, attempted to show the following: (1) That it is quite idle to argue about the detailed methods of valuation without a fundamental and uniform conception of what valuation and property are in the first instance and what the reasoning of the courts has been on these subjects. (2) That, fundamentally, the art of valuation must rest in the law and in the interpretation of the law by the courts. (3) That the Supreme Court has repeatedly ruled that it is the value of the property used for the public purpose that must be considered, and it is the value of that property now. (4) That most public utility commissions and many estimators who have been following their rulings are at variance with the opinions and decisions of the courts, in that they are insisting upon retracing an investment rather than valuing a property. (5) That the reproduction method is in most cases a most useful line of inquiry in arriving at a conclusion as to what the value of a property may be at the present time, but that it is not the only line of evidence to be considered. (6) That reproduction is a cost method and does not of itself determine value; it is only one of the means and not an end, and must be complete in itself, including going cost, before it can properly be used as a basis for reasoning. (7) That when all lines of evidence are properly presented, appraisers must reason as to what bearing on valuation each one may have.

Mr. Alvord's paper as a whole is an amplification along the above lines. In his opinion the science of valuation calls for a knowledge in three professions: law, engineering and economics, although the law and its interpretation control. Mr. Alvord believes that wherever there are wide differences of opinion as to the value of a property, a large part of the difference is usually caused by differing conceptions as to what is being valued and differing definitions. If appraisers, and especially engineers, would once thoroughly understand that it is the function of the law and not themselves to say what is to be appraised, most of the troubles and confusion in appraisal work would be eliminated.

To produce good results in appraisal work, according to Mr. Alvord, it is necessary to have practical experience in considerable amount, alternately representing both conflicting interests in order to appreciate fully the varying points of view. The only golden rule for the engineering appraiser in valuation work is for him to value the property so that he would be satisfied with the valuation if he had been appointed by the other side, or if at any time hence he found himself on the other side of the issue in some other case. Mr. Alvord states that what is greatly needed is a book compiling in full without partiality the decisions and opinions of courts in valuation cases to be accompanied by a topical index. In connection with his paper he appends a list of the more important decisions for immediate reference.

OUTLINE OF PAPER BY MR. GANDOLFO

The primary purpose of the paper by Mr. Gandolfo is to show that in any valuation or appraisal that is made for purposes of rate-making or security issues the proper figure to be used is actual cost to date of the work in question, provided of course that there has not been extravagance, fraud or gross mismanagement in the origin or development of the enterprise. Although this valuation is a basic figure, however, it is not necessarily the only and final one to be used for any and every purpose for which a valuation may be undertaken. Reproduction or replacement cost, cost of reproduction less depreciation, etc., all have their proper place and should be used under the proper conditions.

To substantiate the above statement, Mr. Gandolfo goes back to the fundamental beginnings of private business and traces the development of the private corporation and the public utility corporation, at the same time showing the similarity and dissimilarity between these three classes. With this as a basis, it is shown how the same principles can and should be applied in the valuation of public utility property as would be used in that of a private individual. In investigating a public utility it is indicated briefly why this class of corporation should be subjected to regulation by the state. Decisions of courts are referred to wherever it is thought necessary to show the trend of judicial opinion.

In conclusion, Mr. Gandolfo states that the actual cost to date is a figure equitable to the investor, the promoter the manager and the public at large. The real object of a valuation of any public utility is to obtain a figure such that any conclusions or regulations founded upon it will be just to all interested parties. Every case must be decided on its own merits with due regard to conditions and circumstances immediately surrounding it.

Consolidation at Ogden, Utah

Important Extensions and New Construction Under Way—New Substation Erected and Others Being Built

The Ogden Rapid Transit Company and the Logan Rapid Transit Company have recently been consolidated under the name of the Ogden, Logan & Idaho Railway Company, which now operates the city system of the Ogden Rapid Transit Company, also the Ogden Canyon interurban line, the North Ogden interurban line, the Brigham City interurban line and the Plain City steam line. It also operates the Logan City lines. In addition it has built a number of extensions to the north and south and has others under way. On the completion of the work already begun, the company will have practically 135 miles of interurban track, in addition to about 6 miles of city system in Logan and practically 40 miles of city system in Ogden.

For the new construction north and south of Logan the company has used 70-lb. A.S.C.E. rail, steel bridges with concrete abutments and catenary overhead construction. It has also constructed a substation in Smithfield, Utah, in which will be located a Westinghouse 235-kva transformer and a 500-kw motor generator set to supply 1500 volts direct current. After the contemplated work is finished next season, the entire interurban system of the company will be changed over from 600 volts to 1500 volts, but the city lines in Ogden will remain at 600 volts.

The cars to be used on the new extensions are being manufactured by the American Car Company, St. Louis. They are all-steel, 68 ft. 8 in. over all in length, and each will have four Westinghouse 110-hp 1500-volt motors with HL control. In addition to the construction mentioned above, the company is building modern concrete and brick depots at a number of the points reached by the new north and south lines.

A union station for the use of the company and also of the Salt Lake & Ogden Railway is being built in Ogden and will be completed about Jan. 1, 1915. This station is of brick, 32 ft. wide and 177 ft. long. The main floor contains a waiting room which extends across the building and is about 64 ft. in length. At the rear are baggage and express rooms and a trainman's room. The ticket office is in the center of the building and on the corridor through which passengers pass to their trains. The ground floor of the building is lighted from the roof by monitor skylights, and a large electric sign is carried in front of the building.

F. D. Kline is general manager of the consolidated company.

Meeting of National Civic Federation

The annual meeting of the National Civic Federation was held at the Hotel Astor, New York, on Dec. 4-5. The address of President Low, which was delivered on Friday morning, discussed briefly the work of the Federation and the problems which had been brought upon this country as a result of the war. He then referred to the recent law creating the Federal Trade Commission, which he said had been favored for a number of years by the National Civic Federation, and believed that in the course of time the powers of this commission would be enlarged so as to permit amendment of the Sherman anti-trust act under government regulation. In conclusion he criticised the Interstate Commerce Commission for recommending an increase in passenger rates rather than in freight rates.

John Hays Hammond then presented a report on business conditions throughout the United States, based upon an extensive inquiry by the Federation. The most gloomy view is that taken by the charity organizations. Next the railroads are the most pessimistic. While electric railway gross receipts have not suffered as have those of the steam railroads, yet these companies also find it impossible to extend their activities, owing to the small margin of their net receipts. A turn seems to have been taken in the steel industry, the savings bank situation has become normal again, and there is a much better situation in the cotton district. Reports of purchases of supplies by belligerent nations may be exaggerated in some cases, but it is nevertheless clear that the aggregate of these orders is enormous. These orders have been a particular help to the commercial vehicle industry, bringing $10,000,000 to the makers of these trucks. The agricultural situation, particularly that between the Mississippi River and the Rocky Mountains, is good.

The Federation was to discuss government ownership of utilities on Friday afternoon.

Annotated Reports of Commissions

Announcement was made this week of the completion of plans for the prompt publication of the decisions and rulings of the public service commissions of the country in convenient form. This work will be undertaken by the Lawyers' Co-operative Publishing Company, of Rochester, N. Y., and the publication will bear the title of "Public Utilities Reports Annotated." The reports will be issued in a series of selected annotated reports similar to the "Lawyers' Reports Annotated," which are published by the same company. The plan is to issue advance sheets in bi-weekly parts. When there is sufficient material in the advance sheets to justify the issue of a bound volume one will be published. It is expected that in the course of a year six bound volumes will be issued. The bound volumes will be on thin paper and each will contain not less than 1200 pages. Each volume will contain tables of cases, arranged by cases and also by states. The cost is to be $5 per volume including the advance sheet service.

The work will start with the decisions of commissions rendered beginning with Jan. 1, 1915, and the first advance sheets will be issued shortly after that date. It is planned to publish all of the important decisions of the commissions in full. Rulings and orders dealing with standards, practices, etc., which are of general interest will also be published in full. The decisions which will be published are those relating to public utilities of all kinds with the exception of steam railroads. It is not planned to publish steam railroad decisions unless they have some incidental bearing on the general public utility situation. Publication will also be made of the decisions of state courts of last resort on public utility commission issues.

The decisions will be so annotated that they may be compared and the harmony or lack of harmony with other decisions in different jurisdictions made clear. The headings, annotations and digest will be so arranged as to provide convenient means of reference, not only for lawyers but also for engineers and others who are unfamiliar with legal practices.

The Missouri Public Service Commission has issued advance sheet No. 5 of its reports of cases. The paging of this advance sheet begins with page 1. This is occasioned by a revision of the reports, cases involving no principles having been withdrawn. The commission feels that this will rid the advance sheets of matter of little or no permanent value and render them more serviceable for ready reference to principles announced. The pages will appear in proper sequence in the bound volume of commission reports.

COMMUNICATIONS

The Code of Principles

STONE & WEBSTER MANAGEMENT ASSOCIATION
BOSTON, MASS., Dec. 1, 1914.

To the Editors:

There is a marked demand from the managers of our various companies for copies of the "Code of Principles." Can you, without inconvenience, send me eighty more copies? EDWARD F. FLYNN, Secretary.

[NOTE: Other requests for copies of the Code, which have been filled during the past ten days, have come from Columbus, Ohio, Davenport, Ia., Denver, Col., Dubuque, Ia., and Fort Wayne, Ind.—EDS.]

Information Wanted by Passengers

BRIDGEPORT, CONN., Nov. 30, 1914.

To the Editors:

The editorial "Helping the Sightseer" in your issue of Nov. 28 affords valuable hints as to the information which the tourist passenger on electric cars wants of the conductor. This suggests the thought that in addition to the places of historical interest along their route the conductors should be educated to know something about the important manufacturing plants. This matter has impressed me because, in my travels, I have often had occasion to inquire the shortest route to reach a certain point, only to find that I could not only get no help from the car conductors on this point but they did not even know of the existence of the company in question. In many cases this has happened when the reputation of the manufacturer was nation wide, and he was a large employer of labor in his city.

It occurs to me that if a railway company should offer a prize for a paper giving the most complete information on points of interest, including industrial establishments, on each of the different runs, it would not only serve to familiarize the men with these things but would awaken an interest in them to keep informed on future developments along their routes.

I submit this as a suggestion and in extension of your recommendation. WILLIAM V. DEE.

A. I. E. E. Standardization Rules

HARVARD UNIVERSITY
CAMBRIDGE, MASS., Dec. 1, 1914.

To the Editors:

Supplementing the statements which you have made in recent issues of the ELECTRIC RAILWAY JOURNAL regarding the new edition of the standardization rules of the American Institute of Electrical Engineers, the following points may be of interest to your readers.

The most fundamental and important improvement in the new rules over the old ones is in connection with the rating of electrical machinery, including limiting temperatures for various kinds of insulation and methods of measuring the same. Although the presumably highest hot-spot temperature allowance for Class B insulation may seem to many far beyond previous practice, it is not so as a matter of fact; but is merely a recognition of a condition which has existed in much of our large capacity machinery. It has not previously been recognized, owing to the inadequate methods of temperature measurement until recently employed. Thermal couples recently inserted in the original Niagara alternators, now twenty years old, have disclosed temperatures as high as 170 deg. Cent.

The new rules contain several entirely new sections, including those on wires and cables, the rating and testing of switches and other circuit-control apparatus, and standards in telephony and telegraphy. This last-mentioned section is only in tentative form, as the nomenclature in this field is still in a state of flux, particularly in the radio corner. Many of the other sections have been completely transformed, so that they are hardly recognizable, but it would be impossible to go into details of these changes here.

I trust that the above statements will serve to direct the attention of your readers to some of the most important and interesting changes in the rules.

C. A. ADAMS,
Professor of Electrical Engineering.

[NOTE: Professor Adams, as the secretary of the standards committee of the Institute, is in an excellent position to point out the novel features of the rules. The attention of the reader is directed also to the editorial printed in this issue of the ELECTRIC RAILWAY JOURNAL.—EDS.]

NEW YORK, Nov. 27, 1914.

To the Editors:

Referring to the electric railway section of the new standardization rules of the American Institute of Electrical Engineers, abstracted in the issue of the ELECTRIC RAILWAY JOURNAL for Nov. 28, page 1201, the following point should be noted: The standards committee, at its last meeting, decided to omit section 418 of the tentative issue of the standardization rules, which related to maximum permissible inputs of motors, as this section was believed to contain requirements unsuitable for general use, although quite acceptable for certain motors under certain conditions of service. It is to be hoped that the committee will be able to formulate a rule acceptable to both railway men and manufacturers. In order to do this, it will be necessary to secure the co-operation of all parties who are interested in obtaining the data upon which such a rule must be based.

The reasons for which a motor is called upon to carry heavy currents for short periods are usually as follows:

1. Rapid acceleration.
2. Acceleration of heavy loads.
3. Heavy but short grades.

These conditions are met with in varying degrees in urban, interurban and locomotive passenger and freight traction, so that a table might be constructed for insertion in the rules, giving the maximum input current which motors for such services should be expected to carry.

Railway men and manufacturers unfortunately have different points of view about this matter. The former think of the railway service primarily, and desire the motors to be designed to conform with their particular service requirements. The latter think of the motor capabilities primarily and more or less unconsciously desire the service to conform thereto. Hence, instead of a table such as suggested above, the manufacturers would probably prefer to have the rules give the maximum input current for motors of different types, having regard to interpoles, scheme of ventilation and the proportion of iron and copper used in their construction.

Both the form of the rule and the particular figures which would enter it are therefore subject to discussion, and it is to be hoped that all who can contribute practical information bearing on this subject will do so.

WILLIAM A. DEL MAR.

[NOTE: It is to be hoped that Mr. Del Mar's request for information on the important subject of motor overloads will meet with a prompt response. Such contributions will be printed in this column with a view to bring out still further suggestions.—EDS.]

American Association News

American Executive Committee Met on Dec. 3 and Considered Plans for Washington and San Francisco Meetings —Hooper-Holmes Service to Be Continued—R. E. Danforth Explained to Public Service Section Comprehensive Program Plans

MEETING OF THE AMERICAN ASSOCIATION EXECUTIVE COMMITTEE

The executive committee met in New York on Dec. 3. Those present were: C. Loomis Allen, Syracuse, N. Y., president; Charles L. Henry, Indianapolis, Ind., first vice-president; L. S. Storrs, New Haven Conn, third vice-president; T. S. Williams, Brooklyn, N. Y., fourth vice-president; C. S. Mitchell, Pittsburgh, Pa., president Accountants' Association; L. P. Crecelius, Cleveland, Ohio, president Engineering Association; William Tichenor, Indianapolis, Ind., president Claims Association; H. H. Vreeland, New York., George H. Harries, Louisville, Ky., and Charles S. Sergeant, Boston, Mass., past presidents, and E. B. Burritt, secretary. C. C. Peirce and H. G. McConnaughy of the Manufacturers' Association were also present.

The following were among the important actions taken by the executive committee:

Certain changes in the rules of the Transportation & Traffic Association were approved, as well as the action taken by this association in the matter of train orders. The following resolution, adopted at the meeting of the executive committee of the Transportation & Traffic Association, was approved:

"Resolved, That whenever an interpretation of any rule or rules is asked for by a member company, such request shall be submitted to the rules committee for its opinion. Interpretation of rules made by the rules committee shall be presented to the executive committee for approval and the action of the executive committee shall be entered in the minutes and referred to the association for final action. When member companies request interpretation of rules, a copy of the opinion expressed by the rules committee may be furnished in advance of any action by this association as representing the judgment of the majority of its members, but the opinion of the committee so furnished shall not be considered in any manner as representing the opinion of this association."

The standards which had been approved by the standards committee and the 1914 convention were approved as follows:

Specification for rubber-insulated wire and cable for power distribution purposes.

Specification for round and grooved high-conductivity trolley wire. This is to supersede the specification for No. 00 hard-drawn copper trolley wire adopted as standards in 1911 and shown as Section Dw 3a in the *Engineering Manual.*

Specification for galvanizing or sherardizing on iron and steel. This is to supersede the specification for galvanizing on iron and steel adopted as standard in 1912 and shown as Section Df 2a in the *Engineering Manual.*

Copper wire tables. These are to supersede those adopted in 1912 and conform to the United States bureau of standards' new tables as issued in second edition of Bulletin No. 31 under date of Jan. 1, 1913.

Wire and cable terminology, amended definitions for "wire" and "concentric lay cable."

Specification for 600-volt, d.c. overhead trolley construction. Sections 51, 54 and 61 amended, covering "spans—installation on tangents"; "trolley wire—sag"; "curves—dressing," respectively.

Specification for solid wrought carbon-steel wheels for electric railway service.

Recommendations for specification for air-brake hose, and the diagram of clearances for overhead working conductors were also approved.

The special membership committee made a tentative progress report and received permission to present its final report at the executive committee meeting to be held in connection with the mid-year meeting.

The committees on the annual dinner and the mid-year conference made a progress report in regard to their work. The list of topics and speakers will be announced shortly.

The decision was reached to continue the association subscription to the Hooper-Holmes accident information service. (See ELECTRIC RAILWAY JOURNAL for Nov. 14, page 1104.)

Preliminary consideration was next given to the San Francisco convention which will be held from Oct. 4 to 8, 1915.

The executive committee also discussed the Interstate Commerce Commission order regarding equipment depreciation and the hearing which is to be held by the same body at the request of the railway association in Washington on Dec. 18. This hearing is to consider the question of the jurisdiction of the commission over purely urban electric lines in the reporting of accidents. The executive committee invites the attendance of interested parties to supplement the association representation.

It is President Allen's intention to call at least four meetings of the executivee committee during the year. of which the January meeting will be third.

MEETING OF COMMITTEES ON SUBJECTS AND MID-YEAR DINNER

A joint meeting of the above committee was held on Dec. 2. Those in attendance were Charles L. Henry, Indianapolis, Ind., R. E. Danforth, Newark, N. J., H. C. Clark, New York, C. S. Mitchell, Indianapolis, Ind., L. P. Crecelius, Cleveland, Ohio, and William Tichenor, Pittsburgh, Pa.; of the dinner committee, J. H. Hanna, Washington, D. C., W. F. Ham, Washington, D. C., C. C. Pierce, Boston, Mass., S. K. Colby, Baltimore, Md., Bertram Berry, New York, H. G. McConnaughy, New York, and E. B. Burritt, New York. The committees considered the details of the arrangements as reported by Mr. McConnaughy, made up a tentative list of prominent Washingtonians to be invited to the dinner and considered the visit to be made to the White House.

PUBLIC SERVICE RAILWAY COMPANY SECTION

As announced in the issue of the ELECTRIC RAILWAY JOURNAL for Nov. 21, page 1165, an important feature of the meeting held in Newark on Nov. 19 was a talk by R. E. Danforth, general manager, outlining the plans for the coming year. He stated, in substance, as follows:

"The time has arrived to furnish members of this company section with accurate information concerning the various items of cost which enter into the construction, maintenance and operation of street railways

LIBRARY OF THE UNIVERSITY OF CALIFORNIA

in order that the members may be intelligently informed upon the subject of the business in which they are engaged. Men engaged in electric railway work have troubles peculiar to this particular line. We get considerable satisfaction, however, in meeting these troubles as they arise and overcoming them. Those in the claim department know that if there were no accidents there would be no claim department, and similarly if equipment needed neither repairs nor inspection, there would be no mechanical department. Therefore not all of the troubles are such as dishearten us. We realize that many of these troubles are expensive, and that it is our duty to decrease not only the expense but the troubles, thus making life easier for us, and to increase the company's profits, with resulting credit to ourselves and the chief executive. However, as we are always in the people's eye, so to speak, and our every act is criticised, we may take satisfaction in the fact that these criticisms by the public are growing rapidly less. This is because there is less to criticise and as a result we stand better to-day before the public than we did a few years ago and our fair-minded citizens speak highly of the class of service we are giving.

"It is in order that we may improve in our work individually, and in the results collectively, that we should be thoroughly posted on the elements and problems entering into the operation of our system. If each employee knows why things are done in a certain way and what is the cost of so doing, such knowledge will aid in the performance of his share of the work.

"In the coming year's section work it is proposed to take up, in due order, the elements which enter into the cost of a railroad; its value, the cost of operating and maintaining a property, what it would cost to run additional trippers during the rush hours, the distance a passenger may profitably be carried for 5 cents, etc. A thorough analysis of the costs entering into the various departmental expenses of construction, operation and maintenance will also be made. These discussions will be opened by members expert in the particular branch of the business under discussion at each meeting. Brief talks will be given by the management on phases of the subject not usually covered in papers presented at meetings of this character."

COMING COMMITTEE MEETINGS

The joint committee of the Engineering and Transportation & Traffic Associations on block signals for electric railways will meet in Newark on Dec. 10.

The national joint committee on overhead and underground line construction (formerly the joint committee on overhead crossings) will meet at 29 West Thirty-ninth Street, New York, on Dec. 16.

MEETING OF THE WASHINGTON RAILWAY & ELECTRIC COMPANY SECTION

The regular meeting of Company Section No. 4 was held on Nov. 23, in accordance with the custom of holding the meetings on the fourth Monday of each month. The program consisted of an address by George P. Hoover, one of the company's attorneys, on "Accidents from the Standpoint of the Trial Attorney." This address was followed by an informal discussion. James L. Wilmeth, chief clerk of the treasury department, described his trip abroad on the United States S. S. *Tennessee*, in aid of American refugees in Europe. The more serious parts of the program were interspersed with vocal and intsrumental music.

DENVER TRAMWAY COMPANY SECTION

Supplementing the preliminary account of the meeting of Nov. 19, Secretary H. G. Mundhenk reports further as follows: In the talk of Vice-President John A. Beeler the speaker endeavored to apply the lessons of the Atlantic City convention to local conditions and urged the necessity for study, by all, of the reports of the meetings. He called attention to the undercurrent of determination on the part of electric railway executives to find sources of economy to offset the general falling off in receipts. He also compared the equipment and operating methods of the local company with those of other properties visited en route to and from the convention. Other speakers, representing different departments, followed Mr. Beeler's lead.

Railway Statistics for 1912

The division of statistics of the Interstate Commerce Commission has just issued its twenty-fifth annual report dealing with statistics of steam railroads in the United States for the year ended June 30, 1912. Besides detailed reports for separate groups of companies there are summaries showing the classification of railways, mileage, equipment; number, territory and compensation of employees; capitalization, traffic statistics, earnings and investments in road and equipment. On June 30, 1912, forty-four railroads operating 9785.83 miles were in the hands of receivers. The total mileage operated (all tracks) as of this date was 371,237.92, an increase of 8413.43 miles for the year. There was very little difference between the proportionate increase in equipment and in length of road. The total railway capital as of June 30 was $19,752,536,264, an increase of $543,601,183 as compared with the previous year. Of this increase $391,917,973 was in the various classes of funded debt and $151,683,210 in stock. The stock increase was caused by a common stock increase of $173,831,981 and a preferred stock decrease of $22,148,771. The average rate on dividend-yielding stock decreased 0.86 per cent as compared with the average of 1911.

The average receipts per passenger per mile were 1.987 cents, the corresponding figure for the previous year being 1.974 cents. Although this was a slight increase, the length of the average journey per passenger and the average receipts per passenger showed a slight decrease. The average receipts per ton per mile were 0.744 cent, which amount is smaller than the corresponding average for any year during the preceding decade. Railroad operating revenues increased $52,933,713 and operating expenses $57,361,771, resulting in a decrease of $4,428,058 in net operating revenue. The total net revenue from operation decreased $5,164,517. Taxes increased nearly 11 per cent, while the dividends declared from current income, as well as additions, betterments, new lines and extensions charged to income, decreased and appropriations to reserves increased. The net decrease in this group of items was $31,389,943. The balance to the credit of profit and loss decreased from $170,212,186 in 1911 to $110,310,963 in 1912. The increased investment in road and equipment during the year amounted to $392,366,121.

The Society for Electrical Development has announced the eight successful contestants in its recent prize story competition. The first prize of $250 was awarded to Roscoe E. Scott, Nela Park, Cleveland, with the National Lamp Works of the General Electric Company. In reaching a decision on the seventh and eighth prizes there were some stories which in the opinion of the judges were so nearly equal in merit that five supplementary "honorable mention" prizes of $5 each were awarded. The stories were submitted under fictitious names and the envelopes in which the names and addresses were contained were not opened until after the awards had been decided upon.

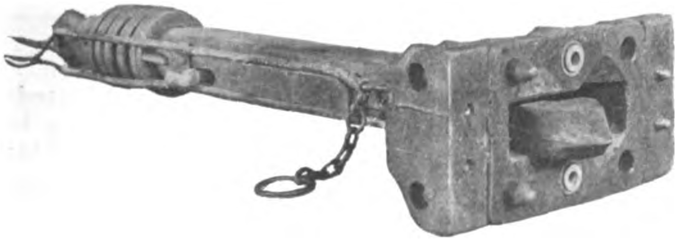
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Omaha Coupler with Air and Electrical Connections for Trailer Service

BY T. E. WOOD, MASTER MECHANIC OMAHA & COUNCIL BLUFFS STREET RAILWAY

Speed in making up trains for rush-hour trailer service is very desirable because every minute counts. On the Omaha & Council Bluffs Street Railway this end has been attained by certain additions to the Tomlinson radial coupler, which in its purchased form already embodied attachments for automatic air brakes. These additions per coupler comprise two curved blocks of paraffined wood, 9¼ in. high, 2¾ in. wide and 5 in. deep, the blocks being bolted to the right and left sides of the coupler proper. One block is fitted with a pair of rigid pins while the other has a pair of sockets fitted with spring contacts. A connection box under the trailer is provided to join up the drawbar connections, which are as follows: Trolley, door signal, buzzer, signal bell. No. 10 wire is used in the power circuit to the trailer and No. 14 wire in the other circuits. In coupling cars all connections are made in one operation, with the exception of opening the air cocks on the two cars and closing the knife switch in the motorman's vestibule.



OMAHA COUPLER WITH AIR AND ELECTRICAL CONNECTIONS FOR TRAILER

A Wheel Press for Pressing Pantograph Shoes and Testing Springs and Hose

BY R. R. POTTER, SUPERINTENDENT OF EQUIPMENT NEW YORK, WESTCHESTER & BOSTON RAILWAY

The diverse uses to which a shop tool may be put to advantage in case of necessity may be exemplified by the following description of the work that is done by a wheel press in a modern railway shop. The press has a capacity of 400 tons, the pressure being obtained from a triple-plunger pump that is driven by a 5-hp motor. The pump plungers are of different sizes so that the ram may be moved quickly under a comparatively low pressure by the two large pump plungers, or comparatively slowly under high pressure by the small plunger. Ordinarily all three plungers are used, and the two larger pump cylinders are cut out when the pressure

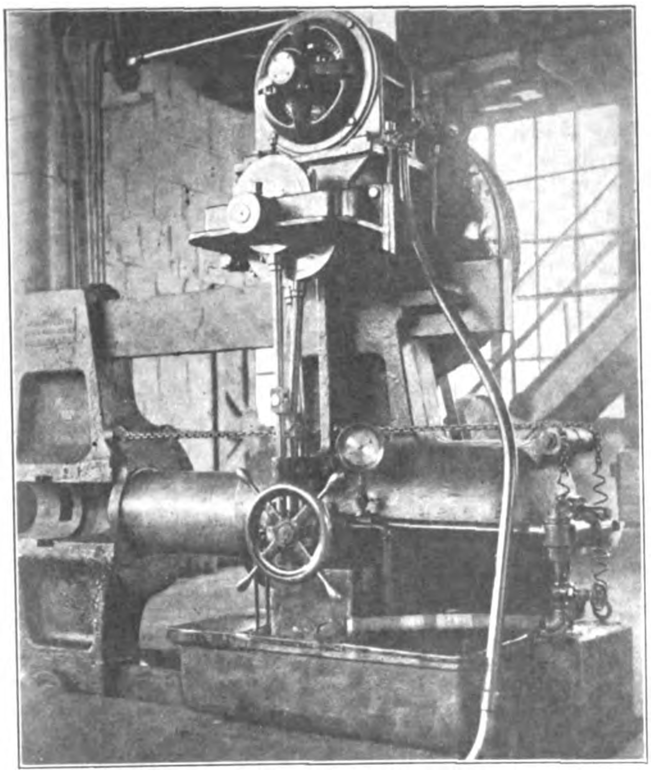
DETAILS OF CONTACT BLOCK AND CONTACTS FOR COUPLER WITH AIR AND ELECTRICAL CONNECTIONS begins to rise rapidly. Each cylinder is fitted with a safety valve so that there is no danger from excessive pressure.

In addition to the regular work of removing and replacing wheels and gears, the next most important work accomplished is the pressing of steel pantograph trolley shoes. These shoes are 1/16 in. thick, 6 in. wide and 4 ft. long. A force of 100 tons is required in this process and as it is important to have this force exact, the safety valve is set to give 100 tons total force, and the pressure is raised until the safety valve blows off. By this means about seventy shoes can be pressed per hour.



WHEEL PRESS USED FOR HYDROSTATIC TEST FOR THE AIR HOSE SHOWN ON BEDPLATE

The press is also used for testing and lubricating truck springs. For this work a steam gage is used in place of the regular hydraulic gage, which registers only the very heavy pressures and is not suited for comparatively low pressures. With the aid of the low-reading gage the capacity of a spring, when compressed by the ram, is readily obtained, and while the results may not be absolutely accurate, the readings are close enough for practical purposes. Such comparative readings of the loads and deflections of various springs are very valuable. The leaves of all elliptic springs for cars in the shop are thoroughly lubricated by compressing and releasing them a few times and at the same time supplying the surface with an abundance of oil. The easy riding qualities of a spring after this treatment, as compared with one which has become dry, is remarkable. In fact, a spring that has become dry shows practically no working or movement of the spring leaves upon each other on account of the great amount of friction. Where car springs do not work easily, heavy and injurious strains are undoubtedly transmitted to the truck and car body and the slight expense of lubrication is paid for many times in the saving of wear to trucks alone.

Still another use to which the press has been put is the testing of hose or pipe to determine the bursting pressure. For low pressures the usual hydraulic gage is replaced by the low-reading steam gage, and the pipe or hose that is to be tested is connected to a pipe leading from the pump to the cylinder of the press. The ram is then allowed to come solid against the yoke. By this method pressures up to 6000 lb. per square inch can easily be obtained. The press has also been used in the same manner to obtain the tensile strength of chain, rods, etc. In one instance trouble was experienced by the breaking of a certain type of chain. Samples of chain of this size were therefore obtained from various manufacturers, and upon testing in the press one of these was found to answer the purpose for which it was intended much better than the others, and at the same time was much stronger, the comparative readings being 9240 lb. for the new as against 3960 lb. for the old. In consequence, the former was adopted to replace the original chain throughout.

Safe Sand Blasting from An Operating Booth

BY R. H. PARSONS, ELECTRICAL FOREMAN

Generally speaking, there are two kinds of sand-blasting outfits, one portable, when it is necessary to carry the outfit to the work as for sanding the sides of a car, and the other stationary, when the work can be carried to the outfit.

The usual custom in sand blasting is to protect the operator by a hood over the head and by gloves. This combination is awkward and does not permit fast and good work. In the scheme herewith illustrated the operator is not embarrassed by hot and heavy head gear to interfere with his breathing and sight, and yet his sand-blasting attachments are most accessible. In brief, the scheme is to use a comfortable booth wherein the operator can stand while his work, the sand and the dust are on the outside.

FIG. I—WORKMAN STANDING IN SANDING BOOTH

Fig. 1 illustrates a booth 6 ft. square and 7 ft. high, inside a room about 12 ft. square and separated by floor to ceiling partitions from the other part of the building. Both the booth and the outer room are built practically airtight. The booth for the operator and the outer room for the sand and the work form in themselves a plant which neither interferes with or suffers interference from the rest of the shop. The booth is built with a bay window at a height which permits the operator, when standing, to look at the work through a removable pane of glass. To reach and handle the work the operator puts his arms through the wall of the booth into long and roomy canvas sleeves. One end of each sleeve is permanently fastened to the booth, while the outer end is strapped to the wrists of the operator.

The sand blast is directly in front of this bay window. As the hopper is just above this blast a clear, straight, non-clogging path is presented for the sand. A sliding damper in the pipe between the hopper and the blast nozzle is used to control the passage of the sand. This damper is within easy reach of the operator. A number of iron supports, located outside the booth as shown, are provided for placing the work when not in the operator's hand. The air valve, shown in Fig. 2, is also easily reached by the sleeved arms of the operator. For additional convenience an air gage is placed inside the booth so that the operator can keep watch of the pressure.

FIG. 2—END VIEW OF SAND BLASTING EQUIPMENT

A hook, attached to a rope which passes over two pulleys and fitted with a weight on the other end is suspended near the nozzle. This helps to support heavy parts.

The booth is ventilated by two small blowers. The one shown in the left-hand corner of Fig. 1 draws fresh air from the outside of the main room directly into the booth; the other at the top of the booth has two functions, one being to draw the foul air out of the booth and the other to blow the sand-blast dust out of a window directly opposite. These fans keep both the booth and the outer room fresh and clear.

A sheet-metal chute under the blasting nozzle allows the sand, after it has been used, to run into one corner of the sand room. Thence it is taken up on the belt conveyor illustrated in Figs. 1 and 2 to a chute which dumps the sand again into the hopper. The motor for this conveyor is located at a dust-free point outside of the sand room. The blower motors and the switches for the conveyor motor are inside the booth.

As shown in Fig. 2, the sand blast itself is made up in the usual manner, consisting of a pipe T for 2½-in. pipe at the top and for 1-in. at the air intake and sand outlet. The top of the T is connected to the pipe from the sand hopper. The air is brought in through a pipe in the side, the pipe being reduced to ¼ in. and bent downward, with a very small hole in the end. The damper previously mentioned is above the T, and a nipple which conveys the sand forced by the air to the work is screwed into the bottom. This nipple is about 10 in. long and is the only part which wears out but is easily replaced.

The operator takes all the work he can do for two or three hours and sets out the pieces on the iron-bar supports, closes the door of the outside room, and then enters the booth and closes the door. Upon this he throws in the switch to start the blower motors and places his arms into the canvas sleeves, strapping up each wrist with the other hand. Next he starts the sand and air control, within easy reach of his hands, and after regulating both to the desired degree of blast he is ready to labor.

Sand Supply
Metal Lining
Metal Lining

FIG. 3—SIDE VIEW OF SAND BLASTING EQUIPMENT

Upon completing his first stint, the operator leaves the booth, removes the pieces finished and brings in more. At this time he starts the conveyor motor so that by the time he is ready to resume work all the sand has been returned to the hopper ready for reuse.

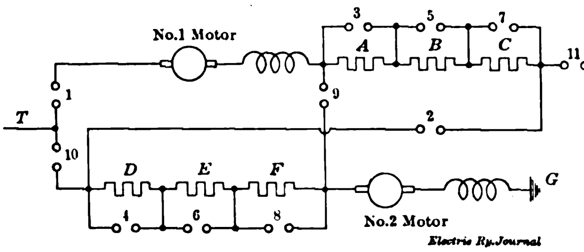
Sand-blasting glass and cleaning iron are old uses for such an outfit, but the many new kinds of work which can be done make it a very good investment for the small outlay necessary. For example, controller connection boards removed from the frame are nicely cleaned without disconnecting the wires or removing the terminals or screws, for although the blast cleans the metal and wood it does not touch the insulation of the wires. Controller cylinders can be perfectly cleaned without removing the plates. Commutators can be cleaned more easily and thoroughly than by the old method of scraping. Controller arc deflectors are made as clean as new in about ten minutes. Controller tops, water collars, etc., also can be cleaned in this manner, although they are usually dipped in acid.

Thus by taking a little pains we have succeeded in making easy and comfortable a class of work that has hitherto been so disagreeable to the operator and so dangerous to his health as to make it almost impossible to get reliable men, who now, under favorable conditions, are able to do better work.

Equipment Defects—Control Apparatus and Connections—IV

BY C. W. SQUIER, E.E.

The Bridging Method of Transition.—This method is quite different from the "open circuit" and "short-circuited motor" methods, in that the current is not shut off from the motors at any time during transition nor is either motor subjected to any sudden rise in voltage like that which takes place in the "short-circuited motor" method. The connections for bridging control are illustrated in Fig. 10. First, the motors are arranged in series with each other and with the regulating resistance, which consists of six groups and is divided into two parts. In operation the control first cuts out the resistance progressively, as shown by the numbers of the different short-circuiting switches. The motors will then be operating in series directly across the line. The resistance is next connected in parallel with the motors, and as it is divided into two parts with the connection between the parts connected between the motors, it follows that there will be the same drop in voltage across each portion as there is across each motor, namely, half the line voltage. The connection between the motors may then be broken provided the resistance connections are not changed. The operation of the different switches and the resulting connections are as follows:



Electric Ry. Journal

FIG. 10—CIRCUIT DIAGRAM FOR BRIDGING TYPE CONTROL

Starting from trolley with contacts 1 and 2 closed both motors are placed in series with all the resistance in the circuit. Contacts 3, 4, 5, 6, 7 and 8 are then closed consecutively, thus cutting out all the resistance. The contacts 9 are then closed, which short-circuits all resistance with their respective contacts. This is the "full series" position of the control and the motors are connected in series across the line with all external resistance cut out. After the contacts 9 have been closed, the contacts 2, 3, 4, 5, 6, 7 and 8 can be opened without changing the circuit, as these have all been short-circuited by the closing of contacts 9. Contacts 10 and 11 are next closed and there is established a circuit from trolley through all the resistance to ground, by way of the contacts 10, 9 and 11. We thus have two circuits through the contacts 9 in opposite directions and current will flow only in the direction of the circuit which has the greater amount of current. If the current in the two circuits is equal, there will be no current through these contacts at all, and they may be opened without causing any change of current in the motor circuits. The opening of the contacts 9 is then the next step in the transition and we have the motors connected in parallel with a section of the resistance in series with each motor. This regulating resistance may then be cut out by closing the resistance contacts as before until the motors are operating in parallel across the line without resistance. Thus the motors have been started in series with the resistance and brought up to full parallel without any greater change of impressed voltage than that derived from cutting out the various steps of resistance.

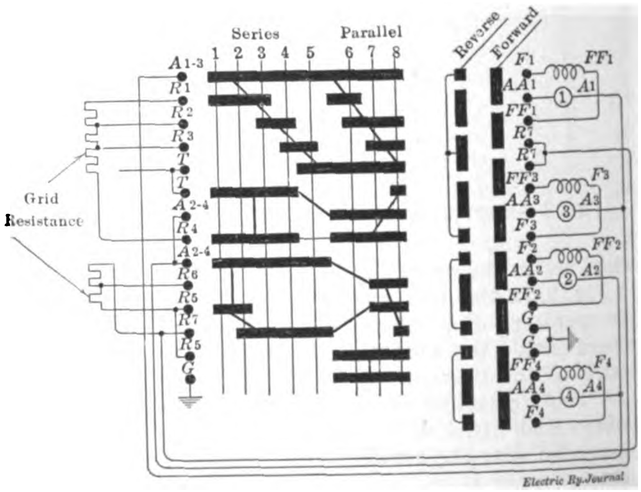
Fig. 11 shows a simplified diagram for the K-35-C controller. This controller uses the bridging method of transition from series to parallel and is used with four-motor equipments with two motors connected permanently in parallel. The controller provides five series and three parallel points and uses five groups of series resistance divided into two parts. However, the first point is intended to be used as a high resistance point for slow movement.

In all the diagrams except Fig. 11 used to illustrate the methods of changing the motors from series to parallel only two motors have been shown, but the various methods apply in like manner for the operation of four motors with the three combinations of four in series; two in series, two in parallel; and four in parallel.

THE JONES SYSTEM OF CONTROL

An interesting method of grouping four motors has been developed by P. N. Jones, general manager Pittsburgh Railways, as fully described in the ELECTRIC RAILWAY JOURNAL of April 11, 1914. The principal features are the elimination of regulating resistance on all points of the controller except the first, and the interruption of the circuit through some of the motors so that in accelerating, all of the motors except No. 4 have periods when they are not connected in circuit. At such times the car is propelled by the remaining motors. The changes from one combination to the next are brought about by means of the "short-circuited" motor method of transition, and the combinations of the motors when all of them are receiving power are four in series; two in series, two in parallel; and four in parallel.

By arranging the circuits so that external resistance is used only on the first point of the control, the resistance losses are cut down very materially. This saving in energy is accomplished, however, by a sacrifice in the uniformity of the voltage steps that are applied to the motors. Thus with a line voltage of 600, in passing from the second to the third point the voltage on motors Nos. 3 and 4 is increased from 150 to 300; in passing from the fourth to the fifth point the voltage on No. 1 motor is increased from 300 to 600, and in passing from the fifth to the sixth point the voltage on No. 4 motor is increased from 300 to 600. While the specially designed "baby" motors used with this equipment may permit this doubling in the applied voltage at one step, still such an increase could not safely be considered with motors having the usual characteristics.



Electric Ry. Journal

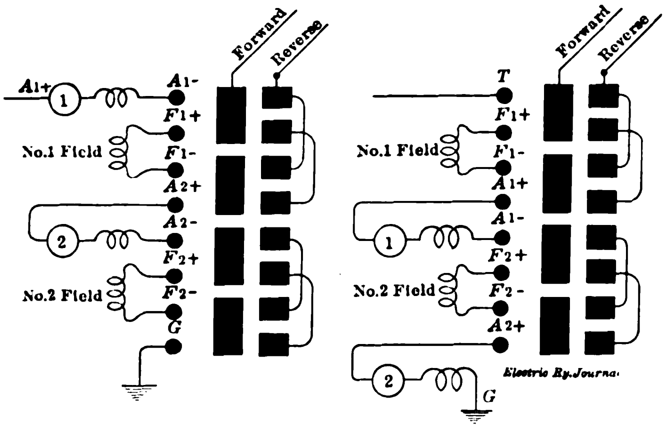
FIG. 11—SIMPLIFIED DIAGRAM OF K-35-C CONTROLLER

CONNECTIONS FOR REVERSING

With all equipments used for car operation it is necessary to arrange the control for changing the direction of rotation of the armatures in the motors. In hand-operated controllers the most common arrangement is that of a separate drum carrying the necessary contacts for reversing and operated by a separate handle. Some rheostatic controllers have the reversing contacts on the main drum, and the handle is moved in one direction for the forward movement and in the opposite direction for the reverse movement. However, when series-parallel operation is desired the latter arrangement makes the drum too large, as but half of the drum is available for the resistance and series-parallel contacts in each direction.

In multiple-unit equipments a separate reverser is usually employed, but in some types of control separate electrically-operated switches are used to give the necessary circuit combinations.

The direction of rotation of a railway motor armature may be changed by reversing the connections of the armature with respect to the field, or by reversing the field connections with respect to those of the armature. In the first designs of controllers the practice was to reverse the armature connections, but since commutating-pole motors have come into general use, the best practice is to reverse the field connections because the commutating field is connected in series with the armature.



FIGS. 12 AND 13—REVERSER CONNECTIONS FOR TWO-MOTOR EQUIPMENT

If the connections of the armature are reversed the commutating-pole fields will be connected first on one side and then on the other side of the armature. In the case of commutating-pole motors, therefore, the reversal of the fields with respect to the armatures has the advantage of securing minimum insulation strains upon the commutating-pole coils by keeping them on the ground side of the armature at all times.

The usual connections for a two-motor reverser are shown in Figs. 12 and 13. Fig. 12 shows the necessary contacts and connections for reversing the fields when they are connected on the ground side of the armature. Where it is desired to operate with the armatures on the ground side, the contacts are the same but the connections should be arranged as in Fig. 13. It will be seen by a comparison of these two diagrams that the only change necessary is in the armature connections, the fields remaining with the same connections in both cases. Equipments that are connected so as to reverse the armature connections can be changed without great expense to reverse the fields instead, as it is necessary to change only the connections from the motors to the controller. No change is required in the reverse drum itself.

Costs of Electric Shovel Work at Cleveland

In building its Seventy-ninth Street line the Cleveland Railway had to do much excavation, for which it employed the electrically-driven Thew automatic shovel illustrated herewith. This shovel is of the horizontal crowding motion type and has several other features of interest. It weighs 13 tons, has a dipper with a capacity of 5/8 cu. yd. and a clearance height over the house of 12 ft. 2 in. It is mounted on regular railway car wheels and in addition is equipped with a set of auxiliary traction wheels, 33 in. in diameter and 15 in. tread, which permits it to run under its own power over the ground, pavement or wherever else it is desired to take it.

The horizontal dipper crowding motion utilized is particularly adapted to electric drive because of the ease of control and power demands. In excavating material with a shovel it is necessary first to crowd the dipper forward into the material, then to hoist it upward through the material. In this case, the first motion is made horizontally and is obtained as follows:

ELECTRICALLY-OPERATED SHOVEL USED AT CLEVELAND

The dipper is suspended by an adjustable arm, hinged to a carriage or trolley moving horizontally along a suitable trackway. This permits the shifting of the point of rotation for the dipper, so that the hoisting force is at all times exerted in the most effective manner, while the crowding force is applied horizontally. The combination of the horizontal trackway and the boom channels produces a structure braced and reinforced to withstand the severe strains which the boom is called upon to endure.

The trolley motion is controlled by a lever. This lever is further connected to a trip rod which is operated automatically when the trolley reaches the limit of its motion in either direction. The crowding motion enables this type of shovel to be advantageously employed for very shallow excavating operations.

The entire motive power for traction, hoisting and swinging consists of one 20-hp Westinghouse compound-wound 550-volt d.c. motor with a starting and reversing control equipment. The motor operates at approximately constant speed, the various motions being controlled through suitable friction and gears. The current is usually admitted to the shovel through a flexible insulated cable connected to a switch on the truck frame and transmitted through copper rings to brushes suspended from the swinging turntable.

The use of one motor appears to be a particularly desirable feature for reducing the initial cost and affording greater flexibility of action in the frequent reversals of the various operating motions; it also means the operation of three levers instead of three separate controllers, and a gain in time over starting and stopping three separate motors. It is distinctly a one-man machine.

The boom is of the jack-knife type with an adjustable section that can easily be lowered, allowing the shovel to pass under the trolley wire without interfering in any way with the efficiency of its operation. The shovel swings through a complete circle, delivering the excavated material at any desired point. A buffer is furnished to take up the shock that occurs when the shovel strikes a hard piece of excavation. This allows the shovel to be released and relieves the whole machine from the strain to which it would otherwise be subjected. The cab is cut away to allow plenty of room for passing cars, a feature of particular importance in street railway work.

The following data, obtained through the courtesy of J. J. Stanley, president, and C. H. Clark, engineer maintenance of way, Cleveland Railway, show the cost of a typical operation for a ten-hour day.

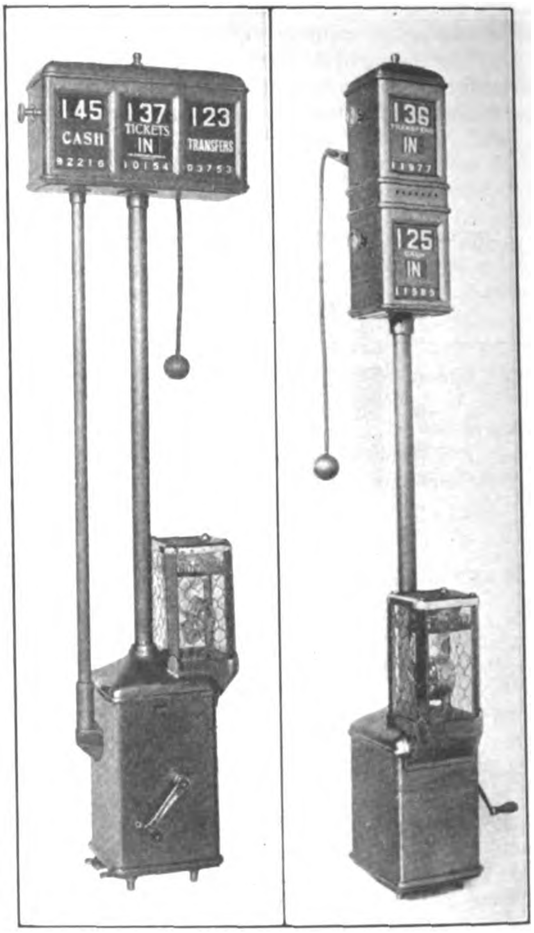
Loading	
Shovel man at 40 cents an hour	$4.00
Four laborers at 21 cents an hour	8.40
Current, oil, repairs, etc	1.50
Loading cost a day	$13.90
Hauling	
Four men at 26 cents an hour	$10.40
Four men at 19 cents an hour	7.60
Two men at 30 cents an hour	6.00
Hauling cost a day	$24.00
One foreman at 30 cents an hour	$3.00
Six laborers at 20 cents an hour	12.00
Dumping cost a day	$15.00
Cubic yards loaded in ten hours, May 8, 1914	540
Cost of loading per cubic yard	2.6 cents
Cost of hauling per cubic yard	4.4 cents
Cost of dumping per cubic yard	2.8 cents
Cost of loading, hauling and dumping	9.8 cents
Lineal feet excavated on this work	2700
Number of ten-hour shifts operated	12
Lineal feet excavated per ten-hour shift	225
Cubic yards loaded (place measure, per ten-hour shift)	450
Average loading cost 450 yds. at 3 cents per cubic yard	$13.90
Average hauling cost 450 yds. at 5½ cents per cubic yard	$24.00
Average dumping cost 450 yds. at 3½ cents per cubic yard	$15.00
Average loading, hauling and dumping cost per cubic yard,	11⅔ cents
Length of haul—approximately 6 miles.	
Average horse-power used in moving shovel	15.0
Maximum horse-power used in moving shovel	20.2
Average horse-power used in operating shovel	11.7
Maximum horse-power used in operating shovel	43.6

The shovel was built by the Thew Automatic Shovel Company, Lorain, Ohio, and the electrical equipment by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

The returns for September show that the registered exports of British and Irish electrical goods for the month amounted to £287,751, which was a satisfactory increase over the total of £238,621 reported for August. The total imports for September amounted to £111,174, which also represented a comparatively large increase when judged by the August imports of £87,031. While machinery exports remained practically stationary during September, considerable improvement was shown in almost every other export section. The largest exports were as follows: India, £50,354; Argentina, £31,254; New South Wales, £31,037, and Victoria, £26,441. Exports to Brazil amounted to £5,378; British West Indies and British Guiana, £4,615; Peru and Uruguay, £1,423, and Chile, £1,320.

Combination Fare Registers for Coins, Metal Tickets and Transfers

A single self-contained unit which registers coins, metal tickets and transfers has been perfected by the International Register Company, Chicago, Ill. Minimum effort on the part of the conductor is required in the operation of this device. In addition to the cash fare and transfer registers, it embodies a mechanism for separately and automatically registering metal tickets on a ticket-fare register, as illustrated. The metal tickets are deposited in the same hopper as the coins and are counted by the operation of the same crank that counts the coins. The transfer register is operated by a cord within convenient reach of the conductor. The machine is also adapted to single-end and center-entrance prepayment cars.



TWO COMBINATION FARE REGISTERS

Another new type of registering fare box which does not embody the metal ticket register is also shown, the transfer register in this case being placed upon the top of the coin register. The latter is of the standard International type. Simply by turning a crank it will register in dollars and cents the total amount of all cash fares, the large figures on the two registers showing the number of passengers on each half trip.

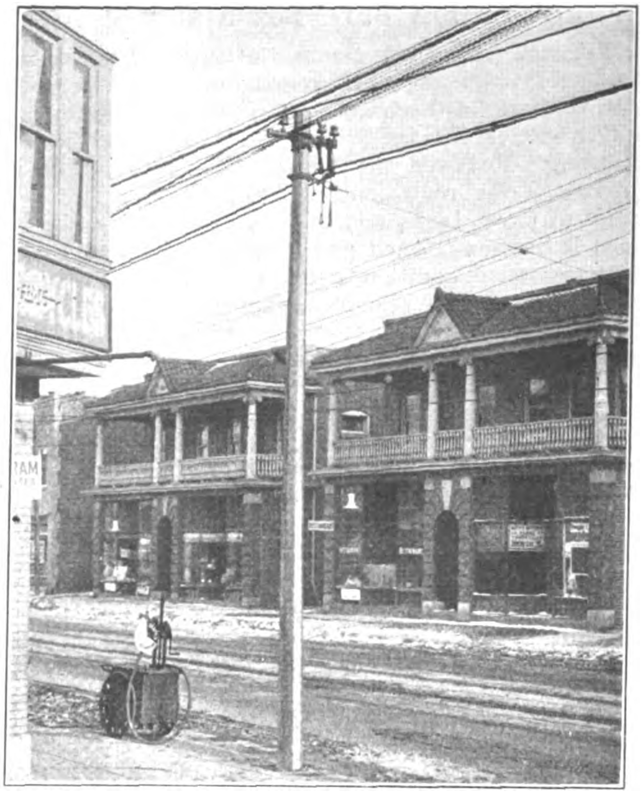
The desirability of having a registration for each passenger that enters a car is now generally admitted. These machines go a step farther in combining in one mechanism functions which have hitherto required separate machines. The registration of metal tickets mechanically is not new, but the automatic operation of a complete ticket-fare register in an elevated position so it can be seen from any part of the car is asserted to be novel. The advantage of combining all these functions into one compact device, that is quick in action and easy to operate, is apparent.

Reinforced Concrete Poles for Railways

Reinforced concrete poles for all classes of service are now being manufactured by the Great Lakes Dredge & Dock Company at its plant in Cleveland, Ohio. During the past several years this company has built thousands of reinforced concrete piles but recently the plant has been extended to include trolley, transmission and telephone poles. A large number of this company's reinforced concrete poles are now in use along the lines of the Cleveland Railway. During a severe storm in the winter of 1913 and 1914, when a great number of wooden poles at Cleveland gave way under the strain, these reinforced concrete poles came through the storm intact. The general dimensions, disposition of reinforcement and section of the poles used by the Cleveland Railway are shown in an accompanying drawing.

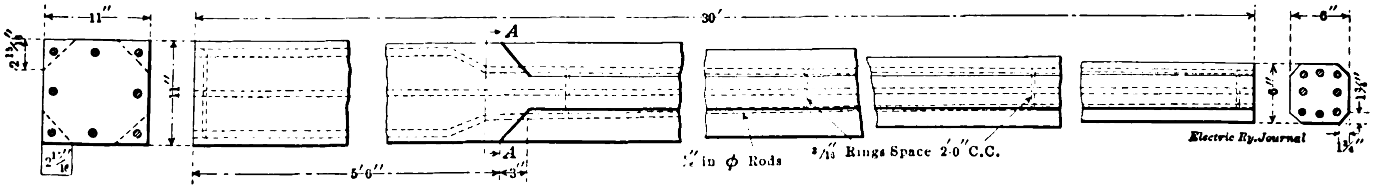
To produce these reinforced concrete poles a special process of manufacture is employed. The steel reinforcing forms are built and anchored firmly in metal forms in their correct position. The forms are then hoisted to a vertical position against the pouring tower, and the concrete is poured in directly from buckets which are elevated from a mixer. The drop of this concrete mixture into the mold insures perfect solidity and a compact column around the reinforcing rods. When the forms are filled they are placed in the horizontal position until the concrete has set sufficiently to allow the mold to be removed.

To accomplish first-class results in the manufacture of concrete poles and piling, the method of curing was considered of prime importance. During the warm summer months these poles are left in the open to dry by natural heat and absorption. During the cold months, however, to prevent freezing, the poles are placed in curing beds where an even temperature is maintained by circulating steam around them until they are thoroughly seasoned. Further to insure these pole against imperfections and to determine whether they will develop their full strength, all poles are tested and inspected.

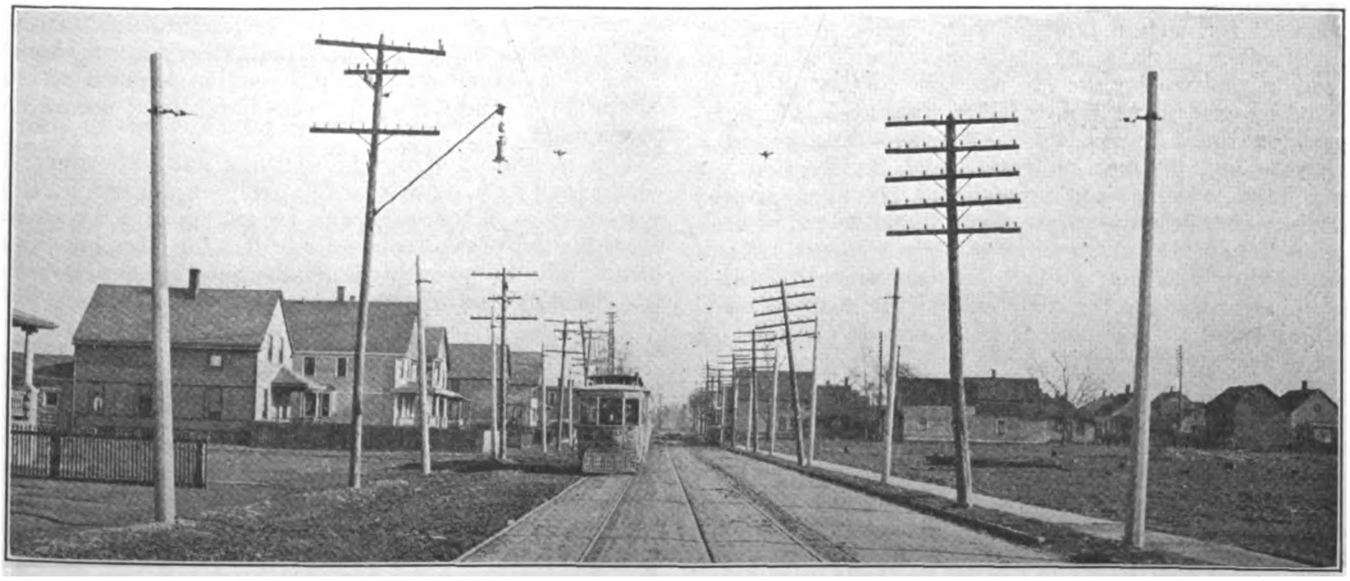


REINFORCED CONCRETE POLE IN CITY CARRYING TROLLEY AND FEEDERS

In the accompanying illustrations are shown two types of concrete poles manufactured by this company, one employed in span wire construction and the other employed in carrying feeder and power lines while also serving to support the trolley lines over double tracks. These are composed of one part cement and three parts sand and gravel which has been screened to reject all particles which will not pass through a 1-in. ring.



DETAILS OF REINFORCED CONCRETE POLE USED BY THE CLEVELAND RAILWAY

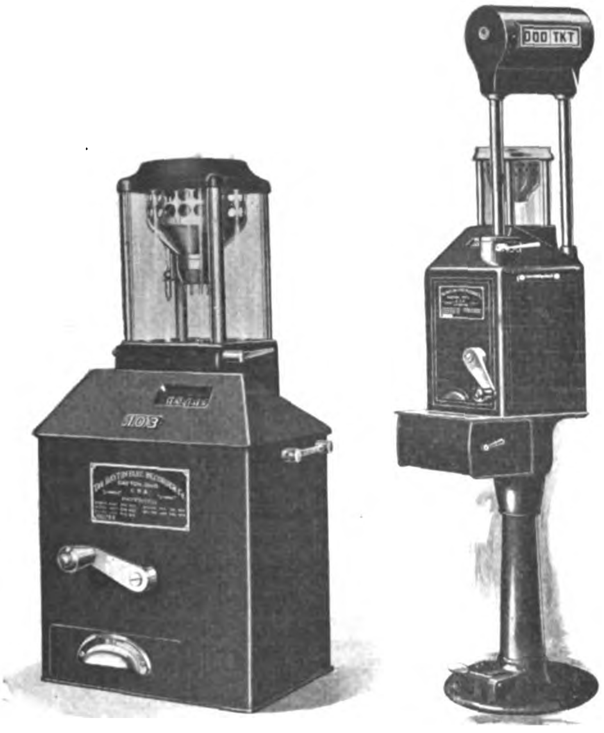


REINFORCED CONCRETE POLES IN SPAN-WIRE CONSTRUCTION IN THE SUBURBS OF CLEVELAND, OHIO

Combination Fare Box and Recorder

With the proved effectiveness of the registering fare box as a fare-getting and fare-handling device, a marked step forward has been made in fare register equipment and in efficiency in the system of fare collection and accounting. However, the straight cash fare box has no provisions for registering tickets, transfers or other kinds of paper fares, and in most cases where they are used it has been found necessary or desirable to use a fare register in addition to the fare box, to register tickets and transfers. While this arrangement is effective and really affords a double check on the fare registrations, it is nevertheless more or less cumbersome and too slow to be satisfactory for heavy traffic.

To overcome this difficulty the Dayton Fare Recorder Company, Dayton, Ohio, is putting on the market the new "Dayton" fare box-recorder which combines in one device the registering fare box and multiple fare recorder, including fare indicator and trip register attachment for certain types of cars. All cash fares are deposited in the fare box and are computed and registered in the usual way. In addition to this all fares, including cash fares, are classified, indicated and registered on the fare-recorder mechanism, thus giving a separate and distinct indication and registration for each fare collected, and providing a classified printed record which is immediately available at the end of each conductor's period of work. The fares are classified and indicated by means of a small lever conveniently located on the recorder, and the registrations are made by operating a treadle. The method is both rapid and positive and is proving very satisfactory under the most difficult conditions of operation.



COMBINATION FARE BOX ALONE AND WITH TRIP-SHEET RECORD MECHANISM

An important feature of the combination fare box-recorder is the form of printed record made of the fare registrations. The register readings for each trip are taken on a card, approximately 5½ in. wide x 7½ in. long, provided on both sides with blank forms for additional traffic data to be filled in by the conductor. At the beginning of his work the conductor takes a zero reading on the record card to indicate the condition of the register, and then prints the record of the fare registrations for each trip in the order in which the trips are made. At the end of the run the record shows in cumulative amounts the number of each kind of fare collected, the amount in dollars and cents of the fare box registrations and the "Total Register" readings. Thus by making two subtractions the itemized results of the fare collections are immediately and accurately determined.

BACK VIEW OF RECORD CARD

The inevitable errors in footings and extensions in conductors' trip reports are entirely eliminated by this system of fare collection and recording, and the entire record is in the most convenient form for office handling, having all the advantages of the modern card system for checking and filing.

The Federal Signal Company, Albany, N. Y., announces that on Sunday, Nov. 15, the first section of its signal system on the Centre Street loop of the Brooklyn Rapid Transit System was placed in service. During the rush hours trains pass over this section on less than one-minute headway. It is stated that since the installation there has not been a single failure or other interruption of traffic on the Brooklyn Rapid Transit lines due to the signal system.

LONDON LETTER

Tramway Receipts and the War—Sheffield Power Changes—Bakerloo Extension

(From Our Regular Correspondent)

Since the outbreak of the war the receipts of the various tramways throughout Great Britain have been more or less seriously affected. One of the greatest sufferers is Leeds, where the decrease for August and September was equal to 6.14 per cent. In Manchester there was a decrease for the same period of 5 per cent, in Hull 3.92 per cent, in Birmingham 3.55 per cent, in Cardiff 2.5 per cent, Nottingham 2.2 per cent, Glasgow 1.11 per cent and Sheffield 0.8 per cent. On the other hand, increases are shown by Dublin of 26.57 per cent, Newcastle 12.4 per cent and Bradford 1.70 per cent. Since mobilization men in military uniform in Leeds have been allowed to travel free on the trams. This privilege has been modified recently, and soldiers are now allowed to travel free only at certain hours of the day. The decreases at Leeds are most marked on the routes serving the industrial areas.

In the metropolitan area the increases are quite substantial, even with undertakings which previous to the war suffered very severely from motor omnibus competition. Many petrol motor buses have, however, been requisitioned by the war department. The number of passengers in the London district has seriously diminished, not only on surface traffic but also on the underground railways. The London County Council has necessarily felt a beneficial effect by the removal of the motor buses, though last year, previous to the war, it had stopped the period of serious decreases, and had managed by various changes in operation to bring increases of nearly £2,000 a week. Since the war the increases average about £1,790 a week. No statistics are at present being published by the London General Omnibus Company, as it has followed the example of the railways in ceasing to publish earnings since the beginning of August. The decreases are generally believed to be extremely severe on account of the many vehicles taken by the government.

In order to maintain the normal standard of employment as far as possible during the war, the government has expedited the acceptance of the contract for the new post-office tube railway from Paddington post-office to the eastern distrist office, Whitechapel. The total length of the new railway is 6½ miles, but the plans allow of future extension. Assurance has been given that the new railway will not run under Westminster Abbey or the Houses of Parliament. The trains will run in a 9-ft. tube, without motormen, under control from the various stations, of which there are to be six. The trains will run at a minimum speed of 25 m.p.h, whereas at present the mails are carried at 8 m.p.h. and parcels at 6 m.p.h., at stated intervals only. Parliament has sanctioned an initial expenditure of £1,100,000, but the total cost is estimated to be not more than £950,000.

Important changes have been effected in connection with the electricity department of the Sheffield Corporation. Hitherto, the tramways department has generated power at its own station, quite distinct from the supply for commercial and lighting purposes generated at the corporation station. Both undertakings have now been brought under the control of the electricity department, which now possesses three power stations, with a total generating plant capacity of 35,150 kw. This outfit will be increased to 45,000 kw on the completion of the new plant now being installed at the Neepsend station. The amount of electrical energy generated by the tramways department was more than 18,500,000 units last year, so that the transfer will result in the Sheffield electrical undertaking becoming the fourth largest in the United Kingdom.

At the annual meeting of the Stirling & Bridge of Allan Tramways, Ltd., the chairman referred to the working of the petrol-driven tramway car (the first of its kind in Scotland), with which the company had been experimenting for about a year. This car, he said, had proved an unqualified success. It was the intention of the company to proceed with a provisional order to authorize the general substitution of mechanical traction for the present horse haulage when the Stirling Town Council entered into negotiations with the company regarding a proposal that the corporation take over the tramway system and electrify it. These negotiations were postponed by reason of the outbreak of the war. Meanwhile the company obtained permission to continue to experiment with the petrol tramcar for another year. The number of passengers carried on the St. Ninians section, where the new car was in constant use, increased by 24,300.

The tramways manager and the chairman of the tramways committee of the Southampton Corporation have reported on their recent visits of inspection to various towns in which motor bus services are running, their object being to decide on the type of vehicle best suited to conditions in Southampton. In all, eight different concerns were visited. The two makes of vehicles of which they formed a very good opinion were the petrol cars of Thornycroft & Company and the Tilling-Stevens petrol-electric system. The Tilling-Stevens vehicle is very smooth in starting, and no sudden loads are placed on the engine. The drive is simple and does not call for the skill which the plain petrol vehicle demands. As the construction of the armature is almost identical with that for a tramway motor, no difficulty would be experienced in dealing with repairs by the existing tramways staff. The men reporting recommended that the tramways committee obtain quotations from Thornycroft & Company and W. A. Stevens, Ltd., for three 40-hp buses, fitted with single-deck bodies.

The extension of the Bakerloo tube from its present terminus at Paddington to Queen's Park, Willesden, will be opened for traffic about Jan. 1. Although the new line is only 1½ miles in length, its completion marks an important development in the railway systems of London, for it will link up the underground railways with the London & North-western main line. The connection at Queen's Park does not form merely an exchange station, for the tube lines are brought to the surface and make a physical junction with the North-Western system. When the electrification of its suburban lines is completed, through electric trains will run from the North-Western station at Watford to the Elephant, while if the proposal to extend the Bakerloo southwards to the Crystal Palace is carried out, through running to Watford will be possible, a total distance of 30 miles. Stations built at Warwick Avenue, Elgin Avenue and Kilburn on the new line serve a densely populated area that hitherto has had to depend mainly upon motor omnibuses. The territory is thus put into direct communication with the London & North-Western mail line in one direction, and with Paddington, Charing Cross and Waterloo in the other.

Several corporations have recently installed electric omnibuses as feeders to their regular tramway services. A few of these buses are in Brighton, Southend and South Shields. Various types of batteries are used. The York Corporation also has ordered four single-deck omnibuses.

The draft agreement between the Stoke-on-Trent Corporation and the Potteries Electric Traction Company proposes that the corporation shall not exercise any of its purchase powers before the year 1940, in consideration for which the company will pay the corporation £2,000 a year for the next thirteen years and £3,000 a year after that until 1940. The company also will undertake to double track certain lines and carry out a number of other improvements.

The Brighton Town Council and the Hove Town Council have not yet agreed as to the system of railless traction which both Councils are desirous of having installed between the two towns. J. B. Hamilton, Leeds, asked to report for the Brighton Corporation, favors the under-running form of current collection, similar to the system in Leeds and Bradford, as opposed to the over-running or Mercedes-Stoll system which the Hove Council is desirous of installing. The Brighton committee has informed the Hove Corporation that it is unable to agree to adopt the over-running system, and that unless an agreement is reached to adopt the under-running system, application will be made to the Board of Trade to appoint an arbitrator. Mr. Hamilton also advised the Brighton committee that on the general question of the advantages of the railless traction system over a petrol traction system, there is a saving of 2d. per car-mile in favor of the railless traction system, amounting to £10,416 per annum on the estimated mileage to be run in Brighton and Hove. It is further pointed out that an increase in the cost of coal would not add to the cost of working the railless traction system in anything like the same proportion as an increase in the cost of petrol would add to the cost of working a petrol traction system.

News of Electric Railways

NEW YORK TRANSIT CONTRACTS

More than 19,000 Men Employed on Contracts Involving $146,253,346—City Paying $2,000,000 a Month—Nineteen Contracts Unlet

Reports showing progress on the new subway contracts of the dual system in New York made by the division engineers to Alfred Craven, chief engineer of the Public Service Commission of the First District, show that there are now 19,223 men employed by the several contractors for the city and the two companies, the Interborough Rapid Transit Company and the New York Municipal Railway Corporation. Of this total, 11,777 are employed on lines for operation by the Interborough Rapid Transit Company and 7446 on lines for operation by the New York Municipal Railway Corporation. Of the total, about 16,000 are employed by contractors working for the city and about 3000 by contractors working on elevated extensions, etc., for the two companies. The construction work to be done by the city is divided into eighty-three contract sections. Contracts have been awarded for sixty-four of these sections, leaving only nineteen to be awarded. Of those already awarded thirty-four are on lines to be operated by the Interborough Rapid Transit Company and thirty on lines to be operated by the New York Municipal Railway Corporation. The total contract prices of the sixty-four sections on city-owned lines already let is $146,253,346, of which $76,172,289 is on Interborough lines and $70,081,056 on New York Municipal lines. In addition, the Interborough Rapid Transit Company has under way the third-tracking of the Manhattan and Bronx elevated lines, which, it is estimated, will cost from $8,000,000 to $10,000,000; and the New York Municipal Railway Corporation has under way elevated third-tracking and extension contracts involving about $6,000,000, so that the grand total of work now going on in different parts of the dual system involves an expenditure of about $162,000,000. The commission is advertising for bids for two additional contracts and it is expected that two or three more will be advertised before the close of the year. Last year the disbursements by the city to contractors on this work averaged about $1,600,000 a month. The average is now about $2,000,000 a month, and for the next year it is estimated payments will run from $2,500,000 to $3,000,000 a month.

As regards the lines for operation by the Interborough Rapid Transit Company, it is expected that the two contracts for the Lexington Avenue Line will be completed during 1917; that both contracts on the Jerome Avenue Line will be finished during 1915; that on the White Plains Road Line, an extension of the existing subway from its terminus at 180th Street north to 241st Street, work will be finished during 1915; that the Southern Boulevard extension of the Lexington Avenue subway to Pelham Bay Park will be completed in 1916; that the Seventh Avenue Line, entirely under contract, will be completed early in 1917; that the Park Place, William and Clark Street line will be completed about the end of 1917; that the Eastern Parkway line, an extension of the existing subway from Flatbush Avenue, in Brooklyn, through Flatbush Avenue and Eastern Parkway to Buffalo Avenue, will be completed during 1917; that the Queens lines, one running north from the Queensboro Bridge through Second Avenue to Ditmars Avenue, Astoria, and the other northeasterly to Alburtis Avenue, Corona, both of which are under contract and well advanced toward completion, will be completed in advance of the contract dates.

The Steinway Tunnel, built by the Interborough interests, and purchased by the city, a portion of which is being reconstructed for temporary operation in connection with the existing subway, is now about 60 per cent completed. The contract for the Steinway tunnel extension, running from the Queens end of the Steinway tunnel in Long Island City to a junction with the Queens lines at the Queensboro Bridge Plaza, is about 28 per cent completed. The contract time for completion expires in July, 1915. As regards the Steinway tunnel extension in Manhattan under Forty-second Street to Times Square, surveys and maps are made and work on the plans is in progress. All the preceding lines are to be owned by the city of New York. In addition the Interborough Company will build at its own expense third-tracks on the Second, Third and Ninth Avenue elevated lines, an extension of the Second Avenue elevated to connect with the Queensboro Bridge and the new lines in Queens, an extension of the Ninth Avenue line from 155th Street across the Harlem River and through 162d Street to the new line in Jerome Avenue, and an extension of the Third Avenue line from its present terminus through Webster Avenue and Gun Hill Road to a junction with the new elevated line in White Plains Road. Work has been going on for several months under the contract let for the third-tracking work. The contract calls for its completion in August, 1915.

As regards the New York Municipal lines it is expected that the whole work on the Broadway line in Manhattan will be completed during 1917. The Whitehall-Montague Street line under the East River is entirely under contract, but the contracts have only recently been awarded. It is now about 2 per cent completed. The time for the completion of the tunnel will expire at the end of 1917. The two-track subway under Canal Street connecting the Broadway line with the Fourth Avenue subway in Brooklyn is about 4 per cent completed. The Fourth Avenue subway, Brooklyn, is practically completed from the Manhattan Bridge to Forty-third Street. The extension from Forty-third Street to Eighty-sixth Street has been under contract since October, 1912. The section north of Sixty-first Street is 72 per cent and the section south of Sixty-first Street 60 per cent completed. It is expected that the whole line will be completed next year. The contractor for the installation of tracks has begun work from both ends of the completed portion of the subway.

The New Utrecht Avenue line of the New York Municipal Railway (Brooklyn Rapid Transit) is entirely under contract. The work in Thirty-eighth Street is 40 per cent and on the elevated portion 27 per cent completed. The time limit for the former expires in August, 1915, and for the latter in July, 1915. In the Center Street Loop line, Manhattan, which connects the Williamsburg, Manhattan and Brooklyn Bridges by subway, two tracks have been in use for more than a year, and work on two other tracks is now more than half done. On the Sea Beach line, a company-owned railroad running to Coney Island, the work is 85 per cent completed. On the Lutheran Cemetery elevated railroad extension the first section, from Wyckoff Avenue to Fresh Pond Road, is finished, and the second section, from Fresh Pond Road to Metropolitan Avenue, is 98 per cent completed. The extension of the Fulton Street elevated railroad of the Brooklyn Rapid Transit System from the Brooklyn-Queens boundary to Lefferts Avenue, Queens, is 52½ per cent completed. The elevated connection between the Myrtle Avenue elevated line and the Broadway elevated line has been finished. Work on the first contract for the Fulton Street elevated third-tracking is about 23 per cent completed. The Broadway elevated third-tracking between Havemeyer Street and Myrtle Avenue should be completed within a year.

With respect to the Broadway line of the New York Municipal Railway Corporation, the commission, on Dec. 11, will open bids for the section from Fifty-first to Fifty-ninth Street, and in a short time will advertise for bids for the section between Thirty-eighth and Fifty-first Streets. The sections in lower Broadway were awarded two years ago and range from 85 to 96 per cent completed. Those awarded later are in various stages of completion, ranging from 1 to 64 per cent.

The New York Municipal Railway Corporation has let contracts for the installation of track equipment on the Liberty Avenue line and the Lutheran Cemetery line and the Myrtle Avenue connection; for the installation of the third-rail in the Fourth Avenue subway; for the signal system in the Centre Street Loop subway; for cables and ducts and manholes in the Fourth Avenue subway and other lines to be operated under the general contract with the city.

KANSAS CITY FRANCHISE EXTENSION

Court Orders Company to Request More Time to Comply with Recent Franchise—Court Control Extended to Light Companies

Judge William C. Hook of the Federal Court at Kansas City, Mo., on Nov. 30 ordered the receivers of the Metropolitan Street Railway to ask Kansas City, Mo., for an extension of six months within which to reorganize under the new franchise. The previous week the judge had intimated that the war and the resulting disturbed financial conditions were sufficient excuse for failure of the receivers and the company to accomplish the reorganization and the liquidations provided in the franchise to be done within six months from July 7, 1914. The order of the court is mandatory on the receivers, but also will have influence in suggesting to the City Council, which has the granting of an extension, that the federal court considers the extension justifiable. Judge Hook urges that suggestions be made to Hermann Brumback, special master, for later transmission to the court, by Jan. 31, 1915, as to the best way to bring about the readjustment of the company's affairs.

The court control over electrical affairs in Kansas City, which heretofore has covered only the Metropolitan Street Railway, was extended on Nov. 30 by Judge Hook to include the Kansas City (Mo.) Electric Light Company and the Standard Electric Light Company, Kansas City, Kan. This was the result of the disclosure in a complete statement of the affairs of the Metropolitan Street Railway filed with the court that there are many interweaving and joint debts and claims of the light companies and the railway, the affairs of which cannot be thoroughly adjusted without court attention to such joint debts and claims. The light companies are in effect operating now under receiverships subject to the orders of the court, except that no receivers have been appointed. The electric light companies are ordered to report all receipts and disbursements to Mr. Brumback every ninety days. The court further ordered the receivers to file ancillary proceedings to clear up title to the various street railway properties in the Metropolitan system, the present proceedings and receivership, in his mind, not being sufficient to comply fully with the new franchise.

ANTE-BELLUM PROGRESS OF ALLGEMEINE ELECTRICITÄTS GESELLSCHAFT

The annual report of the Allgemeine Electricitäts Gesellschaft, Berlin, Germany, covering the fiscal year ended June 30, 1914, shows that despite the depressing conditions that existed for some time previous to the war the company did more business than in the preceding year. On account of the war, however, the business of the company has already been seriously affected, and in some foreign countries almost entirely destroyed. Out of net earnings of $4,723,160 a dividend of 10 per cent on the capitalization of $38,750,000 was declared. The bank deposits of the company after the payment of the dividend were approximately $19,250,000.

One of the accomplishments of the year was the organization of the A. E. G. Rapid Transit Company, which is building a subway system in Berlin. The parent company succeeded in selling $5,625,000 of 4½ per cent preferred stock.

At the close of the fiscal year the company employed 66,100 people, of whom 13,000 are already mobilized for military service. (The actual proportion of male employees is greater as the company employs many women.—Eds.)

The output in machinery and transformers comprised 123,162 pieces with a combined rating of 1,840,273 kw compared with 122,452 pieces and 1,973,987 kw for 1912-1913. The company completed two out of twenty-seven locomotives for the Prussian State Railways and also some driving gear for the experimental train of the Berlin Stadtbahn. The kilowatt output of turbines increased from 559,908 kw to 564,033 kw with a maximum unit of 22,500-kva capacity. The total amount of copper used was 33,250 tons, almost the same as 1912-1913.

The electric railway business was practically the same as for 1912-1913. The railways owned by the company showed gratifying returns. Construction has been begun between Humboldhain and Invalidenstrasse on the subway line in Berlin to extend from Gesundbrunnen to Neukölln.

The subsidiary Felten & Guilleaume Carlswerk Company paid 8 per cent and the A. E. G. Promotion Company formerly the Lahmeyer Works paid 6 per cent as last year.

NO I. T. S. EXTENSION AT PRESENT

In the ELECTRIC RAILWAY JOURNAL for Nov. 14 and 21, reference was made to the proposed extension of the Illinois Traction System via St. Louis proper and via a belt line in East St. Louis, Ill., to connect with the Southern Traction Company's line between East St. Louis and Bellville, Ill. The items in the issues mentioned were based on an alleged interview with officials of the Illinois Traction System since denied as unauthoritative and without foundation. At some time the Illinois Traction System will build an elevated structure from the Illinois end of the McKinley bridge above Main Street in Venice, and the tracks of the Wabash, Alton and other railroads, over a private right-of-way to connect with its line at grade in Madison, Ill., but nothing has been done toward carrying out the work at the present time.

COMPANY RELATIONS IN SAN FRANCISCO

Homes for Employees — President Lilienthal "a Father Rather Than a Boss"

Various plans have been advanced recently by the United Railroads, San Francisco, Cal., for bettering the relations between the company and its employees. On Jan. 1 of this year the company took out group insurance for all employees and about a month ago outlined plans for a remedial loan association formed by the company to make loans to employees. Through President Jesse W. Lilienthal the company is now encouraging the Co-operative Home Builders' Association, the president of which is a conductor with the company, the vice-president a motorman, the secretary an employee of the employment department, and the treasurer a division superintendent. The association has already closed options on the first of a series of plots of land on which it is proposed to erect homes for employees of the company. The association is capitalized at $50,000 with shares of a par value of $1 each, and subscription to stock, confined to employees of the railroad, totaled $22,000 at the end of November. The officers of the association serve without pay, while legal advice is furnished through the company without cost to the association. In discussing the plan Mr. Lilienthal was quoted recently as follows:

"Our only interest in this matter is to encourage every man in our employ to own his little home and to see that he gets that home at the least possible cost. The United Railroads is not financially interested in the Co-operative company, nor are we helping it financially, but we believe it to be a good thing for the men. The scheme has our moral support and we are encouraging the men to support it. We insist upon seeing all contracts before they are closed to make sure the men do not obligate themselves for anything until the money is in sight. Their meetings are held in our offices and under our supervision, but we have carefully refrained from influencing them in the selection of their officers or other similar action. I personally will not interfere with the plan only as much or as little as the men themselves want me to. The ultimate purpose is to help employees to own their own little homes and the benefit of our experience and knowledge is always at their service to prevent the making of mistakes."

One of the officers of the association is quoted as follows by the San Francisco *Call:*

"So far we have worked only among the men of the Turk and Fillmore division. There are eight other divisions, and, judging by the way the plan has taken in the one division, it is certain that the stock of the company will be oversubscribed long before we cover all the divisions. It is therefore to the interest of employees to get in as early as possible.

"The men all regard President Lilienthal as a father rather than as a boss. When they are in trouble they write letters to him, and when the cause seems just he helps them. No step is taken by the Co-operative company without consulting him—not as our employer, but as a friend whose learning, experience and position are of great value in the counsel he gives us."

CLEVELAND SUBWAY GRANT IN COUNCIL

The amended franchise of the Cleveland (Ohio) Rapid Transit Railway was placed on second reading in the City Council on Nov. 30. The revised draft contains the conditions suggested by the franchise committee of the Cleveland Chamber of Commerce, with the exception of the automatic forfeiture clause, which was omitted on the advice of Mayor Newton D. Baker.

The most important provisions of the amended grant have already been mentioned in the ELECTRIC RAILWAY JOURNAL. The grant as it now stands allows the company to build larger tubes than were originally planned, so that larger cars may be used. The price of the property per mile, in case the city desires to purchase it, has been increased in proportion, and the time within which the company is to begin construction and complete certain lines has been extended. The franchise provides, however, that a certain amount of money must be expended each year, after the first construction work is begun. No provision was made for other roads to use the subways, as the Public Utilities Commission has authority to adjust this matter.

GERMAN STORAGE-BATTERY CARS IN BELGIAN HOSPITAL SERVICE

An unexpected use for the 200-odd storage-battery cars which the various State railway systems of Germany have hitherto had in use for branch-line service has developed as a result of the present war. The cars were withdrawn from the lines on which they had been operating, and by means of steam locomotives were hauled to Belgium in trains of about six units each. They are now in use throughout Belgium to carry wounded soldiers from the front. The batteries were fully charged before the trip to Belgium, and as their operating radius varies from 62 to 112 miles their capacity is ample to permit a round trip between any point of the Belgian battle line and one of the larger cities, where the patients are removed to hospitals and the batteries recharged at the local charging stations. The batteries for all of these cars were supplied by the Akkumulatoren Gesellschaft, Berlin, Germany, which has also supplied much equipment to the German navy.

TROLLEY LINES IN WESTERN MASSACHUSETTS

Some interesting testimony in regard to transportation conditions in western Massachusetts was brought out at the recent hearings of the Western Massachusetts Transportation Commission in Boston, reported briefly in the last two issues of this paper. Among those who testified were L. S. Storrs, Bentley W. Warren, Henry C. Page, J. T. Harmer and F. A. Farnham, representing the different railway interests, and a number of representatives from the district concerned.

Chairman Hyde of the commission said that there was a strong public demand for extensions of the trolley system in various parts of western Massachusetts and asked Mr. Farnham, attorney for the New York, New Haven & Hartford Railroad, whether the New Haven would undertake to build these lines, or operate them if they were built by the State, if the national government should change its attitude. At present all of the lines in the State formerly owned by the New Haven have been alienated by the company with the exception of the Berkshire Street Railway. Mr. Farnham said that he could not tell, as that was a matter for the judgment of the directors of the company, but that the plan was impractical now. In answer to a question as to whether the New Haven directors were not living in hopes that the government decree would be modified or revised under a change of administration Mr. Farnham said that he had never heard of any such feeling. Commissioner McKechnie criticised the application of the Sherman act to the railway situation, and Charman Hyde expressed his belief that a wave of reaction might sweep over Massachusetts when the State realized the benefit of joint ownership and operation of steam and trolley lines.

Detroit Appraisals.—It is announced that the appraisal which Prof. E. W. Bemis is making for the city railway commission of Detroit, Mich., of the properties of the Detroit United Railway within the one-fare zone will be completed within two or three weeks. It is not likely that the appraisal being made by Dean Cooley for the State Railroad Commission will be completed before next month.

Automobile Accidents in Ohio.—In discussing the proposed public safety meeting at Columbus in January with the correspondent of the ELECTRIC RAILWAY JOURNAL in Ohio, a prominent electric railway manager said that 95 per cent of the accidents which occur at crossings are due to careless operation of automobiles. The present safety laws are not effective, he said, because little effort is made to enforce them.

Providence Labor Case Decision.—The majority of the board of three arbitrators which has been considering the cases of two men in the employ of the Rhode Island Company discharged for alleged infractions of the company's rule against drinking while on duty has found the men not guilty on the evidence submitted. The board said that the men are entitled to their wages from June 23, 1914, to and including Nov. 21.

The Lexington Arbitration.—Testimony relating to all alleged acts of discrimination by the Kentucky Traction & Terminal Company, Lexington, Ky., against its union employees will be considered, if it is made specific, in the hearing in the case of Robert E. Walker, a motorman dismissed by the company. This is the ruling of Charles C. Bagby, Danville, Ky., umpire in the disagreement between the company and its union employees.

East Liverpool Arbitrators.—Edward M. Crosser, Lisbon; Wilbur A. Snediker, Wellsville, and C. F. Lease, Salem, have been named by Judge J. G. Moore as a board of arbitration to decide whether eleven firemen, boiler tenders and helpers were rightfully discharged by the East Liverpool Traction & Light Company, East Liverpool, Ohio, recently. When the men were discharged a general strike of firemen took place, but the men returned to work pending the findings of a board of arbitration.

Rehabilitating the Pekin Street Railway.—The Mayor and the City Commissioners of Pekin, Ill., have awarded the contract for the rehabilitation and the extension of the street railway in Pekin to the Barnewoit Construction Company, Peoria, Ill., for $38,000. The work must be completed by April 1. The line will be extended from Capitol Street east on Court Street to the Chicago & Alton Railway. The motive power will be changed from storage battery to the overhead trolley system.

Mayor Mitchel for Broad Municipal Powers.—In a speech delivered at the annual dinner of the Academy of Political Science on Nov. 19 at the Hotel Astor, New York, N. Y., Mayor Mitchel defined his views on the measure of home rule that should be given to cities of New York State in the new constitution. The Mayor urged that among other things New York City should have power to own and operate public utilities so broad that under it the municipality might run almost anything from a street railroad to a grocery store.

Kansas Arbitrators Selected.—Frank A. Wightman, member of the Missouri Utilities Commission, has been selected by James A. Cable and John M. Kinkel as the third member of the board of arbitration to consider the wage schedule of the Joplin & Pittsburg Railway, Pittsburg, Kan. Both Mr. Cable and Mr. Kinkel are members of the Kansas Commission. Under the agreement between the men and the company, the finding will automatically become a part of the agreement under which the strike of last summer was settled.

Pittsburgh Subway Plans Furthered.—The public service and surveyor's committee of the City Council of Pittsburgh, Pa., has recommended that $10,000 be set aside to pay for securing engineering data in regard to the construction of the downtown subway loop in which it is intended that surface cars shall be operated. A communication from A. E. Anderson, counsel for the Pittsburgh District Railroad, objecting to the subway as now proposed and asking when the committee intended to resume the hearings on his company's plans for a freight and passenger subway, has been referred to the law department.

State Ownership Bill Filed at Boston.—Representative Harrington, of Fall River, Mass., has filed a bill with the clerk of the House providing that on July 1, 1916, Massachusetts shall take over all the street and electric railways within its borders, with all property necessary to their operation, except in cases where such action shall constitute a breach of contract. The measure, to which a statewide referendum is attached, provides that the Legislature of 1916 shall make provision for the operation of the roads and for compensating their owners. The bill will be considered at the coming session in January.

Right to Force Elevated Stub's Removal Questioned.—For some time past there has been considerable agitation in an endeavor to force the Chicago & Oak Park Elevated Railroad to remove a stub terminal on Market Street which occupies three blocks. The city, through its corporation counsel, has filed a petition in the United States District Court to attain this end. Samuel Insull, receiver of the Chicago & Oak Park Elevated Railroad, in his answer states that the city has no right to force the removal of the stub terminal. He sets forth that in May, 1893, the City Council granted an ordinance to construct the stub terminal and use it for fifty years.

Richmond Franchise Hearing in January.—The committee on streets of the City Council of Richmond, Va., has voted to lay the petition of the Virginia Passenger & Power Company for a blanket franchise on the table until the first meeting in January, at which time it will name a date for an initial public hearing. The Council will meet in regular session for the first time next year on Jan. 11. The company reported to the committee at a recent meeting that the work of compiling its franchise instruments intended for distribution to the Council was still incomplete. The company also plans to prepare an illustrated sketch of the street railway systems in Richmond dating from 1860.

Political Wrath.—The Board of Supervising Engineers, Chicago Traction, is again forced by Mayor Harrison and his henchmen to submit to an investigation of fancied inaccuracies in bookkeeping. The corporation counsel for the city has taken it upon himself to venture an opinion opposed to the various constructions placed by the Board of Supervising Engineers upon provisions of the traction ordinances. Walter L. Fisher, one of the authors of the 1907 settlement ordinances, and counsel for the board members, assailed the entire legal groundwork upon which the city's opinions have been built. The discussions now under way are merely preliminary to the final report of an audit of the books which will be completed shortly.

New Franchise in Cincinnati.—A new franchise has been prepared for the Cincinnati, Newport & Covington Railway, Cincinnati, Ohio. The company asks for a twenty-five-year grant and proposes in return to settle the city's claim for $106,000 for car licenses and taxes on gross earnings for $40,000 cash, with a payment of $8,500 for the first year of the new franchise and an increase of 1 per cent for each succeeding year of the life of the franchise, instead of the tax of 1¼ per cent on its gross earnings. It also asks the right to lay tracks on the south side of Pearl Street between Broadway and Sycamore Streets, and the use of any subway the city may build. The city has a suit pending against the company for the amount claimed to be due for licenses and taxes.

Many Auto Bus Lines Projected in Chicago.—The State Public Utilities Commission of Illinois has before it petitions for permits for the operation of a number of auto bus lines in Chicago. The International Gas & Electric Automobiles Bus Company plans to begin business with 120 motor buses. It is to be capitalized at $1,000,000. The Chicago Motor Bus Company, capitalized at $300,000, proposes to operate in the loop district and upon the boulevards north and south of the central business portion of the city. The fare around the loop will be 5 cents, while 10 cents will be charged for transportation north and south of the city. The petition of the City Electric Omnibus Company will be heard by the commission on Dec. 9. The Chicago Automobile Transportation Company, which was granted a certificate of convenience and necessity more than a month ago, objects to the granting of rights to other companies. Commissioner Richard Yates has instructed the attorney of this company to place his objections in writing.

Subway Labor Problems.—The business agent of the Bricklayers & Masons Union has withdrawn his complaint filed with the Public Service Commission for the First District of New York against the Dock Contractor Company for alleged violation of the labor law. Mr. Gill had complained that this company, which has the contract for the new subway in Broadway between Bleecker Street and Union Square, was employing workmen who are not citizens of the United States and that the labor law forbids the employmnet of any but citizens. Upon the affidavit of the vice-president and general manager of the Dock Contractor Company that the company is now complying with the law and is not employing any non-citizens, Mr. Gill withdrew his complaint; but immediately filed another complaint against the Underpinning & Foundation Company, which is a sub-contractor on the Dock Contractor Company's contract. The allegations against the Underpinning Company are the same as those against the Dock Contractor Company.

Decision in Preliminary Des Moines Case.—Judge McHenry of the equity division of the District Court at Des Moines, Ia., has ruled that the Des Moines City Railway has been proceeding under a misapprehension regarding the proper section of the statute upon which to circulate the petition for a special election on the street railway franchise matter. Judge McHenry held that the present attempt of the company to bring the franchise to a vote would put it under the provisions of the initiative and referendum, which measure he ruled was designed to give the people the right to pass ordinances over the head of the City Council, but did not cover the enactment of original franchise ordinances. Under the statute which Judge McHenry contends the company must follow, the franchise would have to be submitted to the people and be approved by the City Council. Emil G. Schmidt, president of the company, is quoted as follows: "The case will now be taken to the Supreme Court to have it determine which section is the proper one under which to go on with the election. It is merely a friendly suit between the city and the company to get a final decision."

PROGRAMS OF ASSOCIATION MEETINGS

Railway Business Association

In anticipation of the sixth annual meeting of the Railway Business Association in New York on Dec. 10, the executive committee has issued its report. The committee believes that to-day the outstanding phase in the general thought is apprehension that injury may come to the railroads through adverse business and political conditions; that general sentiment is in favor of an increase in steam railroad rates and that legislation relieving the railroads of various burdens should be enacted. It also calls attention to the lack of coordination in jurisdiction between state and federal regulatory bodies. The speakers at the banquet in the evening are to be Fairfax Harrison, president of the Southern Railway, and Warren G. Harding, United States senator-elect from Ohio.

Central Electric Railway Accountants' Association

The annual meeting of the Central Electric Railway Accountants' Association will be held at the Hotel Beckel, Dayton, Ohio, on Dec. 11 and 12. The executive committee will meet at 1:30 p. m. on Dec. 11, and at 2:30 p. m. the regular session will begin. The presentation of the address of the president, the report of the executive committee and the report of the treasurer will be followed by these special committee reports: standing committee on freight accounts, standing committee on passenger accounts, query box committee, committee to confer with C. E. R. A. C. S. Mitchell, comptroller of the Beaver Valley Traction Company, Pittsburgh, Pa., will then deliver an address.

At the session on Dec. 12, which will convene at 9:30 a. m., the following papers and addresses will be presented:

Paper, "Cost Accounting in a Manufacturing Plant," by G. D. Piper, director of works accounting of the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.

Address, "Basis and Methods of Accounting for Depreciation of Equipment," by H. J. Davies, secretary of the Cleveland (Ohio) Railway.

Financial and Corporate

UTILITY SECURITIES AND EARNINGS

The week ended Dec. 2 has seen a marked improvement in general market conditions and the demand for public utility securities. With the opening of the New York Stock Exchange on Nov. 28 local traction issues showed strength, Interborough-Metropolitan 4½'s being the most prominent feature with a gain of one-half over the July 30 price of 72. On Dec. 1 Public Service Corporation 5's sold at 86½ as compared to 88¼ on July 30, while New York Railways 4's brought the minimum price of 70 and the 5's ranged from 47½ to 47¾. On Dec. 2 Hudson & Manhattan adjustment income 4's dropped seven-eighths, but Brooklyn Rapid Transit 5's advanced one-eighth; New York Railways 5's, 1⅛, and Third Avenue Railway adjustment 5's, one-half. Public utility bonds in the Boston, Philadelphia and Chicago markets were steady.

The improvement of the bond market helped both the curb market and the stock market through the clearing house committee. Brooklyn Rapid Transit stock, which closed on July 30 with dividend on at 79½, was quoted on Dec. 2 at 86½ bid, and Interborough-Metropolitan preferred sold at its July 30 price of 52. Third Avenue and Twin City Rapid Transit both sold nearly three points above the established minimum prices. The curb was active, American Light & Traction common and Cities Service issues both showing marked advances.

Current reports concerning railway earnings vary considerably as to increases or decreases, but a general tone of optimism is heard. The Federal Light & Traction Company now looks for a steady improvement, while the Cities Service Company gained a substantial increase in gross for October. Henry A. Blair, president Chicago Railways, says that traffic in Chicago in the middle of November was breaking about even as compared with the banner year of 1913. The gross income for the year ended Jan. 31 is expected to show a slight decrease, but through decreases in operating expenses, the net profits should advance. The company has spent more than $4,000,000 in building 20 miles of track and buying new equipment. Such reports, together with the fact that the Santa Fé Railroad has placed an order for 12,000 tons of steel rails with the United States Steel Corporation, show a tendency toward business recovery.

OPTIMISM IN ENGLAND AND AMERICA

Henry L. Doherty returned to New York on Nov. 17 on the steamship *Transylvania* after a three weeks' trip to England. In speaking to a representative of the ELECTRIC RAILWAY JOURNAL about business conditions as he found them in England, Mr. Doherty said the most significant factor was the general assurance that whatever investments are made, outside of subscriptions to the war loan, will be in American securities. Bankers in England feel that there will be enough new investment buying of American securities to offset the forced liquidation, and that in addition to that factor there will later be an absorption of a reasonable amount of securities from investors in this country.

Regarding the change in American conditions during his absence, Mr. Doherty said:

"On my return from England I was astounded to see how greatly sentiment had changed. People who told me before I left that we would have a long period of business depression were the first to say on my return that we are going to see greatly increased industrial activity here. The news from our operating properties is, on the whole, very encouraging. As a matter of fact, I think that I see a more pronounced change in sentiment than the actual conditions warrant. It is important to remember, on the other hand, that nothing contributes so much to increase and stability of business as a sentimental feeling that conditions will improve. The result of the recent election has played an important part in this condition of sentiment. It has been interpreted by business men, and especially by the people, as an indication that the great body of voters want to have every encouragement given to railroads and business industries. The record of views expressed by the election will tend to lead the present administration to go still further in its encouragement of business."

ANNUAL REPORT

Virginia Railway & Power Company

The comparative statement of income, profit and loss of the Virginia Railway & Power Company, Richmond, Va., for the year ended June 30, 1914, follows:

	1914	1913
Gross earnings	$5,156,048	$4,864,107
Operating expenses, including $100,000 set aside for depreciation	2,565,908	2,416,988
Operating revenue over operating expenses and depreciation	$2,590,140	$2,447,119
Other income	80,909	86,703
Gross income	$2,671,049	$2,533,822
Taxes and licenses	308,111	274,589
Income applicable to fixed charges and rentals	$2,362,938	$2,259,233
Fixed charges and rentals:		
Interest on outstanding funded debt	$1,108,325	$1,086,638
Sinking fund payments	98,779	40,273
Norfolk Railway & Light Company, rental	99,000	99,000
Other interest charges	1,244	....
Total fixed charges	$1,307,348	$1,225,912
Surplus over fixed charges and rentals	$1,055,590	$1,033,321
Other charges:		
Proportion of discount on sale and purchase of bonds and other securities	$25,767	$23,680
Net miscellaneous charges, not operating, charged direct to surplus	57,918	26,464
Total direct charges	$83,685	$50,144
Surplus over fixed and other charges	$971,905	$983,177

The foregoing statement includes the income and disbursements of the Norfolk & Ocean View Railway and the City Gas Company of Norfolk, both of which are controlled by stock ownership and operated as part of the Virginia Railway & Power Company's system. The report of the company is one of the most complete issued by public utilities, with its minutely detailed financial statements and statistics concerning capital and income and expense items of not only the separate railway, light and power, and gas departments, but also the several divisions of each department. The analysis of operating revenues and expenses is particularly interesting. The item of $5,156,048 for gross earnings was made up of $2,173,983 for light, power and gas revenues, an increase of $236,240, and $2,982,065 for railway revenues, an increase of $55,701. This increase in railway revenues arose from increased passenger revenues of $52,470, decreased freight revenues of $1,487, and increased revenues from outside operations of $4,728. The operating expenses of $2,565,908 were divided $845,323 to the light, power and gas departments and $1,720,585 to the railway department. The amount expended for maintenance of way and equipment for the year was 16.01 per cent of the gross railway earnings, as compared to 14.99 per cent for the previous year. This 16.01 per cent was divided 9.72 per cent for maintenance of way and structures, an increase of $26,577, and 6.29 per cent for maintenance of equipment, an increase of $12,000. Railway traffic expenses decreased $6,795, but transportation and general expenses increased $4,803 and $13,762 respectively.

The above operating expenses include a charge of $8,333 per month, aggregating $100,000 for the year, which is charged against operating expenses for the Richmond, Petersburg and Interurban divisions to provide for depreciation. In addition to this amount set aside in cash, the directors authorized the transfer from the surplus as of June 30 to the reserve for depreciation an additional amount of $559,364, making the total amount credited to the reserve since July 1, 1911, the date of consolidation of the Norfolk & Portsmouth Traction Company with the Virginia Railway & Power Company, 6 per cent of the total gross earnings of the company for the period. The total amount to the credit of the several depreciation accounts as of June 30, 1914, was $856,640.

The company has pursued the policy of charging against operation each month and crediting to the injuries and damages reserve a percentage of the gross earnings sufficient to provide for expenditures on this account. During the last fiscal year the amount so credited was $133,572, while the amount paid out for injuries and damages, and expenses incident thereto, was $115,578, leaving a balance of $17,994. For the fiscal year ended June 30, 1913, the expenses on account of injuries and damages amounted to $131,022, which was $15,733 in excess of the amount reserved. It is stated that the results for the year show considerable improvement in this department. The credit balance in the reserve account as of June 30, 1914, was $48,769.

The income from operations of the company for the year increased $143,021, but other income decreased $5,793, giving an increase in gross income of $137,227. Taxes and licenses increased $33,522, and fixed charges and rentals $81,436, giving an increased surplus over fixed charges and rentals of $22,269. The surplus over fixed and other charges decreased $11,272 to an amount of $971,905, which was applied to the payment of two dividends on preferred stock amounting to $192,480 and $230,976 and two dividends on common stock amounting to $179,251 and $179,141. The surplus after payment of dividends was $189,956.

The total mileage of the company as of June 30 was 252.974 miles. Its rolling stock consisted of 289 double-truck cars and 248 single-truck cars. Twenty new steel side-entrance cars were purchased and put in service during the year and three new service cars were built in the company's shops. A number of cars owned by the company were also rebuilt and changed from single to double truck and otherwise improved. The expenditures during the fiscal year for additions, extensions and betterments charged to capital account amounted to $582,453, of which amount $318,429 was applicable to the railway department. The revenue passengers carried during the year totaled 65,695,197, an increase of 1,163,118, while the transfer and free passengers carried totaled 15,676,096, a decrease of 441,608. The car mileage amounted to 12,478,058 car miles, an increase of 270,639, and the total car hours were 1,515,016, an increase of 41,076. The total revenue per car mile was $0.239, a decrease of $0.001, and the operating expenses per mile, including depreciation, were $0.138, an increase of $0.001. The total revenue per car mile was $1.97, a decrease of $0.02, while the operating expenses per car hour, including depreciation, remained the same at $1.13.

The report states that in addition to providing additional coaster meters and extending the system of service rewards to motormen and conductors to avoid accidents, which method has produced excellent results, the company during the last year undertook to extend the provisions for the aid of its employees through the relief association. Plans are now under consideration for the organization of a system of limited pensions to employees to be paid through the relief association and on the recommendation of its board of managers.

NORTHERN ELECTRIC RAILWAY FINANCES

Bankers' Syndicate Formed to Provide Funds for Operation of System for from Two to Five Years

At a recent meeting of up-State bankers, the holders of the overlying bonds of the Northern Electric Railway, Chico, Cal., and the notes indorsed by W. P. Hammon, E. J. De Sabla, Jr., E. R. Lilienthal, Leon Sloss and Louis Sloss, secured by these bonds as collateral, organized the Bankers' Syndicate and appointed A. Bonnheim, Sacramento; A. F. Jones, Oroville, and George P. McNear, Petaluma, as trustees for the syndicate. The object of the syndicate, as defined in the agreement signed by the constituent bankers, is to provide funds for the operation of the several roads constituting the Northern Electric system for at least two years and not more than five years and to provide for the interest on all the underlying bonds of the system.

The agreement, which was signed by a large majority of the stockholders present at the meeting, provides that it shall become effective in thirty days if signed by the holders of $2,500,000 par value of bonds or by the holders of notes secured by that amount of bonds, or it may become effective thirty days after execution in the event of the holders of $2,000,000 signing and the trustees so electing. Sufficient signatures were secured to assure the agreement becoming effective.

The amount which the Bankers' Syndicate pledges itself to subscribe is limited to a total sum for the five years of $500,000. Provision is also made that it shall not be called upon for more than $250,000 in any one year. Interest on the first mortgage bonds, aggregating $94,000, is now overdue, and also $37,840 for the sinking fund. These sums will be subscribed at once, as well as about $100,000 for repairs of roadbed and bridges.

As additional security for the projected outlay, the Sloss Securities Company and the five indorsers of the notes made over to the trustees of the Bankers' Syndicate $29,890,000 of preferred stock and $14,949,000 of common stock of the Northern Electric Railway. This transfer was made in trust to protect the general creditors, as well as to assure the voting control to the syndicate. In the event of an opportunity arising to sell any of this stock the indorsers are to be allowed sixty days in which to buy it at the same price offered by anyone else.

An agreement signed by the holders of the overlying first and consolidated 5 per cent forty-year gold bonds of the Northern Electric Railway provides for postponing the collection of all interest coupons and waiving the sinking fund provisions for five years. The right to bring suit on the notes is postponed for a like term and during this period the bonds securing the notes are not to be sold. Another agreement, signed by many of the general creditors, states that no adverse action will be taken by them during the five-year period. The final agreement provides for the purchase from the present holders at 90 of the $1,400,000 of first mortgage bonds of the Northern Electric Company, Sacramento & Woodland Railway and Marysville & Colusa Branch Railroad now held by banks as collateral for loans to the company. This fund already has been subscribed.

Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala.—Charles H. Zehnder, chairman of the committee of holders of first mortgage 5 per cent thirty-year gold bonds of the Birmingham, Ensley & Bessemer Railway, has announced the fixing of Dec. 15 as the limit of time up to which the holders of undeposited bonds may make deposits with the Empire Trust Company, the depositary, or its agents and thereby become parties to any plan or agreement of reorganization which may be adopted by the committee. More than a majority of the outstanding bonds has already been deposited with the committee.

California Street Cable Railroad, San Francisco, Cal.—The California Street Cable Railroad has filed with the Union Trust Company, San Francisco, a new first mortgage to secure $900,000 of bonds. The present mortgage will expire on Jan. 1, 1915, but $516,000 of the bonds thereunder are in the sinking fund, leaving only $384,000 to be refunded by the sale of an equal amount of bonds secured by the new mortgage. The authorization of the issue of these new bonds by the California Railroad Commission was noted in the ELECTRIC RAILWAY JOURNAL of Nov. 21.

California Railway & Power Company, San Francisco, Cal.—The directors of the California Railway & Power Company have authorized the redemption at par for cash of $100,000 prior preference stock, the drawing to take place on Jan. 2, in accordance with the provisions of the certificate of incorporation.

Chicago & Oak Park Elevated Railroad, Chicago, Ill.—Judge Kohlsaat, of the Federal Court at Chicago, has directed Charles D. Morrison, master in chancery, to take proofs in the matter of the application of Samuel Insull, receiver of the Chicago & Oak Park Elevated Railroad, for permission to issue certificates for the purpose of elevation in Oak Park and Austin. The Continental & Commercial Trust & Savings Bank of Chicago, which as trustee of an existing mortgage opposed the petition, has been asked to file a report in the matter as soon as possible. Previous references to this matter were made in ELECTRIC RAILWAY JOURNAL of Oct. 31 and Nov. 21.

Cincinnati, Dayton & Toledo Traction Company, Hamilton, Ohio.—On Nov. 24 the Cincinnati, Dayton & Toledo Traction Company field a mortgage to the Fidelity Trust Company, Philadelphia, to secure not exceeding $7,500,000 of bonds, of which a sufficient amount will be reserved to retire $5,000,000 of existing bonds due from 1916 to 1922. The remaining $2,500,000 of the new bonds will be held by the trustees to provide for future improvements and additions made from time to time. The bonds are a general refunding and gold mortgage thirty-year 5 per cent issue, dated Oct. 1, 1914. The common stock of the company has been reduced from $5,000,000 to $2,000,000, according to an official statement of Nov. 23. The plan of reduction provides for the surrender for cancellation of $1,000,000 par value of common stock owned by the Ohio Electric Railway, which leases the property, and the exchange of one share of new common stock for two shares of the present outstanding common stock. The Ohio Electric Railway has already deposited its $1,000,000 of stock, and the holders of the common stock have been notified to present their stock for exchange. The outstanding preferred stock amounting to $250,000 is not disturbed by the reduction plan. The modification of the lease to the Ohio Electric Railway in accordance with the above plan was noted in the ELECTRIC RAILWAY JOURNAL of July 5, 1913.

Cleveland (Ohio) Railway.—The operating report of the Cleveland Railway for October, presented to the board of directors on Nov. 28, shows that the receipts were $70,622 greater than for the same month in 1913, although there was a decrease of 204,402 in the number of passengers. The penny charge for transfers accounts for $60,543 of the gain, while the remainder was owing to an increase in the number of passengers who paid fares but did not transfer. The interest fund, $200,707 at the end of September, increased $4,279. The operating allowance showed a deficit of $9,618, and the maintenance fund a deficit of $7,644.

Commonwealth Power, Railway & Light Company, Grand Rapids, Mich.—The Michigan Railroad Commission on Nov. 27 authorized the merger of eleven lighting companies with the controlling company, The Consumer's Power Company, which is in turn controlled by the Commonwealth Power, Railway & Light Company through complete stock ownership. The application for the merger, together with a list of the lighting companies affected, was published in the ELECTRIC RAILWAY JOURNAL of Nov. 28, page 1217.

Dominion Power & Transmission Company, Ltd., Hamilton, Ont.—A dividend of 2 per cent has been declared on the $5,100,000 of limited preference stock of the Dominion Power & Transmission Company, payable on Dec. 15 to holders of record on Nov. 30. Three prior payments of 2 per cent and three of one-half of 1 per cent bring the total payments to date up to 7½ per cent. When the dividends aggregate 10 per cent the limited preference stock will bcome ordinary stock, of which $2,614,500 is now outstanding.

Federal Light & Traction Company, New York, N. Y.—The quarterly dividend of 1½ per cent on the preferred stock of the Federal Light & Traction Company, due at this time, has been deferred.

Fresno (Cal.) Interurban Railway.—The Fresno Interurban Railway has filed an application with the California Railroad Commission for authority to issue $212,500 of common stock and $350,000 of first mortgage 6 per cent twenty-five-year bonds at not less than 80. The company also wishes authority to issue $350,000 of 6 per cent cumulative preferred stock only when an equivalent amount of bonds has been retired. The company proposes to use the proceeds in building a standard gauge electric railway from Fresno eastward, with a branch line to Clovis. The total length of the main line and branches as now projected is approximately 26 miles, with an estimated cost of construction per mile of $17,300. This company already has 2 miles of line in operation between Fresno and Belmont Avenues in Fresno and Alvina Heights. Previous authorizations to this company were noted in the ELECTRIC RAILWAY JOURNAL of Oct. 31 and Nov. 7.

Gary & Interurban Railroad, Gary, Ind.—The Gary & Interurban Railroad has deposited with the Baltimore Trust Company, as trustee, the required funds to meet the interest payment, defaulted Sept. 1, upon its $350,000 of three-year 6 per cent notes.

Lehigh Valley Transit Company, Allentown, Pa.—The Philadelphia Stock Exchange has listed $5,124,000 of refunding improvement mortgage fifty-year 5 per cent gold bonds of the Lehigh Valley Transit Company.

Lincoln Railway & Light Company, Lincoln, Ill.—A decree of foreclosure was ordered on Nov. 14 against the Lincoln Railway & Light Company by Judge Thomas M. Harris, sitting in the United States Circuit Court. The order followed a suit by bondholders, the filing of which was noted in the ELECTRIC RAILWAY JOURNAL of June 13. At the end of four weeks the master in chancery is expected to sell the effects of the corporation at public auction. Subsequent to the failure of the company to pay interest and principal on its outstanding bonds, James E. Hoblit was appointed receiver, as stated in the issue of this paper of Aug. 1.

Lorain (Ohio) Street Railway.—The Lorain Street Railway on Nov. 24 applied to the Ohio Public Utilities Commission for authority to issue $200,000 of three-year 6 per cent notes to be sold for not less than 99½. The proceeds, together with cash in the treasury, are to be used for the payment of $200,000 of first 6's due on Jan. 1, 1915.

Los Angeles & San Diego Beach Railway, San Diego, Cal.—The California Railroad Commission has issued a supplemental order authorizing the Los Angeles & San Diego Beach Railway to issue $375,000 of bonds. This authority is in substitution for the commission's order, noted in the ELECTRIC RAILWAY JOURNAL of Nov. 7, by which the company was authorized to issue a sufficient number of bonds to yield $250,000. The new order provides that the bonds are to be sold at not less than 80 and that the proceeds are to be used for electrification and the liquidation of indebtedness. The commission has also issued a supplemental order amending its previous decision authorizing the company to issue $32,000 of one-day promissory notes, as stated in the ELECTRIC RAILWAY JOURNAL of Nov. 21. The company is now given permission to issue ninety-day notes instead.

New York (N. Y.) Railways.—In the purchase of the $600,000 of capital stock of the Twenty-third Street Railway by the New York Railways at $350 per share, the Public Service Commission for the First District of New York has agreed to the amortization of 20 per cent of the $2,100,000 of thirty-year 4 per cent bonds to be issued in payment therefor. When the purchase was authorized, Commissioner Milo R. Maltbie made it a condition precedent to the consummation of the deal that 22 per cent should be amortized, inasmuch as New York Railway bonds were selling at from 78 per cent to 80 per cent of par. The company objected to this amount but has now consented to amortize 20 per cent of the par value of the bonds. The permission to make the stock purchase was noted in the ELECTRIC RAILWAY JOURNAL of Nov. 7.

Norwood, Canton & Sharon Street Railway, Canton, Mass.—On Nov. 26 the Norwood, Canton & Sharon Street Railway petitioned the Massachusetts Public Service Commission for the approval of an issue of $30,000 of twenty-year 5 per cent bonds and the authorization of a reduction in capital stock from $62,500 to $32,500. The new bonds are to be used to finance the $30,000 reduction in stock.

Oakland, Antioch & Eastern Railway, Oakland, Cal.—It is reported that the Oakland, Antioch & Eastern Railway is circulating among bondholders an agreement providing for the payment of bond interest for three years in company notes secured by 200 per cent of bonds. The company on Nov. 23 applied to the California Railroad Commission for authority to renew promissory notes amounting to $295,345.

Pacific Electric Railway, Los Angeles, Cal.—The Pacific Electric Railway on Nov. 25 received permission from the California Railroad Commission to issue $2,942,000 of fifty-year gold bonds at not less than 87½ and accrued interest to provide for improvements already completed or under way. The expenditures already made and to be made for work now under contract include the following items: bridges and paving, $1,050,000; rolling stock, $800,000; additions and betterments, $471,000; extensions and branches, $250,000; station and shop improvements, $177,000; power plant, substations and transmission lines, $100,000, and real estate purchases, $2,500. Of the total issue $1,213,000 is to be used to pay for work long completed. It is made a condition of the order that whenever any of the bonds are used for the above purpose a like amount of the indebtedness of the company shall be paid off and cancelled. The purpose of this provision is to prevent the same money remaining outstanding as an indebtedness and being represented by promissory notes in addition to the bonds authorized.

Pacific Gas & Electric Company, San Francisco, Cal.—As a result of the recent offer of the Pacific Gas & Electric

Company to accept delivery as of Oct. 31 at the lowest prices offered of $2,500,000 of its one-year 5 per cent gold notes maturing March 25, 1915, as noted in the ELECTRIC RAILWAY JOURNAL of Nov. 7, $3,751,000 of notes were tendered out of the outstanding issue of $7,000,000. The company purchased $2,511,000 of the tendered bonds at prices netting about 1 per cent as compared to the call price.

San Diego Consolidated Gas & Electric Company, San Diego, Cal.—The California Railroad Commission has authorized the San Diego Consolidated Gas & Electric Company to issue $250,000 face value of 6 per cent debentures payable on Dec. 1, 1922, and $240,000 par value of common stock. The order provides that the bonds are to be sold to net the company not less than 93 and accrued interest, and the stock at not less than par. The proceeds are to be used for discharging or refunding obligations amounting to $472,296.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The original application of the San Francisco-Oakland Terminal Railways to the California Railroad Commission for authority to issue $10,000,000 of 5 per cent general and refunding mortgage bonds has been indefinitely postponed by the commission. This application was noted in the ELECTRIC RAILWAY JOURNAL of June 6, 1914.

Southern Pacific Company, San Francisco, Cal.—Kuhn, Loeb & Company, New York, have purchased and resold an issue of $1,170,000 of 4½ per cent equipment trusts, series C, of the Southern Pacific Company. These notes, the application for the issuance of which was noted in the ELECTRIC RAILWAY JOURNAL of Nov. 28, were authorized by the California Railroad Commission on Nov. 25. These certificates will mature annually in equal installments from Dec. 1, 1915, to Dec. 1, 1924, and will be callable on Dec. 1, 1919, or at any interest date thereafter, at 102½ per cent. The issue will be known as series "C," and will differ from the company's equipment trust certificates of series "A" and "B" in that the present agreement provides for the payment in cash of 15 per cent instead of 10 per cent of the purchase price of the equipment and does not obligate the Southern Pacific Company to pay the federal income tax for the benefit of the holders of the certificates. The equipment that the company proposes to acquire will cost $1,426,053, which besides steam equipment covers sixteen motor coaches at $248,000, six motor coaches at $93,300 and two motor combination coach and express cars at $30,800.

Toronto (Ont.) Railway.—The Toronto Railway has sold to William A. Read & Company, Boston, $1,500,000 of 6 per cent notes, $750,000 of which will be due on Dec. 1, 1915, and the remainder on Dec. 1, 1916. The notes maturing in 1915 are being offered at 100¼, and those maturing in 1916 at par. Surplus earnings of the company in 1913 are reported to have been more than eighteen times the amount required for interest on the present issue.

United Traction & Electric Company, Providence, R. I.—C. S. Sweetland, secretary United Traction & Electric Company, says in a recent circular letter that while the control of the stock of the Rhode Island Company and the management have now been transferred to the five trustees, in accordance with the recent decree of the United States District Court, there has been no change in the relations of this company to the United Traction & Electric Company, or in its obligations to the United Traction & Electric Company and the latter's three lessor companies, so that the stability of income to the United Traction & Electric Company is assured. On June 24, 1902, the Union Railroad, the Pawtucket Street Railway and the Rhode Island Suburban Railway, the entire capital stock of each of which belongs to the United Traction & Electric Company, leased all their properties for 999 years to the Rhode Island Company. The annual rentals of $850,000 have enabled the United Traction & Electric Company to pay the interest on its $9,000,000 of 5 per cent bonds and 5 per cent annual dividends on its $8,000,000 of capital stock. Besides the rentals, however, the Rhode Island company agreed among other things to provide all further equipment and make all improvements necessary, all such equipment and improvements to become the property of the three lessor companies. In case the lessor companies should now resume possession under conditions of default covered by the lease, they would have the benefit of expenditures of more than $7,000,000 that have been made on the leased properties by the Rhode Island Company.

Virginia Railway & Power Company, Richmond, Va.—Coleman Wortham, Richmond, Va., and Finley J. Shepard and Arthur W. Kelly, New York, have been elected directors of the Virginia Railway & Power Company, to succeed Guy Phillips, Victor Cumberson and J. L. Sellman.

DIVIDENDS DECLARED

Brooklyn (N. Y.) Rapid Transit Company, quarterly, 1½ per cent.

Eastern Texas Electric Company, Beaumont, Tex., 3 per cent, preferred.

Frankfort & Southwark Passenger Railway, Philadelphia, Pa., $4.50.

Louisville (Ky.) Traction Company, quarterly, 1 per cent, common.

Massachusetts Electric Companies, Boston, Mass., $2, preferred.

Second & Third Streets Passenger Railway, Philadelphia, Pa., quarterly, $3.

Traffic and Transportation

INCREASE IN FARE ON OHIO-PENNSYLVANIA LINE

Discontinuance of Service Only Other Alternative—Deficit on One Division Since 1910

The Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, has given notice that beginning Dec. 15 an increase in fares will go into effect on its lines between Sharon and Bedford. The company's statement follows in part:

"The gross earnings of the Sharon & New Castle Street Railway have failed steadily to meet the ordinary operating expenses of the line. An increase in fares and a slight reduction in the schedule of cars operated is imperative. Ordinarily, when the receipts of a line are sufficient to meet its operating expenses and taxes, it is deemed good practice to continue operation in the hope that the road may eventually be placed on a self-sustaining basis and afford the stockholders some return on the money invested to serve the public. But when, as is the case with the Sharon & New Castle line, a road fails to pay operating expenses, let alone interest on indebtedness, abandonment of the line is usually considered necessary to protect the shareholders from the continued drain on their resources.

"This company is reluctant to consider for a moment the withdrawal of electric railway facilities from the communities traversed by this line and has determined upon the only other course that is possible in the circumstances —an increase in fares, so that the line may be placed nearly on a self-sustaining basis. In taking this step the company has kept well within the limit of 2 cents a mile for passenger fares.

"A glance at the financial condition of the Sharon & New Castle Railway for the last five years will show that the increase in fares is in the interest of the people served by the line. In 1910, the gross earnings were $33,333, while the operating expenses, including taxes, were $33,528, creating a deficit of $194. This deficit was increased by interest on notes and bonds to $9,901. This is the best showing made in five years. In 1911, the gross earnings were $31,747, and the operating expenses $33,130, leaving a deficit of $1,383, which was increased to $11,155, by interest on debt. In 1912, gross earnings $31,146, operating expenses $35,052, deficit $3,906; deficit, including interest, $13,719. In 1913, gross earnings $32,278, operating expenses $38,391, deficit $6,113; deficit, including interest $15,954. For nine months of the present year the gross earnings were $24,417, operating expenses $30,556, deficit $6,139; deficit, including interest, $13,611.

"The increase of fares includes the equalization of the charges for transporting the people and the general application of approximately a 2-cent fare per mile. Regular patrons will not be affected by the increase in fare as the rates for commutation tickets and for school tickets are to remain unchanged."

NEW SOUTHERN PACIFIC FARE SCHEDULE

The Southern Pacific Company on Nov. 24 submitted to the Railroad Commission of California for its approval a revised schedule of commutation fares between San Francisco and certain Alameda County points in the company's electric zone. This readjustment was ordered by the commission in the so-called transbay rate cases, which were decided on Oct. 10, 1914. The Southern Pacific Company subsequently applied for a rehearing, which was denied.

The Southern Pacific Company has also asked for permission to eliminate the commutation fare of $2.50 now in effect between Oakland and Stonehurst and intermediate points, and to increase the monthly commutation fare between Oakland and San Leandro from $2.50 to $3. It is stated that there is practically no travel under these latter fares.

In addition to the reductions in one-way and commutation fares between San Francisco and Alameda County points, the Southern Pacific Company was also required by the commission's decision in the transbay rate case to establish a fare of 5 cents between all points in Oakland, with the exception of Oakland Mole. This affects a material reduction in the fares within the city limits between West Oakland and 105th Avenue on the Melrose extension of the Southern Pacific Company, the fares in some cases being as high as 10 cents and 15 cents.

The proposed schedule is shown by the following table:

Between San Francisco and	Monthly Commutation Fares		One-Way Fares	
	Present	Proposed	Present	Proposed
Havenscourt	$4.75	$3.50	..	..
Yokum Avenue	4.90	3.50	..	..

Between Oakland and				
Broadmoor	4.30	3.50	.15	.10
Dutton Avenue	4.40	3.50	.15	.10

Increase in Fare on Jersey Line.—The Atlantic City & Shore Railroad, Atlantic City, N. J., has announced that the fare over its line between Atlantic City and the mainland will be increased from 10 cents to 15 cents.

New Transfer System in Youngstown.—The Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, has announced that a new form of transfer will be put into effect on its lines in Youngstown, Niles, Warren, Sharon and New Castle at a date yet to be announced.

Accident Faker Convicted.—George DeGraff was convicted in Common Pleas Court at Cleveland, Ohio, on Nov. 23 of obtaining $500 from the Cleveland Railway on false pretenses. DeGraff claimed he injured himself in a fall from a car on Jan. 14, 1914. The company produced evidence to show that his injury was received prior to that date.

Park Lease Negotiated.—Arrangements have been perfected by which Crump's Park, on the line of the Macon Railway & Light Company, Macon, Ga., will be leased to the Coney Island Amusement & Realty Company, Coney Island, N. Y., which operates a number of amusement resorts. It is planned to change the name of the resort to "Dreamland."

Finding on Cambridge (Mass.) Subway Station Improvements.—The Massachusetts Public Service Commission has issued an order requiring the Boston Elevated Railway to install a single-file escalator of the cleat type at the Harvard Square station of the Cambridge subway, connecting the inbound Mt. Auburn Street platform with the surface of the square. The estimated cost of the installation is $18,000.

Fast Freight Run.—The Illinois Traction System, Peoria, Ill., has established a fast freight run between Peoria and Decatur, Ill. The train makes connections at Decatur for Springfield and points east of Decatur. Fast freight runs have been in operation between Peoria and St. Louis, through Springfield, for some time. Under the new run a train will leave Peoria at 8:55 p.m. and will arrive at Decatur at 12:45 o'clock.

Interurban Roads Hurt Commuter Business.—Some of the steam railroads entering Cincinnati have filed notice with the Interstate Commerce Commission of an increase of commutation rates, effective about Jan. 15, 1915. They will also do away with the 100-mile ticket, it is said, and substitute a coupon ticket, good for only one month. The railroad men say the interurban electric railways have cut into their business until it is no longer profitable at the rates that have been in effect.

Rochester Fare Hearing.—The hearing in regard to the application of the Mayor of Rochester to the Public Service Commission of the Second District of New York for an order to require the Rochester city lines of the New York State Railways to charge only 3 cents in the rush hours was adjourned from Oct. 31 to Nov. 13. On the latter date the hearing was further adjourned to Nov. 20. Both sides then exchanged briefs. The matter has now gone over until

Jan. 6, 1915, when the commission will hear oral arguments at Albany.

Central States Passenger Rate Increase.—Although the Interstate Commerce Commission received numerous complaints requesting it to suspend the increased passenger rates, some of which became effective in the Central States passenger district on Dec. 1, the remainder to become effective between Dec. 7 and Dec. 15, it held that the investigation in the Eastern rate case, decided last July, was sufficient to prove the necessity and reasonableness of the new rates. It seems likely, however, that further hearings may be held on commuter rates.

Chicago "Skip-Stops."—In order to increase the track capacity by speeding up schedules outside the loop district, the "skip-stop" plan will be tried in Chicago. In the initial test it is proposed to make eight stops to the mile, or approximately every two blocks. Exceptions will, however, be made in heavy traffic zones. Traffic surveys are to be made to determine intersections to be dropped from the schedule. The test will be conducted over a line 10 miles in length in a district which is known to adjust itself readily to new equipment and conditions.

Front-End Collectors in Detroit.—On recommendation of Barclay Parsons & Klapp, New York, N. Y., engineers engaged in a traffic survey of Detroit, the city railway commission has requested the Detroit United Railway to load cars at the front end during the rush hour period in the congested districts. The company will start the experiment on Dec. 7 at two of the busiest intersections on Woodward Avenue. The plan is to have the street collectors handle nothing but ticket and cash fares, the conductor issuing all transfers and making all change.

Employees' Purchases Delivered.—The Interborough Rapid Transit Company, New York, N. Y., has inaugurated a delivery service in connection with its employees' stores. The cost of delivery of purchases less than $2 is 5 cents and on purchases more than $2 it is 10 cents. Arrangements have also been made to fill and deliver orders sent in by mail. In connection with the delivery service a new system of tickets has been installed under which purchasers have only one ticket to present at the cash window no matter how many purchases are made at the various departments which they visit.

Hearing Regarding Fare Petition.—A hearing was held before the Public Service Commission of the Second District of New York on Nov. 24 in regard to the petition for a reduction in the fare on the Schenectady Railway between Albany and Schenectady from 25 cents to 20 cents and for the redivision of the road into four instead of the present five fare zones. At the conclusion of the hearing Commissioner Emmett adjourned the hearing for three weeks. He urged the parties to the petition and the representatives of the company to make an effort to reach an agreement without the need of a formal order from the commission.

"Shop Early in Kansas City"—The Metropolitan Street Railway, Kansas City, Mo., is doing its part to stimulate the "shopping early" movement. In all its cars the company is displaying prominently placards on which is printed in green ink, surrounded by a holly border, the following: "The Metropolitan Street Railway, R. J. Dunham and Ford F. Harvey, receivers. The company requests its patrons to join the nation-wide movement to make Christmas a happy one by shopping early in the season, early in the week, early in the day. By request of the Kansas City Consumers' League. Shoppers should use home-bound cars early in the day."

A Story That Beats any "Movie" Plot.—A conductor in the employ of the Grays Harbor Railway & Light Company, Aberdeen, Wash., sent the following accident report to the operating department of the Federal Light & Traction Company, New York, which controls the Aberdeen company: "A man at Hoquiam came on the car at 7 p.m. He spit and expectorated all over the car and when I asked him to quit he swore strong at me. Then he vomited all over a seat and on the floor. I told him to clean it up or I would have him arrested. He started to clean it up, and then he went to the door, jumped from the car, and ran down E Street to the river and jumped in. I stopped the car, ran after the man, jumped in the river, dragged him out and had him arrested for spitting on the floor of the car."

New Mail Service in Suburban New York.—A trolley mail service has been established between Yonkers and Mount Vernon, N. Y., over the Mount Vernon line of the Yonkers Railroad, and is saving many hours in the delivery of first-class mail, the only kind carried at present. The New York Central & Hudson River Railroad passes through Yonkers and the New York, New Haven & Hartford Railroad through Mount Vernon. All the mail for Mount Vernon coming from the North and West is thrown off at East at Mount Vernon. Previously all mail was carried through to the Grand Central Terminal in New York City, where it was distributed and sent out again.

Donation Day in Cleveland.—The completion of the count by the auditing department of the Cleveland (Ohio) Railway shows that $14,074 was placed in the fare boxes for the Associated Charities on the day before Thanksgiving, known as donation day. On the morning of the day in question the conductors pinned carnations and strips of white ribbon bearing the words "Donation Day" upon their lapels. Posters were placed in the car windows, asking for donations, and small placards were attached to the fareboxes, with words of thanks to those who gave. The crews on the various lines vied with each other in their efforts to secure the largest amount collected. The lines which lead in the contest were Euclid, Detroit and Superior in the order named. Several $5 and $10 bills were taken from the boxes. The auditor's department secured an average of the receipts at this season of the year and based the company's portion of the fund upon this.

Fare Injunction Increase Denied.—The application of the receivers of the Seattle, Renton & Southern Railway for an injunction against the Public Service Commission of the State of Washington, which decided against the railway in its efforts to raise its rates and establish a rate zone, was denied recently by Judges William B. Gilbert, Jeremiah Neterer and Cushman, sitting in the District Court as a circuit court of appeals. The court held that no emergency had been shown for the order at this time. The receivers contended that the injunction of the commission prohibiting the company from raising the rates and establishing fare zones was confiscatory. The commission took the position that the company was bound by the terms of its franchise until such time as the commission or the Legislature should fix a different rate; that the service rendered was not reasonably worth more than the fare charged, and that an increase in rates would reduce the revenue rather than increase it by diminishing the patronage. Under the decision the company will have to continue operating under the schedule of rates granted it in its franchise until the case comes up regularly for trial, which will be some time in January.

Interchange Traffic Into Kansas City.—The Kansas City, Clay County & St. Joseph Railway (electric) has recently assumed terminal service to Kansas City's Union Station for the Quincy, Omaha & Kansas City Railroad (steam). The Quincy, Omaha & Kansas City Railroad, having made no arrangement to enter the station, has established its new terminus at Avondale, 5 miles from Kansas City. Here it transfers passengers to the electric line, which takes them into Kansas City or, in the case of through passengers, to city cars bound for the Union Station and there they board the steam roads for a continuation of their journey. The Quincy, Omaha & Kansas City Railroad sells through tickets to Third and Cherry Streets, Kansas City, the electric line taking up coupons at 2 cents a mile for the 5 miles it carries the passengers. The interurban collects from passengers entering Kansas City the 5 cents city fare after leaving Third and Cherry Streets. Tickets on the steam road reading to points beyond Kansas City provide also for the city fare, and for the city transfers. Passenger traffic routed by the steam railroad from the Union Station is correspondingly handled, the electric line receiving the passengers from the Metropolitan Street Railway and delivering them to the steam road at Avondale. The interurban's city station is ten blocks north of the Union Station, but Union Station loop cars and other cars reaching the depot run on both Walnut Street and Grand Avenue, the two streets used by the interurban.

Personal Mention

Mr. William F. Woerner has resigned as member of the Public Service Commission of Missouri to give his attention to private affairs.

Mr. William S. Ready has been appointed instructor of motormen on the Detroit city lines of the Detroit (Mich.) United Railway to succeed Mr. J. W. McIntosh.

Mr. Bayard Kilgour has been elected president of the Cincinnati (Ohio) Street Railway, operated under lease by the Cincinnati Traction Company, to fill the position caused by the death of his father, John Kilgour.

Mr. G. Masunaga, electrical engineer of the Imperial Government Railways, Tokyo, Japan, is on a tour of inspection of the electrified railways of the United States. Mr. Masunaga is interested particularly in block signal protection for electrified tracks.

Mr. E. A. Johnson has been appointed superintendent of the railway department of the Omaha & Lincoln Railway & Light Company, Ralston, Neb., to succeed Mr. George D. Rice. Mr. Johnson has been with this company as assistant superintendent since February, 1909.

Mr. George B. Wheeler, whose resignation as secretary and general manager of the Chippewa Valley Railway, Light & Power Company, Eau Claire, Wis., was announced in the ELECTRIC RAILWAY JOURNAL of Oct. 17, has been elected president of the Union National Bank, Eau Claire, Wis.

Mr. H. M. Aldrich has been appointed superintendent of the Northampton (Mass.) Street Railway to succeed Mr. E. C. Clark. Mr. Aldrich has recently been an inspector for the Massachusetts Public Service Commission and was formerly superintendent of the Amherst & Sunderland Street Railway, Amherst, Mass.

Mr. Henry Grenacher, who for several years has been connected with the engineering department of H. M Byllesby & Company Chicago, Ill., has been appointed efficiency engineer for all operated properties, in which capacity he will visit the various properties and co-operate with the local managers in improving the efficiency of plant operation.

Mr. Howard Rhoda has been appointed master mechanic of the Binghamton (N. Y.) Railway. For two years prior to his appointment to the Binghamton Railway Mr. Rhoda was employed as master mechanic of the Long Island Electric Railway, Jamaica, L. I., and for ten years prior to that he was assistant master mechanic of the Reading (Pa.) Transit Company.

Mr. C. B. Fairchild, Jr., who has been statistician of the Philadelphia (Pa.) Rapid Transit Company for the last three years, has been appointed executive assistant of the company. Before going to Philadelphia Mr. Fairchild was statistician of the Chicago (Ill.) City Railway for about two and a half years. Prior to that he was engaged in electric railway editorial work.

Mr. E. C. Clark has resigned as superintendent of the Northampton (Mass.) Street Railway. Mr. Clark entered the employ of the company under his father, the late Capt. E. C. Clark, whom he succeeded as manager in 1892. He continued as manager until Mr. L. D. Pellissier became manager of both the Northampton Street Railway and the Holyoke Street Railway a few years ago. Mr. Clark then was appointed superintendent of the Northampton lines.

Mr. Richard Sachse has been appointed chief engineer of the California Railroad Commission, with offices in San Francisco. Mr. Sachse entered the service of the commission in 1911 as assistant engineer. He was promoted to the position of principal assistant engineer in 1913, and has been acting chief engineer since December, 1913. Prior to becoming connected with the commission Mr. Sachse was with the Western Pacific Railway, the Southern Pacific Company and the United States reclamation service.

Mr. Edwin D. Smith, at present vice-president of the Arrow Engineering Company, will become connected with the United Railways, St. Louis, Mo., on Jan. 1, 1915, in a position to be created, having charge of the engineering and construction work of the railway company. Mr. Smith was graduated in engineering at the Missouri State University. He became connected with the United Railways in the power department about 1900, and was placed in charge of that department in 1904. He remained as superintendent of power until Jan. 1, 1911, when he resigned to become chief engineer of the board of education of the city of St. Louis. After serving two years in that capacity he was made vice-president and manager of the Arrow Engineering Company, a subsidiary of the North American Company.

Mr. L. C. Bewsey, who has been the local superintendent for the Union Traction Company of Indiana at Indianapolis since 1911, has resigned to accept the position of superintendent of transportation of the Buffalo, Lockport & Rochester Railway, which has headquarters at Rochester, N. Y. The resignation becomes effective on Dec. 15. Mr. Bewsey was born in Clinton, Ind., in 1882. His first railroad experience was as a fireman and brakeman for the Baltimore & Ohio Railroad and the Big Four Railroad. In 1899 he entered the service of the Lafayette (Ind.) Railway and served as motorman and shop foreman until he became connected with the Union Traction Company. In 1909 when the Muncie Meteor was put on by the Union Traction Company he became motorman and continued in that position until he was appointed local superintendent.

Mr. Maurice E. McCormick, who has been appointed assistant general maanger of the Bangor Railway & Electric Company, Bangor, Maine, entered railway work on Jan. 1, 1896, as an apprentice in the repair shops of the Public Works Company, Bangor, Maine, and has remained continuously in the service of that company and its successor, the Bangor Railway & Electric Company. He has in turn held the positions of shop foreman, master mechanic, assistant superintendent of operation and claim agent. The Bangor Railway & Electric Company owns and operates the electric railway and lighting companies in Bangor and vicinity. The company was organized in 1905 when the Public Works Company, the Bangor, Hampden & Winterport Railway, the Bangor, Orono & Old Town Railway, the Penobscot Central Railway and the Old Town Electric Company were consolidated. It also controls the Bar Harbor & Union River Power Company and the Bangor Power Company.

Mr. H. S. Newton has resigned as general manager of the Mesaba Railway, Virginia, Minn. He has been with the company since August, 1912. Mr. Newton was graduated from Ohio State University as an electrical engineer. He became connected with the General Electric Company at its Lynn shops and was later transferred to the Thompson-Houston Company at Cincinnati, for which he supervised the installation of apparatus on properties throughout the Central West. Subsequently he became electrical engineer for the Wheeling (W. Va.) Railway and later electrical engineer for the Syracuse (N. Y.) Railway and the Syracuse Consolidated Street Railway, eventually serving in the same capacity for the consolidated company, the Syracuse Rapid Transit Railway. Mr. Newton was appointed general manager and chief engineer of the Syracuse, Lakeside & Baldwinsville Railroad when the road was projected and continued with it during the first two years of its operation. He next became general manager of the Beaver Valley Traction Company, Pittsburgh. Before becoming connected with the Mesaba Railway he was general manager of the Hartford & Springfield Street Railway, Warehouse Point, Conn., for nine years.

Mr. E. A. Humphrey has been appointed electrical engineer of the Great Northern Railroad to succeed Mr. C. L. Daugherty, who, as previously noted in the ELECTRIC RAILWAY JOURNAL, has been appointed assistant general manager of the St. Petersburg & Gulf Railway and St. Petersburg Light & Power Company, St. Petersburg, Fla. From March, 1899, to June, 1904, Mr. Humphrey served as "head-end" electrician on the Lake Shore Limited between Chicago and New York on the Lake Shore and the New York Central lines. From June, 1904, to January, 1909, he was electrical foreman in charge of cab lighting at the Root Street Yards of the Lake Shore and Massachusetts Southern Railway. He then entered the employ of the Great Northern Railway, and from January, 1909, to April, 1911, was chief train electrician with that company. From April, 1911, to September, 1911, he was chief electrician of the Cascade Tunnel electrification of the Great Northern Railway. From September, 1911, to November, 1914, Mr. Humphrey was assistant electrical engineer of the Great Northern Railway. He was appointed electrical engineer of the company last month.

Mr. Howard Whitney, Nashua, N. H., formerly with the maintenance of way departments of the Boston & Maine Railroad and the Missouri Pacific Railroad, has been appointed engineer of maintenance of way of the Springfield (Mass.) Street Railway and the Worcester (Mass.) Consolidated Street Railway, to succeed Mr. Herbert Flanders, the newly appointed general manager of the Springfield Street Railway. Mr. Whitney will take charge of the maintenance of track and bridges of the systems owned and controlled by the New England Investment & Security Company. Mr. Whitney has had extended experience on engineering work with several railroads, but has never before been connected with an electric railway. He was graduated from Tufts College and was first employed in the construction of bridges and maintenance of track on the Missouri Pacific Railroad. Later he became construction engineer for the Central Vermont Railroad, a subsidiary of the Grand Trunk System, when it started construction of the branch from Palmer to Providence. During the time he was with the Central Vermont Railroad Mr. Whitney was resident engineer with headquarters in Woonsocket, R. I. He was later employed on the main line of the Boston & Maine Railroad with the maintenance of way department. Previous to the time of his appointment to the position of engineer of maintenance of way of the companies at Springfield and Worcester Mr. Whitney was employed as engineer with a contracting firm in Nashua, N. H.

OBITUARY

Charles J. Canda, a member of the old Rapid Transit Commission of New York City, is dead. Mr. Canda was born in Paris in 1838 and was long prominent in steam railroad work.

Col. George W. Dunn, a member of the State Railroad Commission of New York, the predecessor of the present public service commission, died at his home in Binghamton, N. Y., on Nov. 27. Colonel Dunn was born in Castle Creek, N. Y., in 1839.

Charles E. Hansell, assistant manager of the Esterline Company, Indianapolis, Ind., died on Nov. 25 as the result of injuries received in a collision between his motor car and a street car. Mr. Hansell was born at Medaryville, Ind., in 1883. He was graduated from the electrical engineering department of Purdue University in 1907, and shortly after entered the employ of the Western Electric Company at Chicago. Later he was electrical engineer of the Duncan Electric Company, LaFayette, Ind., and three years ago entered the employ of the Esterline Company as assistant manager and instrument engineer. He is survived by his widow and five children.

Lucius Tuttle, former president of the Boston & Maine Railroad, died at Brookline, Mass., on Nov. 30. Mr. Tuttle was a native of Hartford, Conn. He was an early exponent of the policy of electric railway control by steam railroads with the object of maintaining a centralized transportation system. Under him as head of the Boston & Maine Railroad, the unprofitable State-operated Hoosac tunnel link of the Fitchburg Railroad was taken over by the Maine system and later was electrified. Besides being a director in various banks and industrial corporations Mr. Tuttle was a trustee of Clark University and a member of the corporation of the Massachusetts Institute of Technology.

Forrest E. Barker, chairman of the Massachusetts Gas & Electric Light Commission, died suddenly at Washington, D. C., on Nov. 20, while in attendance upon the convention of the National Association of Railway Commissioners. Mr. Barker was born in Exeter, N. H., in 1853, was graduated from Wesleyan University, Connecticut, in 1874, and later took up the study of law at the Boston University Law School. After being admitted to the bar, he practised law in Worcester, Mass. In 1885 he was appointed a member of the Gas & Electric Light Commission by Governor Robinson of Massachusetts. That the commission was not abolished at the time of the creation of the Massachusetts Public Service Commission in 1913 was in no small part due to the years of devoted service and wise direction given by Mr. Barker in his responsible office.

RECENT INCORPORATIONS

***Richmond Railway & Viaduct Company, Richmond, Va.**—Chartered in Virginia to take over the Richmond & Henrico Railway and the Broad Street viaduct in Richmond. Capital stock, $25,000. Officers: E. R. Williams, president; Thomas B. Gay, vice-president; W. H. Chalkley, secretary and treasurer, all of Richmond.

FRANCHISES

Los Angeles, Cal.—The Los Angeles Railway has received from the Council a sixty-day extension of time on its franchise in which to complete work on Long Beach Avenue and Vernon Avenue in Los Angeles.

Pasadena, Cal.—An agreement as to the North Lake Avenue franchise in Pasadena has been reached between the Pacific Electric Railway and the Council, and the Commission has ordered a notice advertising the sale of the franchise to be published. The duration of the franchise is to be for thirty years.

Pittsfield, Mass.—The Berkshire Street Railway has received from the Massachusetts Public Service Commission an extension of time on its franchise to Dec. 1, 1915, in which to finish the construction and alterations of its lines in North Adams.

Cleveland, Ohio.—The Cleveland & Youngstown Railway has received a franchise from the Council in Cleveland to make certain changes in its grade that have become necessary since the original franchise was granted.

Medford, Ore.—The Southern Oregon Traction Company has received from the Council an extension of time on its franchise until June 30, 1915, in which to complete its 2-mile line in Medford. S. M. Bullis, Medford, president.

San Antonio, Tex.—The San Antonio Traction Company has received a franchise from the Council for an extension on West Commerce Street from Main Plaza to San Saba Street. At the same time authority was given to remove one of the tracks on Dolorosa Street in San Antonio.

Port Arthur, Tex.—The Port Arthur Traction Company has asked the Council for a franchise for an extension to the Pleasure Pier in Port Arthur.

Morgantown, W. Va.—The Morgantown & Wheeling Railway has received a franchise from the County Court to extend its lines through Clay and Battelle districts, bonds having been voted by these two districts to aid in the construction project.

TRACK AND ROADWAY

Pacific Electric Railway, Los Angeles, Cal.—Grading has been begun by this company on the link between Arlington and Corona, 8 miles.

Fresno (Cal.) Interurban Railway.—This company has asked the Railroad Commission for authority to issue $212,500 common stock and $350,000 of bonds. The proceeds will be used to build the 26 miles of railroad, one branch of which will run from Fresno to the Centerville citrus district, and the other from Fresno to Clovis and Gould Colony. The estimated cost of construction per mile is $17,500. After building the line the company plans to issue $350,000 of preferred stock, the proceeds to be used for the purpose of refunding the bonds. This stock is to be sold to landowners along the line of the road.

Fresno (Cal.) Traction Company.—Plans are being revived by the company to build a 2½-mile extension south of Fresno to Calwa.

Benicia Land & Terminal Company, Benicia, Cal.—Financial backing has been secured and plans are being made to begin work soon on this proposed electric line to connect Benicia and Vallejo. [E. R. J., Oct. 24, '14.]

Clear Lake Railroad, Lakeport, Cal.—About 18 miles of track will be built by this company during 1915.

***Ukiah, Cal.**—Plans are being considered to build an electric railway from Ukiah to Lake County via Potter Valley. Among those interested are: Eli Jones, J. G. Newman and Albert Clapp.

Middletown & Chester Railway, Middletown, Conn.—Preliminary arrangements are being made by this company to build its electric line between Middletown and Chester. Richard H. Bunce and Gustaf B. Carlson are among those interested. This railway will be an extension of the Shore Line Electric Railway. A separate company has been formed to obtain the charter for this line, which will be known as the Middletown & Chester Railway.

Washington Railway & Electric Company, Washington, D. C.—Construction of a branch line on Fourteenth Street between F Street and Pennsylvania Avenue so as to provide direct transportation over the lines of the Washington Railway & Electric Company from the northwest section of the city to the bureau of engraving and printing and other government buildings in that section is practically assured. The Public Utilities Commission and the company have reached a tentative agreement as to the building of the extension and work on the improvement may be begun within a few weeks. Details of the plan, which also provides for the establishment of terminal facilities in the neighborhood of the bureau of engraving and printing, will not be made public until after the commission has finally approved the project.

Southern Illinois Railway & Power Company, Chicago, Ill.—Work will be begun at once by this company on its line between Herrin, West Frankfort, Johnson City and Benton in Illinois.

Chicago, Peoria & Quincy Traction Company, Quincy, Ill.—According to officials of this company, the line which the company proposes to build from Peoria to Quincy will be in operation by Jan. 1, 1916. The company has entered into an arrangement with Woolf, Teitel & Company of California and Utah to finance the building of the railway. John L. Soebbing, president. [E. R. J., June 27, '14.]

Kankakee & Urbana Traction Company, Urbana, Ill.—This company opened a 5-mile extension from Rantoul to Ludlow on Dec. 1. About 20 miles are now in operation on this line and the officials plan to build 5 miles more in the spring, which will complete the line to Paxton.

Union Traction Company, Coffeyville, Kan.—This company is asked to consider plans to build a 25-mile line southeast from Coffeyville to Centralia.

***Garden City, Kan.**—The Garden City Sugar Company is making plans to construct an electric railroad to connect its farms with the beet factory.

Arkansas Valley Interurban Railway, Wichita, Kan.—Charles D. Bell, superintendent of this line, has closed a contract with the Hutchinson Street Railway for the use of its track in entering Hutchinson, and it is now planned to ask a franchise in Hutchinson permitting the interurban railway to operate over the street railway's lines; also the interurban railway will ask for a special election at an early date to vote on a $30,000 bond issue for the purpose of building interurban terminals in Hutchinson. The proposed extension of the interurban line would be 22 miles and would cost approximately $350,000. About half of the right-of-way from Halstead to Hutchinson has already been secured.

Kentucky Utilities Company, Somerset, Ky.—A $3,000,000 mortgage, in favor of the Illinois Trust & Savings Bank, and William H. Henkle, trustees, has been recorded in several central Kentucky counties by the Kentucky Utilities Company. With a franchise for using certain of the Winchester streets, the company keeps one electric car in operation in Winchester, the car meeting every train and making the round trip at other intervals. Extension of the lines to some of the outlying residence districts and connection with interurban lines in other directions are contemplated by this company.

Orleans-Kenner Electric Railway, New Orleans, La.—Construction of this line from New Orleans to Kenner, La., and the St. Charles Parish boundary is almost completed. E. A. Stanford, president. [E. R. J., Oct. 24, '14.]

Texas-Louisiana Traction Company, Shreveport, La.—Surveys are being made by this company on the section of its line between Shreveport and Marshall. The contract for financing and for the construction of this line between Shreveport and Monroe has been awarded. This railway will run through Jefferson and Greenville and will connect with the electric line from Dallas. Ultimately this line will connect Shreveport, La., and Jefferson and Longview, Tex., via Mansfield, Vivian, Blanchard, Oil City, Mooringsport, Greenville, Monroe and Marshall. A. B. Blevins, Jefferson, president. [E. R. J., Feb. 14, '14.]

Hagerstown & Frederick Railway, Frederick, Md.—Plans are being made by this company to build a high-tension line to Williamsport, with the possibility of outlets from Williamsport and an extension across the Potomac River into Berkeley County, W. Va. Poles are now being erected from Hagerstown to a point west of Halfway for the new trolley wires. With the installation of the high-tension line, cars can be operated at a greater speed. The new bridge at Williamsport was constructed with a view of carrying the tracks of an electric railway.

Milford & Uxbridge Street Railway, Milford, Mass.—This company is asked to consider plans to extend its lines to Purchase.

Worcester (Mass.) Consolidated Railway.—This company is asked to consider plans to extend its Sandersdale line to the site of the old waiting station in Southbridge.

***Lansing, Mich.**—The project to build an electric railway from Charlotte to Albion has been extended to include Grand Ledge and Lansing. The proposed line is a combination of two old plans. It was proposed to build a railway from Charlotte to Albion many years ago. The right-of-way was completed most of the distance. The new company has secured possession of this grading. Application for a charter will soon be made by the promoters. The new line will connect with the lines of the Michigan United Traction at Albion. A. D. Wood, Lansing, promoter.

Metropolitan Street Railway, Kansas City, Mo.—This company is replacing with iron poles the wooden trolley poles on West Electric Street in Independence.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.—At a hearing before Judge John Kennish of the State Public Service Commission on Nov. 18 one of the commission's engineers reported against the Hyde Park Line extension which complainants were asking for. General Manager John H. Van Brunt and H. A. Cowgill, engineer of maintenance of way, also offered testimony to the effect that the proposed loop would entail an unjustifiable expense.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has placed in operation its new line to Fifty-first Street and Center Street in Omaha.

Brooklyn, N. Y.—Following are unofficial totals of bids opened Dec. 1, at the Public Service Commission, 154 Nassau Street, New York City, N. Y., for reconstructing part of Section No. 9-C-1 of Route No. 9, a part of the Fourth Avenue subway in Brooklyn: Samuel Beskin, Beacon, N. Y., $134,085; Ward & Tulley, Inc., West Twentieth Street and Railroad Avenue, Brooklyn, $141,762; Thomas F. Shaughimessy, Albany, N. Y., $154,144; Frawley, Kaufman Contracting Company, 51 Chambers Street, New York, $158,109; Thomas Crimmins Contracting Company, 444 East Sixty-ninth Street, New York, $168,000; Snare & Triest Company, 233 Broadway, New York, $172,733; Norton & Gorman, 303 Douglas Street, Brooklyn, N. Y., $185,830; J. F. Cogan Company, 233 Broadway, New York, $190,000, and Degnon Contracting Company, 30 East Forty-second Street, New York, $192,389. The work includes the installation of cross-overs and partial reconstruction of De Kalb Avenue Station in the Flatbush Avenue extension in Brooklyn.

Westchester Electric Railroad, Mount Vernon, N. Y.—A tentative proposition recently suggested in connection with the extension of the North Pelham line of this company from Mount Vernon to Tuckahoe, reported in a late issue of the ELECTRIC RAILWAY JOURNAL, provides for the immediate construction of an extension to the Chester Hill station of the New York, Westchester & Boston Railroad and later continuing the line to Waverly Square, Tuckahoe, about 1 mile distant.

Dan River Railway, King, N. C.—Grading will soon be begun by this company on the 3-mile section of its line between King and Granite Quarry. This is part of a plan to build a 30-mile line from King to Asbury. H. A. Miller, Clemons, president. [E. R. J., Jan. 17, '14.]

***Canton, Ohio.**—The Chamber of Commerce at Canton, as well as prominent men in both Canton and Steubenville, are interested in the construction in a proposed electric line between Canton and Steubenville, via Carrollton, Minerva, Osnaburg, Oneida and Amsterdam, a distance of 60 miles.

Cleveland, Youngstown & Eastern Railway, Cleveland, Ohio.—At a rehearing before the Public Utilities Commission on Nov. 25, the commission refused to modify its original order that extensive repairs to track and equipment be made on this railway and that until this is done cars must run very slowly between Chagrin Falls and Garrettsville. The company pleaded the stringency of the money market as a reason for not having made repairs under the order.

East Linden Electric Railway, Linden, Ohio.—The Council committee on railroads at Columbus has approved a resolution establishing the route proposed by this company and asking for bids on the lowest rate of fare to be charged over the route. This step was necessary before the Council could advertise for bids. The line will extend from the western end of Leonard Avenue viaduct, near the present terminus of the Columbus line, into the corporate limits of the town of Linden. Paul H. Kohr, secretary. [E. R. J., June 6, '14.]

Toronto, Ont.—The Board of Control has been asked to place before the public on Jan. 1, 1915, a by-law asking for the extension of the Toronto Civic Car Line from St. Clair Avenue south along Vaughan Road to Badhurst Street Hill, and for a similar extension from St. Clair Avenue down Lansdowne Avenue in Toronto.

Toronto (Ont.) Suburban Street Railway.—On the Guelph extension of this company tracklaying has been completed from Islington to beyond Eden Mills. Considerable ballasting has been done, poles have been placed, and other work done. While some work is still in progress west of Eden Mills, operations on other sections of the line have been suspended.

West Side Electric Street Railway, Charleroi, Pa.—This corporation is yet in the formative stages. At present right-of-way is owned by this company traversing the properties of the West Sacramento Company. Capital stock, $1,000,000. Officers: Samuel Pond, president; J. K. Armsby, vice-president, and William Herlitz, secretary.

Philadelphia & West Chester Traction Company, Philadelphia, Pa.—Plans are being considered by this company for a line for East Lansdowne and Lansdowne. It will extend from the terminal at Sixty-ninth Street, thence through private right-of-way to Church Lane and Pembroke Avenue, East Lansdowne, and thence to Stewart Avenue and Lansdowne Avenue, making the terminus at Lansdowne and Baltimore Avenues, Lansdowne.

Rhode Island Company, Providence, R. I.—This company has placed in operation its new Mount Pleasant Avenue line from Chalkstone Avenue to Atwell's Avenue in Olneyville. Plans are being contemplated for a further extension of the new line to the junction of Manton Avenue and Atwell's Avenue, so that the desired belt line to Olneyville Square may be built.

Cumberland Valley Interurban Railway, Nashville, Tenn.—Surveys have been completed by this company through Wilson County, a few miles south of Lebanon, to Watertown, Alexandria, Smithville, McMinnville and Sparta. Branches will be constructed from points along the line to the Hermitage and Lebanon. This line will penetrate territory much of which is not reached by a railroad of any kind. W. G. Baird, Lebanon, president. [E. R. J., July 11, '14.]

Middle Tennessee Traction Company, Nashville, Tenn.—Grading has been completed by this company on the 23-mile section of its line between Franklin and Eaglesville. This line will ultimately connect Franklin, Eaglesville, Shelbyville, Fayetteville, Tenn., and Huntsville, Ala. John A. Pitts, Nashville, president. [E. R. J., June 20, '14.]

Nashville-Gallatin Interurban Railway, Nashville, Tenn.—Among the improvements planned by this company in the near future will be a branch line leaving the main line at Goodlettsville, to Springfield via Guthrie. Ultimately this line will be extended to Clarksville. Another extension contemplated is from Gallatin, the present northern terminus of the main line, to Bowling Green, Ky. An important extension of the line from Nashville to Franklin is already under way.

Bryan & Central Texas Interurban Railroad, Bryan, Tex.—Plans are being considered by this company to build a line from Bryan to Navasota, Tex.

Dallas (Tex.) Consolidated Electric Railway.—Work involving an expenditure of $40,000 will be begun at once by this company on Main Street between Exposition Avenue and Haskell Avenue in Dallas. The improvement includes relaying the present tracks with new rails. The street will also be paved.

Houston (Tex.) Electric Railway.—This company is asked to consider plans to build an extension from Whitman Street, north on Clark Street to Dudley Street, about 1 mile.

Pier Railway, Port Arthur, Tex.—A 1-mile branch from Procter Street to Pleasure Pier in Port Arthur will be constructed by this company during 1915.

Ogden, Logan & Idaho Railway, Ogden, Utah.—Preliminary arrangements are being made by this company for the extension of its line from Idlewild, the present Ogden canyon terminus, to Huntsville. [E. R. J., Oct. 31, '14.]

Utah Light & Railway Company, Salt Lake City, Utah.—This company has a large force of men repaving, constructing and extending some of its lines in Salt Lake City.

***Walla Walla, Wash.**—Plans are being contemplated to build a 75-mile electric railway from Walla Walla to La Grande. Among those interested are: C. J. Franklin, Boise; J. G. Brown, Galion, Ohio, and E. A. Pack, Weiser, Wash.

Washington-Oregon Corporation, Vancouver, Wash.—About 2 miles of new track will be built by this company in Vancouver during 1915.

Charleston, Parkersburg & Northern Railroad, Parkersburg, W. Va.—Bids will be awarded by this company in January to build its electric line between Parkersburg, Charleston, Sissonville and Guthrie. K. B. Stephenson, Parkersburg, secretary. [E. R. J., Sept. 19, '14.]

SHOPS AND BUILDINGS

Bay State Street Railway, Boston, Mass.—On Jan. 1 all departments of this company located in Lynn will move from the old Currier Building, the quarters which they have occupied, and will locate in the second story offices of the new Security Trust Company building at Central Avenue and Willow Street in Lynn.

POWER HOUSES AND SUBSTATIONS

Cleveland & Eastern Traction Company, Cleveland, Ohio.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for three 185-kva, single-phase, sixty-cycle, 16,500-volt high tension to rotary volts low tension O. I. S. C. transformers.

Schuylkill Valley Traction Company, Norristown, Pa.—After being under construction for more than two years, the new plant of the Phœnix Water Power Company at Black Rock, is in operation to supply current for the Schuylkill Valley Traction Company's line between Pottstown and Chestnut Hill. The plant cost $300,000, but in addition to this the Schuylkill Navigation Company expended $100,000 rebuilding the dam and in constructing concrete retaining walls.

Manufactures and Supplies

ROLLING STOCK

Toronto (Ont.) Civic Railway expects to purchase within about a week three light closed motor cars and one sweeper.

Ogden, Logan & Idaho Railway, Ogden, Utah, expects to purchase one electric locomotive within the next two months.

Tidewater Power Company, Wilmington, N. C., is having three 21-ft. semi-convertible city cars built by The J. G. Brill Company.

Shore Line Electric Railway, Norwich, Conn., has issued specifications for about ten double-truck closed passenger cars for city and suburban service; length over buffers to be 47 ft., length of car-body 36 ft.

Bay State Street Railway, Boston, Mass., has ordered one 30-ft. semi-steel semi-convertible city car from the Laconia Car Company. This company is reported to be preparing plans for the purchase of a large number of cars.

London & Port Stanley Railway, London, Ont., expects to order within the next two or three weeks, three two-compartment and three three-compartment 55-ft. passenger motor cars, four trail cars and three 60-ton locomotives.

Empire United Railways, Syracuse, N. Y., is reported to be expecting to purchase twelve cars before Jan. 1, 1915, in addition to those which were noted in the ELECTRIC RAILWAY JOURNAL of August 15 as having been ordered from the St. Louis Car Company.

Boston (Mass.) Elevated Railway is discussing plans to revise the specifications which it has recently issued for the purchase of 100 new cars. The company is reported as considering the purchase of fifty motor cars and fifty trailers instead of 100 trailers, as formerly intended, to be of lighter construction than the design provided for in the original specifications. No decision, however, has yet been reached on this matter.

Charleston (S. C.) Consolidated Railway & Lighting Company announces that it has not purchased twelve all-steel cars, as recently reported. The car specifications which were published in the ELECTRIC RAILWAY JOURNAL of Nov. 14, 1914, apply to twelve composite pay-within street cars, six of which were ordered by this railway from the Cincinnati Car Company in December, 1911, five in November, 1912, and one in September, 1913.

TRADE NOTES

McLeer Electric & Manufacturing Company, Brooklyn, N. Y., manufacturer and engineer, has changed its name and will hereafter be known as the Electric Operations Company, Inc.

Union Switch & Signal Company, Swissvale, Pa., has made the following changes and appointments: Central district, Chicago office, V. K. Spicer, special representative; W. H. Talbert, resident manager; George Marloff, office manager; S. E. Gillespie and J. L. Lucks, engineers. Eastern district, New York office, A. Dean, resident manager; H. McCready, office manager; H. W. Griffin, R. P. Tuttle, J. W. White and H. H. Hamilton, engineers; T. H. Patenall, resident manager, Montreal, Que.

Manganese Track Society and the Steel Foundries' Society at their October meeting adopted standards for manganese steel pointed switches. The joint standardization committee of these societies has agreed upon what, in their opinion, constitutes the best practice in regard to the design and dimensions of manganese steel pointed switches. Its recommendations include the manner of attaching the manganese steel tips to the switch point, limiting the dimensions of the piece, as well as recommendations governing the position of the manganese steel point when it is in contact with the running rail or when the switch is open.

William F. Bauer has been appointed manager of the Chicago office of the Edison Storage Battery Company, succeeding Charles B. Frayer who retired on Nov. 30 to devote himself to private interests. Mr. Bauer has been a familiar figure in railway and electrical circles of Chicago since he went there in 1906 as sales engineer of the Electric Storage Battery Company. In 1889 he was the electrician in charge of the original train lighting equipment of the Chicago Limited of the Pennsylvania Railroad, a lighting system designed by his father, then chief electrician of the Pullman Company at Chicago. Later, after practical experience with the old Electric Accumulator Company, the Westinghouse Electric & Manufacturing Company and the Pullman Company, he became train electrician of the Lake Shore Limited in the employ of the Wagner Palace Car Company. In 1901 he joined the forces of the Consolidated Railway Electric Lighting & Equipment Company and two years later was appointed chief electrician of the Missouri Pacific Railroad in charge of car lighting. Mr. Bauer has been with the Edison Storage Battery Company about a year as assistant manager of the railway department. He is president of the Railway Electrical Supply Manufacturers' Association, an organization in which he has been active since its formation.

ADVERTISING LITERATURE

American Electrical Works, Philadelphia, R. I., has issued a price list of its wire and cable materials.

Independent Pneumatic Tool Company, Chicago, Ill., has issued a folder which describes its "Thor" portable electric drills.

Nungesser Carbon & Battery Company, Cleveland, Ohio, has issued a card on its dry batteries for railway signal service.

Chicago Pneumatic Tool Company, Chicago, Ill., has issued bulletin No. 34 S, describing its small power-driven compressors.

Watson-Stillman Company, Aldene, N. J., has issued a catalog describing its "Kromax" leather packings for various kinds of machinery.

Electric Service Supply Company, Philadelphia, Pa., has issued a folder describing its "Melobeam" incandescent headlights for traction service.

Railway & Power Equipment Company, Buffalo, N. Y. (Charles F. Johnson—established 1901), has issued For Sale List No. 99 with a practical mailing card and a special circular describing a type of portable crane. This company is covering a broad field of equipment, represents several manufacturers, and is handling both new and second-hand equipment. It announces that a broad advertising campaign for the coming year is being planned to include numerous special pamphlets covering separate departments of their business.

Western Electric Company, New York, N. Y., prints as a leading article in the December issue of the *Western Electric News* an illustrated account, entitled "Telephoning the Isthmus," of the telephone construction work installed by this company in the vicinty of the Panama Canal. The article tells for the first time the story of the important part the telephone plays in the operation and management of the canal. Nearly 4000 telephones, together with magnets and central battery switchboards, power plants, cables and other apparatus have been installed in and around the Canal Zone by this company.

Another consolidation hearing was given on Dec. 2 by the Massachusetts Public Service Commission upon the legislative resolve covering proposed transportation improvements in the Boston metropolitan district. James F. Jackson, counsel for the Bay State Street Railway, appeared on behalf of the consolidation of that company with the Boston Elevated Railway. At a previous hearing the commission had requested Mr. Jackson to discuss more in detail the benefits of the consolidation. He pointed out that equalization of fares would be one of the chief gains and said that the financing of necessary transportation improvements, including new subways and rapid transit lines, would be greatly facilitated if a single organization controlled the service in and about Greater Boston. The studies submitted of proposed plans for handling the suburban railroad traffic in connection with downtown electric railways were only tentative, and until an act approving the consolidation was passed, the detail could not be worked out. In closing, Mr. Jackson pointed out that the working out of the consolidation would be completely under the supervision of the commission.

Vol. XLIV NEW YORK, SATURDAY DECEMBER 12, 1914 No. 24

LET SHOPMEN HELP DESIGN

On several occasions we have called attention to errors in maintenance structure design which might have been avoided had the shop employees been taken into consultation. The bad consequences of leaving everything to the man at the drafting board were noted again lately in a certain New England carshop. The building was laid out for aisle sprinklers, but after these were installed it was discovered that thereafter trolley poles on cars would have to be turned in the open air. Another part of the building was confidently laid out as a paint shop, but when car painting began it was found that a painter could not possibly work in the narrow space which had been left between the painting track and the wall. In general, the provision of satisfactory working clearances for a car shop requires more foresight than may reasonably be expected even from the combined experience of the draftsman, the shop superintendent and general manager. A hint or two from the men closest to the job may avoid many distressing incidents of the nature cited.

THE SKIP-STOP IDEA

One of the reforms which seem a long time in coming is the skip-stop for city service. Railway managers who have studied the plan approve of it, but the inertia of the public in matters of this kind is so great that this reform has been adopted in very few places. Chicago is now reported to be contemplating a trial of the plan. An account of the Denver experience has been published in recent issues. In Los Angeles, where the skip-stop has also been tried, there seems to be some doubt as to the advisability of its continuance. On the other hand, in Cleveland and in Kansas City, where the skip-stop appears to have been originally introduced in the year 1911, it has been continued in operation with every evidence of success. The increase in schedule speed has been reported to be nearly 10 per cent but since half of the cars stop at "odd" streets and the other half at the "even" streets, only about half of the people that collect at a corner board the first car that arrives. Thus the load is distributed more evenly among the cars on the route. There is no doubt that the public would be greatly benefited by the skip-stop because it materially increases the average speed by cutting out the number of stops and yet does not greatly increase the distance which the passengers have to walk to catch a car. In a number of cities the near-side stop has recently been introduced without creating public opposition. Perhaps this change will make the general adoption of the skip-stop more of a possibility.

AUTOMOBILES IN CITY TRAFFIC

Automobiles for private use have now become so common that it is not surprising they should have invaded the passenger transportation field, and several electric railway companies on the Western Coast report considerable competition from automobiles which carry passengers over certain routes for nickel fares. We have no fear that such cars, with the tire cost and other depreciation inseparable from automobile service, can ever be commercial competitors on the same terms with an electric railway system. The report of Mr. McCullom to the Board of Estimate and Apportionment of New York, abstracted in this paper about a year ago, presents ample evidence to this effect. Nevertheless, experience has shown that this fact will not prevent the owners of cars from attempting a service of this kind. In a free country like this, electric railway companies cannot suppress this competition even if they would, but it is only fair to them as large taxpayers and also to the public as a whole, whose patronage is solicited by these buses, that both classes of transportation should be placed under similar regulations in regard to responsibility, and that strict traffice regulations should be enforced. The Merchants & Manufacturers Association of Los Angeles has called the attention of the City Council of that city to the tremendous liability of street accidents from these irresponsible automobiles, and Long Beach, Cal., has imposed a license fee of $25 a year and has required taking out of a $10,000 liability insurance for every such car. Charges of short changing by irresponsible automobile conductors is also made in some of the Western cities. Railway companies can ask no more than a free field and fair play for all, but both they and the public should demand that fair play means an equal degree of responsibility from the operators of both classes of service.

STREET RAILWAY LOADS ON SOILS

A part of the discussion of the way committee's report on track at the convention was devoted to the distribution of railway loads over the ballast and sub-grade. While this subject is of vital importance to steam railroad engineers, owing to the great increase in the weight of locomotives as well as the adoption of higher scheduled speeds of trains, neither of these factors has any bearing on the study of track foundations in paved streets. Moreover, the conditions governing the depth of loose, unconfined ballast are hardly comparable with those surrounding a foundation of concrete or compactly-rolled ballast, such as is required by a modern electric railway. In steam

***Ukiah, Cal.**—Plans are being considered to build an electric railway from Ukiah to Lake County via Potter Valley. Among those interested are: Eli Jones, J. G. Newman and Albert Clapp.

Middletown & Chester Railway, Middletown, Conn.—Preliminary arrangements are being made by this company to build its electric line between Middletown and Chester. Richard H. Bunce and Gustaf B. Carlson are among those interested. This railway will be an extension of the Shore Line Electric Railway. A separate company has been formed to obtain the charter for this line, which will be known as the Middletown & Chester Railway.

Washington Railway & Electric Company, Washington, D. C.—Construction of a branch line on Fourteenth Street between F Street and Pennsylvania Avenue so as to provide direct transportation over the lines of the Washington Railway & Electric Company from the northwest section of the city to the bureau of engraving and printing and other government buildings in that section is practically assured. The Public Utilities Commission and the company have reached a tentative agreement as to the building of the extension and work on the improvement may be begun within a few weeks. Details of the plan, which also provides for the establishment of terminal facilities in the neighborhood of the bureau of engraving and printing, will not be made public until after the commission has finally approved the project.

Southern Illinois Railway & Power Company, Chicago, Ill.—Work will be begun at once by this company on its line between Herrin, West Frankfort, Johnson City and Benton in Illinois.

Chicago, Peoria & Quincy Traction Company, Quincy, Ill.—According to officials of this company, the line which the company proposes to build from Peoria to Quincy will be in operation by Jan. 1, 1916. The company has entered into an arrangement with Woolf, Teitel & Company of California and Utah to finance the building of the railway. John L. Soebbing, president. [E. R. J., June 27, '14.]

Kankakee & Urbana Traction Company, Urbana, Ill.—This company opened a 5-mile extension from Rantoul to Ludlow on Dec. 1. About 20 miles are now in operation on this line and the officials plan to build 5 miles more in the spring, which will complete the line to Paxton.

Union Traction Company, Coffeyville, Kan.—This company is asked to consider plans to build a 25-mile line southeast from Coffeyville to Centralia.

***Garden City, Kan.**—The Garden City Sugar Company is making plans to construct an electric railroad to connect its farms with the beet factory.

Arkansas Valley Interurban Railway, Wichita, Kan.—Charles D. Bell, superintendent of this line, has closed a contract with the Hutchinson Street Railway for the use of its track in entering Hutchinson, and it is now planned to ask a franchise in Hutchinson permitting the interurban railway to operate over the street railway's lines; also the interurban railway will ask for a special election at an early date to vote on a $30,000 bond issue for the purpose of building interurban terminals in Hutchinson. The proposed extension of the interurban line would be 22 miles and would cost approximately $350,000. About half of the right-of-way from Halstead to Hutchinson has already been secured.

Kentucky Utilities Company, Somerset, Ky.—A $3,000,000 mortgage, in favor of the Illinois Trust & Savings Bank, and William H. Henkle, trustees, has been recorded in several central Kentucky counties by the Kentucky Utilities Company. With a franchise for using certain of the Winchester streets, the company keeps one electric car in operation in Winchester, the car meeting every train and making the round trip at other intervals. Extension of the lines to some of the outlying residence districts and connection with interurban lines in other directions are contemplated by this company.

Orleans-Kenner Electric Railway, New Orleans, La.—Construction of this line from New Orleans to Kenner, La., and the St. Charles Parish boundary is almost completed. E. A. Stanford, president. [E. R. J., Oct. 24, '14.]

Texas-Louisiana Traction Company, Shreveport, La.—Surveys are being made by this company on the section of its line between Shreveport and Marshall. The contract for financing and for the construction of this line between Shreveport and Monroe has been awarded. This railway will run through Jefferson and Greenville and will connect with the electric line from Dallas. Ultimately this line will connect Shreveport, La., and Jefferson and Longview, Tex., via Mansfield, Vivian, Blanchard, Oil City, Mooringsport, Greenville, Monroe and Marshall. A. B. Blevins, Jefferson, president. [E. R. J., Feb. 14, '14.]

Hagerstown & Frederick Railway, Frederick, Md.—Plans are being made by this company to build a high-tension line to Williamsport, with the possibility of outlets from Williamsport and an extension across the Potomac River into Berkeley County, W. Va. Poles are now being erected from Hagerstown to a point west of Halfway for the new trolley wires. With the installation of the high-tension line, cars can be operated at a greater speed. The new bridge at Williamsport was constructed with a view of carrying the tracks of an electric railway.

Milford & Uxbridge Street Railway, Milford, Mass.—This company is asked to consider plans to extend its lines to Purchase.

Worcester (Mass.) Consolidated Railway.—This company is asked to consider plans to extend its Sandersdale line to the site of the old waiting station in Southbridge.

***Lansing, Mich.**—The project to build an electric railway from Charlotte to Albion has been extended to include Grand Ledge and Lansing. The proposed line is a combination of two old plans. It was proposed to build a railway from Charlotte to Albion many years ago. The right-of-way was completed most of the distance. The new company has secured possession of this grading. Application for a charter will soon be made by the promoters. The new line will connect with the lines of the Michigan United Traction at Albion. A. D. Wood, Lansing, promoter.

Metropolitan Street Railway, Kansas City, Mo.—This company is replacing with iron poles the wooden trolley poles on West Electric Street in Independence.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.—At a hearing before Judge John Kennish of the State Public Service Commission on Nov. 18 one of the commission's engineers reported against the Hyde Park Line extension which complainants were asking for. General Manager John H. Van Brunt and H. A. Cowgill, engineer of maintenance of way, also offered testimony to the effect that the proposed loop would entail an unjustifiable expense.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has placed in operation its new line to Fifty-first Street and Center Street in Omaha.

Brooklyn, N. Y.—Following are unofficial totals of bids opened Dec. 1, at the Public Service Commission, 154 Nassau Street, New York City, N. Y., for reconstructing part of Section No. 9-C-1 of Route No. 9, a part of the Fourth Avenue subway in Brooklyn: Samuel Beskin, Beacon, N. Y., $134,085; Ward & Tulley, Inc., West Twentieth Street and Railroad Avenue, Brooklyn, $141,762; Thomas F. Shaughimessy, Albany, N. Y., $154,144; Frawley, Kaufman Contracting Company, 51 Chambers Street, New York, $158,109; Thomas Crimmins Contracting Company, 444 East Sixty-ninth Street, New York, $168,000; Snare & Triest Company, 233 Broadway, New York, $172,733; Norton & Gorman, 303 Douglas Street, Brooklyn, N. Y., $185,830; J. F. Cogan Company, 233 Broadway, New York, $190,000, and Degnon Contracting Company, 30 East Forty-second Street, New York, $192,389. The work includes the installation of cross-overs and partial reconstruction of De Kalb Avenue Station in the Flatbush Avenue extension in Brooklyn.

Westchester Electric Railroad, Mount Vernon, N. Y.—A tentative proposition recently suggested in connection with the extension of the North Pelham line of this company from Mount Vernon to Tuckahoe, reported in a late issue of the Electric Railway Journal, provides for the immediate construction of an extension to the Chester Hill station of the New York, Westchester & Boston Railroad and later continuing the line to Waverly Square, Tuckahoe, about 1 mile distant.

Dan River Railway, King, N. C.—Grading will soon be begun by this company on the 3-mile section of its line between King and Granite Quarry. This is part of a plan to build a 30-mile line from King to Asbury. H. A. Miller, Clemons, president. [E. R. J., Jan. 17, '14.]

***Canton, Ohio.**—The Chamber of Commerce at Canton, as well as prominent men in both Canton and Steubenville, are interested in the construction in a proposed electric line between Canton and Steubenville, via Carrollton, Minerva, Osnaburg, Oneida and Amsterdam, a distance of 60 miles.

Cleveland, Youngstown & Eastern Railway, Cleveland, Ohio.—At a rehearing before the Public Utilities Commission on Nov. 25, the commission refused to modify its original order that extensive repairs to track and equipment be made on this railway and that until this is done cars must run very slowly between Chagrin Falls and Garrettsville. The company pleaded the stringency of the money market as a reason for not having made repairs under the order.

East Linden Electric Railway, Linden, Ohio.—The Council committee on railroads at Columbus has approved a resolution establishing the route proposed by this company and asking for bids on the lowest rate of fare to be charged over the route. This step was necessary before the Council could advertise for bids. The line will extend from the western end of Leonard Avenue viaduct, near the present terminus of the Columbus line, into the corporate limits of the town of Linden. Paul H. Kohr, secretary. [E. R. J., June 6, '14.]

Toronto, Ont.—The Board of Control has been asked to place before the public on Jan. 1, 1915, a by-law asking for the extension of the Toronto Civic Car Line from St. Clair Avenue south along Vaughan Road to Badhurst Street Hill, and for a similar extension from St. Clair Avenue down Lansdowne Avenue in Toronto.

Toronto (Ont.) Suburban Street Railway.—On the Guelph extension of this company tracklaying has been completed from Islington to beyond Eden Mills. Considerable ballasting has been done, poles have been placed, and other work done. While some work is still in progress west of Eden Mills, operations on other sections of the line have been suspended.

West Side Electric Street Railway, Charleroi, Pa.—This corporation is yet in the formative stages. At present right-of-way is owned by this company traversing the properties of the West Sacramento Company. Capital stock, $1,000,000. Officers: Samuel Pond, president; J. K. Armsby, vice-president, and William Herlitz, secretary.

Philadelphia & West Chester Traction Company, Philadelphia, Pa.—Plans are being considered by this company for a line for East Lansdowne and Lansdowne. It will extend from the terminal at Sixty-ninth Street, thence through private right-of-way to Church Lane and Pembroke Avenue, East Lansdowne, and thence to Stewart Avenue and Lansdowne Avenue, making the terminus at Lansdowne and Baltimore Avenues, Lansdowne.

Rhode Island Company, Providence, R. I.—This company has placed in operation its new Mount Pleasant Avenue line from Chalkstone Avenue to Atwell's Avenue in Olneyville. Plans are being contemplated for a further extension of the new line to the junction of Manton Avenue and Atwell's Avenue, so that the desired belt line to Olneyville Square may be built.

Cumberland Valley Interurban Railway, Nashville, Tenn.—Surveys have been completed by this company through Wilson County, a few miles south of Lebanon, to Watertown, Alexandria, Smithville, McMinnville and Sparta. Branches will be constructed from points along the line to the Hermitage and Lebanon. This line will penetrate territory much of which is not reached by a railroad of any kind. W. G. Baird, Lebanon, president. [E. R. J., July 11, '14.]

Middle Tennessee Traction Company, Nashville, Tenn.—Grading has been completed by this company on the 23-mile section of its line between Franklin and Eaglesville. This line will ultimately connect Franklin, Eaglesville, Shelbyville, Fayetteville, Tenn., and Huntsville, Ala. John A. Pitts, Nashville, president. [E. R. J., June 20, '14.]

Nashville-Gallatin Interurban Railway, Nashville, Tenn.—Among the improvements planned by this company in the near future will be a branch line leaving the main line at Goodlettsville, to Springfield via Guthrie. Ultimately this line will be extended to Clarksville. Another extension contemplated is from Gallatin, the present northern terminus of the main line, to Bowling Green, Ky. An important extension of the line from Nashville to Franklin is already under way.

Bryan & Central Texas Interurban Railroad, Bryan, Tex.—Plans are being considered by this company to build a line from Bryan to Navasota, Tex.

Dallas (Tex.) Consolidated Electric Railway.—Work involving an expenditure of $40,000 will be begun at once by this company on Main Street between Exposition Avenue and Haskell Avenue in Dallas. The improvement includes relaying the present tracks with new rails. The street will also be paved.

Houston (Tex.) Electric Railway.—This company is asked to consider plans to build an extension from Whitman Street, north on Clark Street to Dudley Street, about 1 mile.

Pier Railway, Port Arthur, Tex.—A 1-mile branch from Procter Street to Pleasure Pier in Port Arthur will be constructed by this company during 1915.

Ogden, Logan & Idaho Railway, Ogden, Utah.—Preliminary arrangements are being made by this company for the extension of its line from Idlewild, the present Ogden canyon terminus, to Huntsville. [E. R. J., Oct. 31, '14.]

Utah Light & Railway Company, Salt Lake City, Utah.—This company has a large force of men repaving, constructing and extending some of its lines in Salt Lake City.

***Walla Walla, Wash.**—Plans are being contemplated to build a 75-mile electric railway from Walla Walla to La Grande. Among those interested are: C. J. Franklin, Boise; J. G. Brown, Galion, Ohio, and E. A. Pack, Weiser, Wash.

Washington-Oregon Corporation, Vancouver, Wash.—About 2 miles of new track will be built by this company in Vancouver during 1915.

Charleston, Parkersburg & Northern Railroad, Parkersburg, W. Va.—Bids will be awarded by this company in January to build its electric line between Parkersburg, Charleston, Sissonville and Guthrie. K. B. Stephenson, Parkersburg, secretary. [E. R. J., Sept. 19, '14.]

SHOPS AND BUILDINGS

Bay State Street Railway, Boston, Mass.—On Jan. 1 all departments of this company located in Lynn will move from the old Currier Building, the quarters which they have occupied, and will locate in the second story offices of the new Security Trust Company building at Central Avenue and Willow Street in Lynn.

POWER HOUSES AND SUBSTATIONS

Cleveland & Eastern Traction Company, Cleveland, Ohio.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for three 185-kva, single-phase, sixty-cycle, 16,500-volt high tension to rotary volts low tension O. I. S. C. transformers.

Schuylkill Valley Traction Company, Norristown, Pa.—After being under construction for more than two years, the new plant of the Phœnix Water Power Company at Black Rock, is in operation to supply current for the Schuylkill Valley Traction Company's line between Pottstown and Chestnut Hill. The plant cost $300,000, but in addition to this the Schuylkill Navigation Company expended $100,000 rebuilding the dam and in constructing concrete retaining walls.

Manufactures and Supplies

ROLLING STOCK

Toronto (Ont.) Civic Railway expects to purchase within about a week three light closed motor cars and one sweeper.

Ogden, Logan & Idaho Railway, Ogden, Utah, expects to purchase one electric locomotive within the next two months.

Tidewater Power Company, Wilmington, N. C., is having three 21-ft. semi-convertible city cars built by The J. G. Brill Company.

Shore Line Electric Railway, Norwich, Conn., has issued specifications for about ten double-truck closed passenger cars for city and suburban service; length over buffers to be 47 ft., length of car-body 36 ft.

Bay State Street Railway, Boston, Mass., has ordered one 30-ft. semi-steel semi-convertible city car from the Laconia Car Company. This company is reported to be preparing plans for the purchase of a large number of cars.

London & Port Stanley Railway, London, Ont., expects to order within the next two or three weeks, three two-compartment and three three-compartment 55-ft. passenger motor cars, four trail cars and three 60-ton locomotives.

Empire United Railways, Syracuse, N. Y., is reported to be expecting to purchase twelve cars before Jan. 1, 1915, in addition to those which were noted in the ELECTRIC RAILWAY JOURNAL of August 15 as having been ordered from the St. Louis Car Company.

Boston (Mass.) Elevated Railway is discussing plans to revise the specifications which it has recently issued for the purchase of 100 new cars. The company is reported as considering the purchase of fifty motor cars and fifty trailers instead of 100 trailers, as formerly intended, to be of lighter construction than the design provided for in the original specifications. No decision, however, has yet been reached on this matter.

Charleston (S. C.) Consolidated Railway & Lighting Company announces that it has not purchased twelve all-steel cars, as recently reported. The car specifications which were published in the ELECTRIC RAILWAY JOURNAL of Nov. 14, 1914, apply to twelve composite pay-within street cars, six of which were ordered by this railway from the Cincinnati Car Company in December, 1911, five in November, 1912, and one in September, 1913.

TRADE NOTES

McLeer Electric & Manufacturing Company, Brooklyn, N. Y., manufacturer and engineer, has changed its name and will hereafter be known as the Electric Operations Company, Inc.

Union Switch & Signal Company, Swissvale, Pa., has made the following changes and appointments: Central district, Chicago office, V. K. Spicer, special representative; W. H. Talbert, resident manager; George Marloff, office manager; S. E. Gillespie and J. L. Lucks, engineers. Eastern district, New York office, A. Dean, resident manager; H. McCready, office manager; H. W. Griffin, R. P. Tuttle, J. W. White and H. H. Hamilton, engineers; T. H. Patenall, resident manager, Montreal, Que.

Manganese Track Society and the Steel Foundries' Society at their October meeting adopted standards for manganese steel pointed switches. The joint standardization committee of these societies has agreed upon what, in their opinion, constitutes the best practice in regard to the design and dimensions of manganese steel pointed switches. Its recommendations include the manner of attaching the manganese steel tips to the switch point, limiting the dimensions of the piece, as well as recommendations governing the position of the manganese steel point when it is in contact with the running rail or when the switch is open.

William F. Bauer has been appointed manager of the Chicago office of the Edison Storage Battery Company, succeeding Charles B. Frayer who retired on Nov. 30 to devote himself to private interests. Mr. Bauer has been a familiar figure in railway and electrical circles of Chicago since he went there in 1906 as sales engineer of the Electric Storage Battery Company. In 1889 he was the electrician in charge of the original train lighting equipment of the Chicago Limited of the Pennsylvania Railroad, a lighting system designed by his father, then chief electrician of the Pullman Company at Chicago. Later, after practical experience with the old Electric Accumulator Company, the Westinghouse Electric & Manufacturing Company and the Pullman Company, he became train electrician of the Lake Shore Limited in the employ of the Wagner Palace Car Company. In 1901 he joined the forces of the Consolidated Railway Electric Lighting & Equipment Company and two years later was appointed chief electrician of the Missouri Pacific Railroad in charge of car lighting. Mr. Bauer has been with the Edison Storage Battery Company about a year as assistant manager of the railway department. He is president of the Railway Electrical Supply Manufacturers' Association, an organization in which he has been active since its formation.

ADVERTISING LITERATURE

American Electrical Works, Philadelphia, R. I., has issued a price list of its wire and cable materials.

Independent Pneumatic Tool Company, Chicago, Ill., has issued a folder which describes its "Thor" portable electric drills.

Nungesser Carbon & Battery Company, Cleveland, Ohio, has issued a card on its dry batteries for railway signal service.

Chicago Pneumatic Tool Company, Chicago, Ill., has issued bulletin No. 34 S, describing its small power-driven compressors.

Watson-Stillman Company, Aldene, N. J., has issued a catalog describing its "Kromax" leather packings for various kinds of machinery.

Electric Service Supply Company, Philadelphia, Pa., has issued a folder describing its "Melobeam" incandescent headlights for traction service.

Railway & Power Equipment Company, Buffalo, N. Y. (Charles F. Johnson—established 1901), has issued For Sale List No. 99 with a practical mailing card and a special circular describing a type of portable crane. This company is covering a broad field of equipment, represents several manufacturers, and is handling both new and second-hand equipment. It announces that a broad advertising campaign for the coming year is being planned to include numerous special pamphlets covering separate departments of their business.

Western Electric Company, New York, N. Y., prints as a leading article in the December issue of the *Western Electric News* an illustrated account, entitled "Telephoning the Isthmus," of the telephone construction work installed by this company in the vicinty of the Panama Canal. The article tells for the first time the story of the important part the telephone plays in the operation and management of the canal. Nearly 4000 telephones, together with magnets and central battery switchboards, power plants, cables and other apparatus have been installed in and around the Canal Zone by this company.

Another consolidation hearing was given on Dec. 2 by the Massachusetts Public Service Commission upon the legislative resolve covering proposed transportation improvements in the Boston metropolitan district. James F. Jackson, counsel for the Bay State Street Railway, appeared on behalf of the consolidation of that company with the Boston Elevated Railway. At a previous hearing the commission had requested Mr. Jackson to discuss more in detail the benefits of the consolidation. He pointed out that equalization of fares would be one of the chief gains and said that the financing of necessary transportation improvements, including new subways and rapid transit lines, would be greatly facilitated if a single organization controlled the service in and about Greater Boston. The studies submitted of proposed plans for handling the suburban railroad traffic in connection with downtown electric railways were only tentative, and until an act approving the consolidation was passed, the detail could not be worked out. In closing, Mr. Jackson pointed out that the working out of the consolidation would be completely under the supervision of the commission.

LET SHOPMEN HELP DESIGN

On several occasions we have called attention to errors in maintenance structure design which might have been avoided had the shop employees been taken into consultation. The bad consequences of leaving everything to the man at the drafting board were noted again lately in a certain New England carshop. The building was laid out for aisle sprinklers, but after these were installed it was discovered that thereafter trolley poles on cars would have to be turned in the open air. Another part of the building was confidently laid out as a paint shop, but when car painting began it was found that a painter could not possibly work in the narrow space which had been left between the painting track and the wall. In general, the provision of satisfactory working clearances for a car shop requires more foresight than may reasonably be expected even from the combined experience of the draftsman, the shop superintendent and general manager. A hint or two from the men closest to the job may avoid many distressing incidents of the nature cited.

THE SKIP-STOP IDEA

One of the reforms which seem a long time in coming is the skip-stop for city service. Railway managers who have studied the plan approve of it, but the inertia of the public in matters of this kind is so great that this reform has been adopted in very few places. Chicago is now reported to be contemplating a trial of the plan. An account of the Denver experience has been published in recent issues. In Los Angeles, where the skip-stop has also been tried, there seems to be some doubt as to the advisability of its continuance. On the other hand, in Cleveland and in Kansas City, where the skip-stop appears to have been originally introduced in the year 1911, it has been continued in operation with every evidence of success. The increase in schedule speed has been reported to be nearly 10 per cent but since half of the cars stop at "odd" streets and the other half at the "even" streets, only about half of the people that collect at a corner board the first car that arrives. Thus the load is distributed more evenly among the cars on the route. There is no doubt that the public would be greatly benefited by the skip-stop because it materially increases the average speed by cutting out the number of stops and yet does not greatly increase the distance which the passengers have to walk to catch a car. In a number of cities the near-side stop has recently been introduced without creating public opposition. Perhaps this change will make the general adoption of the skip-stop more of a possibility.

AUTOMOBILES IN CITY TRAFFIC

Automobiles for private use have now become so common that it is not surprising they should have invaded the passenger transportation field, and several electric railway companies on the Western Coast report considerable competition from automobiles which carry passengers over certain routes for nickel fares. We have no fear that such cars, with the tire cost and other depreciation inseparable from automobile service, can ever be commercial competitors on the same terms with an electric railway system. The report of Mr. McCullom to the Board of Estimate and Apportionment of New York, abstracted in this paper about a year ago, presents ample evidence to this effect. Nevertheless, experience has shown that this fact will not prevent the owners of cars from attempting a service of this kind. In a free country like this, electric railway companies cannot suppress this competition even if they would, but it is only fair to them as large taxpayers and also to the public as a whole, whose patronage is solicited by these buses, that both classes of transportation should be placed under similar regulations in regard to responsibility, and that strict traffice regulations should be enforced. The Merchants & Manufacturers Association of Los Angeles has called the attention of the City Council of that city to the tremendous liability of street accidents from these irresponsible automobiles, and Long Beach, Cal., has imposed a license fee of $25 a year and has required taking out of a $10,000 liability insurance for every such car. Charges of short changing by irresponsible automobile conductors is also made in some of the Western cities. Railway companies can ask no more than a free field and fair play for all, but both they and the public should demand that fair play means an equal degree of responsibility from the operators of both classes of service.

STREET RAILWAY LOADS ON SOILS

A part of the discussion of the way committee's report on track at the convention was devoted to the distribution of railway loads over the ballast and sub-grade. While this subject is of vital importance to steam railroad engineers, owing to the great increase in the weight of locomotives as well as the adoption of higher scheduled speeds of trains, neither of these factors has any bearing on the study of track foundations in paved streets. Moreover, the conditions governing the depth of loose, unconfined ballast are hardly comparable with those surrounding a foundation of concrete or compactly-rolled ballast, such as is required by a modern electric railway. In steam

road, or even interurban road open-track construction, a certain amount of flexibility is required, while track in paved streets must be as rigid as is consistent with economical operation. To obtain rigidity the foundation must be made much heavier than that actually necessary to carry the track loads. In other words, one should determine the average soil-bearing power condition and then select a foundation which will distribute the track loads well within the safe limit. It would be impractical to change the character of foundation with every slight change in the bearing quality of the soil. On the other hand, it is necessary to change the character of foundation when there is a marked change in the soil-bearing power, such as might be found where track is constructed over filled-in areas or where the soil contains excessive moisture. Of course, a drainage system would go far toward improving the latter condition, while rolling the sub-grade will often be all that is necessary to prepare filled-in areas for foundation construction. To sum up, it appears impossible to calculate exactly the distribution of track loads over the foundation and sub-soil. Hence, the selection of the foundation must be based largely on experience, after such mathematical checks as may be required have been made to determine the relation of the load to be carried to the bearing power of the sub-soil.

SNOW REMOVAL

That the removal of snow from city streets should constitute one of the most exasperating of the unsolved engineering problems of long standing is really remarkable when it is considered that the cost of the fuel necessary to melt the snow would be hardly 15 per cent of the expense of removal involved under present methods, the latter consisting, almost without exception, in shoveling the snow into wagons and carting it away. It may be, of course, that snow storms will have to be fought for some time by this primitive scheme, yet in this age of flying machines and wireless telegraphy one must be a true conservative at heart to accept this as a fact, even though the recommendations of the committee on resolutions of the snow removal conference, which were presented before the American Society of Mechanical Engineers last week, approved no new process except the limited use of the sewer system to get the snow off the streets.

The reasons that prevented the general use of sewers, as outlined in the report, could be summed up in the one generality—insufficient sewage flow. In New York, during the last winter, experiments demonstrated that the large trunk sewers with a continuous and fairly rapid flow were not clogged by any snow that might be shoveled into them. The small sewers, however, of about 12-in. diameter required flushing with hydrant water and even then had to be treated with considerable care.

The same idea has been suggested for Philadelphia, where the contractors are supposed to commence the work of plowing or sweeping the snow to the sides of the streets within one hour after a storm begins, the work of carting the piles away being aided by the use of certain sewer manholes for dumps. It is now planned to extend the use of the sewers by having water connections placed inside of the manholes, thus increasing the flow in the sewer and permitting the flushing away of accumulations of snow.

Removal of snow by flushing the streets with cold water naturally seems like carrying coals to Newcastle, but the experience in Scranton has demonstrated that with proper temperature conditions the scheme is capable of reducing the expense of removal to one-half that of cartage. However, when a cold snap follows a snow storm, the presence of great quantities of water on the streets might easily become fraught with considerable danger. This fact, indeed, is implied in the recommendations of the committee. Considerable hope is also held out in regard to the disposal of snow by melting in a furnace. The committee estimates that with a perfect furnace the cost of the coal required would be 3 cents, or with a furnace efficiency of 33 per cent, 9 cents, per cubic yard, against the present cost of carting of about 50 cents. This difference provides a considerable margin from which, of course, the cost of apparatus, labor and maintenance must be deducted. The problem should be an attractive one to the inventor, because there are many objections to carting besides its cost. One is its slowness, another is the congestion caused in the streets by the carts, and a third is the increasing scarcity in most cities of carts suitable for this purpose, owing to the growing tendency to substitute in commercial work for the horse-drawn cart a specialized motor truck not suitable for snow removal.

Surface railways, of course, are not so much interested in the manner of snow removal as in the provisions for operating their lines during and after snow storms. The matters of complaints from the public and of decreased receipts, which are the invariable accompaniments of heavy snow falls, are of serious importance, and at least one road, the New York Railways, is going to great expense to develop a wing sweeper that will clear a passageway beside the track. This has been planned solely to provide space for vehicular traffic which, during snow storms, utilizes the street railway tracks because these provide the only clear space in the street. Obviously the consequent congestion practically prevents the railway company from moving cars. To meet this difficulty wing brooms have also been suggested for Philadelphia and wing plows have been in successful use in Montreal for several years, a layer of snow being intentionally left on the streets in the latter city. It seems unfair to require a railway company, which is responsible only for the clearing of its tracks, to take care of the snow elsewhere on the street. But in many cases, owing to the slowness of the city force, this appears to be necessary for the railways, purely as a means for self-protection, and the development of wing brooms and wing plows seems to constitute peculiarly the railways' share in the problem, just as much as the prompt removal of the snow piles constitutes the share of the municipality.

FEDERAL AND STATE JURISDICTION OVER CITY RAILWAYS

It is not surprising, in view of the recent establishment of commission regulation in this country, that there should be many unsettled questions as to the powers and duties of regulatory commissions. One of the most important of those which remain to be settled is where the power of the federal commission should end and that of the state commissions begin. It would seem that with all of the problems in connection with valuation of steam railroads and the establishment of freight rates that the Interstate Commerce Commission has enough to occupy its time during the next few years, and that to the various state commissions could be assigned the adjudication of all of the intrastate matters which arise in connection with the operation of electric railways. This was the view which a committee of the American Electric Railway Association urged before a sub-committee of the House committee on interstate and foreign commerce last January in a hearing on several bills which would have brought certain equipment of all electric roads which do any interstate business under the jurisdiction of the Interstate Commerce Commission. The protestants at that hearing called attention to the fact that only a small percentage of their business, averaging in most cases less than 1 per cent, was interstate in character.

Now the question has come up again through an order to the Detroit United Railway, which owns about 800 miles of track in Michigan and 2 miles in Ohio, to make reports to the Interstate Commerce Commission on all accidents including, of course, all of those on its large city system in Detroit. If this policy should be adopted as standard, very few urban companies, certainly among those which haul freight and so issue through bills of lading, would be exempt. Moreover, if the jurisdiction of the Interstate Commerce Commission covers this case, it is likely to cover almost any other detail of city operation, and we should then have a centralized government control of our public utilities in addition to state control.

At the last meeting in Washington the railway managers present did not question the good intentions or the ability of the Interstate Commerce Commission in dealing with these matters, as compared with the state commissions. The principal grounds urged were the absence of knowledge of local conditions and the immense amount of work which would be entailed on a central commission and also on the railways themselves in taking up all of these subjects at the federal capital as well as at the state capitals.

If precedent can count for anything, the decision of the Supreme Court in the opinion on the case of the Omaha & Council Bluffs Street Railway vs. the Interstate Commerce Commission (230 U. S. 324) would indicate that that court does not believe that the interstate commerce law covers cases of this kind. At Omaha the situation was somewhat different because the question was one of rates on street railways which happened also to be interstate roads. The conclusion reached then by the court was that the character of the service was the criterion of whether a road is embraced under the interstate commerce law, and certainly the character of the accidents in city service and the means to be taken to avoid them by fenders or otherwise bears little relation to what is generally understood as interstate commerce. We hope that the hearing at Washington next Friday, to which a letter from Arthur W. Brady in our "Communication's" column this week calls attention, will be effective in impressing this fact upon the Interstate Commerce Commission.

HUMANIZING DISCIPLINE

A casual study of a number of bulletins issued to platform men indicates an often unnecessary brusqueness in many of the instructions and little or nothing of a commendatory nature. Of course, the purpose of the merit and demerit system in disciplining trainmen has taken this into account to a certain extent, but attention is here directed to the day-to-day bulletins. Would not the suggestive effect of a meritorious act spread on these bulletins be of much value in disciplining and at the same time offer relief from the constant repetition of "do" and "don't"? Orders must, of course, be issued, but occasional commendation and a mixing of the "sweet" with the "bitter" will help greatly toward better service. The iron hand of discipline might well be covered with the silk glove of consideration. In other words, the human side of disciplining must be recognized.

The frailties of the human mind and body have been thoroughly safeguarded in the operation of trains, so as to make the man as nearly as possible an automaton. All of these precautions have done much to make operation more safe, but they cannot make a machine out of the human body. Hence disciplining in various forms is necessary to make up for this deficiency, and the point we have in mind is that, in disciplinary methods, full cognizance should be taken of the human factor. To illustrate what we mean, take the case of the application of discipline after accidents have occurred. After a serious accident the superintendent's first tendency is to discharge the offenders if they prove to have been guilty of lack of attention or lapse of memory. It is worth while in such cases to go behind the facts and consider some of the contributing causes and thus possibly justify the retention in service of men who will afterward be much more valuable on account of the accident. A momentary mental lapse during a run may result in disaster. Yet we all have mental lapses and the very fact that a man has had no accidents or "near" accidents during his railway career may in itself have made him subject to a false sense of security. As he ages in service his alertness is apt to become sluggish. But this defect may be more than made up, so far as his value of the company is concerned, by better knowledge of local conditions and clearer judgment. This fact should receive consideration when his case is decided. After he gets his "nerve" back he may be a safer man than one with no accident to his credit.

New Cars of Seattle Municipal Railway

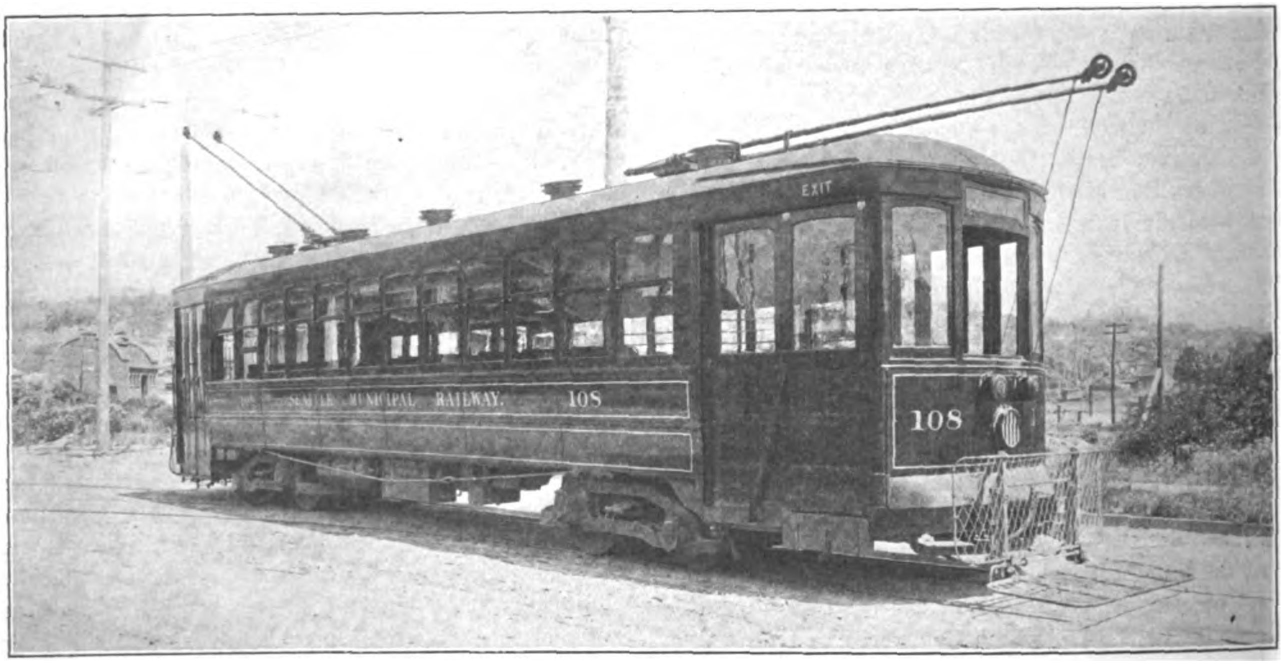
Multiple-Unit Control Arranged for a Double Trolley Wire System, Gearless Air Compressors and Air-Operated Fenders Are Among the Unusual Features of These Cars

BY H. J. KENNEDY, ELECTRICAL AND MECHANICAL ENGINEER

In the ELECTRIC RAILWAY JOURNAL, April 26, 1913, and June 20, 1914, some general accounts were given of the municipal railway construction in Seattle. In the present article the new cars built for this railway by the Cincinnati Car Company are described.

The twelve cars are of the double-end, semi-convertible "pay-within" type, having composite-type framing, exterior doors on platforms, and no interior bulkheads. They have arch roofs, are mounted on maximum-traction trucks, and have the following general dimensions:

Length of car over bumpers	44 ft. 5 in.
Length of car over vestibules	43 ft. 1 in.
Length of car over end posts	31 ft. 1 in.
Spacing of transverse seats	2 ft. 5½ in.
Width of car over posts	8 ft. 5 in.
Height of car over trolley boards	11 ft. 2 in.
Distance between truck centers	23 ft. 1 in.
Seating capacity	48
Weight of car empty, approximately	42,000 lb.
Weight empty, per passenger seat	875 lb.



SEATTLE MUNICIPAL CAR—GENERAL VIEW OF CAR IN OPERATION

The 75-hp motors which are of the Westinghouse 310-C type, were tested at the builders' works by coupling two together, running one as motor and the other as generator, on 125 per cent and 100 per cent loads. In addition, an overspeed test of 1800 r.p.m. and 2600-volt one-minute insulation tests on field and armature were made. One out of each twelve motors had a one-hour A. I. E. E. temperature run, at full load. Commutation was also tested at 200 per cent load. On the one-hour run at 500 volts, a current of 107 amp was applied at 460 r.p.m. to 475 r.p.m., heating the series field (the hottest part) to 79 deg. Cent., the air being 23 deg. Cent.

Among the other items of equipment on the cars are "Utility" ventilators, "Standard" motor trucks, Agasote ceiling, Hale & Kilburn seats, Crouse-Hinds headlights, Earll trolley retrievers, Pantasote curtains, Johnson fare boxes and Forged Steel Wheel Company's rolled steel wheels. The interior lighting of the car is effected by 23-watt, Mazda, half-frosted, incandescent lamps, one lamp being placed over each seat and three being located in each vestibule. The latter are connected in series with the destination sign and headlight at the opposite end of the car.

CONTROL SYSTEM AND WIRING

The control system is Westinghouse type HL, electro-pneumatic, with master controllers at each end of the car. Train line receptacles have not been provided, but they can be added at any time when it is desired to arrange for running multiple-unit trains. At the time the cars were ordered, the future conditions of operation of the road were so uncertain that it was felt to be an advantage to have cars which could, if needed, be used in multiple-unit train operation by the addition of the train line receptacles. At present, with the exception of the third-rail interurban line to Tacoma, electric cars for passenger service in Seattle rarely haul trailers or run in trains. However, the Seattle, Renton & Southern Railway, which connects with the new line is, in conditions affecting rolling-stock, almost an interurban and it is difficult to foretell what future conditions may be.

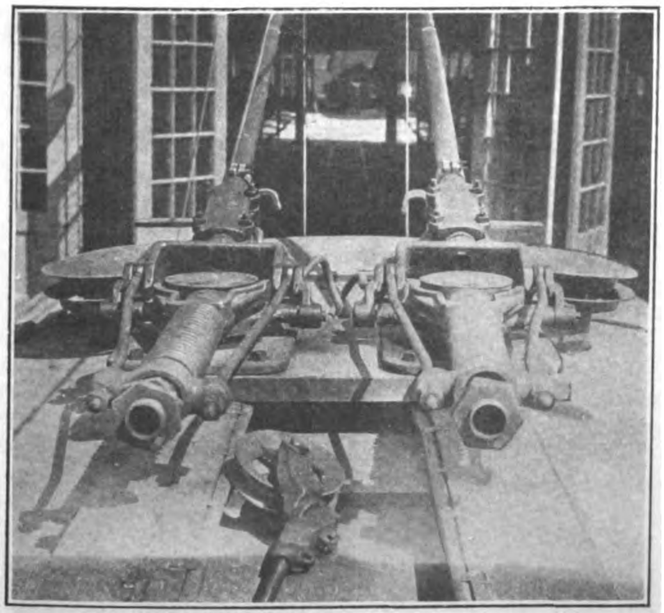
The standard control system has been modified for the double-trolley system which has been installed on the Seattle Municipal Railway, by the addition of an extra line switch in the unit-switch group with corresponding contacts in the master controllers and by an additional control switch in the hood connected on the negative side of the circuit. The overload trip relays on the line switches, positive and negative, of the unit switch groups are set at 325 amp. Instead of one control-

reset switch in the hood, as usual in the unit-switch system, there are two switches, one with fuses on the positive side and one on the negative side of the car circuit, the former being double-throw, the latter single-throw. It may be noted that the apparatus will work if polarity be reversed, the signs mentioned indicating the normal method of operation.

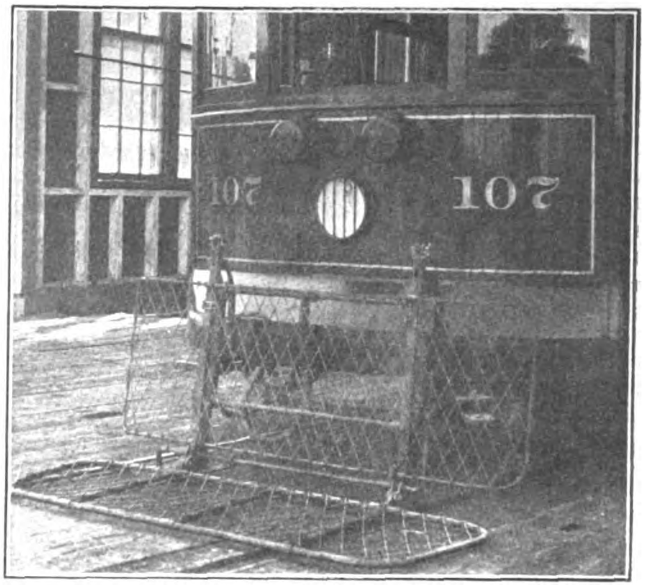
A feature of the wiring peculiar to these cars is the installation under the hood at each end of the car of a single-pole double-throw knife switch encased in a box. The blade of the switch is connected at the hinge to ground to truck, and the terminals to the positive and negative trolleys, respectively. In running from a double-trolley to a single-trolley track, one trolley pole is hooked down and the grounding or transfer switch is thrown to connect the truck with it. It is possible to make the change without stopping the car. For the cars that are in continuous service on the single-trolley Lake Burien Division, however, the negative trolley poles have been entirely removed.

An interesting feature to note in this connection is that, in case of the use of a grounded neutral for the three-wire generators which have been installed in the substation, as soon as a car passes from the double-trolley to the single-trolley line, the position of the ground relative to the outside of circuit moves over by 300 volts, assuming 600 volts total emf. In other words, the potential on the single-trolley wire would be 300 volts higher than that on the positive double-trolley wire, when measured with reference to the ground. Hence there must be an insulated break between the two systems, although, if the car should run past the break with the controller on, the grounding switch being instantly thrown at the same time, there would be no change in the emf impressed on the motors, since the grounding switch raises the negative potential 300 volts simultaneously with the raising of the positive, so that the difference of potential between outside terminals is the same as before. Even if it were possible to perform this experiment, it would not, of course, be made an operating practice because of the consequences in case of failure to perform it successfully. It should be noted that up to date the line has been operated without grounding the direct-current neutral. The three-wire generators are for probable commercial loads.

The trolley bases were designed especially for these cars. The base casting is rectangular, 12 in. x 18 in., the two being mounted side by side on wood trolley boards so as to have a 6-in. air gap between them. The base castings are not themselves live, the trolley poles being insulated from the sockets by a ¼-in. thickness of insulating bushing. The roof cables are connected, not to the bases as is usual but to the poles by flexible pig tails. The poles on diagonally opposite corners of the car are connected to each other, so that the right hand one is positive independent of direction of running, assuming that the overhead system is connected up that way. However, in certain cases of special work, the polarity on the trolley wires is reversed for a short distance. The bases are ball bearing and have one spring.



SEATTLE MUNICIPAL CAR—VIEW SHOWING POSITIVE AND NEGATIVE TROLLEYS AND BASES



SEATTLE MUNICIPAL CAR—VIEW SHOWING FENDER HELD DOWN ON CURVED TRACK BY AIR PRESSURE IN CYLINDERS

GEARLESS AIR COMPRESSOR

An interesting feature of the brake equipment is the gearless air compressor, made by the Allis-Chalmers Manufacturing Company. This is remarkable for its compactness and small weight of 425 lb. including suspension cage. It has three cylinders which are approximately horizontal and are connected to the same shaft with a four-pole 600-volt motor, the latter taking 5.7 amp, 3.42 kw, when delivering 18 cu. ft. of free air per minute against 90 lb. pressure, with a temperature rise not exceeding 50 deg. Cent., when operation does not continue over thirty minutes out of an hour. The cylinders are provided with sliding sleeve intake valves of the type used in the Knight automobile engine. These valves are operated by eccentrics on the crank shaft, compelling the opening and closing to be at exactly the proper instant, and insuring large port openings.

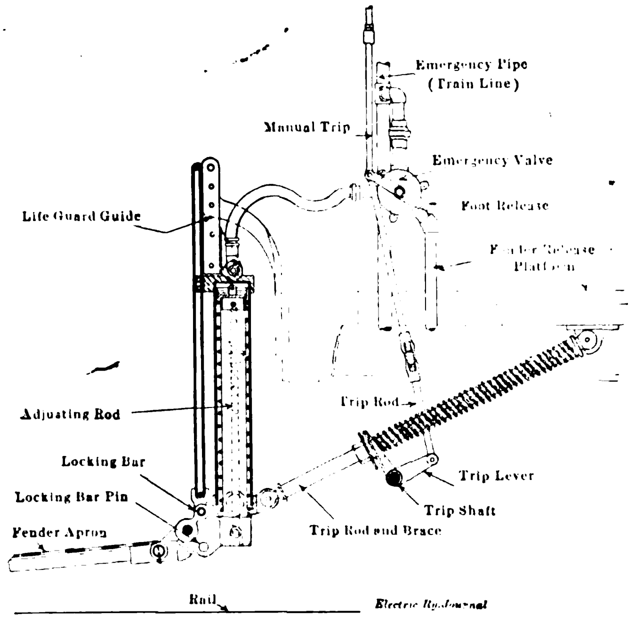
The compressor is 21⅝ in. from the cylinder head to outside of motor casing, and 29⅜ in. long over all measured parallel to shaft. In spite of its speed it operates without any disagreeable vibration. Instead of the noticeable pulsation of the usual geared compressor, the sound takes the form of a hum, due to the speed of rotation and the use of three cylinders instead of two. The motor brushes are readily accessible from the outside of the car by opening the cover located just below the side sill.

PNEUMATIC FENDERS

The fenders on these cars are of the Nelson pneumatically-operated type, generally similar to those used in Portland, Ore., and other places, but of a design improved in several particulars. The fender, both apron

and lifeguard, is hung on slides and kept at its normal height by helical springs contained in two vertical cylinders of 3-in. boiler tube, attached to the bumper beam of the car by brackets. The springs are 2 11/16 in. in outside diameter, 22 in. in free height and have about twenty-three coils of ¼-in. steel. The weight of the moving parts is about 180 lb. Upon admission of air to the cylinders, the springs are compressed and the sliding parts forced down upon the track very quickly and held down with strong pressure so as to scoop up anything lying thereon. The apron is framed of ¾-in. standard wrought-iron pipe and is 78 in. wide over all, and 26 in. deep over all. The frame is filled in with mesh of No. 7 steel wire, 3½-in. diamond mesh. The lifeguard or vertical screen is framed of ¼-in. round iron, is 78 in. wide over all and 27 in. high over all, and is filled in with mesh similar to the apron. The projection of the apron in front of the bumper beam is approximately 33 in. The front edge of the apron is suspended so that it clears the track by about 6 in.

A few inches above the platform floor is placed a special rotary fender valve with axis horizontal. On the stem is a lever with a pedal, and with a link connection to the swinging fender, which is hung on pins on the brackets. Impact with some body on the track will therefore throw the fender back and operate the fender valve. The fender valve can also be operated by a bronze handle placed beside the motorman's brake valve and connected by link with the fender valve. In an emergency, when confronted with the danger of running over someone, the motorman uses this handle instead of the air-brake handle, pushing it away from him in practically the same direction as in moving the brake valve handle to emergency. This results not only in dropping the fender on the rails but also in making an emergency application of the air brakes, by admitting air through the fender valve independent of the regular brake valve. Pressure on the pedal releases the air from the fender cylinders and allows the springs again to raise the fender. The air brake is then released by the brake valve in the ordinary way, a check valve preventing the air from running back through the fender valve, although permitting air to be fed through fender valve to brake cylinders, with brake valve in "lap" position.



SEATTLE MUNICIPAL CAR—ELEVATION SHOWING FENDER MECHANISM

A fender is permanently attached to the bumper beam at each end of car, the fender not in use being folded up against the dashboard, allowing freedom of motion for the drawbars. There is a double articulation for folding, the first motion merely folding the apron against the lifeguard, the second doubling both of them up and back against the dash. The weight specified for each fender is not in excess of 210 lb., and the pressure on the travel stops of the moving part which drops on the track is specified to be at least 500 lb., but not in excess of 1000 lb., with a pressure of 60 lb. per square inch in the air cylinder.

Electric Sign in Street Railway Competition

As a stranger in the city of Topeka emerges from the union railway station, he is greeted with the shouts of hackmen and cabmen seeking business. If he is alert and is inclined to be thrifty, his eye soon catches sight of a small but concisely worded electric sign on a pole across the street. This sign is shown in the accompanying illustration. Its legend reads "Cars Leave This Point Every Five Minutes Reaching All Parts of City."

CARS LEAVE THIS POINT EVERY FIVE MINUTES REACHING ALL PARTS OF CITY

TOPEKA ELECTRIC SIGN WHICH ATTRACTS THE TRAVELER'S CUSTOM

The Topeka Street Railway, operated by the McKinley Syndicate, has chosen electrical advertising as the most efficient method of attracting the attention of the traveling public and thereby bringing the nickels to the company's purse. It is noticeable that in Topeka the bus and cab business is less flourishing than in the neighboring towns and cities.

Passenger Traffic to Illinois State Fair

The Springfield Consolidated Railways Company of Springfield, Ill., reports that 67,000 less passengers were handled in 1914 than in 1913, to and from the Illinois state fair grounds in that city. In 1913 the company handled to the fair grounds a total of 798,000 passengers and in 1914 the number dropped to 731,000. These figures include all transfers from other lines in the city, police passes and all other forms of free transportation allowed by law. The largest day in the state fair week this year was Thursday when 115,000 fares were collected. This is a falling off of 29,000 fares from the largest day in 1913. The company has not sought to ascertain the reason aside from the fact that the state fair of Illinois in 1914 was not as well attended as was the exposition in 1913 and in previous years. The ticket sales at the fair grounds gates showed a decided falling off from the previous year and the receipts of the Springfield Consolidated Railway Company showed a similar decline.

Fair Interest on Investment in Public Utilities

The Author Discusses the Claim that Rates Should Be Based on Depreciated Values and Points Out that the True Criterion Is the Principal Invested—Different Values Also for Rate-Making and Taxation

BY H. J. DAVIES, TREASURER CLEVELAND RAILWAY

John B. Geijsbeek, C.P.A., contributed an article to the April, 1914, number of the *Journal of Accountancy* on "Fair Return to Public Utilities," in which he undertook to show the normal value of a public utility plant to be about 54.55 per cent of its original cost, or half-way between cost and scrap value. Mr. Geijsbeek says that this premise is not new and was described in a report made in September, 1912, to the Public Service Commission of St. Louis by James B. Allison, its chief engineer.

The operating efficiency of a traction plant is probably as high as that of a telephone plant, used by Mr. Geijsbeek for illustration, and higher than 54.55 per cent of its original cost. In a growing city a public utility plant never stands still, never is finished, never stops growing. Demand for additional service requires an increased supply of capital. And so the investment, the amount of "original cost," becomes legitimately larger, annually, monthly, almost daily. And the cost of the additional property is so large a proportion of the total investment that always more than half the property is less than half worn out—has lived less than half its life. The value of such a property, therefore, never falls to an average or "normal" of 54.55 per cent, or half-way from its original cost to its selling price as scrap.

Public utility companies usually own land, and the value of land in a growing community usually appreciates instead of depreciates as the value of all other property does. This enhancement in the value of land tends to keep the average value of the whole property above the half-way point on the road from first cost to final junk pile.

A "normal value line" of 50 per cent or 55 per cent can only apply to or be true of a utility that is neither increasing nor decreasing its plant or its service. Every public service company that is adding to its property to meet the increasing demands and needs of the public has, and must necessarily have, a property worth more than 54.55 per cent of its cost.

DEPRECIATED VALUE STILL IN PROPERTY

Mr. Geijsbeek says that "if depreciation is charged in addition to repairs and renewals, the public, or the consumer, has paid back to the utility company that amount for immediately existing reduction in the value of the property due to wear and tear not yet made good by renewals. That is either in the pockets of investors or stockholders or is in a reserve fund; if not in the fund, then it is in the reserve account and has been used to purchase additional plant. This, the depreciated plant value, added to earned surplus either on hand or paid to stockholders, will equal the original investment. In such a case a fair return can be only on the depreciated value of the original cash investment, and not on the cost of reproduction. Therefore, if depreciation is allowed in addition to repairs and replacements, the cash investment upon which a fair return is allowed is reduced each year by the amount of depreciation so allowed."

This is not so, unless the amount of the depreciation is returned to the investors as part of their principal. If the amount of all depreciation is returned to the investors as part of their principal, then, when replacements are needed, it will be necessary to invest new capital, which also must be returned with full interest.

If the stockholders have received from earnings, in addition to a fair return of interest upon their investment, a part of the investment itself, and if the contract between the utility and the municipality limits the rate of interest upon investment, it may be proper to reduce the capitalization, or the amount upon which interest shall be paid; but if the principal of the stockholders is kept in the business, whether a depreciation reserve adequate to provide for the disappearing value of the physical property is set up or not, the stockholders should receive interest upon the entire amount and not merely on the depreciated value of the property. Mr. Geijsbeek seems to see this in his "Conclusions as to Deterioration," for he says "Instead of paying this depreciation item to its stockholders in dividends out of surplus, this amount may be held by the company in a reserve account or, sometimes, a reserve fund, in order to keep the investment always at 100 per cent, i.e., present value (or, ultimately, normal value) plus unconsumed depreciation reserve, must always equal original cost." He further says, and truly, that it is difficult to divide the difference between "cost new" and "present value" into renewals and what he says is called depreciation, viz., "that unknown portion of plant value lying between reproduction and normal values that will never be replaced by renewals and which should remain in the reserve accounts or funds to be given to the stockholder at the cessation of operations in order to return to him the 100 per cent he originally invested."

In the meantime, and until the cessation of operations, or at least until he gets his money, or some of it, back, the stockholder should receive interest on the entire amount of his original investment and not merely on the remaining value of the property purchased with his money.

INTEREST SHOULD BE PAID ON ENTIRE PRINCIPAL

Again, under the heading "Fair Return on Investment," Mr. Geijsbeek writes: "Having decided the subject of depreciation, the question of fair return on the investment comes up. It seems almost impossible to find any two men who agree on what amount the interest considered to be the fair return should be charged. Especially is there a great difference of opinion as to whether the fair return should be calculated on the original cost value or the cost to reproduce the property, or whether it shall be the depreciated value, or the present value, which ultimately will become the normal value."

On the contrary, it is difficult to see how any two men can disagree as to the amount on which interest should be charged. It should be the full amount of honest investment, not the depreciated or present value of the physical property. The toll or rate of fares should be high enough to pay expenses, taxes, a fair interest on original cost, i.e., investment, and to set up a maintenance reserve equal to the difference between cost and present value. If this reserve, which may be

in cash, securities or other physical property (cash and securities are as much property as cars or telephone wires), is adequate, then the value of the company's property will be equal to the investment—as it should be. If, instead of providing for such a reserve, and then keeping it in cash or investing it in additional physical property or in securities, the company uses it to return to its stockholders a part of their principal, calling in some of the outstanding stock or bonds, it may be argued that, the investment having been reduced, the rate thereafter should be based upon so much of the original amount as is still invested. In no case should the rate be based upon present (depreciated) value—unless the stockholders have received, in addition to their interest, the entire difference between cost and present value. If a part of the investment of the stockholders has been returned from earnings and the amount of stock or bonds originally issued has been correspondingly reduced, or if additional property has been purchased from earnings and the difference between investment and present value has been thus lessened, the ratepayers who have contributed to the earnings so used have paid more than should have been charged them; and the ratepayers of the future will be charged less than they ought to pay, because they will pay upon a valuation smaller than the amount of money invested for their benefit.

For illustration, suppose an investment of $1,000,000 in an electric railway property, under an agreement between the company and the municipality that 10 per cent per annum on the investment shall be paid to the stockholders of the company, and suppose that a depreciation of 20 per cent, or $200,000, ensues, the remaining value of the property being $800,000. The company ought then to have, in addition to the $800,000 worth of physical property, a reserve of $200,000 to take care of the 20 per cent depreciation. If, instead of keeping this reserve in cash or investing it in bonds or other property, the company should pay it to the stockholders, in addition to interest at the rate of 10 per cent per annum, then 10 per cent interest on the remaining $800,000, instead of on the original investment of $1,000,000, may be the fair return thereafter, because 20 per cent of that investment has been returned to the investors. In that case $200,000 of the stock or bonds should be called in.

This transaction is perfectly fair and just to the investors and the company; but is it fair to the car-riders of the period in which the depreciation occurred or the reserve was accumulated? Should they have paid for their rides $200,000 in addition to 10 per cent ($100,000) upon the original investment? And should the car-riders of the future have the benefit of that contribution to capital by the car-riders of the earlier period and receive their rides for 10 per cent ($80,000) on only $800,000? If so, then when the property is worn out, or becomes inadequate or obsolete, and is replaced by other property, the cost of the new property must be provided from new capital, on which interest must be paid. And so, instead of paying off a part of capital as physical property depreciates and calling for additional capital when the time for replacement comes, the practice has been to set aside a reserve for maintenance or for depreciation and replacement of physical property and to invest the reserve, or some part of it, in securities or additional physical property. It is not necessary that the reserve be kept in cash. Invested in securities or physical property it should earn a larger return than savings bank interest. This practice is a better security for the investment than alternate payments of principal and demands or calls for new principal.

The car-riders of each month or year should pay a toll or rate of fare sufficient to enable the company to pay its operating expenses, its taxes and a fair rate on its investment, and, in addition, to set up out of the earnings of the month or year a reserve sufficient to take care of the depreciation, as nearly as it can be estimated, in the value of the physical property in the month or the year. The reserve ought not to be less than the depreciation. It ought not greatly to exceed it. Of course, the depreciation is not susceptible of exact ascertainment in advance; but it is possible to make a reasonable estimate, based on the experience of the company and the known experience of other companies in the same business. The reserve should be ample—too large rather than too small. It is easier to reduce the rate of fare to correct an overestimate than to raise the rate to make good an underestimate.

If it were practicable, from the beginning of such an enterprise as an electric railroad, to pay to the stockholders as a partial return of the investment the amount of the increasing difference between the original cost and the present value of their property until the average or "normal" value, or a still lower value, was reached, calling in outstanding stock or bonds as partial return of investment was made, then it would be necessary, whenever renewals or replacements were required, to call on the investors or the public for additional capital to pay for new property to take the place of the obsolete, inadequate or worn-out equipment.

A reserve to provide for repairs as well as for renewals and depreciation would seem to be better than a reserve for depreciation merely, or for depreciation and renewals. It may be called a maintenance reserve. It should be large enough to provide for the difference between cost and the remaining value, at any time, of the physical property. An amount should be set aside in cash each month or each year, or by other periods, equal to the estimated difference between cost and present value in the period, and charged to expense. This reserve should be used for repairs and renewals. The excess above expenditures may be invested.

Different Values for Rate-Making and Taxation

Public utility managers and taxing officials have been embarrassed and confused by attempts to fix one value of physical property for rate-making purposes and another value for purposes of taxation. There should be no confusion. The value for rate-making purposes may be greater than the value for taxing purposes without inconsistency. The value for rate-making purposes should be cost or reproduction value; the value for purposes of taxation should be the value at the time of the tax assessment. If the maintenance reserve is sufficient to make good the difference between cost and present value, the tax value will be the same as the value for rate determination. The property taxed will include the maintenance reserve, whether the reserve is in cash, securities or plant. If the reserve is not as large as the difference between the original cost and the present value of the property, the loss is not the public's but the company's. It indicates that the fare is not high enough to secure the entire investment and a fair return upon it. The public gains, therefore, rather than loses.

The company should not be taxed on the amount of its loss by reason of the insufficiency of the fare to provide for depreciation and reasonable dividends; it is enough that it be taxed on the fair value of its property, including whatever is in its maintenance reserve. It should not be taxed upon its capitalization, unless its physical property and its reserve are equal to its capitalization; and even then the basis of taxation should

be expressed as the value of the property and not as the capitalization. It should not be taxed on the capitalized value of its supposed or actual net earnings, as has been attempted in Ohio. If the rate of fare is inelastic—fixed by contract for a term of years—and the company cannot pay reasonable dividends and provide a sufficient reserve to take care of the difference between cost and present value, it must forego the dividends or a part of them, or, at the end of the contract, lose the difference between cost and the value at that time of its property. But the value of the property, including the value of the reserve, should be the basis of taxation. If the combined value of the existing property and the reserve is equal to the investment, the value for taxation and the value for rate-making will be the same. If the reserve is too small, the loss of the difference between cost and present value, or any part of that difference, will be, as before stated, the investor's loss, and not the public's, in the case of a franchise with a fixed rate of fare. If the reserve is too large under such a contract, the company will gain, but the public will pay only the rate of fare it contracted to pay and will gain in taxes on the excess of value. In the case of a franchise providing for an elastic fare, like the Cleveland franchise, if the company cannot earn its fixed rate of interest and a sufficient reserve at the going rate of fare, the fare may, and ought to be, raised. If the earnings are more than sufficient to pay the stipulated interest and provide a sufficient reserve for maintaining the property at a value equal to its cost or agreed "capital value," then the rate of fare may be reduced. Capital should equal cost—should be neither more nor less than cost. Conversely, cost should equal capital. Present value, plus reserve, should equal cost. But whether capitalization, original cost and present value plus reserve are equal to each other or not, the basis of taxation should be the present value of the property, including the reserve. That value may be more or less than the original cost or the outstanding capital. In either case, it, and it only, should be taxed.

I do not mean that there should be excluded from cost any proper "overhead charge," using that phrase in its widest application, nor the value at the time of its acquisition or subsequently of any land, money or other property donated to the company.

Chicago Elevated Safety Rule Book

As a part of its general safety movement, the Chicago Elevated Railways has issued a book of safety rules. In the preface President Budd states that the purpose of these rules and regulations is to induce habits of caution and cultivate in every employee the thought of being careful of his own safety as well as that of his fellow employees. The rules and cautionary instructions are the result of experience, and putting them in printed form merely places general information in definite and convenient shape for reference by employees.

The book contains about eighty pages of safety rules applying to all departments, and others intended specifically for the transportation department, trainmen, motormen, guardmen, towermen, crossing flagmen and gatemen, and the shop, road and electrical departments. In addition to these rules the book contains a set of first-aid instructions, a list of the first-aid relief stations on the elevated system and the contents and use of the first-aid boxes. In the back of the book several pages are devoted to a telephone directory of the various offices and departments of the road, as well as the telephone numbers and addresses of the company's physicians.

Discussion on Government Ownership

The National Civic Federation Devoted One Session to Discussion of This Subject

One session of the fifteenth annual meeting of the National Civic Federation, held at the Hotel Astor, New York, on Dec. 4 and 5, was devoted to discussion on the subject of "Governmental versus Private Enterprise." Samuel Gompers, president American Federation of Labor, presided at this meeting which was held on the afternoon of Dec. 4. In opening the meeting Mr. Gompers spoke of the committee of the American Federation of Labor which went to Europe to investigate the subject of public ownership and its relations to workers in the endeavor to reach proper conclusions on this much-mooted question. An abstract of this report was published in the issue of this paper for Nov. 21. Mr. Gompers added that the question was not merely academic, but the claims of each side should be critically examined to disclose whether the proposal is practicable or impracticable, wise or unwise.

DISCUSSION BY PROFESSOR JENKS

The first speaker was Prof. Jeremiah W. Jenks, New York University, who said that the post-office department, so far as anyone can learn, has made no statement of cost accounting in connection with the parcel post, so that one can determine whether it is really carrying cheaper than do the express companies or whether, as seems not improbable, the difference in charges to shippers is made up by the low rates forced upon the railroads against their will or by shifting the burden upon other branches of the postal service or upon the taxpayers. Concerning the question of whether municipal utilities shall be owned and managed by the municipality or by private companies under municipal control, Professor Jenks thought the advocates of this plan should declare what they considered should be guiding principles. Is it to be better service, cheaper service, even free service, or revenue? Whatever the principles may be, the facts should be known. If we are to compare costs, let us have identical systems of cost accounting. If the question is service, let us know whether the people prefer seats or to wait for half an hour before they get a ride, as passengers often have to do in continental cities. If the government is to take the telephone and telegraph, is it to secure better service or cheaper service or for the protection of the people? The state ought to undertake nothing without definite knowledge of the facts to guide it.

Professor Jenks said that in the discussion of the subway situation in New York City which preceded the settlement and the recent contracts, much time was given to the consideration of the matter by public officials. If this had been the time of the officials of a private corporation their salaries and the interest on the capital would be charged as part of the cost of the undertaking. He had never heard it suggested that if there was to be proper cost accounting these costs should be included under the existing subway arrangement, or that the rent for quarters in the City Hall should be so apportioned that part of the charge should be allocated for the time thus spent. All of these considerations were dropped. If private and public operations are to be compared all of these should be included. There is not now sufficient knowledge to permit careful consideration, and this will not be obtainable until systematic cost accounting is introduced.

DISCUSSION BY CONGRESSMAN LEWIS

Congressman David J. Lewis spoke in favor of public ownership of the telephone and telegraph service.

UNIVERSITY

"Postalization" of telephone and telegraph service would bring under the control of the government the only outstanding means of communication. Manifestly competition in electrical means of communication is wasteful. On economic grounds that field belongs to monopoly which alone can discharge the functions with proper regard to the price. The speaker pointed out one difference between the express companies, which have been affected by the parcel post, and the telephone and telegraph companies, which would be affected by public ownership. He said that the express companies were really only preferred shippers on the railroad while the telephone and telegraph companies had large investments of their own capital in plants.

DISCUSSION BY MR. GORDON

F. R. G. Gordon, organizer American Federation of Labor, Boston, gave facts and statistics to controvert the argument and statements of Congressman Lewis. He said that practically every telephone and telegraph government system abroad is run with extraordinarily poor service, although paying about one-third of the wages to operatives that are paid by the American Telephone & Telegraph Company and the Western Union Telegraph Company. He said that the so-called wonderful post-office department of the government is the worst managed big business in the country. The post-office department is the recipient of very large favors from other departments of the government because of the failure to introduce cost accounting principles between the various departments. The post-office department does not pay for either use or care of many buildings which it occupies. Mr. Gordon said that the reason why the post-office department is able to claim a success in the parcel post is that it does not pay the railroads what it should pay them for carrying packages. The United States pays less than any other government for transportation of its mail. To take over the telephone and telegraph system would mean that all of the people would be taxed for the benefit of the 5 per cent or 6 per cent who use the service and are best able to pay the bills therefor. He declared that public ownership was cursed by red tape and was characterized by inefficient service, poor wages and large deficits. Governments have always been extravagant and wasteful.

DISCUSSION BY DR. HOWE

Dr. Frederick C. Howe, commissioner of immigration of New York, in his argument in favor of public ownership, declared that probably the political and moral gains would be even more important than the financial and social gains. Public ownership removes one of the principal causes of corruption from politics.

DISCUSSION BY MR. SULLIVAN

J. W. Sullivan, member of Typographical Union, New York, made an address on "Municipalization or a Just Regulation, a Plea for the Facts." Mr. Sullivan was a member of the National Civic Federation commission which studied the subject of municipal ownership abroad in 1907. He also spent last summer in Europe and rendered assistance to the committee of the American Federation of Labor which studies electric railway labor conditions abroad.

He said that comparisons of British and American street railway fares were usually misleading because the British municipal tramways rarely give transfers and that a passenger changing from one line to another paid another fare and was counted as a second passenger. For all distances beyond 5.8 miles the fares in Glasgow are higher than the American 5-cent fare, and Glasgow has only 1 mile of track per 6779 of its population, whereas Philadelphia has 1 mile per 2533, or three times the accommodations. For most British cities, fares beyond 3½ miles are higher than the standard American fare and transfer. The British systems also invariably stand second to American systems in speed, headway, car lighting and in an all-night service. European tramway managers are now abandoning the rule of a seat for every passenger, borrowing from America the practical idea, especially in rush hours, when all the cars possible are run, that the extra people want to travel speedily to their destination standing in the cars rather than to lose time and endanger their health standing on the street corners waiting exposed to the weather. Mr. Sullivan quoted a number of failures of British municipal enterprises, including the municipal Thames River boat system with a loss of $2,500,000, and the Glasgow municipal telephone system with a loss of $275,000, and said that the municipal ferry system of New York was a grand object lesson in municipal ownership.

In discussing the labor situation on municipal roads abroad he said in part: "Strikers against municipalized undertakings are treated as mutineers; the position of the municipal wage-working employee is that of a common soldier directed by a drill sergeant, whose whip is a discharge which closes to the man other municipal employment everywhere. Among the assumed certainties of the early theoretical municipalizers was set down the one that municipal employees would not or could not strike. But bitterly contested tramway strikes, viewed by the authorities as rebellions, have taken place in the last four years in Leeds, Stockport, Blackburn, Cardiff, Oldham, Liverpool and Glasgow. After the Glasgow strike of 1911, 400 of the strikers were victimized and never allowed to return to the service, and after the strike in Leeds in 1913 practically the entire tramway force was similarly victimized. In Glasgow, in the seven years, 1901-1908, 1228 traffic employees were dismissed and 2384 resigned, a number equivalent to a change of the entire traffic force every four years, testimony to an unhappy situation. The Glasgow tramway management, maintaining an open shop, permits no labor union of employees to exist. Were all Britain to imitate the attitude of Glasgow's municipal committee and managers toward labor, no employee would be permitted to be active in politics, no man would be taken on at work without a civil service examination, no trade agreement could be thought of, no liberty of association among the wage-workers could exist, no work at his trade could be found by a man once blacklisted, and no labor movement would be tolerated in the country."

After referring to the report of Messrs. Mahon and Bland on labor conditions abroad, abstracted in a recent issue of this paper, Mr. Sullivan said: "Municipalism breaks down trade union principles; it substitutes for them a one-sided dictation which strips labor of independent action in its own behalf, clothes managers with the powers of an upper caste, backed by the forces of law, and to the extent that it prevails establishes in society a condition destructive of democracy. On that score alone the American wage-worker needs only to have experience with it to reject it. But the American wage-worker, a citizen with the cause of his country at heart, may be depended on to weigh the facts in general relative to municipalism, when he finally obtains access to them, and render fair judgment in the case. Further, whatever is to be said of contests over wages or of the social unrest, it is usually a fact that American employees regard their employers as friends for whose rights they will contend as they would for their own, and if municipalism is to be built up on abuse of the employer and depriving him of any of his just rights, it to-day stands small chance of success."

B. R. T. Safety Work for Employees

Moving Pictures as a Safety Lesson for the Mechanical Department's Men—Safety Programs of Mechanical and Transportation Departments, Including List of Suggestions Adopted by the Former and Employees' Committee—Organization of the Latter

The thorough safety campaign which the Brooklyn Rapid Transit System has carried on for a year or more among the general public, and particularly among the schools, has lately been extended to its employees. As one feature to secure the interest of the men a safety rally was held for the employees of the mechanical department at the East New York headquarters of the B. R. T. Employees' Benefit Association on Saturday night, Dec. 5. The meeting was under the chairmanship of W. G. Gove, superintendent of equipment mechanical department, who introduced as the speakers of the evening H. A. Bullock, chairman of the company's central safety committee, and Dr. Francis D. Patterson, director of the department of sanitation and accident prevention formed jointly by The J. G. Brill Company, Harrison Brothers Paint Company and Electric Storage Battery Company, all of Philadelphia. A concert by the B. R. T. Employees' Band preceded the addresses.

Mr. Gove told what the mechanical department had already done for safe operation. It had occurred to him, however, that a face to face meeting with the men would accomplish even more than correspondence and bulletins. He emphasized the fact that mechanical protection was not everything. Real safety could be achieved only with the co-operation of the individual workers.

Mr. Bullock, after being introduced by Mr. Gove, said that the object of the company was to make the endeavor for safety continuous and permanent. Working rules were just as necessary to maintain the morale of a shop as of an army. He then gave a résumé of the growth of the "safety first" movement and showed particularly how electric railway hazards had been increased by the introduction of heavier, faster cars and the congestion of city tracks. Discussing safety from the psychological standpoint, Mr. Bullock told how custom breeds such indifference to danger that a soldier will risk his life to get a light for his pipe. The same characteristic leads a workman to become careless in doing things that always have an element of danger, such as climbing ladders, serving rip-saws and steam hammers, etc. Co-operative action as well as the physical resistance embodied in rules and devices was necessary to combat this tendency. In conclusion, Mr. Bullock asked every man to appoint himself a safety inspector to aid in the removal of dangerous conditions, and to resolve furthermore that if any casualties did occur to a fellow-worker he would make use of the company's first-aid treatment instead of trying to carry out the cure himself.

Following the showing of the company's well-known safety film, "The Price of Thoughtlessness," the audience was addressed by Dr. Patterson. The speaker first presented some statistics of railway and individual accidents in the United States, and followed this with a splendid collection of slides which illustrated the wrong and right way of doing scores of building, yard and machine tool jobs. As an example of what safety work could do, he said that accidents at the Brill shops had been cut from 260 to thirty a month. One of the most prolific sources of accident had been protruding nails. This evil had been scotched so thoroughly that during the past six months not one nail wound had occurred to a Brill workman. It was a good thing to have employees' safety committees, for a man who had once served on such a committee was likely to retain his interest in the work. Dr. Patterson's pictures and his comments on them were well received.

In taking the floor again, Mr. Gove said that the mechanical department had done much to attain safety, but more remained to be done. He wanted the men to understand that he was just as anxious to have safe and satisfactory working conditions for them as he was to have safe and satisfactory cars. As an individual he could do much for their welfare and he knew that he could rely upon co-operation of the office staff with which he was in daily contact, but his goal would not be attained unless the man behind the tool was also determined to help. Without clean shops, clean floors and clean machines, and without due regard by each man for the welfare of his fellow-employee, the organization would never get anywhere. In analyzing the shop accident reports covering the preceding six months he had been deeply impressed to find that 75 per cent of them could have been avoided had the injured man used ordinary care. In conclusion, Mr. Gove mentioned the probable early formation of employee's safety committees at each shop. He also assured the men that every suggestion for betterment would receive due attention.

The meeting concluded with a display of several moving pictures by Dr. Patterson, one of which told the story of an old-fashioned workman whose ill-timed counsel to remove a safety device on gearing was responsible for a serious injury to his future son-in-law.

DEPARTMENTAL SAFETY COMMITTEE OF THE MECHANICAL DEPARTMENT

The departmental safety committee organized for the mechanical department has already submitted a report for the first three months of its existence, July 1 to Sept. 30, 1914, and will hereafter continue to submit similar quarterly reports. The committee is composed of the following officials: superintendent of equipment, chairman; superintendent Fifty-second Street surface shop, vice-chairman; division shop foreman Southern division; foreman Crosstown surface carhouse shop, and the superintendent of electric car equipment. The chairman serves continuously while the other members hold office for one year from June 30, 1914. The plan is to appoint those holding similar positions in the mechanical department as members of the succeeding committees. Local shop committees, if appointed, will report to the departmental committee. Regular meetings are held at 3 p. m. every Monday in the office of the superintendent of equipment. Special meetings are held at the different shops whenever called by the vice-chairman.

The following is an abstract of the first quarterly report which was distributed in an edition of 3500 to employees of the department. The next edition will total 12,000 copies and will be distributed to all employees of the company. The report was produced by the department with a motor-driven American Multigraph.

SAFETY REPORT OF THE MECHANICAL DEPARTMENT

The first work of the departmental safety committee was to make the following recommendations:

Place mail boxes in all shops for safety suggestions, providing frames to post pictorial matter in reference to safety work; supply supporting beams at maintenance

in cash, securities or other physical property (cash and securities are as much property as cars or telephone wires), is adequate, then the value of the company's property will be equal to the investment—as it should be. If, instead of providing for such a reserve, and then keeping it in cash or investing it in additional physical property or in securities, the company uses it to return to its stockholders a part of their principal, calling in some of the outstanding stock or bonds, it may be argued that, the investment having been reduced, the rate thereafter should be based upon so much of the original amount as is still invested. In no case should the rate be based upon present (depreciated) value—unless the stockholders have received, in addition to their interest, the entire difference between cost and present value. If a part of the investment of the stockholders has been returned from earnings and the amount of stock or bonds originally issued has been correspondingly reduced, or if additional property has been purchased from earnings and the difference between investment and present value has been thus lessened, the ratepayers who have contributed to the earnings so used have paid more than should have been charged them; and the ratepayers of the future will be charged less than they ought to pay, because they will pay upon a valuation smaller than the amount of money invested for their benefit.

For illustration, suppose an investment of $1,000,000 in an electric railway property, under an agreement between the company and the municipality that 10 per cent per annum on the investment shall be paid to the stockholders of the company, and suppose that a depreciation of 20 per cent, or $200,000, ensues, the remaining value of the property being $800,000. The company ought then to have, in addition to the $800,000 worth of physical property, a reserve of $200,000 to take care of the 20 per cent depreciation. If, instead of keeping this reserve in cash or investing it in bonds or other property, the company should pay it to the stockholders, in addition to interest at the rate of 10 per cent per annum, then 10 per cent interest on the remaining $800,000, instead of on the original investment of $1,000,000, may be the fair return thereafter, because 20 per cent of that investment has been returned to the investors. In that case $200,000 of the stock or bonds should be called in.

This transaction is perfectly fair and just to the investors and the company; but is it fair to the car-riders of the period in which the depreciation occurred or the reserve was accumulated? Should they have paid for their rides $200,000 in addition to 10 per cent ($100,000) upon the original investment? And should the car-riders of the future have the benefit of that contribution to capital by the car-riders of the earlier period and receive their rides for 10 per cent ($80,000) on only $800,000? If so, then when the property is worn out, or becomes inadequate or obsolete, and is replaced by other property, the cost of the new property must be provided from new capital, on which interest must be paid. And so, instead of paying off a part of capital as physical property depreciates and calling for additional capital when the time for replacement comes, the practice has been to set aside a reserve for maintenance or for depreciation and replacement of physical property and to invest the reserve, or some part of it, in securities or additional physical property. It is not necessary that the reserve be kept in cash. Invested in securities or physical property it should earn a larger return than savings bank interest. This practice is a better security for the investment than alternate payments of principal and demands or calls for new principal.

The car-riders of each month or year should pay a toll or rate of fare sufficient to enable the company to pay its operating expenses, its taxes and a fair rate on its investment, and, in addition, to set up out of the earnings of the month or year a reserve sufficient to take care of the depreciation, as nearly as it can be estimated, in the value of the physical property in the month or the year. The reserve ought not to be less than the depreciation. It ought not greatly to exceed it. Of course, the depreciation is not susceptible of exact ascertainment in advance; but it is possible to make a reasonable estimate, based on the experience of the company and the known experience of other companies in the same business. The reserve should be ample—too large rather than too small. It is easier to reduce the rate of fare to correct an overestimate than to raise the rate to make good an underestimate.

If it were practicable, from the beginning of such an enterprise as an electric railroad, to pay to the stockholders as a partial return of the investment the amount of the increasing difference between the original cost and the present value of their property until the average or "normal" value, or a still lower value, was reached, calling in outstanding stock or bonds as partial return of investment was made, then it would be necessary, whenever renewals or replacements were required, to call on the investors or the public for additional capital to pay for new property to take the place of the obsolete, inadequate or worn-out equipment.

A reserve to provide for repairs as well as for renewals and depreciation would seem to be better than a reserve for depreciation merely, or for depreciation and renewals. It may be called a maintenance reserve. It should be large enough to provide for the difference between cost and the remaining value, at any time, of the physical property. An amount should be set aside in cash each month or each year, or by other periods, equal to the estimated difference between cost and present value in the period, and charged to expense. This reserve should be used for repairs and renewals. The excess above expenditures may be invested.

DIFFERENT VALUES FOR RATE-MAKING AND TAXATION

Public utility managers and taxing officials have been embarrassed and confused by attempts to fix one value of physical property for rate-making purposes and another value for purposes of taxation. There should be no confusion. The value for rate-making purposes may be greater than the value for taxing purposes without inconsistency. The value for rate-making purposes should be cost or reproduction value; the value for purposes of taxation should be the value at the time of the tax assessment. If the maintenance reserve is sufficient to make good the difference between cost and present value, the tax value will be the same as the value for rate determination. The property taxed will include the maintenance reserve, whether the reserve is in cash, securities or plant. If the reserve is not as large as the difference between the original cost and the present value of the property, the loss is not the public's but the company's. It indicates that the fare is not high enough to secure the entire investment and a fair return upon it. The public gains, therefore, rather than loses.

The company should not be taxed on the amount of its loss by reason of the insufficiency of the fare to provide for depreciation and reasonable dividends; it is enough that it be taxed on the fair value of its property, including whatever is in its maintenance reserve. It should not be taxed upon its capitalization, unless its physical property and its reserve are equal to its capitalization; and even then the basis of taxation should

be expressed as the value of the property and not as the capitalization. It should not be taxed on the capitalized value of its supposed or actual net earnings, as has been attempted in Ohio. If the rate of fare is inelastic—fixed by contract for a term of years—and the company cannot pay reasonable dividends and provide a sufficient reserve to take care of the difference between cost and present value, it must forego the dividends or a part of them, or, at the end of the contract, lose the difference between cost and the value at that time of its property. But the value of the property, including the value of the reserve, should be the basis of taxation. If the combined value of the existing property and the reserve is equal to the investment, the value for taxation and the value for rate-making will be the same. If the reserve is too small, the loss of the difference between cost and present value, or any part of that difference, will be, as before stated, the investor's loss, and not the public's, in the case of a franchise with a fixed rate of fare. If the reserve is too large under such a contract, the company will gain, but the public will pay only the rate of fare it contracted to pay and will gain in taxes on the excess of value. In the case of a franchise providing for an elastic fare, like the Cleveland franchise, if the company cannot earn its fixed rate of interest and a sufficient reserve at the going rate of fare, the fare may, and ought to be, raised. If the earnings are more than sufficient to pay the stipulated interest and provide a sufficient reserve for maintaining the property at a value equal to its cost or agreed "capital value," then the rate of fare may be reduced. Capital should equal cost—should be neither more nor less than cost. Conversely, cost should equal capital. Present value, plus reserve, should equal cost. But whether capitalization, original cost and present value plus reserve are equal to each other or not, the basis of taxation should be the present value of the property, including the reserve. That value may be more or less than the original cost or the outstanding capital. In either case, it, and it only, should be taxed.

I do not mean that there should be excluded from cost any proper "overhead charge," using that phrase in its widest application, nor the value at the time of its acquisition or subsequently of any land, money or other property donated to the company.

Chicago Elevated Safety Rule Book

As a part of its general safety movement, the Chicago Elevated Railways has issued a book of safety rules. In the preface President Budd states that the purpose of these rules and regulations is to induce habits of caution and cultivate in every employee the thought of being careful of his own safety as well as that of his fellow employees. The rules and cautionary instructions are the result of experience, and putting them in printed form merely places general information in definite and convenient shape for reference by employees.

The book contains about eighty pages of safety rules applying to all departments, and others intended specifically for the transportation department, trainmen, motormen, guardmen, towermen, crossing flagmen and gatemen, and the shop, road and electrical departments. In addition to these rules the book contains a set of first-aid instructions, a list of the first-aid relief stations on the elevated system and the contents and use of the first-aid boxes. In the back of the book several pages are devoted to a telephone directory of the various offices and departments of the road, as well as the telephone numbers and addresses of the company's physicians.

Discussion on Government Ownership

The National Civic Federation Devoted One Session to Discussion of This Subject

One session of the fifteenth annual meeting of the National Civic Federation, held at the Hotel Astor, New York, on Dec. 4 and 5, was devoted to discussion on the subject of "Governmental versus Private Enterprise." Samuel Gompers, president American Federation of Labor, presided at this meeting which was held on the afternoon of Dec. 4. In opening the meeting Mr. Gompers spoke of the committee of the American Federation of Labor which went to Europe to investigate the subject of public ownership and its relations to workers in the endeavor to reach proper conclusions on this much-mooted question. An abstract of this report was published in the issue of this paper for Nov. 21. Mr. Gompers added that the question was not merely academic, but the claims of each side should be critically examined to disclose whether the proposal is practicable or impracticable, wise or unwise.

Discussion by Professor Jenks

The first speaker was Prof. Jeremiah W. Jenks, New York University, who said that the post-office department, so far as anyone can learn, has made no statement of cost accounting in connection with the parcel post, so that one can determine whether it is really carrying cheaper than do the express companies or whether, as seems not improbable, the difference in charges to shippers is made up by the low rates forced upon the railroads against their will or by shifting the burden upon other branches of the postal service or upon the taxpayers. Concerning the question of whether municipal utilities shall be owned and managed by the municipality or by private companies under municipal control, Professor Jenks thought the advocates of this plan should declare what they considered should be guiding principles. Is it to be better service, cheaper service, even free service, or revenue? Whatever the principles may be, the facts should be known. If we are to compare costs, let us have identical systems of cost accounting. If the question is service, let us know whether the people prefer seats or to wait for half an hour before they get a ride, as passengers often have to do in continental cities. If the government is to take the telephone and telegraph, is it to secure better service or cheaper service or for the protection of the people? The state ought to undertake nothing without definite knowledge of the facts to guide it.

Professor Jenks said that in the discussion of the subway situation in New York City which preceded the settlement and the recent contracts, much time was given to the consideration of the matter by public officials. If this had been the time of the officials of a private corporation their salaries and the interest on the capital would be charged as part of the cost of the undertaking. He had never heard it suggested that if there was to be proper cost accounting these costs should be included under the existing subway arrangement, or that the rent for quarters in the City Hall should be so apportioned that part of the charge should be allocated for the time thus spent. All of these considerations were dropped. If private and public operations are to be compared all of these should be included. There is not now sufficient knowledge to permit careful consideration, and this will not be obtainable until systematic cost accounting is introduced.

Discussion by Congressman Lewis

Congressman David J. Lewis spoke in favor of public ownership of the telephone and telegraph service.

LIBRARY OF THE UNIVERSITY

"Postalization" of telephone and telegraph service would bring under the control of the government the only outstanding means of communication. Manifestly competition in electrical means of communication is wasteful. On economic grounds that field belongs to monopoly which alone can discharge the functions with proper regard to the price. The speaker pointed out one difference between the express companies, which have been affected by the parcel post, and the telephone and telegraph companies, which would be affected by public ownership. He said that the express companies were really only preferred shippers on the railroad while the telephone and telegraph companies had large investments of their own capital in plants.

DISCUSSION BY MR. GORDON

F. R. G. Gordon, organizer American Federation of Labor, Boston, gave facts and statistics to controvert the argument and statements of Congressman Lewis. He said that practically every telephone and telegraph government system abroad is run with extraordinarily poor service, although paying about one-third of the wages to operatives that are paid by the American Telephone & Telegraph Company and the Western Union Telegraph Company. He said that the so-called wonderful post-office department of the government is the worst managed big business in the country. The post-office department is the recipient of very large favors from other departments of the government because of the failure to introduce cost accounting principles between the various departments. The post-office department does not pay for either use or care of many buildings which it occupies. Mr. Gordon said that the reason why the post-office department is able to claim a success in the parcel post is that it does not pay the railroads what it should pay them for carrying packages. The United States pays less than any other government for transportation of its mail. To take over the telephone and telegraph system would mean that all of the people would be taxed for the benefit of the 5 per cent or 6 per cent who use the service and are best able to pay the bills therefor. He declared that public ownership was cursed by red tape and was characterized by inefficient service, poor wages and large deficits. Governments have always been extravagant and wasteful.

DISCUSSION BY DR. HOWE

Dr. Frederick C. Howe, commissioner of immigration of New York, in his argument in favor of public ownership, declared that probably the political and moral gains would be even more important than the financial and social gains. Public ownership removes one of the principal causes of corruption from politics.

DISCUSSION BY MR. SULLIVAN

J. W. Sullivan, member of Typographical Union, New York, made an address on "Municipalization or a Just Regulation, a Plea for the Facts." Mr. Sullivan was a member of the National Civic Federation commission which studied the subject of municipal ownership abroad in 1907. He also spent last summer in Europe and rendered assistance to the committee of the American Federation of Labor which studies electric railway labor conditions abroad.

He said that comparisons of British and American street railway fares were usually misleading because the British municipal tramways rarely give transfers and that a passenger changing from one line to another paid another fare and was counted as a second passenger. For all distances beyond 5.8 miles the fares in Glasgow are higher than the American 5-cent fare, and Glasgow has only 1 mile of track per 6779 of its population, whereas Philadelphia has 1 mile per 2533, or three times the accommodations. For most British cities, fares beyond 3½ miles are higher than the standard American fare and transfer. The British systems also invariably stand second to American systems in speed, headway, car lighting and in an all-night service. European tramway managers are now abandoning the rule of a seat for every passenger, borrowing from America the practical idea, especially in rush hours, when all the cars possible are run, tnat the extra people want to travel speedily to their destination standing in the cars rather than to lose time and endanger their health standing on the street corners waiting exposed to the weather. Mr. Sullivan quoted a number of failures of British municipal enterprises, including the municipal Thames River boat system with a loss of $2,500,000, and the Glasgow municipal telephone system with a loss of $275,000, and said that the municipal ferry system of New York was a grand object lesson in municipal ownership.

In discussing the labor situation on municipal roads abroad he said in part: "Strikers against municipalized undertakings are treated as mutineers; the position of the municipal wage-working employee is that of a common soldier directed by a drill sergeant, whose whip is a discharge which closes to the man other municipal employment everywhere. Among the assumed certainties of the early theoretical municipalizers was set down the one that municipal employees would not or could not strike. But bitterly contested tramway strikes, viewed by the authorities as rebellions, have taken place in the last four years in Leeds, Stockport, Blackburn, Cardiff, Oldham, Liverpool and Glasgow. After the Glasgow strike of 1911, 400 of the strikers were victimized and never allowed to return to the service, and after the strike in Leeds in 1913 practically the entire tramway force was similarly victimized. In Glasgow, in the seven years, 1901-1908, 1228 traffic employees were dismissed and 2384 resigned, a number equivalent to a change of the entire traffic force every four years, testimony to an unhappy situation. The Glasgow tramway management, maintaining an open shop, permits no labor union of employees to exist. Were all Britain to imitate the attitude of Glasgow's municipal committee and managers toward labor, no employee would be permitted to be active in politics, no man would be taken on at work without a civil service examination, no trade agreement could be thought of, no liberty of association among the wage-workers could exist, no work at his trade could be found by a man once blacklisted, and no labor movement would be tolerated in the country."

After referring to the report of Messrs. Mahon and Bland on labor conditions abroad, abstracted in a recent issue of this paper, Mr. Sullivan said: "Municipalism breaks down trade union principles; it substitutes for them a one-sided dictation which strips labor of independent action in its own behalf, clothes managers with the powers of an upper caste, backed by the forces of law, and to the extent that it prevails establishes in society a condition destructive of democracy. On that score alone the American wage-worker needs only to have experience with it to reject it. But the American wage-worker, a citizen with the cause of his country at heart, may be depended on to weigh the facts in general relative to municipalism, when he finally obtains access to them, and render fair judgment in the case. Further, whatever is to be said of contests over wages or of the social unrest, it is usually a fact that American employees regard their employers as friends for whose rights they will contend as they would for their own, and if municipalism is to be built up on abuse of the employer and depriving him of any of his just rights, it to-day stands small chance of success."

B. R. T. Safety Work for Employees

Moving Pictures as a Safety Lesson for the Mechanical Department's Men—Safety Programs of Mechanical and Transportation Departments, Including List of Suggestions Adopted by the Former and Employees' Committee—Organization of the Latter

The thorough safety campaign which the Brooklyn Rapid Transit System has carried on for a year or more among the general public, and particularly among the schools, has lately been extended to its employees. As one feature to secure the interest of the men a safety rally was held for the employees of the mechanical department at the East New York headquarters of the B. R. T. Employees' Benefit Association on Saturday night, Dec. 5. The meeting was under the chairmanship of W. G. Gove, superintendent of equipment mechanical department, who introduced as the speakers of the evening H. A. Bullock, chairman of the company's central safety committee, and Dr. Francis D. Patterson, director of the department of sanitation and accident prevention formed jointly by The J. G. Brill Company, Harrison Brothers Paint Company and Electric Storage Battery Company, all of Philadelphia. A concert by the B. R. T. Employees' Band preceded the addresses.

Mr. Gove told what the mechanical department had already done for safe operation. It had occurred to him, however, that a face to face meeting with the men would accomplish even more than correspondence and bulletins. He emphasized the fact that mechanical protection was not everything. Real safety could be achieved only with the co-operation of the individual workers.

Mr. Bullock, after being introduced by Mr. Gove, said that the object of the company was to make the endeavor for safety continuous and permanent. Working rules were just as necessary to maintain the morale of a shop as of an army. He then gave a résumé of the growth of the "safety first" movement and showed particularly how electric railway hazards had been increased by the introduction of heavier, faster cars and the congestion of city tracks. Discussing safety from the psychological standpoint, Mr. Bullock told how custom breeds such indifference to danger that a soldier will risk his life to get a light for his pipe. The same characteristic leads a workman to become careless in doing things that always have an element of danger, such as climbing ladders, serving rip-saws and steam hammers, etc. Co-operative action as well as the physical resistance embodied in rules and devices was necessary to combat this tendency. In conclusion, Mr. Bullock asked every man to appoint himself a safety inspector to aid in the removal of dangerous conditions, and to resolve furthermore that if any casualties did occur to a fellow-worker he would make use of the company's first-aid treatment instead of trying to carry out the cure himself.

Following the showing of the company's well-known safety film, "The Price of Thoughtlessness," the audience was addressed by Dr. Patterson. The speaker first presented some statistics of railway and individual accidents in the United States, and followed this with a splendid collection of slides which illustrated the wrong and right way of doing scores of building, yard and machine tool jobs. As an example of what safety work could do, he said that accidents at the Brill shops had been cut from 260 to thirty a month. One of the most prolific sources of accident had been protruding nails. This evil had been scotched so thoroughly that during the past six months not one nail wound had occurred to a Brill workman. It was a good thing to have employees' safety committees, for a man who had once served on such a committee was likely to retain his interest in the work. Dr. Patterson's pictures and his comments on them were well received.

In taking the floor again, Mr. Gove said that the mechanical department had done much to attain safety, but more remained to be done. He wanted the men to understand that he was just as anxious to have safe and satisfactory working conditions for them as he was to have safe and satisfactory cars. As an individual he could do much for their welfare and he knew that he could rely upon co-operation of the office staff with which he was in daily contact, but his goal would not be attained unless the man behind the tool was also determined to help. Without clean shops, clean floors and clean machines, and without due regard by each man for the welfare of his fellow-employee, the organization would never get anywhere. In analyzing the shop accident reports covering the preceding six months he had been deeply impressed to find that 75 per cent of them could have been avoided had the injured man used ordinary care. In conclusion, Mr. Gove mentioned the probable early formation of employee's safety committees at each shop. He also assured the men that every suggestion for betterment would receive due attention.

The meeting concluded with a display of several moving pictures by Dr. Patterson, one of which told the story of an old-fashioned workman whose ill-timed counsel to remove a safety device on gearing was responsible for a serious injury to his future son-in-law.

DEPARTMENTAL SAFETY COMMITTEE OF THE MECHANICAL DEPARTMENT

The departmental safety committee organized for the mechanical department has already submitted a report for the first three months of its existence, July 1 to Sept. 30, 1914, and will hereafter continue to submit similar quarterly reports. The committee is composed of the following officials: superintendent of equipment, chairman; superintendent Fifty-second Street surface shop, vice-chairman; division shop foreman Southern division; foreman Crosstown surface carhouse shop, and the superintendent of electric car equipment. The chairman serves continuously while the other members hold office for one year from June 30, 1914. The plan is to appoint those holding similar positions in the mechanical department as members of the succeeding committees. Local shop committees, if appointed, will report to the departmental committee. Regular meetings are held at 3 p. m. every Monday in the office of the superintendent of equipment. Special meetings are held at the different shops whenever called by the vice-chairman.

The following is an abstract of the first quarterly report which was distributed in an edition of 3500 to employees of the department. The next edition will total 12,000 copies and will be distributed to all employees of the company. The report was produced by the department with a motor-driven American Multigraph.

SAFETY REPORT OF THE MECHANICAL DEPARTMENT

The first work of the departmental safety committee was to make the following recommendations:

Place mail boxes in all shops for safety suggestions, providing frames to post pictorial matter in reference to safety work; supply supporting beams at maintenance

shops in jacking cars; provide on all air hoists cylinder head with jaw for hanging in place of heads with hook upset inside of head, thereby permitting more ready and easy inspection; take photographs to illustrate accidents that frequently occur and that are due to carelessness; use sheet metal non-slip slings for handling armatures; paint red all safety appliances and devices installed at shops, attached to or placed around machinery.

The following work has already been undertaken:

Installed safeguards around machinery at Thirty-ninth Street elevated shop on Sept. 21 for $397.83; at Southern Division elevated shop on Aug. 13 for $344.35, and at Fifty-second Street surface shop (under way) for about $133; purchased four hydraulic jacks for DeKalb Avenue shop (under way) for about $460; constructed four hooks for hoisting open cars at the Ninth Avenue shop on July 23 for $188.07; constructed and installed mail boxes for safety suggestions, and frames for pictorial matter, at all shops (under way) for about $112.78.

The accidents during the quarter under report are classified in the accompanying table.

SUMMARY OF ACCIDENTS

Class	Injuries	52d St. Srf. Shop	Ea. Div. El. Shop	39th St. El. Shop	El. Mtce. Shops	S. C. H. Shops	Totals
A	Cuts	8	28	87	9	20	152
B	Burns	2	3	3	2	7	17
C	Bruises	6	11	44	9	15	85
D	Bones broken...	..	..	..	..	1	1
E	Sprains and strains	6	..	5	2	1	14
F	Electric shocks.	..	..	1	1	..	2
G	Foot punctures.	1	..	5	..	..	6
H	Nails torn off..	1	2	1	..	..	4
J	Eye	1	5	3	..	..	9
K	Loss of member	1	..	..	..	..	1
L	Internal	..	1	1	..	..	2
	Totals	26	50	150	23	44	293

Attention is specifically directed to the large number of miscellaneous accidents which consist principally of accidents that occurred to employees while they were engaged in their regular duties and which, in most cases, were the result of carelessness, such as striking hand against projecting nails or sharp corners, dropping material which struck the person handling same or others, jumping from car or truck to floor, etc. The figures cover a total of 2000 employees. The comparatively large number of accidents at the Thirty-ninth Street shops were due to the extraordinary reconstruction of 2411 surface cars for air-brake service as described in the ELECTRIC RAILWAY JOURNAL for Oct. 31, 1914.

SURFACE TRANSPORTATION DEPARTMENT

Bulletin No. 11, just issued from the office of William Siebert, superintendent of surface lines, outlines the safety work of the surface transportation department. The safety committee of this department consists of the following: superintendent of surface lines, chairman; chief of the time-table department, supervisor of instruction, supervisor of line inspection, superintendent of employment, general inspector and two assistant superintendents. All the assistant superintendents will serve in turn on the committee.

In every depot there has been organized a depot safety committee, consisting of the following: Assistant superintendent in charge of the depot, chairman; day depot master, night depot master, one starter, one inspector, three motormen and three conductors. The starter and the inspector will be designated in rotation, so that all starters and inspectors will serve in turn. On Dec. 7, 1914, the motormen and conductors were elected by all the motormen and conductors at the depot in the following way:

The twenty motormen longest in service at the depot on the regular list and the five motormen longest in service at the depot on the extra list were the nominees in the first election, and each motorman in the depot force voted for three out of the twenty-five nominees. The same practice was carried out for conductors. The men who led in the vote received will serve six months on the depot safety committee, while those who secured the second largest number of votes will serve four months and the third highest men, two months.

At the future elections which will be held every two months, one motorman and one conductor will be chosen from a list of twenty-five motormen and twenty-five conductors as in the first election. In this way membership of the depot safety committee will rotate.

Membership is voluntary. Members who are paid by the hour are allowed compensation at their regular rate for time actually spent in assignments of safety work made by the departmental committee. The names of those elected are posted in the extra room, together with the names of the other members of the committee. The stenographer attached to the assistant superintendent's office serves as secretary of the committee. Regular meetings will be held weekly.

For the safety suggestion box the company has provided two forms as follows: Form A to cover suggestions submitted for consideration by the depot safety committee and departmental safety committee, but not requiring immediate consideration; Form B to cover suggestions relating to safety matters requiring immediate consideration, and submitted to the assistant superintendent, depot master or other official in charge of the depot at the time such suggestions are made.

Safety suggestions submitted on Form A are considered by the depot safety committee and the departmental safety committee. They are written on a special form (not reproduced), showing the name, class of employment of the man who makes the suggestion, and the badge number, all written above a perforated line, while the suggestion itself is written below a perforated line. These suggestions are deposited in the safety suggestion box, from which they are removed each day by the assistant superintendent, who forwards them to the office of the superintendent of surface lines, where the portion of each form above the perforated line is detached and placed in a file. The portion of each blank below the perforated line will be returned to the safety committee of the originating depot, which will approve or disapprove them without knowing the names of the writers. The depot safety committee's report on the suggestions is transmitted to the departmental safety committee, which reviews the report and recommends to the superintendent of surface lines for immediate or ultimate adoption, any suggestions which it approves. As each part of the form has a serial number, the names of the men whose suggestions are adopted can be readily determined by headquarters and due credit given.

No discipline is administered to any employee on account of facts revealed by safety suggestions submitted, and employees are asked to feel entirely free to discuss in these suggestions any conditions which bear upon the problem of safety without regard to the question of reflecting upon the work of any other employee. The same credit is given to employees who make meritorious suggestions on Form B as in the case of suggestions on Form A submitted through the safety suggestion box.

The following outline of topics for safety suggestions has been prepared for the guidance of employees:

A—Reports of conditions which are observed to be the cause of accidents. B—Reports of conditions which in the judgment of the employee submitting them may be the cause of accidents. C—Changes of methods which will tend to prevent accidents occurring or likely to occur as reported under (A) or (B). D—Changes in track construction or equipment which will tend to prevent accidents occurring or likely to occur as reported under (A) or (B). E—Any idea which in the judgment of an employee will promote safety in operation.

The safety bulletin board which carries bulletins, pictures and other data relating to safe operation is under the jurisdiction of the depot safety committee.

Convention of Pennsylvania Association

A Full Report of This Meeting in Harrisburg, Abstracts of the Various Reports and Papers Presented are Published—The Topics Considered Included Questions Relating to Engineering, Accounting, Transportation and Public Relations

The winter meeting of the Pennsylvania Street Railway Association was held in the Board of Trade Building, Harrisburg, on Dec. 8 and 9. The opening session on Tuesday was called to order at 1:45 p. m. by C. L. S. Tingley, vice-president Scranton Railway, who then read his president's address. This was followed by an address by Prof. Emory R. Johnson, member Public Service Commission of Pennsylvania, on the subject of "Electric Railways and the Public." These addresses are abstracted elsewhere in this issue. At the conclusion of Professor Johnson's address, E. H. Davis, manager Williamsport (Pa.) Passenger Railway, moved a vote of thanks, which was duly seconded and carried, and President Tingley assured the commissioner that the officers and members of the association were always ready to co-operate with the commission along the lines indicated. H. M. Stine, secretary-treasurer, then rendered a report for the year, showing a balance of more than $2,200. On motion of T. A. Wright, vice-president and general manager Wilkes-Barre Railway, the report was referred to an auditing committee to be appointed by the chair.

President Tingley at this point remarked that he had been requested by C. Loomis Allen, president American Electric Railway Association, to remind the delegates of the winter conference of the American Association to be held in Washington on Jan. 29. For specific information he called upon E. B. Burritt, secretary-treasurer of the American Association, who said that a very attractive program had been provided for the Washington meeting. The meeting was being held in that city largely on account of the opportunity for added publicity. President Wilson had promised to receive the delegates at the White House, and the meeting topic of "Public Relations" would be ably discussed by T. S. Williams, president Brooklyn Rapid Transit Company, and other notable speakers. Mr. Burritt also urged attendance at San Francisco next autumn. In closing he emphasized the desirability of closer relations between the national and the state associations, in which he was cordially seconded by President Tingley.

W. A. Heindle, superintendent Southern Pennsylvania Traction Company, Chester, Pa., next presented eight problems that had been referred to the "Question Box" and urged a spirited discussion thereon at the next session. President Tingley appointed F. B. Musser, president and general manager Harrisburg (Pa.) Railways; C. H. Bishop, president Valley Railways, Lemoyne, Pa., and Thomas Cooper, Philadelphia representative Westinghouse Electric & Manufacturing Company, as members of the nominating committee to report on the following day. The meeting was then suspended while the stereopticon apparatus was being set up, after which W. R. Stinemetz, in connection with his paper on "The Latest Developments in Street Railway Equipment," presented pictures and charts to illustrate means of cutting operating expenses through saving power and of increasing revenues through doing a freight business. The paper by Mr. Stinemetz is published in abstract form in another column.

RATES AND TARIFFS

The progress report of the committee on preparing and filing rates and tariffs was read by C. B. Fairchild, Jr., executive assistant Philadelphia Rapid Transit Company. Mr. Fairchild said that the Interstate Commerce Commission tariff requirements were extremely voluminous, but that in consultation with the traffic bureau of the Public Service Commission of Pennsylvania the committee had endeavored to boil down the federal requirements for State use. He mentioned the necessity of filing exceptions to the official classification and the overlapping of fare zones as two matters requiring special attention. The tentative draft submitted by the committee for discussion was criticised by W. B. Rockwell, manager Eastern Pennsylvania Railways, Pottsville, Pa., on the ground that freight and express tariffs were classified under one head. In his opinion the two classes may easily be separated by remembering that all express is delivered and called for, which is not true of freight as regards rates. Mr. Rockwell said that he recently rented a car to the express companies at a fixed sum per car-mile. If electric railways took up the question of express rates, they should charge on the basis of the pound-mile, but the pound must be limited as regards its cubic contents.

President Tingley stated that it was not within the province of the committee to discuss the setting of rates, inasmuch as it was appointed to solve rather the vexatious problem of securing non-cumbersome rules for filing rates and tariffs. As regards the distinction between freight and express, he felt that the combination classification best recognized existing inconsistencies in such kinds of traffic on Pennsylvania electric railways and had the support of the Public Service Commission. Mr. Rockwell said that no company should carry freight or express in passenger cars or handle such traffic at all if its business did not warrant special cars for such purposes. However, according to an analysis of the varieties of freight and express service in the State, made by Mr. Fairchild, many small companies secure both increased revenues and better public relations by offering a little express or light freight service, and the joint classification is well suited to all such railways. Mr. Rockwell moved the acceptance of the progress report and the continuation of the committee, which was duly seconded and carried.

With the meeting then open for new business, Secretary Stine read a letter from R. P. Stevens suggesting that the association follow the lead of the American Association and substitute "Electric" for "Street" in its name. President Tingley said that the committee which drafted the constitution had discussed this point but had deemed the change unwise on account of the prestige of the old name. Mr. Davis called attention to the fact that under the act of 1889 most companies in Pennsylvania are incorporated as "street" railways, and Mr. Fairchild quoted the new public service commission law to show further adherence to this practice. Mr. Wright moved that the letter be laid on the table, which was carried.

CLASSIFICATION OF VOLTAGES AND SAFETY RULES

Owing to the inability of Gordon Campbell, president York Railways, to be present on Wednesday, the report of the committee on classification of voltages, of which he is chairman, was moved ahead a day on the program. An abstract appears elsewhere.

J. W. Welsh, electrical engineer Pittsburgh Railways, stated that the proposed Pennsylvania rules for safety had been submitted to the American Institute of Electrical Engineers and had been referred to the code committee of this association. He attended the meetings of the code committee as a representative of the American Electric Railway Association. At two meetings in the last month the committee recommended several changes in the rules, especially with regard to striking out the classification of low potential as up to 300 volts, high potential as 300 volts to 3500 volts and extra-high potential as above 3500 volts. Mr. Welsh criticised the idea running through the code that less than 300 volts were harmless and more than 300 volts destructive, for such a classification was purely arbitrary and injurious to the public, and no reason existed for such voltage classification from the standpoint of safety. The rules were also modified to apply only to cases of new installation. The general requirements of the code were not stringent and would be acceptable to most electric railway companies.

Mr. Fairchild quoted a recent order on his company to provide a guard on the blank polished end of a converter shaft in a substation as showing how vital this question is. Mr. Davis urged every member to read Circular No. 49, for in his opinion the rules suggested will prevent companies from pleading customary reasonable care against accidents and will increase the physical space required for attachments. President Tingley said that at one conference in Philadelphia the State Department of Labor and Industry had admitted that it had not considered street railways in the voltage classification, and this led to the reference of the question to the American Institute of Electrical Engineers. F. R. Phillips, superintendent of equipment Pittsburgh Railways, said that the real sting of the proposed State code lay in the voltage classification and he desired the opinion of the practical operating men of the American Electric Railway Engineering Association on the subject.

EMPLOYERS' COMPENSATION ACT

President Tingley announced that the draft of the employers' compensation act made by a special commission appointed by the Governor was now in print and ready for distribution. The meeting was then adjourned. At 7:30 p. m. an informal dinner was served to the members of the association and guests at the Harrisburg Club.

WEDNESDAY'S SESSION

The last day's session was called to order on Wednesday at 10 a. m. President Tingley stated that he had been asked by Mr. Burritt to announce that a one-hour hearing on the subject of reporting accidents was to be held before the Interstate Commerce Commission in Washington on Dec. 18. The commission is attempting to require the Detroit (Mich.) United Railway to report all accidents in the city of Detroit because it has a spur line running into Ohio. In view of the fact that many urban lines have extensions crossing state borders, the American Electric Railway Association has taken this matter up. Although only one speaker will be allowed at the hearing, a general demonstration is desired, for the entering of appearances will be allowed by the Interstate Commerce Commission.

The report of the committee on a uniform crossing agreement was then presented by its chairman, R. P. Stevens, president Mahoning & Shenango Railway & Light Company, Youngstown, Ohio. In connection with the report Mr. Stevens said that at a conference in Philadelphia the previous day it seemed that a closer feeling was being manifested between electric railways and other utilities in the State. The telephone companies were showing more co-operation, and if the telegraph companies and the Pennsylvania Railroad could be led to see electric railway difficulties, an acceptable and workable crossing agreement could be devised. An abstract of Mr. Stevens' report is published in another column. On motion the report was accepted and the committee was continued.

HEIGHTS OF CAR STEPS

In the absence of the chairman, H. J. Crowley, vice-president Scranton Railway, the report of the committee on height of street car steps was read by P. N. Jones, general manager Pittsburgh Railways. This committee was appointed to take up with the Public Service Commission of Pennsylvania the matter of the height of car steps. A meeting was held with representatives of the commission during the last national convention, and a large amount of data from the national body was submitted to the commission. Later the committee conferred with car builders, who furnished considerable construction data covering the limitation of minimum height allowable. This, together with photographs taken underneath a car to show the necessary equipment for its operation and control, has been turned over to the commission, upon which now devolves the task of determining the maximum height in accordance therewith. On motion the report was received and filed with thanks.

On account of the unavoidable absence of H. S. Swift, treasurer West Penn Traction Company, Pittsburgh, Pa., his paper on "The Work of the Accounting Officer of Public Service Corporations" was read by Mr. Fairchild. An abstract of this paper is published elsewhere.

QUESTION BOX

In taking over the meeting for the discussion of "Question Box" problems, Mr. Heindle said that fuller information should henceforth be presented with questions so as to cover all essential local conditions. Regarding the first question on what is the best automatic signal system for a medium sized single track interurban line operating at not very high speed, Mr. Heindle said that in times of rigid economy the old hand throw signal of five lights in series would be the most advisable system. With reference to automatic systems, P. T. Riley, Scranton Railways, described the three-year use of Nachod signals on a high speed 10-mile line with a 3 per cent grade, and P. F. Gerhart, electrical engineer Harrisburg Railways, said that on 20 miles of single track with twenty-two blocks the company had fairly good results from Eureka automatic signals. He presented some figures on their performance and maintenance cost. T. A. Wright, Wilkes-Barre Railway, then described the modified Ramsey signal used on part of that line and the Nachod system, which is used on 16 miles. His preference was for the latter system.

R. P. Stevens brought out the point that there is a large personal element in signal operation. After fifteen years' experience with all signals, he had decided that the Nachod system was best for and most satisfactory to his employees. Some trouble had been experienced with the contactor, but on his new Ohio properties there were high speed sections controlled by Nachod signals, and the service was smooth and reliable. The men were trained to use such signals and were in sympathy with them.

W. B. Rockwell was of the opinion that the so-called hand signal should be abolished. He criticised signal manufacturers for saying that their systems would run themselves but also said that electric railway operators had often failed to give signals fair treatment by not having an inspector to keep them in shape.

Mr. Stevens mentioned an absolutely "fool-proof" hand throw target signal, a few of which are used by the Lehigh Valley Transit Company, Allentown, Pa. One man is unable to put his key in the hole until the preceding man has gone through the block to unlock the box. While not advocating a hand-throw system, Mr. Stevens advised companies having such a system and desiring new equipment to investigate these signals.

On the subject of using in cars a small number of large-capacity lamps with reflectors and selector switch, Mr. Phillips said that recent investigations in Cleveland and Indianapolis at first impression showed the economy of such a practice, but that it was now beginning to be believed that small wattage lamps would give more economical service as well as correct illumination. He advised careful consideration of the subject before large lamps were installed. To determine losses in car circuits from trolley to motor and motor to ground, Mr. Phillips advised the use of a voltmeter and the temperature drop method.

The next query dealt with smoking regulations in closed cars. Mr. Heindles' company permits smoking on the rear platform in Delaware, but prohibits the practice in Pennsylvania. President Tingley said that his company in Dayton, Ohio, had tried ejectment proceedings, but after adverse court decisions efforts to stop smoking were abandoned. Mr. Rockwell favored prohibiting smoking on city lines and short suburban runs of fifteen and twenty minutes, but on long lines felt that the practice should be allowed. Mr. Heindle said that in Baltimore smoking is allowed on the rear seats of semi-convertible cars when the windows are open. Mr. Fairchild stated that the Philadelphia lines had prohibited smoking, mostly on account of its unsanitary features. Passengers were not permitted to carry lighted cigars on the cars. Regarding the loss of short riders as a result of such rulings, Mr. Fairchild believed that Chicago and Buffalo experience showed passengers soon chose to save time by riding rather than to walk and smoke.

The discussion on the advisability of concrete poles, especially in city work, was opened by Mr. Heindle, who said that his company had installed about fifty at $12 apiece, including frames and setting expenses. Such poles were often demanded by the public in select districts, but were not advisable for general city use when chestnut poles could be bought for $3.50 or $4. In reply to a question by President Tingley, Mr. Heindle said that concrete poles might well be used in fine districts, being cheaper than steel poles and yet long-lived.

Another question dealt with the use of a $\frac{5}{8}$-in. wheel flange instead of a $\frac{3}{4}$-in. flange in cases where the deeper flanges wear or become chipped before full life is secured. J. H. Yardley stated that a $\frac{5}{8}$-in. flange is used in Philadelphia, and Mr. Fairchild called attention to the investigations on this subject of the American Electric Railway Engineering Association.

STANDARDIZATION OF ACCOUNTS

At this point Dr. John Price Jackson, Commissioner of Labor and Industry of Pennsylvania, delivered an address, which is abstracted elsewhere. Following this, C. J. Joyce, head of the Bureau of Accounts and Statistics of the State Public Service Commission, spoke a few words in connection with the uniform system of accounts yet to be adopted by the commission for electric railways. He said that not all accountants would agree with some details of the new Interstate Commerce Commission uniform system, but that this was quite workable. Moreover, by law it must be used by the interstate electric railways in Pennsylvania, and the adoption of a different system for intrastate lines would make it inconvenient to prepare intelligible statistics for all railways. Mr. Joyce stated that a recent circular letter suggesting the adoption of the national system had resulted in a few replies, all favorable. The State commission will take no action nor set a hearing until all companies have had sufficient time to study the system. If sufficient criticisms come up, the commission will call a meeting of electric railway accountants to thresh the matter out.

PUBLICITY

An additional query was at this point submitted to the "Question Box" on the subject of how far companies should go in giving out construction and operating costs to the public. Mr. Heindle felt that there was a point beyond which facts and figures were unintelligible to the public mind, both on account of lack of education and biased attitude. Mr. Rockwell thought that the greatest trouble was caused by facts being handled by reporters not acquainted with the technique of the industry.

President Tingley then recited how his company had in the last three years secured municipal grants in limited-franchise States by means of publicity. To make the situation more easily understood financial figures should be reduced to divisions of the nickel. Safety campaigns used by the company have been adopted as reading lessons in the public schools of two cities. In one case a good impression was created by showing the cost of an extension, the selling price of adjacent lots before the extension, operating receipts from the opening of the extension and enhanced sales value of lots as a result of the extension.

CONCLUDING BUSINESS

Owing to the recent severe sleet storm in eastern Pennsylvania, E. C. Spring, Lehigh Valley Transit Company, Allentown, Pa., was unable to be present and give his paper on "Efficiency Through Conservation of Time in Interurban Traffic." The auditing committee, W. S. Bell, assistant secretary and treasurer Wilkes-Barre Railway, and John O'Connell, secretary and treasurer Harrisburg Railways, reported on Mr. Stine's financial statements for the year, which were ordered filed.

President Tingley brought up the appointment of a committee to study auto buses, mentioned in his president's address. On Mr. Musser's motion, the matter was referred to the executive committee to prepare a report for next year and to work in conjunction with the committee of the American Association on the same topic. Mr. Heindle moved a vote of thanks to the Westinghouse, Electric & Manufacturing Company for sending a representative to give a paper.

The report of the nominating committee named the following men for office during the ensuing year: President, C. L. S. Tingley, vice-president Scranton Railway; vice-president, T. A. Wright, vice-president and general manager Wilkes-Barre Railway; secretary, H. M. Stine; executive committee, P. N. Jones, general manager Pittsburgh (Pa.) Railways; T. B. Donnelly, claim agent West Penn Traction Company, Pittsburgh, Pa.; Gordon Campbell, president York (Pa.) Railways, and Thomas Cooper, Philadelphia manager Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa. The secretary was instructed to cast one ballot for the above nominees and the meeting was then adjourned.

PRESIDENTIAL ADDRESS

BY C. L. S. TINGLEY, VICE-PRESIDENT AMERICAN RAILWAYS COMPANY

President Tingley stated that the work of the association has grown steadily in volume and value, the membership now including thirty-eight active members and thirty-six associates. The only resignation during the past year was caused by a merger. The fortnightly bulletin issued from the secretary's office is giving valuable service.

The work in collaboration with the state departments is of particular importance. Conferences have been held with representatives of the Public Service Commission. A conference on the question of agreement upon a general form for filing rates and tariffs was followed by the appointment of a committee, which has held several conferences with George P. Wilson, chief of the bureau of rates and tariffs. Another conference on the height of car steps was held between Dr. F. Herbert Snow, chief engineer, and J. P. Dohoney, investigator of accidents, representing the commission, and a committee of the association. Still another conference on the subject of wire crossings resulted in a joint conference with other utilities interested. The association has also co-operated with the Department of Labor and Industry with respect to reporting industrial accidents and to safety rules and regulations. These State departments have extended courtesy and consideration to the representatives of the Railway Association at all times.

Mr. Tingley quoted the Code of Principles adopted at the Atlantic City convention and recommended its adoption by the association. He called attention to the reflection of the business depression and unrest in electric railway receipts. Referring to the coming biennial session of the State Legislature he directed special attention to the problems of vital interest to electric railways which will come before that body. The Republican platform contains recommendations in regard to a workmen's compensation law, to changes in the laws governing corporation taxation and to amendments to the public service commission law. He anticipates a demand for "municipal home rule," which would produce a return to the conditions existing prior to the passage of the public service commission law. The Railway Association and its members should oppose any tinkering with the present law, which should be given time to work out and develop efficiency.

Mr. Tingley favored co-operation in connection with the workmen's compensation legislation provided that a reasonable and equitable bill can be secured. In the matter of corporate taxation he feared that an effort will be made to increase such taxes. This should be resisted as corporations are already taxed out of proportion to other property in the State.

Among other topics touched upon by Mr. Tingley were the satisfactory financial condition of the association and the increasing importance of the automobile bus, which is becoming a factor in the transportation problem. He recommended the appointment of a committee to study the latter subject. In closing he summed up an important phase of public relations as follows:

"There is one angle of our proposition which everybody seems prone to forget, namely, that these great utilities are, as a matter of fact, owned by the people. Every man who has a deposit in a savings bank is interested in the integrity of the great utilities corporations that serve this country because their bonds are held as investments by those banks. Every man who has a life insurance policy, and every woman and child who will become dependent upon a life insurance policy, is vitally interested in the prosperity of these great corporations. Four years ago all the railroad bonds owned by the New York State savings banks were worth $5,000,000 less than their par value; at the beginning of the present year these bonds were worth $41,000,000 less than their par value; to-day the depreciation is even greater. I believe that the last election indicated that the voter appreciated that there was something wrong. He realizes dimly that radicalism has gone too far, but he is not yet fully informed and the radicals are still wide awake and on the job; and it is up to us to do our part to enlighten the voter and to see that he is not again lulled to sleep by the siren song of the theorist."

LATEST DEVELOPMENTS IN RAILWAY EQUIPMENT

BY W. R. STINEMETZ, WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

Under the above title, Mr. Stinemetz discussed the ways in which the cost of maintaining and operating electric railway motors has been reduced, in spite of the more severe service requirements imposed by present operating conditions. Success in reducing maintenance cost is shown by the decrease from $14.63 per 1000 motor-miles, which was the maintenance cost for the Westinghouse No. 56 motor, to 23.2 cents, which is the cost for the Westinghouse No. 323-A motor. The saving in maintenance cost per year of the latter motor over the Westinghouse No. 12-A, assuming 30,000 car-miles per year, amounts to $267.84. As many roads do not keep accurate records of cost of maintaining old equipment, they do not realize what an important part this plays in their total operating cost. Owing to differences in operating conditions on different roads the figures for one road cannot be compared with those of another.

Modern equipment is not only cheaper in maintenance cost but it is more reliable. As a result the public can be kept satisfied through the elimination of delays on the road due to defective cars and at the same time all cars are available for service at all times. Reliability is particularly important during the rush hours when old equipment is likely to be pressed into service.

Modern equipment requires less power, particularly if the motors are properly geared. The development of the field control motor, reduction in weights, and the use of meters and coasting clocks to encourage proper handling of cars have all contributed to power saving.

Many of the older cars were geared too high. As an example of this Mr. Stinemetz referred to a test made in city service where a change from a gear ratio from 18:66, which was in use, to 15:69, resulted in a saving of 13.8 per cent in power under the same operating conditions. In interurban service high gear ratios have sometimes been made to compensate for voltage drop in the line, whereas redistribution of copper and the use of portable substations, if necessary, would have permitted the making of the required schedules with lower gear ratios.

The use of field control results in power saving, as has been shown from the results published from time to time. This form of control virtually provides an electrical means for changing gear ratio. Power can also be saved by a reduction in weight of equipment. Motors with cast-steel frames have reached the limit in weight reduction as further reduction means higher armature speeds, smaller shafts, thinner bearing shells and fewer commutator bars. All of these result in increased maintenance cost. By the use of pressed-steel frames a reduction in weight of 275 lb. has been secured in 40-hp motors, and at the same time there was greater uniformity in speed characteristics, due to the forged steel ring which is used. This motor weighs 2050 lb., has an armature speed of 540 r.p.m. at rated load, and is adapted for use with 26-in. wheels.

As an example of the saving in power which can be secured by the use of the proper gear ratio and of two-motor field-control equipment instead of four-motor, non-field-control equipment, with the permissibly lighter cars and higher schedule speeds, Mr. Stinemetz states that a road in Utica, N. Y., secured a power saving of nearly 50 per cent, as is shown by the following table:

	With Non-Field-Control	With Field-Control
Weight of car equipped but unloaded—pounds	51,000	36,800
Motors—horse-power	4—40	2—40
Gear ratio	17:69	15:69
Wheel diameter, inches	35	33
Schedule speed—miles per hour	9.8	10.13
Stops per mile	6.59	5.89
Duration of stops—seconds	10.88	10.43
Kilowatt-hours per car mile	3.588	1.892
Weight of loaded car—tons	28.52	21.0
Watt-hours per ton-mile	125.8	90.1
Reduction in watt-hours per car-mile—per cent		47.2

Power can also be saved by proper handling of cars. The use of instruments, such as watt-hour meters, coasting clocks, etc., together with the awarding of prizes for excellent performance, has resulted in savings from 2.7 per cent to 8.5 per cent.

The use of the newer forms of control also effects power saving. The Westinghouse "PK" control keeps down current peaks by regulating the rate of acceleration and the controller is more easily handled by the motorman than those of the older forms. The "HL" control has also proved very reliable in service.

THE ELECTRIC RAILWAYS AND THE PUBLIC

BY EMORY R. JOHNSON, PH.D., SC.D., PROFESSOR OF TRANSPORTATION AND COMMERCE, UNIVERSITY OF PENNSYLVANIA AND MEMBER OF PUBLIC SERVICE COMMISSION

The former antagonistic relationship between the electric railway companies and the public is fortunately changing for one of mutual understanding. The obligations of the service companies to the public and the duty of the public towards the companies are coming to be clearly recognized and to be defined more and more clearly by municipal ordinances and state legislation. It should be the purpose of the board of directors and officials of the service companies and also of all responsible public officials to place the relations of the companies and the public upon a permanent basis of mutual confidence. It is necessary that the companies and the public understand and trust each other, otherwise the companies will not prosper, the service will be poor and the public will suffer.

Electric railway and other public service companies can secure the confidence of the public, provided the companies adhere to methods of financiering and management that square with approved moral standards, provided the companies keep the public fully and accurately informed regarding the affairs of the corporations that serve the public, and provided the service rendered is adequate and efficient.

Little need be said as to the importance of adherence to approved moral standards in corporation management. From now on, the affairs of public service companies must be matters of public knowledge, and it will be impossible for a company successfully to conceal operations that would not meet with public approval. As a matter of fact, no well-managed public service company can afford to adopt business methods that need concealment. Sound financiering and wise accounting have everything to gain and nothing to lose from publicity in corporation management.

All public service companies need particularly to give the public information in order that those who patronize the company may understand what services the company is endeavoring to render and what is needed in order to perform those services adequately. More specifically stated—it is necessary that electric railway and other public service companies should keep accurate accounts according to uniform methods and that their financial obligations should be so straightforward that the public will be convinced that the companies are not resorting to the speculative methods of financiering which, though prevalent in the past, have now come to be condemned. It is also necessary that the companies should systematically publish information that will help the public to understand and correctly judge the financial and service operations of the companies.

Good service is fundamental and all-important. It is essential to the success of the company and is necessary to secure public approval of what the company does. If the public feels that utility companies are straightforward in their financial management and are rendering good service, it will not be opposed to the maintenance of charges that yield adequate profits. The public demand for good service is stronger than for low fares.

The policy of every utility company should be to study the service demands as fully as possible. Such a policy is to be commended, first of all, because it will give the public greater confidence in the companies; the policy is also wise because it may enable the companies to discover what changes are needed in service. It is human nature to keep on doing things as they have been done, and the longer established methods are adhered to, the harder it becomes to change to new, and possibly, better methods. Every electric railway company should seek constantly to discover how its service methods may be changed for the better. Careful attention to complaints as to service will be helpful to the company as well as gratifying to the public.

Many electric railway companies have been apprehensive because of the increasing degree of public regulation of their finances, services and charges, but I believe there is less apprehension now than there was ten years ago. Regulation of public service companies in increasing measure by states and municipal authorities has come about naturally and logically. It is necessary for each municipality to have a unified transportation service, and, with but few exceptions, there is now but one street railway company in each city. The requisite unified service is performed by a consolidated company.

The welfare of the municipality and of the electric railway company which serves the people of the municipality are linked together. The prosperity and development of the municipality require that the management of the public service company conform to the needs of the community served. Municipal regulation is necessary. Likewise, the larger interests of the people of a state as a whole demand that the state shall, by appropriate regulatory authority, supplement municipal regulation of public utilities. State regulation is necessary, first of all, because the public service company often serves more than one municipal area. The power that regulates must be as extensive as the object regulated. Moreover, state regulation is desirable because experience has clearly shown that in the supervision of accounts, finances, services and charges of public service companies there needs to be an executive body whose jurisdiction is state-wide and whose powers are as comprehensive as the tasks to be accomplished. If the regulation of electric railway and other public service companies were left entirely to municipalities, the regulation would be incomplete and would vary greatly as between different localities. Such a condition would be of disadvantage to the companies and not a benefit to the public.

Public service companies may well welcome, and most of them probably do welcome, intelligent public regulation, because the fundamental purpose of such regulation is to bring about an equitable adjustment of the relations of the companies and the public. Wise public regulation makes for the better management of the companies and for improved service; while it also enables the companies, by securing the confidence of the public, to obtain equitable returns upon the property devoted to the performance of their services.

WORK OF PUBLIC SERVICE ACCOUNTANTS

BY H. S. SWIFT, TREASURER WEST PENN TRACTION COMPANY, PITTSBURGH, PA.

In his address concerning the work of accounting officers of public service corporations, Mr. Swift stated that the public no longer regards electric railways and other public utilities as private enterprises to be conducted for the profit of their owners but rather as quasi-public undertakings whose operations, accounts and records are to a certain extent public property. The old order of things under which utilities operated their properties and kept their books as simply or as elaborately as seemed best to the officials, with little or no outside interference as long as they kept within the law, is past. Then the accounting was for the information of the officers, the directors and, lastly, the stockholders, but now the accounting officer has become responsible to governmental authorities and various regulatory bodies for the honesty and the correctness of his work.

Mr. Swift believed that the requirements for the success of public service accountants are many. They should have a general knowledge of what is going on in the operating department, in order to devise proper accounting methods in connection with new construction or reconstruction work. Moreover, a duty sometimes neglected is the inspection of all such undertakings so that accountants shall be prepared to consider intelligently what proportion of expenditures can properly be charged to capital account, as well as the proper amounts to be provided for cost of unproductive labor, cost of new money, interest during construction and similar items. At the present time complete data are probably not available from which to determine proper depreciation and overhead charges, for previous consideration of these subjects has been academic rather than practical. Such problems can best be solved by the collection of accurate historical data. Mr. Swift emphasized the fact that many items of construction cost tend to disappear when it comes to a valuation of physical property years after, but such items should be entered upon the books in sufficient detail to prevent their being overlooked at a later date.

The accounting officer should give some attention to a systematic analysis of the increased cost of operation. A statement to the general manager that a certain power house or carhouse employed so many more men this year as compared to last is much more impressive than the bare statement that the labor cost was greater. A similar analysis can be made of the amount of supplies used, showing the number of units and the cost. In the case of the purchase of the control over underlying companies, the interests of stockholders must sometimes be safeguarded by a careful consideration of the value of services and expenses incurred by each company on account of other companies associated with it under the same management. All expenses for intercompany services should be justly distributed so that the operating costs of each company may be correct.

Mr. Swift stated that the development of the accounting departments of electric railways has been rapid, although it has received less assistance from without than some other departments. One feature of this development was the perfecting and adopting of a suitable uniform system of accounts. Another indication of growth is found in the increasingly important position held by the accounting officers. This position, however, is not without its additional responsibilities. The accountant should have some knowledge of commercial law, particularly at this date in connection with income taxes and special war taxes. He should also be able to keep a record of contracts and agreements in so far as they affect accounting, and he should so study his company's financial affairs and history as to be in a position to offer plans for new financing or refunding existing obligations. In closing, Mr. Swift spoke of the present opportunity of electric railway accounting officers, but said that they should possess imagination, or that quality of grasping the problems that the future may bring and preparing for them.

CO-OPERATION IN ELECTRIC RAILWAY WORK

BY JOHN PRICE JACKSON, COMMISSIONER OF LABOR AND INDUSTRY, PENNSYLVANIA

Mr. Jackson stated that the four human elements in electric railway work are the patron, who uses the service; the stockholder, who placed his money in the enterprise; the employee, who performs the daily labor, and the government, which acts as the representative of the people. The problem of the present day is to instill the proper confidence in and co-operation among all of these elements. The old days of close personal relation between employer and workmen have gone and in their place exists a period of highly systematized organization dealing more and more with impersonal elements. The modern foreman is told to see that expenses are kept down in order to show a proper balance and as a result often deals in an impersonal and unjust manner with the men under him. On the other hand, the workmen have often looked upon their employer only as an insatiable blood-sucker.

In a similar fashion, the patron of an electric railway, in Mr. Jackson's opinion, sometimes believes that the company is deliberately making him unhappy in order to fill its own coffers, and the public official often assumes that a public utility is guilty without proof or reason. Such a lack of confidence and co-operation is largely caused by irresponsible statements made in the press and public places. In fact, ninety-nine out of everv hundred of labor disputes arise from a misunderstanding with the management.

The work of the Bureau of Labor and Industry in devising standard safety rules, however, said Mr. Jackson, has proved that co-operation between some of these elements is possible. In about twelve industries, safety standards have been secured by the unanimous judgment of committees composed of capital, labor and bureau representatives. This marks a tendency toward the age to follow that of electricity—the age devoted to the perfection of the human machine and the proper correlation of co-operation between all of its elements.

In closing, Mr. Jackson offered some data gleaned from his recent European trip, to show that German roads are not so superior to American railways as often stated. The tracks are good, but this is largely a result of lightness of the cars. Many cars have no airbrakes, so that stopping is a long, slow process. The heating arrangements on most cars are of an antiquated type, and there is no vestibule, although the winter is quite severe. The cars, however, have large platforms at each end, on which the crowding exceeds that on American cars. No safety doors are used, and the passengers, both men and women, board and alight while the car is in motion. A notice to ladies, however, is carried on the rear platform, telling them to take hold with the left hand in alighting—a practice which Mr. Jackson thinks American railways might well adopt.

REPORT ON STANDARD SAFETY RULES FOR ELECTRICAL APPARATUS

This committee was appointed on Nov. 12, in connection with the Second Annual Pennsylvania Industrial Welfare and Efficiency Conference, conducted by the Department of Labor and Industry of the State. The matter of especial interest to the committee was suggested standard safety rules for electrical apparatus, which the department has under consideration for use throughout the State. On Nov. 19 a paper was presented by Dr. Rosa of the federal bureau of standards regarding Circular No. 49 of this bureau. This contained standardized safety rules suggested for use in the electrical industry. The rules now under preparation by the Pennsylvania Department of Labor and Industry are a move toward the single safety standard recommended by the bureau of standards. They will, it is understood, be submitted shortly to those interested for study and suggestions, and in the opinion of the committee there should be careful collaboration with electric railway operators in order to avoid imposing needless limitations or establishing hurtful precedents. The dividing lines in classifying voltages should be drawn at the proper points. It is the general practice of electric railways of Pennsylvania to operate at 550 volts, which in actual practice means 600 volts to 650 volts at the busbar, and if boosters are used to compensate for heavy loads, 600 volts to 750 volts to provide for line loss and thereby apply satisfactory voltage at the ends of long lines. This is essential to good service and these voltages are not ordinarily dangerous. Throughout the rules of the bureau of standards 750 volts is specified in overhead construction, above which special precautions are required. Direct current of the above voltage should not be classed with alternating current used for primary distribution, generally at 2200 volts. The committee feels, in general, that there is merit in the suggestion of the bureau of standards, for one standard for all states, but a careful study of proposed rules by all members is recommended.

Analysis of Stresses in Chicago Elevated Steel Car

BY H. A. JOHNSON, MASTER MECHANIC CHICAGO ELEVATED LINES

In connection with the methods employed in designing the new pressed steel cars for the Chicago Elevated Railroads, which were described in the ELECTRIC RAILWAY JOURNAL of Dec. 5, 1914, on page 1234, it may be that a detailed description of the stress analysis will be of general interest. As mentioned in the article describing the car, the minimum loads assumed included a standing and seated load of 150 passengers weighing 140 lb. each, or a total of 21,000 lb. To this the dead-load weight of the car body, amounting to 35,600 lb., was added. This weight was distributed 27,860 lb. between bolsters and 7740 lb. outside of the bolsters. In addition to the ordinary loads, the ends of the car were so designed as to support a total load of 28,500 lb. This is approximately the weight of a car body in a partially telescoped position, and the allowance provides for a condition which might occur in a collision.

Each side of the car body was designed as a continuous truss with intermediate supports at the two body bolsters. The entire carload between body bolsters was carried on side trusses while the platform load was distributed over the extended bottom sills, which form cantilevers. The bending moments due to the differently distributed components of the total load were computed and plotted to scale. The resulting diagram showed that the maximum unbalanced bending moment at the center of the car totalled approximately 900,240 in.-lb. on each of the two side trusses. A reproduction of this diagram is shown in one of the accompanying illustrations.

Having determined the general dimensions of the side truss, together with the number of posts required to give standard commercial sizes of window glass, and having calculated the maximum bending moment to be resisted, an analysis was made of the resulting stresses in all members of the side truss. These stresses are also shown in one of the accompanying diagrams, a detailed explanation of which may assist in an understanding of the methods used in the calculations. The side framing of the car, extending from body corner post to body corner post, was treated as a riveted truss. Since this side truss could not be extended effectively beyond the body corner posts of the car, the underframing was designed strong enough to support the loads beyond the

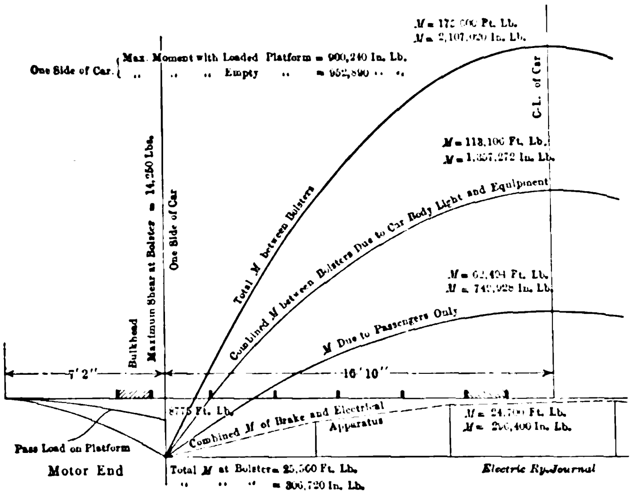
CHICAGO STEEL CAR—STRESS DIAGRAM SHOWING STRESSES IN THE VARIOUS SIDE-FRAME MEMBERS bolsters and to contribute a balancing bending moment to the side trusses, as noted on the bending moment diagram.

The maximum unbalanced bending moment of 900,240 in.-lb. in the side truss, which is 84⅜ in. in depth, results in a tension of 10,800 lb. in the bottom chord, or side sill, and an equal compression in the top chord, or deck plate. As there are no effective diagonals in this truss, the compression in the deck plate must be absorbed by the posts rigidly held in a vertical position by the side sheathing and belt rail to which they are riveted. The intermediate posts, together with the panel posts at the vestibules and flanking the center entrance, act as simple beams each rigidly supported at one end and with the total compression in the deck plate, applied to the other end.

In a cantilever beam of length l, the deflection is given by the formula, deflection $= \frac{Wl^3}{3EI}$ where E is the modulus of elasticity of the material and I is the moment of inertia of the section resisting the bending action. As all the side posts are deflected an approximately equal amount by the thrust of the deck plate to which they are riveted, the force each resists is proportional to its moment of inertia. This is true since all the other factors in the formula are constant when the deflection is the same for each post. These forces and the resulting maximum fiber stresses in the posts are noted on the stress diagram.



CHICAGO STEEL CAR—BENDING MOMENT DIAGRAM

The compression shown in the belt rail beside the center entrance is determined by multiplying the 6993-lb. thrust absorbed by the panel post by the depth of the truss and then dividing it by the distance between the belt rail and the base of the post. Similarly, the tension shown in the belt rail at the side of the body corner post is obtained by multiplying the outward thrust of 3615 lb. at the deck plate by the depth of the truss and dividing by the distance between the belt rail and the base of the post. With the completion of this analysis the problem was then one of selecting suitable and economical sizes for the side frame members.

As evidence of his confidence in the business future of this country, W. E. Hodges, vice-president in charge of purchases of the Santa Fé Railroad, announced the purchase of 66,000 tons of 90-lb. main track rail for spring delivery. In connection with this $2,000,000 contract he also announced in an interview that his company would spend $3,000,000 a month for the next few months for supplies and equipment.

COMMUNICATION

Hearing on Jurisdiction of I. C. C. Over Urban Railways

UNION TRACTION COMPANY OF INDIANA
ANDERSON, IND., Dec. 9, 1914.

To the Editors:

The Interstate Commerce Commission is insisting, in the case of certain urban electric railway companies having interstate connections of some sort, that accidents on purely urban lines of such companies be reported to it. The claim of the commission to jurisdiction over these companies appears to be opposed to the principles laid down by the Supreme Court of the United States in the Omaha & Council Bluffs case. Whether this particular question is of great practical importance or not, it is important that the general jurisdiction of the commission over purely urban companies and lines be confined to lawful limits.

A hearing before the commission at Washington on the question of the duty of urban companies of the kind mentioned to report such accidents has been arranged for Friday, Dec. 18, at 10:30 a. m. Argument is limited to one hour. James M. Barrett, president Fort Wayne & Northern Indiana Traction Company, has consented to make the presentation.

It is highly desirable that the commission appreciate the fact that electric railways regard the question as one of importance. The feelings of electric railways with regard to the matter will be partly judged by the interest displayed at the hearing.

It is the wish, therefore, of the committee on federal relations of the American Electric Railway Association, at whose instance the hearing has been arranged, that all electric railways interested be represented at the hearing. Representatives from several large urban companies of the Middle West have already signified their intention to attend.

ARTHUR W. BRADY,
President.

Dinner of Railway Business Association

The two speakers at the dinner of the Railway Business Association at the Waldorf-Astoria on Dec. 10 were Fairfax Harrison, president of the Southern Railway, and Warren G. Harding, Senator-elect from Ohio.

Mr. Harrison said: "In the controversy between the owners of railroads and the representatives of the public, the pendulum has now swung to an extreme on the side of irresponsible public power as it had previously swung to an extreme on the side of irresponsible ownership." In discussing commission regulation he said that one of the most dangerous weaknesses of the system is its inability to give prompt decisions. If a change of policy is demanded in the public interest, the power to pass upon the question must be capable of convenient and prompt exercise. The problem now before the country forms an opportunity for the statesman, who must have the power to impress his views upon his fellowmen. The speaker believed that President Wilson is equal to this great achievement.

Mr. Harding said that the railroads should be prosperous not so much to permit general prosperity but because it was a matter of justice. He believes that ninety-nine out of every 100 thinking people believe the railways are entitled to an increase in rates. He said the country needs to-day fewer legislative bills pending and more bills of lading. In conclusion, he urged managers to have a full understanding with the public.

At the business meeting of the Railway Business Association held during the afternoon George A. Post of New York was re-elected president.

American Association News

The Executive Committees of the Engineering Association and the Transportation & Traffic Association Assign Subjects to Various Committees—Hearing on I. C. C. Jurisdiction Over Electric Railways—Meeting of Joint Committee on Block Signals—Milwaukee Company Section Meeting

ENGINEERING ASSOCIATION COMMITTEE SUBJECT ASSIGNMENTS

The executive committee of the Engineering Association approved the following plan of work for the several committees at its last meeting.

The committee on buildings and structures will prepare general specifications and form of contract for railway structures. It will suggest proper provision for expansion and contraction in concrete structures, together with a provision for properly water-proofing and protecting them. This subject is to be considered along broad lines of application either to thin slab construction or to massive monolithic work, having in mind the carrying of reinforcement throughout either type of work. Further consideration will be given to the fire protection rules, especially with regard to the use of soldering or other heating equipment. The design of a standard fireproof substation building of 1000-kw capacity will also be studied.

The committee on electrolysis will continue its study of the general subject.

The committee on equipment will make a study of, and report upon, the need of a revision of the standard specification for heat treated carbon steel axles, shafts and similar parts, adopted in 1912, and will report upon a specification for gears and pinions, including tolerances. The committee will further make a study of difficulties with M. C. B. journal brasses in heavy electric traction service, by conducting such tests as may seem necessary and will collaborate with the M. C. B. Association and the committee on heavy electric traction. Attention will be given to wires and cables for car equipment, with special reference to fire protection. This subject will be considered jointly with the N. F. P. Association, especially as to the use of lighter conduits in car roofs. The specification for air-brake hose will be broadened to include smaller sizes. The committee will submit a design for a limit-of-wear gage for measuring flange thickness of the Association standard wheel. The steel wheel design will also be revised to include smaller diameters.

The committee on heavy electric traction will conduct a further joint study, with the various other railway associations, of the equipment clearance line shown on the third-rail equipment diagram adopted by this association at the 1912 convention, between the point FE and the gage line of the nearest running rail, and the location of the third-rail clearance line between point ET and the gage line of the nearest running rail. A study of the modern electric locomotive will also be made. Further consideration will be given to the definition of third-rail gage, with reference to the question whether it is advisable to have a definition of the term "Gage Line of Third-Rail." The protection of the contact rail, where an exposed third-rail is used in rapid transit operation, will be considered also.

The committee on lightning protection will take up the general subject as applied to car and line equipment.

The committee on power distribution will study the following specifications: for reinforced concrete poles, for sundry line materials, and for 600-volt d.c. overhead trolley construction with respect to lightning arrester location and grounds. A revision of the standard specification for tubular steel poles will also be prepared.

The committee on power generation will report on good practice in regard to smoke abatement from the standpoint of smoke observations, and in regard to appliances and devices used for determining smoke density. It will consider a specification for boiler tubes, including both open-hearth, seamless, hot-drawn steel tubing and charcoal iron tubes, and others for the purchase of fuel and of power station lubricants. The committee will also review the boiler code of the American Society of Mechanical Engineers with special reference to specifications for boiler tubes.

The committee on standards will determine what roads are using Association standards and recommendations, and will draft a style for the make-up of specifications.

The committee on way matters will continue the study of the proper foundation for tracks in paved streets, and of pavement for use in connection with girder and high T-rails. Traffic counts will be obtained from different companies in accordance with forms submitted in the 1914 report. The committee will prepare specifications, with definitions, for sundry track materials such as ties, track spikes, bolts, tie rods, tie plates, etc., with particular reference to physical characteristics, and a standard specification for special work. A revision will be made of the recommended designs of 7-in. and 9-in. joint plates with special reference to sizes of bolt holes and fits, as covered in Section Wm 4a in the *Engineering Manual.*

TRANSPORTATION & TRAFFIC ASSOCIATION COMMITTEE ASSIGNMENTS

The executive committee of this association recently approved the following list of subjects:

The committee on fares and transfers will continue the study of transfer issuing and collection devices; will study, report, and summarize the fare collection methods used with center-entrance cars; will study the problem of fare collection on prepayment cars on multiple fare lines, reporting on the advisability of stationing extra men at congested points and terminals to collect fares and so to increase the rate of loading on prepayment types of cars, and will investigate the subject of through collection versus zone collection on suburban and interurban lines.

The committee on express and freight traffic will make a further study of the organization of a freight department, giving further and more comprehensive details than were contained in the 1914 report; will investigate the matter of uniform class rates; will report on the relative cost of handling different classes of freight and the relative proportion of each class handled; will continue the investigation of laws, franchises and other restrictions relating to this traffic and will investigate the questions of handling express and of weighing and inspection. The committee will also analyze 1914 passenger and freight earnings as compared with those of 1913, with a view to determining whether, as some companies report, freight business is increasing while passenger business has fallen off. If so, such conclusions will be drawn as are pertinent to the building up of freight and express business by member companies to take the place of passenger revenue lost through the inroads of the automobile.

The committee on passenger traffic will continue the study of the motor bus and the trackless trolley, supplementing the report of the 1914 committee, summarizing the results obtained in European operation and recommending how electric railways can make use of these two modes of travel. Digests of laws and franchises showing specifically where additional restrictions have been imposed by the authorities on these companies will be prepared. The committee will examine into the results of one-man car operation from such standpoints as speed, accidents, equipment, maintenance and other cost, summarizing present practices, and will further study the effects of the increasing use of automobiles on passenger traffic, with particular reference to interurban and suburban roads, giving specific results as determined by studies made by individual companies.

The committee on rules will continue the consideration of markers in the light of the discussion at the 1914 convention; will compile a joint index of similar or identical rules in the two standard codes for the use of companies which desire to issue a joint code; will investigate and report on the flagging rule as instructed by the 1914 convention, and will develop for the approval of the executive committee and for the use of Association members a procedure for the interpretation of rules and train orders. The committee will report as to the state commissions that have approved the standard codes of the Association or have adopted codes of their own, in the latter case making a statement as to the logical points of difference between the adopted codes and the Association standard codes. The number of roads that have adopted the standard codes since the 1914 convention, up to June 1, 1915, will also be reported.

The committee on schedules and time-tables will continue the study of train dispatching in city service, making a summary of results obtained in the various cities in which this practice is in vogue, and the consideration of the problem of developing capable schedule makers. It will recommend methods of making and recording periodical traffic counts, and will make a study of the influence of frequency of stops on schedule speed and the influence of schedule speed on operating cost, possibly developing curves to show results. Other investigations to be made are those of the effect of the use of fully vestibuled cars on schedule speed and other operating factors, including accidents; of near-side stop practice, indicating the increase in this method of operation that has occurred by years for the past three or four years, and of the standard interurban time-table as adopted in 1911, to determine whether changes or modifications should be made.

The standards committee will undertake the formulation of a standard practice and policy for the adoption of standards for the Transportation & Traffic Association, and will issue a Transportation & Traffic syllabus during the present year.

The committee on the training of transportation employees will bring up to date the digest of laws and regulations affecting employment, last printed in the 1912 report. It will investigate the disciplining of new men where this is handled by the instruction department, and will outline a systematic program for improving courtesy on the part of trainmen, to include recommended bulletins and notices to the men as well as a general outline of practice. Another item of the year's work will be an investigation of watch inspection methods.

The committee on uniform definitions will recast and recompile the definitions submitted by the 1914 committee, with such additional definitions as are necessary, these to be submitted to member companies for specific criticism. A co-ordination of the definitions with the standard codes will follow and this is to be submitted to the Transportation & Traffic Association's standards committee in time to have that committee pass upon it before its submission to the next convention.

JOINT COMMITTEE ASSIGNMENTS

The executive committees concerned have approved the following programs of joint committee work:

The joint committee of the Engineering and Transportation & Traffic Associations on block signals for electric railways will prepare a digest of signal laws and rulings to show if any new rulings of state commissions have been made subsequent to the dates of information contained in the 1914 report. A bibliography on block signals installed subsequent to June 1, 1914, will also be compiled. Designs of standard signal apparatus will be prepared, the committee to co-operate with the Railway Signal Association committee on signaling for electric railways in the adoption of standard signal apparatus. The clearance diagram for semaphore signals is to be considered after conference with the committees on power distribution and heavy electric traction, and a revision of the block signal rules for contactor signals is to be considered jointly with the committee on rules of the Transportation & Traffic Association, Rule No. 10 covering this matter having been referred back to the committee. The subject of light signals for interurban railways is to receive further consideration with a view to the adoption of a definite standard for sizes of lenses for light signals operated by continuous track circuits or contactors. The advisability of changing the reading of the standard light aspects in three-position signaling from "Non-Car Counting" or "Car Counting" to "Non-Registering" or "Car Registering" signals, in view of the fact that the new contactor signal rules all read "Car Registering Signals," will also be considered. A study will be made of signal systems on roads that are signaled from end to end, to cover maintenance cost, efficiency of operation and effect on traffic. The remaining subjects listed are: An investigation of the question of a standard definition for signal failure, the general study and summary of highway crossing protection, and the preparation of a report as to the advisability of operating on single-track interurban line blocked by signals alone without dispatching.

The joint committee on engineering accounting will draft a set of standard forms for use with the cost accounting system recommended by the 1914 committee; will revise the subdivision of operating maintenance accounts to meet the new I. C. C. classification, and will develop a proper ledger, looking toward the maintenance of a continuous inventory. Other subjects will presumably be assigned to this committee by the Accountants' Association.

The joint committee of the Engineering and Accountants' Associations on the life of railway physical property will continue its study of the general subject.

The committee on transportation accounting has received the following partial list of assignments: To investigate the cost of handling baggage free to determine whether or not it brings business to the line, and if it does whether the cost of handling this baggage wipes out the profit resulting from the fare received; to investigate the sub-division of power cost among construction, maintenance and operation.

The committee on transportation engineering will study the operation of trains of two cars or more in interurban passenger and freight service to include cost of operation and comparative figures for single-car operation. A second investigation is into the effect of car and equipment design on duration of stops, in both passenger and freight service. Car design is to be studied from a traffic standpoint in all its phases, first standardizing the methods of determining results. The investigation is to include specimen data sheets showing information which should be obtained in order that member companies who desire to follow the recommendations may have full information before them. An investigation of braking distance on interurban cars is to be made with special reference to the location of block signals. In addition current saving devices will be studied and a summary prepared showing the results obtained, together with costs, including maintenance, etc.

STUDY OF A. I. E. E. STANDARDIZATION RULES

The new standardization rules of the American Institute of Electrical Engineers have been brought to the attention of the committees to which parts are of interest, with the recommendation that they be reviewed and considered.

HEARING ON I. C. C. JURISDICTION OVER ELECTRIC RAILWAYS

At the instance of the committee on federal relations of the American Electric Railway Association, of which A. W. Brady, president Union Traction Company of Indiana, is chairman, a hearing on the above subject will be held in Washington at 10:30 a. m. on Friday, Dec. 18. At this time, in the hour allotted by the commission, an argument will be presented by James M. Barrett, president Ft. Wayne & Northern indiana Traction Company, outlining the reasons against the commission order requiring interurban lines to file monthly reports of accidents in urban operation. The act of 1910 requires monthly reporting of accidents on the lines of interstate carriers by railroad. This has been interpreted by the commission, in the case of the Detroit United Railway and others, to cover urban lines operated by such roads which by virtue of their interurban lines come within the commission's jurisdiction. This is held to conflict with the decision of the United States Supreme Court in the Council Bluffs case. Secretary Burritt has sent out a circular letter inviting company members to be represented at the hearing.

MEETING OF JOINT COMMITTEE ON BLOCK SIGNALS FOR ELECTRIC RAILWAYS

A meeting of the joint committee of the Engineering and Transportation & Traffic Associations on the above subject was held at the offices of the Public Service Railway in Newark, N. J., on Dec. 10. The following members were present: Of the Engineering Association, J. M. Waldron, Interborough Rapid Transit Company, chairman; C. H. Morrison, New York, New Haven & Hartford Railroad; John Leisenring, Illinois Traction System; G. N. Brown, New York State Railways; of the Transportation & Traffic Association, J. W. Brown, Public Service Railway, co-chairman; C. D. Emmons, Chicago, South Bend & Northern Indiana Traction Company. There were also present by invitation H. W. Griffin, Union Switch & Signal Company, and H. H. Norris, ELECTRIC RAILWAY JOURNAL.

Mr. Waldron was elected chairman of the meeting and Mr. Norris secretary. A vote of thanks to the ELECTRIC RAILWAY JOURNAL for its practical interest in the work of the committee was unanimously passed.

The committee then considered the assignments made for the coming year's work, printed elsewhere in this issue, and delegated the work to the following sub-committees, in the lists of which the chairman's name is placed first in each case.

Digest of signal laws and rulings, A. E. Roome, Pacific Electric Railway Company.

Bibliography on block signal installations, H. H. Norris.

Design of standard apparatus, J. M. Waldron, C. H. Morrison.

Clearance diagram for semaphore signals, J. Leisenring, G. N. Brown.

Revision of block signal rules for contactor signals, C. D. Emmons, H. A. Nicholl.

Light signals for interurban railways, J. Leisenring, H. A. Nicholl, C. H. Morrison.

On certain changes in phraseology in regard to standard light aspects, J. W. Brown, C. D. Emmons.

Study of costs of maintenance, etc., of signal systems, G. N. Brown, J. W. Brown.

Review of block signal standards and recommendations, C. H. Morrison, J. M. Waldron.

Consideration of A. I. E. E. standardization rules, as they have bearing on signal matters, G. N. Brown, C. H. Morrison.

Preparation of a definition of "signal failure," A. E. Roome.

Study of highway crossing protection, J. Leisenring, H. A. Nicholl, J. W. Brown.

Report on advisability of operating single-track interurban signal-blocked lines without dispatchers, H. A. Nicholl, J. W. Brown; C. D. Emmons, J. Leisenring.

Preparation of a list of items of information needed in connection with block signal contracts; for trolley contact systems, J. M. Waldron; for track circuit systems, G. N. Brown, J. Leisenring, H. W. Griffin, S. N. Day, General Railway Signal Company.

After making the above assignments the committee considered them informally and discussed the general principles involved.

It was then decided to hold sub-committee meetings in New York on Jan. 4, 5 and 6, and in Chicago on Jan. 18. The next and probably the final meeting of the full committee will be held in Chicago on March 16 and 17 at the time of the meeting of the Railway Signal Association.

MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY SECTION

Company section No. 1 has elected the following officers: President, W. W. Cook, superintendent Cold Spring shops; vice-president, V. W. Dentz, engineer; secretary, H. G. Abendroth, valuation committee; treasurer, A. G. Schwenke, auditor railway receipts. E. W. Miller was elected director for a term of three years.

On Dec. 5 Secretary Burritt sent to all company members of the association copies of the war tax act of Congress, officially known as Public Act No. 217. This act affects electric railways in several particulars, principally in requiring a stamp tax to be paid on bonds, debentures and certificates of indebtedness and upon bills of lading. The act became operative on Oct. 23 and remains so to and including Dec. 31.

The merchants and manufacturers of Peoria, Ill., are arranging to establish in that city a traffic bureau which will have supervision over all switching charges and other shipping conditions. The Illinois Traction System has become one of the most important freight lines entering Peoria and it is proposed to include that company under the new arrangement.

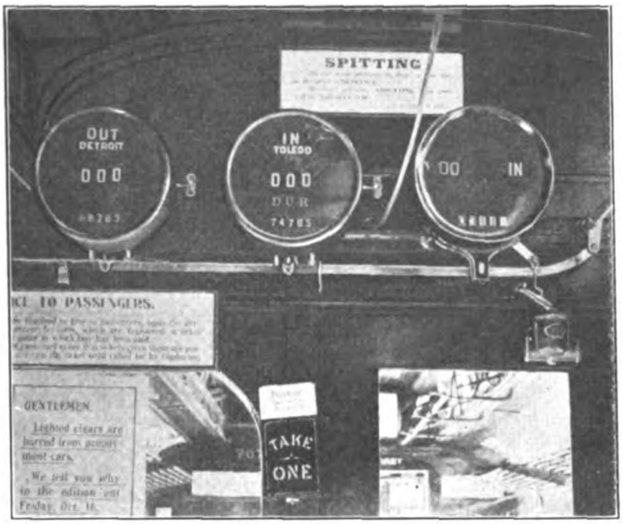
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

An Ingenious Interline Register System

BY C. L. KELLER, ASSISTANT MASTER MECHANIC DETROIT UNITED RAILWAY

Through cars between Detroit, Mich., and Cleveland, Ohio, operate over the tracks of five different companies, namely, the Detroit United Railway, Detroit, Monroe & Toledo Short Line, Toledo Railway & Light Company, Lake Shore Electric Railway and the Cleveland Railways. A separate account must be kept of the fares collected on each line and, in so doing, the city fares collected in Detroit, Toledo and Cleveland are registered on three separate registers.



INSTALLATION OF REGISTERS FOR INTERLINE OPERATION

On a through car recently put in service by the Detroit United Railway, a simple, effective method of ringing each register was installed. The registers used were two Sterling-Meaker No. 8 and one International. Each register was marked with the name of the particular city in which it was to be used, although the illustration shows only two registers so marked. Instead of using separate cords or rods for operating each, the three registers were arranged to be operated by means of one ⅜-in. square cold-rolled steel shaft which extends the full length of the car and has a strap pull at each window.

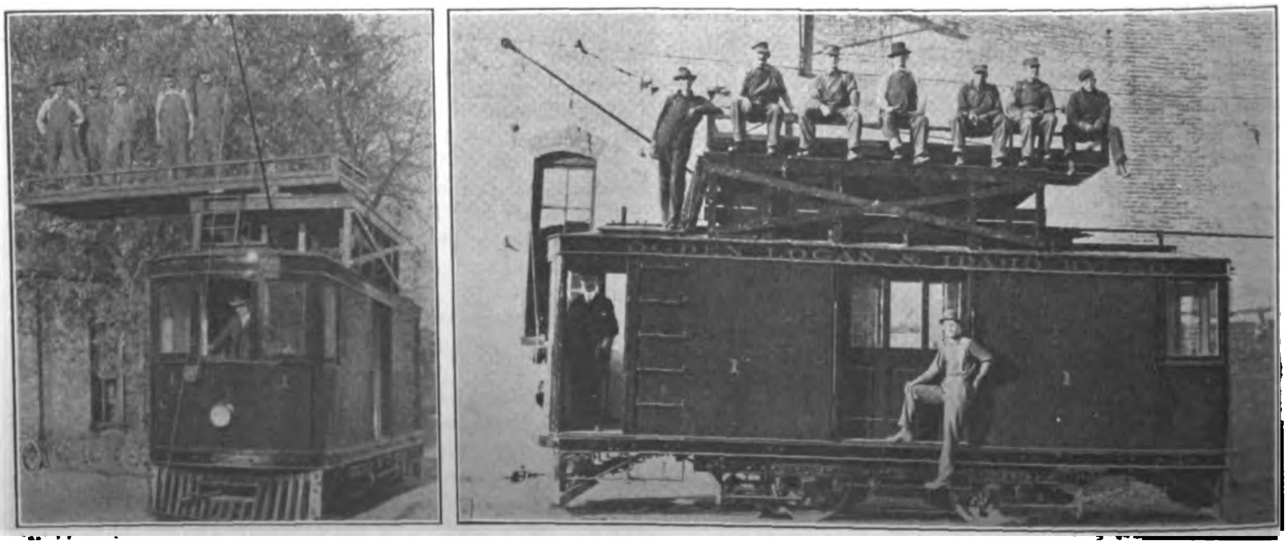
The register racks were placed side by side on the passenger compartment side of the partition between it and the smoking compartment. Just below the racks was placed a ¼-in. x ⅞-in. flat-steel bar. One end of this bar was connected to a clevis fastened to the register rod while the other end was passed through a guide. To the operating lever on each register a 2½-in. steel-wire screwhook was riveted and corresponding screw-eyes were riveted to the steel bar. To use any one of the registers, it is necessary only to unfasten one hook and connect up another. The accompanying half-tone shows the mechanism as installed in a car.

A Home-Made Line Car

BY H. E. WURZBACH, MASTER MECHANIC OGDEN, LOGAN & IDAHO RAILWAY

The accompanying illustrations show a line car designed by the writer and built in the Ogden shops of the Ogden (Utah), Logan & Idaho Railway. In its construction we used an old truck from a single-truck car which had been out of service for some time and two GE-90 motors. The body we built. The principal dimensions of the car follow: Total length, 26 ft.: height from track to top railing, 14 ft. 6 in.; length of turntable platform, 15 ft.; length of turntable platform from center bearing, 12 ft., and width of car, 6 ft. 10 in.

An important feature is the channel iron which completely encircles the body. This channel greatly adds to the strength and rigidity of the car. As the channel flanges are turned outward the beam acts as an anti-climber at the bumper. The car is completely equipped



END AND SIDE VIEW OF LINE CAR MADE BY THE OGDEN, LOGAN & IDAHO RAILWAY with shelving, lockers and hooks for hanging wire and ropes. A place for long bars or shovels is arranged under the top platform. The speed of this car is about 35 m.p.h. It has been in operation since the middle of October.

Rebabbitting Journal Bearings

BY W. L. FULTON, CHIEF DRAFTSMAN OMAHA & COUNCIL BLUFFS STREET RAILWAY

In the rebabbitting of worn-out journal bearings the Omaha & Council Bluffs Street Railway uses molds of home manufacture. The details of three types of these bearings, namely, armature, motor axle and truck journal bearings, together with details of molds for rebabbitting the same, are shown in the accompanying figures.

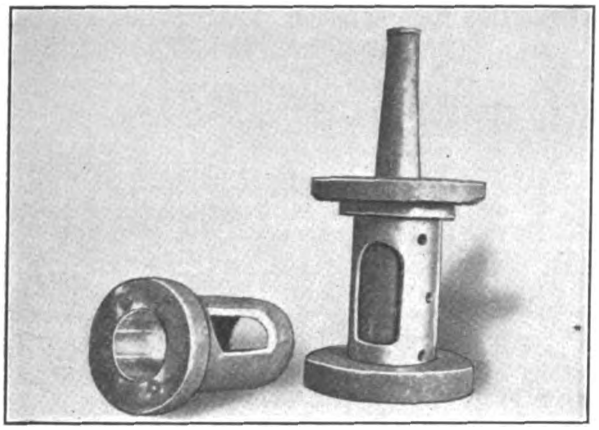


FIG. 3—FINISHED BEARING AND MOLD

Armature Bearings.—A bearing typical of this class is the commutator-end armature bearing for the GE-80 motor, the details of which are shown in Fig. 1. The mold for babbitting the same is shown in Fig. 2. This mold consists of two cast-iron plates and a round steel mandrel. The shell of the bearing forms the outside of the mold. The two cast-iron plates are machined to provide an even bearing for the mandrel and to give true surfaces to the babbitt. The upper plate contains two 11/16-in. holes for gate and air vent. Each plate also contains a hole through which the end of the mandrel projects. At the lower end of the bearing (Fig. 2) the mandrel has a shoulder which centers the bearing shell. Another shoulder, at the upper end of the bearing, supports the upper plate, giving the proper clearance between it and the end of the bearing shell. The projecting ends of the mandrel, and the taper of 1/32 in. in the length of the bearing, are made to facilitate the driving of the mandrel out of the bearing after the babbitt has cooled.

FIGS. 1, 2 AND 7—CAST-IRON ARMATURE BEARING FOR GE-80 MOTOR, MOLD FOR BABBITTING SAME AND MOLD FOR JOURNAL BEARINGS

Oil holes, etc., in the babbitt are made by the use of felt plugs, inserted in holes in the bearing shell and held in place by wires around the shell. A view of the mold and a finished bearing is shown in Fig. 3.

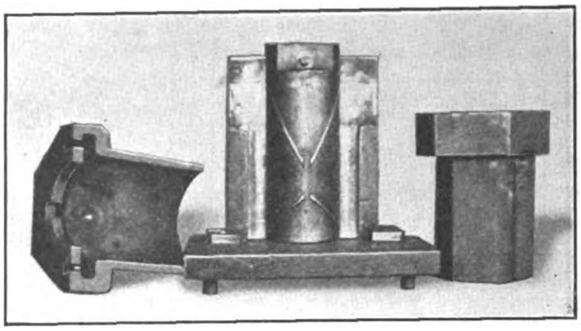

FIG. 6—MOLD FOR MOTOR AXLE BEARINGS WITH CORES IN PLACE AND BACKS REMOVED

After being babbitted, these bearings are machined to an exact fit.

Motor Axle Bearings.—Drawings illustrating this type of bearing and the molds for babbitting it are shown in Figs. 4 and 5, respectively. The mold was designed to cast the two halves of the bearing in one operation and consists of a stand, two cores and two backs. The stand is made of two smooth steel plates connected by cast-iron brackets which also serve to center the backs properly when the mold is being assembled. The cores are placed one on either side of the vertical plate, and are held in place by lugs in the base plate and by a tap bolt extending through the vertical plate. The cores are provided with ridges of the proper size and shape for the purpose of casting oil grooves in the babbitt.

The bearing shells are placed over the cores and the backs are then put in place, covering the shells. The shells and backs fit snugly, centering the shells properly when the backs have been put in place between the brackets of the stand. Each back is provided with a gate and air vent. A ¾-in. threaded hole is also made in each back to admit the crank used for forcing apart the mold and bearing after the babbitt has hardened. Oil holes, etc., are cast by the use of felt plugs of the proper shape and thickness placed in the bearing shell while the mold is being assembled. In Fig. 6 the mold is shown with the cores in place and the backs removed. Axle bearings are not machined after being babbitted.

Truck Journal Bearings.—The molds for babbitting truck journal bearings consist merely of mandrels, each one being shaped to fit one particular type of bearing. These mandrels are usually in the shape of cylinders with lugs or shoulders built out to meet the edges of the bearing shell and of a height to give the proper space between the mandrel and shell. Each mandrel is made to take two bearings at once, one on either side, a clamp being used to hold them in place while babbitt is being poured. Fig. 7, showing the details of the mold for the journal bearings of a Brill 39-E truck, illustrates this type of mold.

FIG. 5—MOLD FOR BABBITTING GE-80 MOTOR AXLE BEARINGS

Equipment Defects—Control Apparatus and Connections—V

BY C. W. SQUIER, E.E.

Controllers for Electric Braking—Certain manually-operated controllers for railway equipments are arranged so that the motors may be used to stop the car as well as to propel it. This is accomplished by connecting the motors as series generators and using the current generated to operate magnetic brakeshoes, or by closing their circuit through a rheostat make use of them for dynamic or rheostatic braking.

It is an inherent characteristic of series motors that when they are connected to the line to work in a forward direction, with the same connections between armatures and fields and the working voltage removed they will work as generators if the armatures are caused to rotate in a direction opposite to that required for the forward movement of the car; or if the connections between the armatures and fields are reversed they will work as generators in the direction in which they car is moving.

Magnetic Braking.—When magnetic brakes are used the voltage generated by the motors is utilized to energize an electric track, wheel or axle brake. All the connections necessary for utilizing this current to actuate the magnetic brakes are made by the controller. Such controllers are provided with what is termed braking notches which are usually located so that a movement of the main or "power" handle in a direction opposite from that necessary to propel the car will bring the fingers into contact with the braking segments and make the necessary connections. By using the same handle continually both for "power" and "brake" the motorman acquires promptness and ease of manipulation. This is a most valuable feature because when emergencies do arise the motorman is never called upon to carry out consciously, yet with extreme promptness, an operation which is not in his regular practice. The simple action of moving the single controller handle in one direction for "power" and in the opposite direction for "brake" reduces to a minimum the "human element" which is so frequently responsible for accidents.

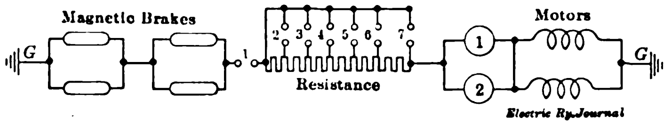

FIG. 14—CONNECTIONS FOR OPERATING MAGNETIC BRAKES

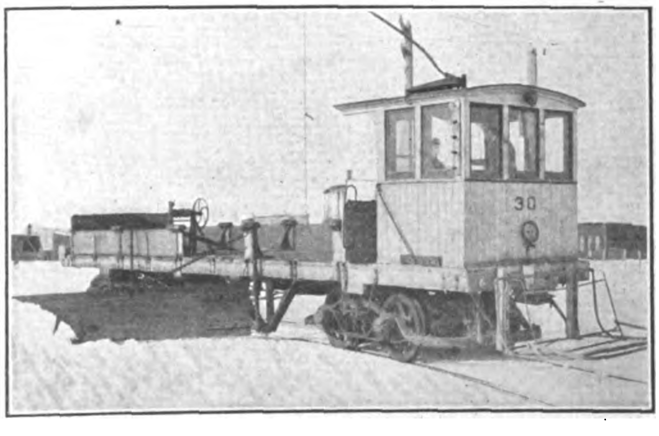
Fig. 14 shows the connections that are necessary to operate magnetic brakes. The motors and the coils of the brake magnets on opposite sides of the car are connected in parallel, and the regulating resistance is placed in series with both. Contacts 2, 3, 4, 5, 6 and 7 are provided for cutting out this resistance so that the amount of current produced by the motors may be varied as required. To apply the electric brakes it is necessary to move the controller handle to the brake notch which agrees with the speed at the moment, and then to move it again notch by notch as the car slows down so as to cut out resistance because the emf generated decreases as the speed of the car falls off. The brake magnets on opposite sides of the car are connected in parallel, as stated, so that the braking force will be the same on both sides.

Magnetic brakes are now seldom used in this country due to the difficulty of securing efficient track braking with the bad track conditions that are encountered on so many roads. In England and on the Continent the track magnets are adjusted so that they are about ¼ in. clear from the rail. It can be readily understood that it would be almost impossible on most American railways to operate with this scant clearance. This trouble could be overcome to a degree by using a less efficient brake magnet. I understand that there has now been developed a magnet which in ordinary service will operate with an adjustment of ¾ in. above the running rail. But even this clearance is much less than we expect for other truck parts.

Dynamic or Rheostatic Braking.—Any controller which is provided with the points necessary for magnetic braking can be used for dynamic or rheostatic braking without any change in the controller itself. No brakeshoes are used with this form of braking. The terminals of the motors are connected to the regulating resistance, and as the current flows there is produced in the motors a back torque (counter emf) which causes the armatures to hold back against their driving force. The greater the torque the quicker will be the stop. Since the armature speed is decreasing the torque will decrease in proportion unless the resistance in the external circuit is decreased as the speed falls off. Therefore, in order that the armatures may exert a uniform back torque while the car slows down, it is necessary that the controller handle be moved from point to point so as to cut out the resistance. As the motors generate current only while the car is in motion, the car will not remain stationary if stopped on a grade unless it is held by some other form of brake. Rheostatic braking uses the back torque alone for making stops. However, where some form of electromagnetic brake is used, the car is not only retarded by the work thrown on the motors, but the current generated is usefully employed in actuating the brakes on the trucks or wheels.

Snow Removal in Montreal

In Montreal the problem of snow removal is a very severe one and the methods used in meeting it have been thoroughly perfected by A. Gaboury, superintendent Montreal Tramway Company. The apparatus consists of the usual sweepers, and, in addition, there are salt cars (which are the equivalent of sand cars) and levelers which are regular motor freight cars fitted up with sheet-iron wings that swing out-board. The latter are for the purpose of pushing the snow into piles along the curbs after it has been thrown aside by the sweepers, thus providing a large clear space beside the track for vehicular traffic. The piles of snow are carted away from the city in sleighs furnished by the city, the cost of removal being borne in part by the company.



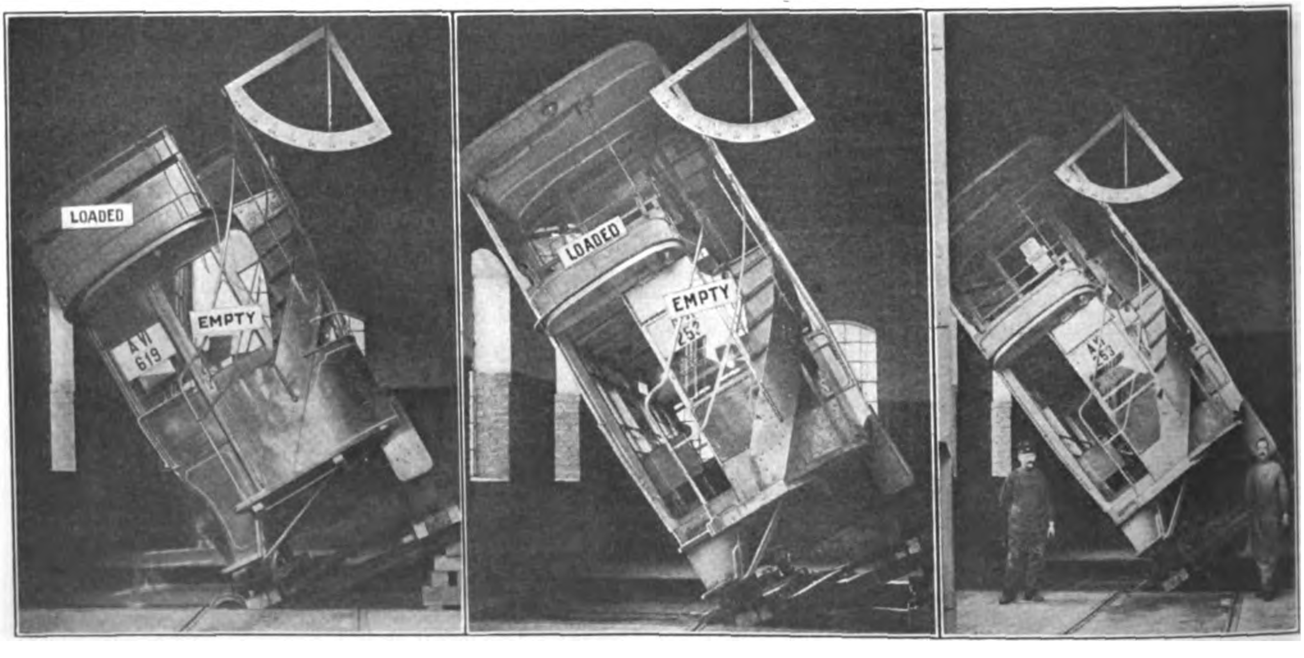
MONTREAL SNOW FIGHTING—FREIGHT CAR TRANSFORMED INTO A LEVELER FOR CLEARING SPACE BESIDES TRACKS

The use of salt has been found to be an absolute necessity during sleet storms or extreme cold weather, and salt cars consisting of old single-truck equipments have been fitted up with longitudinal boxes for holding coarse salt, the material being dropped on the switches through tubes opening from the center part of the bottom of each box.

In operation the snow-fighting equipment is assigned to definite routes so arranged as to have each one completely covered at intervals between forty-five minutes and one hour. In addition the routes provide central conveying points for three or four sweepers, so that one can be diverted if necessity arises on some other route. In addition to the equipment a force of from eighty to one hundred men is constantly employed during the winter on all hills to keep the rails and switches in a safe condition, and during heavy snows this force is augmented from the construction department. As soon as a snow storm begins men are also sent out to sweep and salt every switch and intersection on the system. One prolific source of danger of blockades has been found in the packing of snow on top of fenders in the cars, and to obviate this men are stationed at various points on the system to shovel the snow off of the fenders, and to clear the vestibule windows and destination signs.

Testing the Equilibrium of Double-Deck Buses at Vienna

In making studies for the operation of double-deck auto buses, Ludwig Spängler, director Vienna Tramways, gave particular attention to the question of equilibrium to secure buses that would not tip over when swerving at their highest speeds under the worst possible conditions of grade and curvature. To this end experiments were made to find the permissible angular deviations from the perpendicular for double-deck buses with and without a covering for the upper deck.



EQUILIBRIUM TESTS OF VIENNA BUSES—OPEN-TOP BUS LOADED ON UPPER DECK, EMPTY ON LOWER DECK, TIPPED 31 DEG.—CLOSED-TOP BUS LOADED ON UPPER DECK AND EMPTY ON LOWER DECK, TIPPED 33 DEG.—CLOSED-TOP BUS EMPTY ON BOTH DECKS, TIPPED 40 DEG.

As shown in the accompanying views, the allowable deviation was measured on a protractor fitted with a swinging pointer. One leg of the protractor was fastened at right angles to the side of the bus so that as the bus was tipped away from the perpendicular by putting blocks under one side of the body, the pointer swung away from 0 deg. accordingly.

When empty the center of gravity of the fully-inclosed double-deck bus is not so low, of course, as that of one with an open top deck, but it was found to be low enough for safe operation. When loaded, however, the inclosed type devised by Mr. Spängler has the lower center of gravity because the "well" construction of the upper floor permits the upper seats to be nearly 16 in. lower than the corresponding seats of the Daimler open-top bus.

The tests with the protractor showed that when the open-top bus carried an upper deck load of fourteen 165-lb. bags of sand, and with no load on the lower deck, unstable equilibrium was reached at 31 deg. from the perpendicular. The angle for the fully-inclosed bus when carrying fifteen 165-lb. bags of sand, and with no load on the lower deck, was 33 deg. and this was increased to 40 deg. when the load from the upper deck was removed. All tests were made with gasoline vehicles.

Better Car Illumination Effects Other Economies

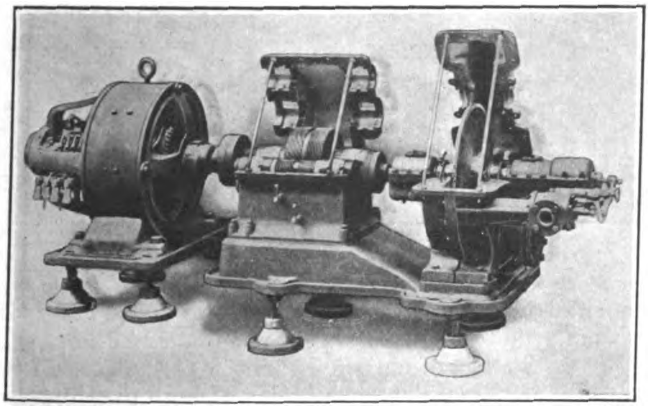
The original lighting scheme on the passenger cars of the Chicago, Lake Shore & South Bend Railway provided for fifty-two 23-watt, 120-volt lamps, five in series in a 600-volt circuit. These lamps were installed one over the back of each seat in a side-wall bracket attached to the window post and a row in the ceiling along the center line of the car. The improved lighting system includes seven 60-watt and five 25-watt Mazda lamps in a 98-volt circuit. The 60-watt lamps serve for general illumination while the 25-watt lamps are installed two in the destination sign, two on the rear platform and one in the toilet. The 60-watt lamps are placed in the ceiling along the center line of the car and are fitted with deep Alba shades set in locked sockets.

This change was a great improvement over the lighting scheme formerly used, which not only supplied too much light but did not distribute it properly. In fact, the light from the lamps in side-bracket fixtures on the window posts was right in the line of vision of seated passengers, and as the light was supplied through thin filaments with energy at twenty-five cycles it was also irritating to the eye. The accessible location of the side brackets also increased the percentage of thefts. In fact, during some months the combined number of lamps broken, stolen or burned out amounted to more than 50 per cent. With the new lighting scheme it is estimated that the savings in lamp replacements and energy consumption will more than pay for the entire installation within one year. All wiring in the new system is in conduit and the circuits are taken off the 98-volt tap of the transformer which forms a part of the 6600-volt, single-phase car equipment. One of the most expensive parts of the improvement was included in replacing the side brackets on the window posts with coat hooks.

Small Geared Turbo Units

The Westinghouse geared turbo-generator set recently brought out is designed to meet the demand for economical turbine units of small capacity. This development was made possible by the Westinghouse reduction gear which permits the efficient coupling of a high-speed turbine to a low-speed generator. These sets are built with either a d.c. or an a.c. generator in capacities from 25 kw to 200 kw, standard voltages. The turbine is designed for condensing or non-condensing operation, as may be desired.

The turbine rotor consists of a single disk, on the periphery of which the blades are carried. On entering the turbine casing the steam expands in a suitable nozzle, passes through these blades and delivers to them part of its velocity energy. On leaving the blades it enters a reversing chamber which redirects it to the blades. This process is repeated as many times as necessary to make efficient use of the energy in the steam.



GEARED TURBO-GENERATOR SET

The gear and the pinion are of the split helical type, mounted in an oil-tight case. Ample lubrication is provided by running the gear in a bath of oil. To make inspection easy, both turbine and gear casings are horizontally split, and all steam nozzles and reversing chambers are mounted in the lower half of the turbine casing. The turbine and gear are mounted on a common bedplate. The bearings are all ring-oiled and self-aligning, and require little attention.

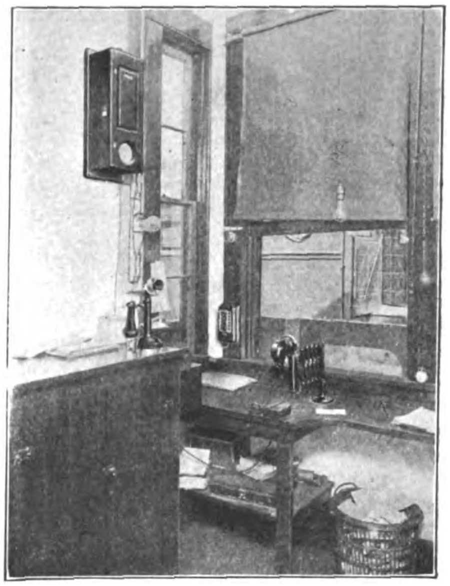
The speed of the turbine is controlled by a centrifugal type governor, mounted on the turbine shaft and connected by a simple lever direct to the stem of the valve. The connection between gear and generator is made by means of a flexible coupling.

Alternating current generators furnished with these sets are of the self-contained revolving field units similar to standard Westinghouse belted and coupled types. They can be wound for two or three-phase sixty-cycle service, and any standard potential between 240 volts and 2400 volts. The d.c. generators furnished are all self-contained similar to the standard Westinghouse belted type, and can be wound for 125 volts and 250 volts, two-wire, and 250 volts, three-wire.

Telephone Train Dispatching on the Cedar Rapids & Iowa City Railway

The Cedar Rapids & Iowa City Railway has recently placed in successful operation a telephone train dispatching equipment covering the entire line. This road runs from Cedar Rapids south to Iowa City, a distance of approximately 30 miles, with a branch going east from Cedar Rapids to Mt. Vernon, an additional distance of 15 miles. This includes some of the best farming land in Iowa, where interurban traffic is exceedingly heavy. The passenger trains on the line are operated by electricity and the freight trains by steam.

Along the route ten open stations are equipped with telephones and selective signaling apparatus. Sets containing the Western Electric selectors are used for signaling station operators and self-contained, folding-gate, telephone arms are used for the operators' talking apparatus. Six way-station outfits are installed between Cedar Rapids and Iowa City and two between Cedar Rapids and Mt. Vernon. The power house, the superintendent's office and the shop are also connected with the telephone distpatching circuit. The dispatcher is located in the shop-office building 2 miles south of Cedar Rapids and is in control of all points on the line.



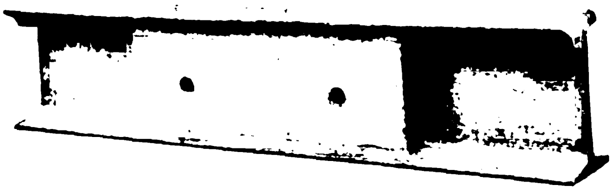
DISPATCHER'S OFFICE, CEDAR RAPIDS & IOWA CITY RAILWAY

A portable telephone set has been furnished to each train crew so that communication may be established with headquarters from various points along the line. These telephones are fitted with cords and plugs arranged for plugging in pole jacks which are placed at a convenient height on the telephone poles along the right-of-way. This equipment is especially valuable in emergencies. Nine pole jacks are placed on the Cedar Rapids and Iowa City division and six on the line to Mt. Vernon.

The normal traffic on this railway system involves the operation of thirty-eight passenger trains and four scheduled freight trains daily between 5 a.m. and 1 a.m. on the Cedar Rapids & Iowa City line and eighteen passenger trains and two scheduled freight trains between 5 a.m. and 12 o'clock midnight on the Cedar Rapids & Mt. Vernon branch. The telephone dispatching system has now been in use for some months and excellent results from every point of view, notably those of economy and efficiency of operation, are reported.

Automatically Welded Electric Joints in Brooklyn

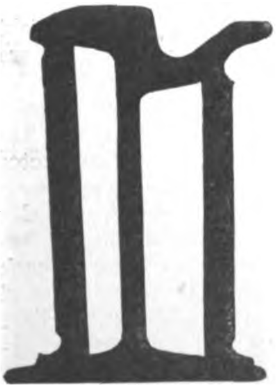
An entirely original method of carbon electrode rail welding was carried out between Nov. 7 and Nov. 18 for the Brooklyn Rapid Transit System by the Atlantic Welding Corporation, New York. The work comprised the installation of sixty-six joints in five-year old rail on the heavily-traveled downtown section of Fulton Street, between Court and Tillary Streets, Brooklyn. Owing to traffic conditions, all work was done between 10 p. m. and 5:30 a. m. and no work at all was permissible on Saturdays and Sundays.



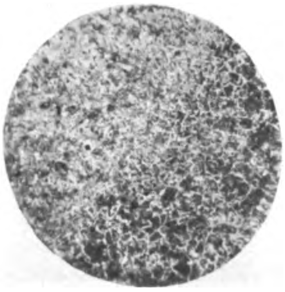
SAMPLE OF A COMPLETE WELD

The rails of Lorain 398 and 423 section had been set on steel ties incased in concrete and had been secured to the ties with clips. In substituting the new welded joint for the riveted type these clips were removed with a cold chisel and the rail was welded directly to the ties. The rectangular joint plates, which support the head as illustrated, were made in lengths of 31 in. and 19 in., several compromise joints with these lengths being, of course, included. Twenty-six of the joints included 12-in. inserts. A metallic electrode process was used to fill the heads of excessively worn rails at joints and at the dishes opposite the joints. The job was finished bv grinding to the original level.

The welding process itself is one which has already been used on a large and successful scale throughout Europe. Its salient features are two: The carbon electrode used is set in a carriage which is moved at a predetermined rate and in a manner which avoids all inequalities due to the varying skill of the welder himself; the welding current is not drawn through wasteful resistance but is taken at an efficiency of 90 per cent or more through a 550/70-volt European-Rosenberg motor-generator set which can withstand a short-circuit indefinitely.



EARLY WELD OF LORAIN NO. 395, 141-LB. RAIL



MICRO-PHOTOGRAPH OF SECTION THROUGH A WELD

A complete welding outfit consists of a covered wagon with the special motor-generator set mentioned, a marble switchboard of power-station type and two portable welding machines or carriages. In executing work, the carriages are operated inside of light-weight tents, which are readily set up or dismantled.

Each outfit has a crew comprising a foreman, two welders and two helpers, one welder and helper working at each carriage. While the special conditions in Brooklyn made work under the best conditions impossible, from twelve to fifteen joints have been made elsewhere per eight-hour day with one outfit and crew, so that the actual time necessary per joint is only twenty-five to thirty minutes. In numerous cases, eighteen joints per day have been made by five men. This rate will suffice to keep step with the tasks of the other track work gangs. If, however, it is necessary to increase the number means can be provided to make as many as twenty-five joints in one shift.

The welding process is purely automatic. After the beveled flat-bar plates have been adjusted, the welding carriage and the arcing element thereon are placed over the joint. The automatic feature lies in the condition that the carbon is set to travel at a predetermined rate over the line to be welded. The carriage is adjustable to any type of rail. The weld is obtained by making the arc fuse the two surfaces (plate and rail), a firm, composite structure being obtained with the help of feed-in material.

MOTOR-GENERATOR WAGON AND TENTS

As shown in an accompanying micro-photograph of a weld made abroad, the transition in the composition of the metal from the plate to the material added and from that material to the head is very gradual and differs only in the percentage of carbon content. As the actual area welded is low in carbon, a junction of high ductility and great strength is obtained. In no case has a microscopic examination shown anything but a close-grained structure with an entire absence of "shoot offs" thus proving that the head had never reached a temperature high enough to change the molecular structure. The intrinsic value of the joints so produced is the firm support given to the head, and the tying together of the head and base to form a rigid box girder of solid section.

In the plant of the United Water, Gas & Electric Company, at Hutchison, Kan., which furnishes power to the Hutchison Interurban Railway, the body of a mouse grounded some important circuits in the station which stopped the railway and put out all the lights in the city. Many other industries depending on electric motors for power were also without energy for about an hour. It appears that the assistant engineer of the plant discovered the mouse and while he was trying to dislodge it from its precarious position without shutting down the plant the little animal jumped into a connection that electrocuted it and caused a serious short-circuit.

News of Electric Railways

DECISION IN PASSAIC GAS CASE

Highest Court in New Jersey Declares Franchises Must Be Valued for Rate-Making Purposes

A decision was rendered on Dec. 9 by the Court of Errors and Appeals of New Jersey upsetting the order of the Board of Public Utility Commissioners requiring the Public Service Gas Company to establish a 90-cent rate for gas in its Passaic district. The interest of this decision to electric railway companies lies in the fact that this rate was based on a valuation in which the commission made an allowance for "going concern" value, but made no special allowance for the value of franchises. The decision of the commission in this case was published on page 35 of the issue of this paper for Jan. 4, 1913. The decision was upheld by the Supreme Court, but was appealed to the Court of Errors and Appeals by the gas company, which is one of the constituent companies of the Public Service Corporation.

The decision of the court, rendered just as this issue was about to go to press, includes the following statement:

"When a public utility corporation is in the enjoyment of privileges to use streets and public places in this State for the purposes of its business, whether such privileges be conferred by the State alone or partly by the State and partly by the municipality, and whether they be exclusive or subject to duplication, such privileges constitute a special franchise which is property, is subject to taxation and has normally a substantial value; and in making a valuation of the property of such corporation for the purpose of establishing a basis for the regulation of rates to be paid to it by the public for its product or service, it is erroneous to assign no value, or a merely nominal value, to such franchise when a substantial value is fairly reflected in the total market value of its securiites."

The report justifies this decision by many citations and also upon grounds of equity. It also considers the statement of the commission that it was the policy of the State not to allow the capitalization of franchises for an amount in excess of the actual cost involved in obtaining such franchises. The court says that even if the franchises are not capitalized this is no reason for the exclusion of the franchise from a valuation for rate-making purposes, because, while the value of the franchise may not be included in the par value of the capital stock it affects its market value.

DES MOINES FRANCHISE MATTER

The Des Moines (Ia.) City Railway is awaiting action by the City Council on its petitions for a special election to vote on the question of granting a franchise. About 10,000 of the voters in the city, or more than half, have signed one petition calling for such an election. The law requires only about 5000 names on this petition. About 1500 property owners have signed a second petition calling for the same election. The law requires only 175 names on this petition. Both petitions were secured so that the city might proceed with both and thus meet the different requirements of two sections of the law governing franchise elections. This was done in order that the date of the election might be fixed without the necessity of delay due to legal proceedings to determine which section of the law should apply.

Members of the City Council, and Mayor Hanna especially, have seen fit to delay the proposition indefinitely and continuously in spite of every effort on the part of the company for speedy action. When the Council refused action on the petitions the company finally took the question to the courts, and in the lower tribunal the decision was soon reached. An appeal has been made to the State Supreme Court and that body has advanced the hearing to Dec. 21. The company's only interest in this decision is to avoid any doubt about the legality of the proceedings. In the meanwhile the city might have proceeded under both sections so that there would be no uncertainty. Instead the city has refused to proceed under either.

Mayor Hanna has stated several times that he proposed to fix Jan. 16 as the date for the election, but he has not yet fixed any date. It has been proposed recently that a vote on the local saloon question be taken at the same time as the vote on the city railway franchise. Mayor Hanna also has proposed to submit a series of amendments to the proposed franchise at the time of the election, but it is thought unlikely that he will be able to do this since the petitions call for an election on the specific franchise called for by the company and none other.

MUNICIPAL OWNERSHIP IN SEATTLE

City Apparently Divided Over Question of Continuing Present System

As a culmination of the controversy waged in Seattle, Wash., the last three years over the question of municipal operation of electric railways, several members of the City Council now advocate disposing of the existing municipal railway system. The leader of the faction in favor of selling the lines was elected to the City Council last year largely on account of his advocacy of municipal ownership, but he is now arrayed on the other side. This state of affairs is attributed to a considerable extent to the filing of a suit on Nov. 27 by the State on behalf of the state board of accountancy against the City Council of Seattle, the Mayor, city treasurer, city comptroller and former Mayor Cotterill to recover money alleged to have been illegally appropriated for the rehabilitation and operation of the Lake Burien Railway outside of the city limits, the second unit in the city's railway system.

The Lake Burien line was accepted as an unincumbered gift from its promoters, property owners along the right-of-way, and $25,000 was appropriated by the City Council to rehabilitate the line. Later $9,000 was appropriated to form an operation fund for this line and Division A of the municipal lines. Since the beginning of operation there has been a deficit each month which has remained a charge against the general fund. Three miles of the Lake Burien line lie outside of the city limits. As if to anticipate the action for recovery of the appropriation a rider to abolish the accountancy board was placed on the ballots which went before the voters at the recent general election, but this issue was defeated at the polls. The attorney-general hopes to establish through the suit whether cities of the State can operate public utilities outside the city limits.

The municipal system of Seattle has been described previously in the ELECTRIC RAILWAY JOURNAL. It consists briefly of a line known as Division A, 4.2 miles long, running from the business district to the mill district of the city, and of the Lake Burien line, 9 miles, which extends from the extreme southern end of the city to Lake Burien. There is a distance of practically 2 miles between the two divisions. The advocates of the municipal railway system have proposed connecting the lines with a motor bus service, and have endeavored to add the Seattle, Renton & Southern Railway to the municipal system. This line traverses the Rainier Valley practically parallel with the Lake Burien line, but 2 miles or 3 miles distant. It crosses the business section of Seattle, however, and could be connected with Division A, but it could not be connected with the Lake Burien line except at considerable expense.

The constant heckling indulged in by members of the City Council has apparently served no purpose except to keep many of the outlying districts of the city without adequate transportation facilities. In five years no extensions of the lines of the Puget Sound Traction, Light & Power Company have been built in Seattle because of the unreasonable demands of a City Council which was determined upon converting the lines of the city into a municipal system.

A resolution since introduced in the Council by A. Allen Dale providing for the sale of Division A and C of the municipal railway has been tabled pending a decision in the suit of the State against the city alleging misappropriation of funds. Mr. Dale advocates the plan of placing the matter of selling the lines before the electorate at the municipal election in Seattle in March.

TOLEDO NEGOTIATIONS HALTED

Nothing has been done toward renewing the negotiations between the city of Toledo, Ohio, and the Toledo Railways & Light Company since the franchise committee of the City Council announced that it had completed a franchise similar in many ways to the one prepared by the company in the first place. It is understood, however, that the draft prepared by the franchise committee contains some requirements objectionable to the company. Copies of the ordinance are in the hands of the attorneys, but they have not as yet been made public.

In overruling the demurrer filed by the Toledo *News-Bee* in the case of the United States against the Toledo Newspaper Company and N. D. Cochran, Judge Killits announced on Dec. 4 that the case would go to trial on its merits on Dec. 28. This is the action in which the defendants were cited for contempt of the Federal Court because of certain publications relating to the receivership case of the Toledo Railways & Light Company, and meetings conducted by so-called agitators after the court had rendered a decision, restoring the old rate of fare pending a final settlement of the franchise question.

CLEVELAND SUBWAY AND LABOR MATTERS

It is stated that the freight subway project under East Fifty-fifth Street, Cleveland, Ohio, as planned by O. C. Barber, Barberton, will depend largely upon the establishment of the harbor line at the foot of the street where he has planned to erect extensive coal and ore docks. The subway would connect the proposed docks with the railroads in the Cuyahoga valley.

Cleveland motormen and conductors are arranging to request the State Industrial Commission to investigate working conditions in the city. They contend that the State law provides for eight hours of continuous rest out of each twenty-four for railway employees and that the commission has authority to investigate and enforce the law. They will, however, ask Attorney-General Hogan for an opinion on the State law before they appeal to the commission.

Several minor amendments to the proposed grant to the Cleveland Rapid Transit Company were submitted at the regular meeting of the City Council on the evening of Dec. 7 and the ordinance was placed back on its second reading.

PROGRESS ON BOSTON SUBWAY CONSTRUCTION

Steady progress is being made in the construction of the Dorchester tunnel and the East Boston tunnel extension, at Boston, Mass., under the direction of the Boston Transit Commission. The former is now completed from Tremont Street to Washington Street, under Winter Street, and the Washington Street station, between Washington and Arch Streets, is completed except for interior finish and equipment. This station is a two-story structure. Transfer between Cambridge subway and Washington Street tunnel and Dorchester trains will be made at the station through passageways or lobby connections. East of this station 270 ft. of tunnel built in open cut is completed, the remaining section of 760 ft. connecting with Dewey Square and the South Station being under construction by the tunneling method. Work has been started on the Dewey Square section, which is to be 800 ft. long.

The East Boston tunnel extension, which connects Scollay Square with the West End, will have stations with island platforms at Scollay and Bowdoin Squares. An inclined elevator will be provided at the former station, which is being built below the Tremont Street subway. The existing entrances will serve for both stations, with an additional entrance at the north side of the square. Between Scollay and Bowdoin Squares the tunnel is a double-barreled structure and throughout the entire extension space for two tracks is provided. West of the Bowdoin Square station an underground loop will be built to enable a portion of the East Boston cars to be turned back at this point, and a switch-back will be installed east of Scollay Square to reverse various Cambridge trips. The general work of construction is practically completed with the exception of the finishing of the stations and the reconstruction of the tunnel between Washington Street and Scollay Square.

MISGIVINGS IN SAN FRANCISCO

"Chronicle" Wants City to Apply Business Principles to Municipal Line

In the issue for Dec. 2 the San Francisco *Chronicle* said in part in an editorial headed "Our Municipal Railroads":

"The profit in owning and operating a street railroad system is made by a very trifling percentage of each fare paid. Now that this city has engaged in the railway business, we all wish it to be successful. The net income ought to be sufficient to make good all that we lose by taxes which private owners have paid, and in addition to pay off all indebtedness incurred in building the system within such a reasonable term as would be accepted by a private company as the period of a franchise. Extensions must be made only when they will pay for themselves during such a period. Upon any other basis, either the taxpayers or those who ride on the cars will have partly to pay for other people's rides. If any section of the city wants a railroad not likely to pay within a reasonable time, the property owners who will benefit by it ought to pay for it.

"In this city we already see different sections vigorously fighting each other before the Supervisors in regard to the location of new railroads. In no case does any faction present figures to show that the road they desire will be profitable. We are already operating lines which for the present are unprofitable, and are operated out of the profits of the paying properties. It is useless to ignore the fact that if the construction of new lines be left entirely to Supervisors their action will be largely determined by its probable ultimate effect on votes. And that is the very worst way there is to fix locations. This scramble for street railroad and other improvements is at the bottom of the movement to return to our old plan of electing Supervisors by wards. The present management of our municipal railroads is competent. Any management if left to itself will strive to make the best possible showing. Such city administrations as we have sometimes had would take care that there was a management to suit them, but that rests with the people. But there should be sufficient backbone in the government to run our street railroads on business principles."

CONSTRUCTION IN TENNESSEE AND KENTUCKY

The extension of existing electric interurban lines and the construction of several others which are definitely projected and some of which are surveyed, are engaging the attention of middle Tennessee and south-central Kentucky. These lines will radiate from Nashville, Tenn., and in connection with two lines already in operation will traverse some of the richest territory in the United States. As has been noted previously, the Nashville & Gallatin Railroad is to build a branch, leaving the main line at Goodlettsville and extending to Springfield, Robertson County, and ultimately to Clarksville, in Montgomery County, passing through Guthrie in southern Kentucky. All of this is a rich tobacco and grain growing section. The same company has outlined an extension northward from Gallatin to Bowling Green, in Warren County, Ky.

An important extension from the line of the Nashville & Franklin line is already under way. Known as the Middle Tennessee Interurban Railroad, it will extend from Franklin, through Eaglesville, Shelbyville, Fayetteville, all in Tennessee, to Huntsville, Ala. The 23 miles between Franklin and Eaglesville is already graded.

Of the new projects, the Tennessee & Kentucky Interurban Railroad is perhaps the most important. This line, as has been indicated, will extend from Nashville, across the State line to Adairville, in Logan County, thence connecting with Russellville, the county seat, and ultimately being extended to Franklin, seat of Simpson County, Ky. The Cumberland Valley Interurban Railway has its line surveyed through Wilson County to Watertown, Alexandria, Smithville, McMinnville and Sparta, from which branches are projected to Lebanon and the Hermitage, the old home of Andrew Jackson. The Nashville & Murfreesboro Interurban Railway is projected to pass through Davidson and Rutherford counties, extending ultimately to Woodbury, seat of Clinton County, while there are various other projects in process of organization, it is said, to build lines from Nashville to Ashland City and out the Charlotte Pike. The Nashville Traction Company is reported to be planning an interurban extension out the Murfreesboro Pike to Una.

The project to build the interurban railway to connect Lexington, Ky., and Richmond, Ky., has received further stimulus from the fact that Lexington's new Board of Commerce is considering it. Louis des Cognets, former president of the Lexington street railway system, said recently:

"Even should the Kentucky Traction & Terminal Company be disinclined to build the line, it has given assurance that it will co-operate in a most friendly spirit with any company operating cars into Lexington from Richmond. The line to Richmond is one of the most important definite plans for the benefit of the whole community that the Board of Commerce can take up."

Costly bridge construction necessary to span the Kentucky River, which has cut a wide deep channel between the two towns, has previously acted as a deterrent to the building of the line. Mr. des Cognets, however, urges that the state law permits toll bridges and that these tolls could be made to meet the fixed charges of such a structure, the cost of which is estimated at $250,000.

Third Track in State Street, Chicago.—The Chicago (Ill.) Surface Lines is asking permission to build an additional third track in State Street, in order to do away with "switchbacks" and to provide loops for cars from the west, northwest and southwest sides.

Washington Air-Brake Order.—The Public Service Commission of the District of Columbia has denied the application of the Washington Railway & Electric Company for an extension of sixty days from Dec. 31, 1914, in which to install air brakes on all cars weighing sixteen tons or more.

Employees Want New Laws.—On Jan. 11 representatives of electric railway employees from all sections of Ohio will meet at Columbus to plan a campaign for the enactment of laws for the regulation of working conditions on electric railways. The call for the meeting was sent out by the Amalgamated Association.

Transportation Commission Favored.—Mayor Hocken of Toronto, Ont., at the recent luncheon of the Municipal Improvement Association in that city, delivered a speech favoring the appointment early next year of a transportation commission to plan civic car line extensions with a view to their unification in 1921 with the present system as operated by the Toronto Railway.

Recovery of Benefit Fund Payments Allowed.—Chief Justice Shepard of the Court of Appeals of the District of Columbia decided on Dec. 9 that an employee of the Philadelphia & Baltimore Railroad was entitled after discharge by the company to recover from the railroad the amounts of money he had paid into the company's benefit fund. The man who sued for recovery had been in the employ of the company twenty years.

Toronto Suburban Railway Rights.—City Solicitor Johnston, of Toronto, Ont., reporting to the Board of Control on Dec. 3 on the rights and privileges held by the Toronto Suburban Railway pointed out that the company had what practically amounted to a perpetual franchise, as provisions were made for its renewal in September, 1929, and at the end of every twenty years thereafter. The only way the city can acquire the rights of the company is by purchase in 1929 or at the end of any other twenty-year period, either by agreement or arbitration.

Service Conference in Pittsburgh.—J. D. Callery, president, and P. N. Jones, general manager of the Pittsburgh (Pa.) Railways conferred with Mayor Joseph G. Armstrong and City Solicitor C. A. O'Brien on Dec. 11 relative to the points at issue between the company and the city. The matter of the suit brought during the term of Mayor Magee to enforce the payment of the car tax was not mentioned, as this is to be handled separately. While transfers, rerouting, street cleaning, track repairing and the establishment of a shuttle between downtown Pittsburgh and the North Side were discussed nothing definite was decided upon. Another conference will be held soon.

The New Haven Indictments.—The case of the indictments against a number of the directors of the New York, New Haven & Hartford Railroad was called in the United States District Court before Judge Rudkin on Dec. 4. Pleas of not guilty were entered for William Rockefeller, Robert W. Taft, Charles F. Brooker, Frederick F. Brewster, D. Newton Barney and Henry K. McHarg. Pleas claiming immunity were entered for William Skinner, James S. Elton and George F. Baker. A. Heaton Robertson and James S. Hemmingway also entered pleas of not guilty. John L. Billard, Edward A. Robins and Thomas De Witt Cuyler have also entered immunity pleas. The remainder of the twenty-one directors indicted for violation of the Sherman law have already entered pleas of not guilty.

Confiscation of Mexican Tramways Reported. — W. E. Pearson, at the New York office of the Pearson Engineering Corporation, Ltd., confirmed the statement recently attributed to Dr. F. S. Pearson, president of the Mexico Tramways, that the latter had received a cable on Dec. 2 from his representative to the effect that the property had been confiscated by the political factions now in control of the city government. The treasurer and other officers were ordered to leave the service forthwith. Both the British and the Brazilian authorities in Mexico City are said to have filed protests. No other advices regarding this matter had been received up to Dec. 9. According to recent reports the Zapatistas have not in any way disturbed the Mexican Light & Power Company, which supplies the tramway, the city and private customers with light and power.

Public Utility Commission Legislation Likely.—The question of a public utilities commission for Michigan, which was before the Legislature two years ago, will probably come up again at the session this winter. It is understood that Governor Ferris and the members of the Michigan Railroad Commission will back the bill, while the Republican state platform pledged the support of that party to such a bill. Two years ago two bills for a utilities commission were before the Legislature, one copied after the Indiana law and the other drawn up by Chairman Hemans of the State Railroad Commission. Both died in committee. Mr. Hemans is now at work on another bill for presentation at the coming Legislature, but his plans are tentative as to what it shall contain. Governor Ferris, it is understood, will make a special plea for a public utilities commission in his message to the Legislature.

Forestall Complaints.—In an editorial "Forestall Complaints Before They Happen," *Printers' Ink*, a journal for advertisers, after quoting from the article "The Importance of Good Public Relations," written by Theodore P. Shonts, president of the Interborough Rapid Transit Company, for the convention issue of the ELECTRIC RAILWAY JOURNAL, says in its isue of Dec. 10: "With Mr. Shonts we are in hearty accord, but *Printers' Ink* would go one step farther. A well-conducted advertising campaign along the general lines of that conducted by the American Telephone & Telegraph Company would forestall most of the complaints before they happen. The American public is not only a reading and a thinking public; it is a public pretty thoroughly alive to the sense of fair play. An understanding of the fundamental problems which 'big business' is forced to solve will go far toward removing hostility on the part of the great mass of the people. In no way can that understanding be given so easily and so quickly as by advertising."

New York's Subway Labor Problem.—The Public Service Commission for the First District of New York has been served with an injunction, otained by William E. Heim, a taxpayer of New York City, restraining it from taking any action to forfeit any construction contract on the new rapid transit lines on account of the alien labor clause of the State labor law, or from withholding payments to such contractors because of violations by them of this clause. Argument on the preliminary order was had in the Special Sessions Court on Dec. 4. It is expected that the decision of this court will be appealed to the Appellate Division and from there to the Court of Appeals, so that the judgment

of the court of last resort may be obtained. The application for the injunction is based upon the allegation that the provision of the labor law forbidding the employment of non-citizens upon public work is unconstitutional and a violation of the treaty between the United States and the Kingdom of Italy and similar treaties with other nations in the most favored nations class.

Reports Requested Regarding Seattle Purchase.—Preliminary to further consideration of the proposition for the purchase of the Seattle, Renton & Southern Railway by the city of Seattle for a consideration of $200,000 in municipal railway bonds and 20 per cent of the gross earnings for a period of twenty-eight years, payable annually, Mayor H. C. Gill recently conferred with the heads of the various departments of the city government on the various phases of the project. The Mayor has asked A. L. Valentine, superintendent of public utilities, to report on the cost of operation of the line by the municipality, the cost of such reconstruction as will be necessary in bringing the tracks to the established grades, and matters of like nature. A. H. Dimock, city engineer, has been requested to furnish an estimate of the cost of grading and regrading the 18 ft. of Rainier Avenue now occupied by the tracks of the Seattle, Renton & Southern Railway. J. D. Ross, lighting superintendent, will report on the estimated cost of current sufficient to operate the line in connection with Division A and the Highland Park & Lake Burien Line, Division C, as well as the advantages that will accrue to the light and power department by city operation of the line. James E. Bradford, corporation counsel, will report on the various suits against the Seattle, Renton & Southern Railway, now in court.

PROGRAMS OF ASSOCIATION MEETINGS

New England Street Railway Club

The regular monthly meeting of the New England Street Railway Club will be held at the American House, Boston, Mass., on Dec. 17. H. A. Bullock, staff assistant to the president of the Brooklyn (N. Y.) Rapid Transit Company, will speak on "The Employee's Welfare." His address will be followed by a discussion in which it is expected that representatives of large corporations in other kinds of business who have had extended experience along this line will take part. The dinner which precedes the meeting will be served at 6 p. m.

American Wood Preservers' Association

The eleventh annual convention of the American Wood Preservers' Association will be held at the Congress Hotel and Annex, Chicago, on Jan. 19, 20 and 21, 1915. The subjects to be treated in papers are as follows:

"Treated Timber for Factory Construction," by F. J. Hoxie, engineer and special inspector of the Associated Factory Mutual Fire Insurance Companies.

"Temperature Changes in Wood under Treatment," by George M. Hunt of the Forest Products Laboratory, Madison, Wis.

"Sill Ties," by F. J. Angier, secretary-treasurer of the association.

"New Data on Properties of Creosote Oil," by Dr. Herman von Schrenk.

"Facts on Treated Ties," by J. H. Waterman, superintendent of timber preservation of the Chicago, Burlington & Quincy Railroad.

"Bleeding and Swelling of Paving Blocks," by Clyde H. Teesdale, in charge of wood preservation at the Forest Products Laboratory, Madison, Wis.

"Economical Use of Steam in Connection with Wood Preserving Plants," by A. M. Lockett, mechanical engineer, New Orleans, La.

"Mechanical Life of Ties as Affected by Ballast," by Earl Stimson, engineer maintenance of way of the Baltimore & Ohio Railroad.

"Determining the Soundness of Timber before Treatment," by C. M. Taylor, superintendent of the Port Reading Creosoting Plant.

"Facts on Creosoted Piling," by T. G. Townsend, piling inspector of the Southern Railway.

"A Problem in Air Seasoning Ties," by A. H. Noyes, assistant treasurer of the Ayer & Lord Tie Company.

Financial and Corporate

RECENT FINANCIAL TENDENCY

The sales of bonds on the New York Stock Exchange on Dec. 9 totaled $1,736,000, par value, as compared with $1,395,500, par value, for the same day last year. This is much the largest day's business in bonds since public trading was resumed. Price movements on the average showed a further gain, but there were reactions in some securities which have lately experienced unnatural advances. Despite the approaching opening of the Stock Exchange for trading in stocks, sterling rates remain normal. Money continues easy. It is not regarded as likely that rates will be materially affected by any borrowing which may be made following the reopening of the exchange for public trading in stocks. Trading in stocks through the clearing house, according to the reports issued on Dec. 9 by the New York Stock Exchange, presented many interesting features. The most important changes reported during the day were in the railroad issues.

CHICAGO TRACTION ACCOUNTING CONTROVERSY

The report of the special audit of the books of the Chicago Railways and the Chicago City Railway being made by the city administration has just been published. That for the Chicago Railways was made by M. & L. W. Scudder, of New York, and that for the Chicago City Railway by Barrow, Wade, Guthrie & Company. In both cases the books were found without important error. The corporation counsel of the city, however, has recommended certain changes in the accounts to which paving and the removal of obstructions should be charged, although both of these questions have either been covered by specific provisions in the ordinance or publicly discussed and decided by the Board of Supervising Engineers, which has had the sole authority under the ordinance in these matters. It has been estimated that these changes, if made, would reduce the Chicago Railways' capital account $6,945,130 and make it necessary to pay the city traction fund $584,264, and that the company should also credit its renewal account with $531,965, and, similarly, that the capital account of the Chicago City Railway would have to be reduced approximately $5,138,000.

Regarding this controversy Henry A. Blair is quoted as saying, in an interview, that the books of the two railway companies have been audited each year by accountants selected by the city and approved by the companies. Through these audits the city comptroller was familiar with the methods of the Board of Supervising Engineers in charging every item which is now sought to be questioned by the Mayor. On these audits the companies have made seven annual settlements with the city, having turned into the traction fund more than $13,000,000,

On the special audits during Mayor Busse's administration the city and the companies had expended approximately $100,000, of which the city has borne 55 per cent. In the audit just completed the city again appropriated $50,000 of its own funds for the work. It would seem that this constituted a liberal expenditure for auditing purposes. Moreover all these firms have reported that the railway companies were conforming to the terms of the 1907 ordinances and the decisions of the Board of Supervising Engineers. The accountants engaged on the work at the present time were not called upon to show what would have been the results of operation during this seven-year period if the companies had followed the ordinance and the decisions, but if they had followed the opinions rendered by corporation counsel. Mr. Blair did not consider these criticisms therefore worthy of serious consideration. Speaking from the standpoint of a financial representative he did not believe that the controversies of this nature were at all helpful either to the city or to the railway companies.

Mr. Blair is also quoted as saying that during the seven-year period the companies had never at any time earned more than a fair rate of return upon the capital fixed by the actual purchase price of the city. The rate of return has been about 7 per cent, which includes the 5 per cent return upon the purchase price, the companies' 45 per cent of the visible net receipts and all construction profits. This rate of return he stated was less than that earned by other public utilities in the city of Chicago.

ANNUAL REPORTS

Eastern Pennsylvania Railways

The consolidated statement of income, profit and loss of the Eastern Pennsylvania Railways, Pottsville, Pa., for the twelve months ended June 30, 1914, follows:

Gross earnings	$826,415
Operating expenses and taxes	503,487
Net earnings from operation	$322,928
Deduct underlying companies charges	45,525
Balance	$277,403
Interest on bonds	$164,863
Other interest and rentals	13,630
Total	$178,493
Surplus for year	$98,909

As compared with the year ended June 30, 1913, the gross earnings increased $56,735, or 7.37 per cent, and the operating expenses increased $67,483, or 15.48 per cent. The net earnings, therefore, decreased $10,748, or 3.22 per cent, while the net profit for the year decreased $19,463. The various departments showed the following earnings results: Railway, an increase of $13,576; electric, an increase of $43,415; gas, a decrease of $55, and park, a decrease of $201. The increased operating expenses were partly caused by higher cost of labor and extra maintenance. Railway maintenance increased by $23,900 to a total of $88,390 for the year, while the cost of transportation increased $13,000. There was charged to capital accounts during the year $115,689, of which $57,666 was for the railway department and $58,023 for the electric department.

San Francisco-Oakland Terminal Railways

Price, Waterhouse & Company recently completed an audit of the books of the San Francisco-Oakland Terminal Railways for the fiscal year ended June 30, 1914, and submitted the following income statement for that period:

Operating revenues		$4,515,798
Operating expenses:		
Maintenance of way and structures	$400,972	
Maintenance of equipment	284,081	
Traffic	25,398	
Conducting transportation	1,923,966	
General and miscellaneous	295,503	
Total operating expenses		$2,929,920
Net operating revenue		$1,585,878
Deduct:		
Taxes and licenses		239,000
Net revenue		$1,346,878
Add:		
Miscellaneous income		125,964
Net income before charging interest, amortization of premiums and discount on bonds and notes, and depreciation of road and equipment		$1,472,842
Deduct:		
Interest on bonds	$859,268	
Interest on collateral trust notes	175,000	
Miscellaneous	23,232	
Total		$1,057,500
Profit after charging all interest, but before providing for amortization of premiums, and discount on bonds purchased, and depreciation of road and equipment.		$415,342
Deduct:		
Amortization of premiums and discount on bonds purchased		10,491
Profit after charging all interest, but before providing for depreciation of road and equipment		$404,851
Add:		
Interest charged by company to capital assets		240,101
Balance carried to surplus account		$644,952

The operating expenses of the company for the fiscal year consumed 64.9 per cent of the operating revenues, divided as follows: maintenance of way and structures, 8.9 per cent; maintenance of equipment, 6.3 per cent; traffic, 0.6 per cent; conducting transportation, 42.6 per cent, and general and miscellaneous, 6.5 per cent. Taxes and licenses absorbed 5.3 per cent of the operating revenues, leaving net revenue of 29.8 per cent. Miscellaneous income constituted 2.8 per cent of the operating revenues, so that the net income before charging interest, amortization and depreciation was 32.6 per cent of the operating revenues.

The auditors report net additions to capital account of $510,927 for road and $105,923 for equipment, a total of $616,850. These amounts are those existing after considerable writing down of the value of land and writing off of the value of abandoned structures. The total amount of bonds outstanding as of June 30, 1914, is certified to amount to $16,656,000 in the hands of the public and $3,256,000 pledged as security for the Oakland Railway notes, making a total outstanding amount of $19,912,000.

The profit of $404,851 after charging all interest, including the interest properly chargeable to capital, does not provide for sinking fund payments. While amply able to maintain itself in excellent operating condition, therefore, the property evidently is not in a position to undertake new construction until, through refinancing, new capital has been obtained.

Barcelona Traction & Light Company, Barcelona, Spain.—Owing to the present European war, the Barcelona Traction, Light & Power Company was unable to meet the semi-annual interest coupons due on Dec. 1 on its outstanding £1,500,000 of first mortgage 5 per cent bonds. According to a statement from the Toronto office, the war has rendered it impossible to continue the arrangement made last June for providing the funds required for the completion of the present program of construction. The board, however, has under consideration a plan which would provide the company the necessary funds for completing the work under construction and for adjusting computing interest. The enterprises of the company at present in operation are said to show satisfactory results, with a steadily increasing revenue. This company was formed in 1911 by F. S. Pearson and associates and it either owns or controls virtually the entire tramway, light and power business of not only the city of Barcelona but the whole district of Cataluna, the industrial center of Spain.

California Street Cable Railroad, San Francisco, Cal.—J. Barth & Company, San Francisco, have purchased the $384,000 of new general first mortgage 6 per cent serial refunding gold bonds of the California Street Cable Railroad, dated Jan. 1, 1915, and due in twelve annual installments beginning Jan. 1, 1916, and ending Jan. 1, 1927. These bonds were referred to in the ELECTRIC RAILWAY JOURNAL of Oct. 31, Nov. 21 and Dec. 5.

Chicago (Ill.) Elevated Railways.—At the annual meeting of the Chicago Elevated Railways collateral trust the trustees reduced the governing board from seven to five members. Ira M. Cobe and F. A. Delano, who joined the Federal Reserve Board in Washington, withdrew. It was not thought necessary to fill their places. The board now stands: Frank A. Vanderlip, Henry A. Blair, Samuel Insull, E. W. Harden and Samuel McRoberts. The governing committee will elect the executive committee at a later meeting. There are three members of that body, Samuel Insull, Henry A. Blair and Ira M. Cobe. Mr. Cobe has tendered his resignation, but his successor has not as yet been selected.

Cumberland County Power & Light Company, Portland, Maine.—It was stated in the ELECTRIC RAILWAY JOURNAL of Nov. 21 that the Cumberland County Power & Light Company has certified and guaranteed, principal and interest, $500,000 of bonds of the York County Power Company, a subsidiary. Of this amount $315,500 are outstanding in the hands of the public, $150,000 are in the treasury of the Cumberland County Power & Light Company and $34,500 are in the treasury of the York County Power Company. The $315,000 outstanding includes $100,500 of bonds which have been exchanged for an equal amount of underlying liens. There has been no offering of these bonds.

Federal Light & Traction Company, New York, N. Y.—E. N. Sanderson, president Federal Light & Traction Company, has issued a circular regarding the recent deferring of dividends on the company's $2,500,000 of 6 per cent cumulative preferred stock, as noted in the ELECTRIC RAILWAY JOURNAL of Dec. 5. The net income of all companies for the twelve months beginning September, 1913,

is said to have been adversely affected by the disastrous fire at Hot Springs, the serious strike in the Trinidad coal fields, and the drastic rate schedules in Tucson, Ariz., and Springfield, Mo. In the opinion of the board, however, the turning point has been passed, and from now on the company will enjoy increased gross and net earnings. During the last twelve months the gross earnings showed an increase over the corresponding previous period, and only the net earnings suffered substantially from the adverse condition. Since July the net income has been constantly improving, so that during the three months ended Oct. 31 the dividend on the preferred stock has been more than earned.

Fresno (Cal.) Interurban Railway.—The Railroad Commission of California has granted the application of the Fresno Interurban Railway for permission to make three stock and bond issues to provide for twenty-six miles of new line at an estimated cost of $17,300 per mile.

Interborough Rapid Transit Company, New York, N. Y.—An extra dividend of 5 per cent has been declared on the $35,000,000 of stock of the Interborough Rapid Transit Company, along with the regular quarterly payment of 2½ per cent, both payable on Jan. 2 to holders of record on Dec. 21. Since the Interborough-Metropolitan Company owns $33,912,800 of the stock, its income from the extra disbursements is $1,695,640. The committee on listings of the New York Stock Exchange has received an application from the Interborough-Metropolitan Company to list $17,942,000 of 5 per cent cumulative preferred stock. This is the stock that was formerly in the hands of the voting trust and does not represent an increase in the capitalization of the company.

Joliet & Eastern Traction Company, Joliet, Ill.—The bondholders of the defunct Joliet & Southern Traction Company have almost unanimously decided to accept stock in the Joliet & Eastern Traction Company in exchange for their holdings. The formation of this new company was described in the ELECTRIC RAILWAY JOURNAL of Nov. 21. The greater part of the $80,000 fund paid into court during the period of bankruptcy of the Joliet & Southern Traction Company will be practically all turned into the treasury of the new company.

Kentucky Securities Corporation, Lexington, Ky.—The annual report of the Kentucky Securities Corporation for the fiscal year ended June 30 is made up principally of a report for the Kentucky Traction & Terminal Company and the Lexington Utilities Company, all the stocks of which are owned by the Kentucky Securities Corporation. The combined operating revenue of the two subsidiary companies, exclusive of inter-company charges, amounted to $782,272 for the last fiscal year, as compared to $742,884 for the previous year, an increase of 5.3 per cent. Operating expenses in the two years were $412,509 and $401,507, an increase of 2.7 per cent. Miscellaneous income increased from $29,941 to $32,022 and fixed charges from $225,268 to $245,184, while the final surplus increased from $146,049 to $156,600, or 7.2 per cent. The operating companies as of June 30 had a credit balance in the reserve for accidents and damages of $27,550, and it was directed that $24,000 should be credited to the depreciation reserve as of June 30. A fixed proportion of gross earnings is set aside monthly on account of maintenance, amounting for the current year to 16½ per cent.

Lehigh Traction Company, Hazelton, Pa.—The Lehigh Traction Company, reversing its previous decision as noted in the ELECTRIC RAILWAY JOURNAL of Nov. 28, paid on Dec. 1 the interest due on its first mortgage 5 per cent bonds. The protective committee representing the bondholders refused to accept the offer of President Markle to purchase the bonds for his personal account, as they had done in connection with the interest default on June 1.

Long Island Railroad, New York, N. Y.—The 5 per cent equipment trust series A of the Long Island Railroad, the authorization of which by the Public Service Commission for the Second District of New York was noted in the ELECTRIC RAILWAY JOURNAL of Oct. 24, consist of a total authorized issue of $1,060,000. Of this amount $1,050,000 is issued and outstanding. The trusts are dated June 1, 1914, and mature $106,000 on June 1, 1915, and June 1 of each succeeding year to 1923, inclusive, and $96,000 on June 1, 1924. The principal and the interest are payable in gold and are guaranteed by the Long Island Railroad. The cost of equipment is $1,175,262, of which the railroad has paid to the trustees $125,000.

Massachusetts Electric Companies, Boston, Mass.—George C. Lee has been elected a trustee of the Massachusetts Electric Companies, succeeding the late Gardiner M. Lane.

Massachusetts Northeastern Street Railway, Haverhill, Mass.—The Massachusetts Northeastern Street Railway on Nov. 28 filed a mortgage for $2,000,000 at Lawrence to the American Trust Company, Boston, Mass., as trustee. This mortgage takes the place of an original one issued in 1903 to the New York Trust Company, New York, which is discharged. The filing of the new mortgage simply provides for a change in the fiscal agent of the corporation.

Mexico Tramways, Mexico City, Mexico.—Officers of the Mexican Light & Power Company, a subsidiary of the Mexico Tramways, recently notified the holders of the $9,733,333 of second mortgage fifty-year sinking fund bonds that the payment of the interest coupons due on Dec. 1 would be deferred. The rate of exchange has been falling continuously in the last few months and the Mexican government officials, who are now in control of the operations of the Mexico Tramways, have prohibited further remittance of funds from Mexico until the rate of exchange improves.

New York (N. Y.) Railway.—At the annual meeting of the New York Railways on Dec. 7 Darwin P. Kingsley, F. S. Witherbee, Henry Ollesheimer, F. L. Leland and J. C. Cobb were elected directors to represent the holders of the 5 per cent income bonds. Harry Bronner, Guy E. Tripp, A. J. Hemphill and E. S. Marsten retired. Mr. Cobb was reelected. A statement of the company's income for the four months ended Oct. 31, last, was read by T. P. Shonts, president. It showed that the gross revenue for the period, October being partly estimated, was $4,618,000, as against $4,828,000 last year, and a surplus over interest charges available for the income bonds of $425,000, against $508,000 last year. The so-called Kingsley insurance company interests already have a suit pending in the courts to decide what constitutes a proper allowance for injury and damage claims or whether or not all surplus revenue not actually paid out in any given year shall be applicable to the adjustment of income bonds. The contention of certain bondholders has been that all surplus revenues not actually paid out during any year should be applicable to the payment of interest on the income bonds. Darwin P. Kingsley is president of the New York Life Insurance Company, F. S. Witherbee is a director of the Equitable Life Assurance Society. Henry Ollesheimer is vice-president of the Metropolitan Bank, New York, F. L. Leland is president of the New York County Bank, and J. C. Cobb resides in Boston. The movement to change the present income bondholders' representation on the board has been under way for a year. A total of $18,000,000 of bonds was voted, of which the so-called Kingsley committee cast $14,000,000 and the so-called Hemphill committee $4,000,000.

Oakland, Antioch & Eastern Railway, Oakland, Cal.—The Railroad Commission of California has rendered a decision authorizing the Oakland, Antioch & Eastern Railway to issue promissory notes of the total face value of $295,345. It is made a condition of the commission's order that these notes shall bear interest at not to exceed 7 per cent per annum.

Rochester Railway & Light Company, Rochester, N. Y.—The Rochester Railway & Light Company has been authorized to issue $250,000 of its 5 per cent fifty-year consolidated trust mortgage bonds for the purpose of refunding a like amount of the underlying bonds of the Brush Electric Light Company, maturing on Jan. 15, 1915. The new bonds are to be sold or exchanged at not less than 95. Should the holders of the underlying bonds not prove willing to exchange for the new bonds at not less than 95, the company has been authorized by the Public Service Commission of the Second District of New York to enter into agreement with such holders whereby an extension of the time for the

payment of the principal may be obtained for one year at an increase from 5 per cent to 6 per cent in interest during that time on the old bonds.

Springfield (Mass.) Street Railway.—The Springfield Street Railway has applied to the Massachusetts Public Service Commission for authority to issue $1,041,000 of additional stock at 110 to pay floating debt. This is part of an issue of $1,290,000 authorized by the stockholders. There is now $3,708,100 of stock outstanding.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.—E. W. Clark & Company, Philadelphia, Pa., are offering for subscription $1,118,000 of St. Joseph Railway, Light, Heat & Power Company 6 per cent sinking fund trust stock certificates due on May 30, 1917, and redeemable at par and accrued dividend on any dividend date. The certificates will be issued by the Guaranty Trust Company, New York, as trustee under an agreement with the Cities Service Company. This agreement provides for the deposit with the trustee of 31,948 shares out of a total of 35,000 shares of the common stock of the St. Joseph Railway, Light, Heat & Power Company. A sinking fund will operate monthly to retire certificates before maturity. The rate at which this fund will work will be $450,000 a year, giving the issue an average life of not more than fifteen months. If the certificates are not obtainable for purchase for the sinking fund at par and accrued dividend or better in the open market, they will be called by lot monthly. All certificates taken up in the sinking fund will be cancelled. The certificates are being offered at 97½ and accrued dividend, yielding more than 7 per cent to maturity and more than 8 per cent on their average life.

Toronto (Ont.) Railway.—William A. Read & Company, New York, N. Y., have sold $1,500,000 of 6 per cent gold bonds of the Toronto Railway, dated Dec. 1, 1914, and due half on Dec. 1, 1915, and half on Dec. 1, 1916, at 100¼ for the former and par for the latter. The purchase of these notes by the bankers was noted in the ELECTRIC RAILWAY JOURNAL of Dec. 5.

Washington Railway & Electric Company, Washington, D. C.—Notice has been served on the Washington Railway & Electric Company that because the purchase by the company of 740 shares of stock of the Washington & Rockville Railway was not authorized in writing by the Public Utilities Commission that body recognizes the transaction as void. The purchase was made from the Potomac Electric Power Company for a consideration said to have been $37,000.

West End Street Railway, Boston, Mass.—The Massachusetts Public Service Commission has received an application from the West End Street Railway for authority to sell at public auction the $650,000 of stock authorized by the stockholders on Nov. 24, as noted in the ELECTRIC RAILWAY JOURNAL of Nov. 28.

Wisconsin-Minnesota Light & Power Company, Eau Claire, Wis.—The Railroad Commission of Wisconsin has authorized the Wisconsin-Minnesota Light & Power Company, a subsidiary of the American Public Utilities Company, to issue preferred stock to the amount of $367,000 and common stock to the amount of $244,000. The company has authority to issue $300,000 in preferred and $200,000 in common stock for the purpose of acquiring the property of the Winona Gas, Light & Coke Company, Winona, Minn., the Red Wing, Gas, Light & Power Company, Red Wing, Minn., the Minnesota-Wisconsin Power Corporation, which furnished electric light to Wabasha and Lake City, Minn., and the Eau Claire Gas Light Company. Under this authorization, stock to the amount of $94,000 may be issued for improvements and extensions to the plants, and preferred stock to the amount of $17,000 may be issued to acquire all property including the accounts receivable of the Neillsville (Wis.) Electric Company.

Worcester (Mass.) Consolidated Street Railway.—The Worcester Consolidated Street Railway has applied to the Massachusetts Public Service Commission for authority to issue $1,880,000 of additional stock to pay floating debt. This is part of an issue of $2,350,000 authorized by the stockholders. The amount of stock already outstanding is $5,112,000.

DIVIDENDS DECLARED

Arkansas Valley Railway, Light & Power Company, Pueblo, Col., quarterly, 1¾ per cent, preferred.

Brazilian Traction, Light & Power Company, Toronto, Ont., quarterly, 1½ per cent, preferred.

California Railway & Power Company, San Francisco, Cal., quarterly, 1¾ per cent, prior preferred.

Cleveland (Ohio) Railway, quarterly, 1½ per cent.

Columbus (Ga.) Electric Company, 3 per cent, preferred.

Continental Passenger Railway, Philadelphia, Pa., $3.

Eastern Power & Light Corporation, New York, N. Y., quarterly, 1½ per cent, preferred.

Indianapolis (Ind.) Street Railway, 3 per cent.

Manila Electric Railroad & Light Corporation, Manila, P. I., quarterly, 1¾ per cent.

Union Traction Company, Philadelphia, Pa., $1.50.

United Light & Railways Company, Grand Rapids, Mich., quarterly, 1½ per cent, first preferred quarterly, three-fourths of 1 per cent, second preferred.

United Railways & Electric Company, Baltimore, Md., 2 per cent, preferred.

United Traction & Electric Company, Providence, R. I., quarterly, 1¼ per cent.

West End Street Railway, Boston, Mass., $2, preferred.

Traffic and Transportation

AUTO BUS COMPETITION IN SOUTHERN CALIFORNIA

Auto Bus Invades San Francisco—Los Angeles Railway, Losing $600 a Day, Has Withdrawn Twenty-One Cars

The "jitney" bus, as the nickel-a-passenger automobile is popularly referred to in southern California cities, has invaded San Francisco. On Dec. 1 six automobiles were put in regular service on Market Street, carrying passengers between the ferry and outlying points for 5-cent fares. As yet no special license has been placed upon these vehicles in San Francisco, but the fact that in that city they will be in competition with a municipal street railway may present the matter in a new light. While an increase in local passenger capacity during the exposition would be welcomed it is conceded that enfranchised street railways should not be deprived of their most profitable traffic by companies free from any obligation to serve in unprofitable districts and that automobiles should be subject to regulation, including a guarantee for damages in case of accident.

Long Beach, Cal., recently imposed a license fee of $25 a year on the "jitney" buses, compels the taking out of a $10,000 liability insurance for every car engaged in transporting passengers, and requires the buses to operate over designated routes and maintain reasonable schedules. On the day that this ordinance went into effect only forty-one out of 130 automobiles carrying passengers in competition with the street cars were continued in service. Prior to the passage of this ordinance in Long Beach the Pacific Electric Railway threatened to discontinue its East Ocean Avenue line altogether unless some regulation was placed upon the 5-cent automobile. Legislation is still pending on the matter in Los Angeles. According to the Los Angeles Railway Corporation its loss in revenue on account of the automobile competition amounts to $600 a day, and has caused the company to withdraw twenty-one cars on six lines and eighty-four motormen and conductors. Up to Dec. 1 the secretary of the Los Angeles police commission had issued a total of 1520 permits to chauffeurs to operate auto buses in competition with street cars, and that the rate of increase is rapid is shown by the record of over sixty additional permits issued on Dec. 2.

So serious has the auto bus matter become in Los Angeles that on Dec. 4 the directors of the local association of merchants and manufacturers addressed a letter in part as follows to the City Council:

"We believe that the time has arrived when your honorable body should take some action regulating the passenger traffic of the 5-cent automobile buses. If these buses can run through the city without proper regulation and protection to the lives of not only patrons but the public in general, we will soon be confronted with a number of accidents. In addition, with several hundred of these buses running up and down the main streets the traffic congestion is greatly increased, and the progress of other machines correspondingly retarded. To allow these machines unrestricted freedom is a menace to the entire community, and we believe that no good reason exists why they should not be placed under strict traffic regulations, and we therefore request that this matter receive the early attention of your honorable body."

NEW COMPANY PUBLICATION

The Hudson & Manhattan Railroad, which operates under the Hudson River between New York and New Jersey, has begun the publication of the *H. & M. Review*. The first issue, dated December, contains eight pages, 6 in. x 9 in. in size. In an article entitled "Object and Future of the *H. & M. Review*," Wilbur C. Fisk, president of the company, says in part:

"The need has been felt for months back for a means of intercommunication between all of us who are employed by the company and also between the departments to which we may be assigned. To accomplish this end, it has finally been decided to issue the *H. & M. Review*.

"The prime purpose to be achieved by the publication is the further promotion and cementation of the good fellowship already existing among the employees of the company. This can only be achieved by the hearty co-operation of all and by keeping the editor posted on all news items which are entitled to publication. The editor will always welcome contributions, but will not publish anything not prompted by the best of motives.

"It must not be forgotten that at times the company and your president may have a message which is meant for all of you, and the columns of the *Review* will be open to any officer of the company who has a message, either for the men of his own department, or which he believes will be beneficial to all. It is needless to say that events occurring during any one month will be faithfully reported in the paper.

"I earnestly request not only the officers but all employees of the company to lend the editor their assistance in his efforts to make the *Review* of real value."

The editor of the *H. & M. Review* is J. J. Scovern.

INTERURBAN SAFETY

The Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, of which E. F. Schneider is general manager, is continuing unabated its campaign of safety begun more than five years ago. The custom of the company has been to cover each year the entire system of 250 miles with talks to the 63,000 school children in the territory contiguous to the company's lines. Ben B. Casson of the company in a talk which he delivered recently to the grammar and primary grade pupils at the German Lutheran Parochial School at Elyria, Ohio, reviewed the activity of the company along these lines. In addressing the grammar grade pupils he said that in the year prior to the inauguration of the safety movement eleven children were injured and three killed, but that since then not a child had been injured or killed while going to or from school. He impressed the children with the necessity of exercising care not only as regards street cars but also as regards automobiles, motorcycles, wagons, bicycles and steam railroads. He emphasized the sad task which confronts the officers of the company in going into the homes of parents of children who had been injured or killed and witnessing the grief in the household. Mr. Casson also reviewed his own experiences during the four years that he operated a car over the Cleveland, Southwestern & Columbus Railway. The great problem before the American people to-day was the preservation of the lives of the people. He advised the school children to discuss safety among themselves and suggested similar discussions in the homes. The address to pupils of the primary grade was, of course, a modification of the one made to the grammar grade pupils. Heretofore the safety addresses to the school children have been made by officers of the company. Mr. Casson is a motorman, and his talks have presented a different viewpoint, and possibly for this reason have been especially valuable.

COMPLYING WITH THE NEW REVENUE PROVISION

A circular letter sent out several days before Dec. 1 to the regular shippers over the Louisville & Interurban Railroad, and a supply of stamps laid in by R. H. Wyatt, general freight and passenger agent of the company, enabled that company to start out under the new revenue tax on the first of the month without confusion. The circular letter reviewed briefly the nature and purposes of the revenue measure, explained what were the duties of the shippers, and then added that for the convenience of the patrons of the Louisville & Interurban Railroad stamps had been supplied to all conductors on freight trains, to agents of the company wherever stations were maintained and that the company would gladly obtain for shippers such supplies of stamps as they needed for use in shipments over its lines. As a consequence every shipper knew beforehand just what was expected of him, as, in addition, copies of the letters which were sent out were posted prominently at every shipping point. The company will continue, while the law is in effect, to have conductors and the various freight offices handle stamps for use of the shippers. Since postmasters are not paid for handling the stamps many of them are refusing to do so. The service which the company has installed in regard to stamps also enables the company to keep its records free from charge accounts of numerous shippers with small entries relating to the stamps.

Lifting Jacks in Pennsylvania.—The Lehigh Valley Transit Company, Allentown, Pa., has equipped all of its cars with lifting jacks conforming with the Pennsylvania statute effective on Dec. 1. The jacks are slung on special hang-

ers from the sides of the cars, and special instructions have been issued to the employees on the handling of the jacks in case of personal injury or derailment.

Increase in Fares in Eastern New Jersey.—The proposed increase in fares between Atlantic City and Pleasantville, N. J., referred to in the ELECTRIC RAILWAY JOURNAL of Dec. 5, page 1274, does not apply to the Atlantic City & Shore Railroad. The steam roads operating between the points mentioned plan, however, to put a higher rate of fare into effect on Dec. 15.

Serious Accident on New York Elevated.—In a rear-end collision between two northbound trains on the Ninth Avenue line of the Manhattan Elevated Railway in New York at 116th Street and Eighth Avenue at 6:30 p. m. on Dec. 9, two men were crushed and received burns from which they died, and more than a score of others were injured in the panic which ensued.

Vermont Fare Matter.—The Barre & Montpelier Traction & Power Company, Montpelier, Vt., has filed with the Public Service Commission of that State a proposed tariff increasing the fare over the line between the cities from 10 cents to 15 cents. The Supreme Court of the State recently held that the company was required to maintain a fare not to exceed 5 cents within the limits of each of the cities in which it operates.

Commutation Fare Order.—The Public Service Commission of Missouri on Dec. 7 issued an order to the Kansas City, Clay County & St. Joseph Railroad to begin on Jan. 1, 1915, issuing commutation tickets on definite rate schedules established by the commission, which figure out at about 1.1 cents per mile. Five days from the receipt of the order are allowed for an answer, which will carry until Dec. 14. A request for a rehearing is to be filed.

Car Advertising in Toronto.—Despite the objection of Works Commissioner Harris the Board of Control of Toronto, Ont., has decided to permit street car advertising in the cars on the city's own line. Last spring the commissioner reported against the proposal and it was dropped for the time being. It has been recommended that the contract be awarded to the Canadian Street Car Advertising Company.

Time-Table Prize.—The offer of a $25 prize for the best time-table to be submitted by one of its trainmen, which was published in the September number of the *United Railroads Magazine*, published by the United Railroads, San Francisco, Cal., aroused considerable interest and resulted in five time-tables being submitted by four contestants, one of whom submitted two tables. The prize was awarded to D. W. Sutlief, a conductor in the Twenty-eighth Street carhouse.

Far-Side Stops at Rock Island.—The City Council of Rock Island, Ill., insists that the Tri-City Railway discontinue the near-side stop and adopt the far-side stop. A plan to stop on the far side was suggested by John G. Huntoon, the general manager of the company, a year ago, but the people of Davenport did not favor the change and the matter was dropped. Now the cities of Rock Island and Moline are insisting on the far-side stop, irrespective of the attitude of the city of Davenport toward the proposal.

Company Relations in Galveston.—For many years the Galveston (Tex.) Electric Company has required a deposit of $30 from each of its trainmen as an assurance of good faith. A new policy, however, is now being put into effect. The deposits are being returned to the trainmen and 6 per cent interest is being paid each man for the time the money has been on deposit. The records for most of the deposits date back no further than 1900. Under the new plan the company has its trainmen under bond, the company itself paying the premium.

Market Transfers.—The Edmonton (Alberta) Radial Railway has adopted a special "market transfer," in order to promote business at the newly-opened civic market. Passengers going direct to the market, on market days, receive a "market transfer," which enables them to make the return trip on a single fare. J. H. Larmouth, superintendent of the railway, a municipal line, is reported to have expressed the opinion to the civic authorities that a portion of the cost of the transfer should be borne by the market committee of the City Council.

Transfer Changes in Savannah.—With a view to giving additional transfer privileges to its patrons, the Savannah (Ga.) Electric Company put into effect on Dec. 1 certain changes in its transfer system. Several important transfer points have been relocated and the system of issuing transfers as regards these points has been changed. The company asked the co-operation of its patrons in inaugurating the changes and announced that misunderstanding regarding the changes would be explained over the telephone or in person at the company's office.

Police in Safety Campaign.—The city of Montreal, Que., has decided to co-operate with the Montreal Tramways in the "safety first" campaign inaugurated by A. Gaboury, superintendent of the company. The chief of police is to work with Mr. Gaboury, and later a committee of civic officials is to be formed to study the entire question as it relates to Montreal. The chief of police has sent out thousands of circulars to owners of vehicles referring to the urgency of observing traffic regulations and making suggestions as to how to avoid accidents.

Height of Steps in New Hampshire.—The Public Service Commission of New Hampshire held a hearing in Concord on Dec. 1 to determine whether steps on the electric cars in the State are reasonably safe and low. Various estimates of the cost of changing the height of steps were made. They ranged from $30 to $150 a car, according to the rolling stock operated. All of the roads were represented except the Concord & Manchester Electric Branch of the Boston & Maine Railroad, which has already complied with an order of the commission in regard to steps.

Operating Changes in Vancouver.—Several of the city lines of the British Columbia Electric Railway in Vancouver, B. C., have been rerouted in order to provide greater economy of operation and still meet existing traffic conditions. The general plan affects the service on stub lines slightly. The company's owl service is also being operated in closer accordance with traffic requirements. The trainmen have made an arrangement among themselves providing for a certain lay-off each week in order to enable a larger force to be kept on than would otherwise be possible.

"Safety First" in St. Louis.—Bruce Cameron, superintendent of transportation of the United Railways, St. Louis, Mo., is quoted as follows in regard to the "safety first" campaign of the company: "I believe when the public has been impressed fully with the necessity for caution, we will find the number of persons injured in street car accidents far less than heretofore. There seems to be a general disposition to heed the warning of our signs. If wagon drivers will obey the traffic laws and pedestrians cross the streets only at street corners, instead of in the middle of the block, we will have few accidents."

Not Within Commission Jurisdiction.—Chairman McCall of the Public Service Commission for the First District of New York replied on Dec. 9 to Health Commissioner Goldwater of New York, who had written to the commissioner calling attention to alleged unsanitary conditions on the transit lines due to overcrowding. Mr. McCall pointed out that breathing, coughing and sneezing by persons in the cars were not matters subject to the jurisdiction of the Public Service Commission, and referred to the expenditure of $325,000,000 now being made for rapid transit lines intended to relieve the congestion of which Dr. Goldwater complained. There has been considerable other gentle persiflage in this connection recently.

Hunters Beware.—An appeal to hunters to be careful in handling firearms while on street cars has been made by the Detroit (Mich.) United Lines based upon a bulletin to conductors issued by the operating department. The bulletin follows: "Attention is called to the matter of firearms, particularly guns used for hunting purposes, carried by passengers. If at any time a passenger is examining a firearm, or handling it carelessly, or in such a way that it might imperil the lives of other passengers, caution him to desist and explain that this is a rule of the company for the protection of passengers. Also, so far as a conductor is able to do so, he must see that firearms carried by passengers are not loaded."

Passengers Carried in Greater New York.—The number of passengers using the transit systems of Greater New York for the year ending June 30, according to tables compiled by the Public Service Commission of the First District of New York, was 1,813,204,692, an increase over the previous twelve months of 43,328,184. They paid out in fares $89,361,262. The number of passengers carried by the Brooklyn Heights Railroad, the principal surface railway subsidiary of the Brooklyn Rapid Transit Company, fell off by 1,140,585, by the New York Railways by 1,742,267. The Second Avenue Railroad carried 858,189 fewer passengers than the year before, the Third Avenue 75,039, the Forty-second Street, Manhattanville & St. Nicholas Company lost 175,443, and the Dry Dock, East Broadway & Battery Company 1,297,743 passengers.

Chicago Drafts Electric Railway Freight Ordinance.—In an effort to further the recommendations of the Chicago Municipal Markets Commission relative to the advantage of permitting all the electric railways which enter Chicago to handle freight, an ordinance granting this privilege is being prepared. At a preliminary conference between a sub-committee of the Chicago City Council's local transportation committee, the officials of the surface and elevated lines, representatives of the city law department and the Chicago Municipal Markets' Commission, the preliminaries were arranged. According to the city legal department there was nothing to hinder the electric lines from carrying freight within the corporate limits. Upon being questioned regarding their attitude toward a proposition including the right to carry freight, the representatives of the surface and elevated lines expressed a willingness to co-operate in the matter.

Ten Months of Safety in Detroit.—W. C. Cann, chairman of the general safety board of the Detroit (Mich.) United Railway, reports that during the first ten months of this year more than 900 safety suggestions were submitted to the division and general safety board and that favorable action has been secured on 95 per cent of the suggestions. So far this year the number of cars in collision has decreased 47.7 per cent, derailments 7.7 per cent, running over crossings 30 per cent, and passengers hurt in boarding and alighting 32 per cent. The only reports showing any appreciable increase are those covering automobiles struck. These have increased 30.9 per cent. Mr. Cann expresses the opinion that the showing which the company had made in decreasing all accidents other than those in which automobiles are involved indicates that the burden of responsibility for the increase of automobile accidents is on the automobile driver and not on the men operating the street cars.

New Traffic Ordinance in Canton.—A new traffic ordinance was passed by the City Council of Canton, Ohio, on Nov. 9. It is provided that automobiles and horse-drawn vehicles shall cross the center of the intersecting street before turning into it rather than follow a diagonal course from one street into the other. No person under sixteen years of age shall be allowed to operate a motorcycle or automobile on the streets of the city. There are strict regulations with regard to automobiles being allowed to stand along the curb in the business district. A rate of speed exceeding 15 m.p.h. is to be taken as evidence of careless driving, and a rate of speed exceeding 20 m.p.h. is prohibited. Drivers of vehicles passing a street car stopping to discharge or to take on passengers, when said vehicle is going in a direction opposite to that from which the street car is moving, shall slow down and exercise due care so as not to endanger the safety of pedestrians. The driver of every vehicle approaching a street car stopping for the purpose of taking on or discharging passengers shall give some signal plainly visible or audible to such passengers, and shall keep such vehicle at least 6 ft. from the running board or lower step of such car. If it is not possible to preserve such distance from such running board or lower step, the driver or operator shall stop until the street car has again started. All vehicles upon a track in front of a street car shall turn out upon the near approach of the car. The penalty for violating the traffic ordinance is a fine not to exceed $100 and costs. In the section regulating the movement of pedestrians, it is provided that pedestrians shall have the right-of-way over drivers of vehicles at street crossings only.

Personal Mention

Sir George S. Gibb, chairman of the Metropolitan District Railway, London, has been appointed a civil member of the Army Council and will be charged with the supervision of army contracts.

Mr. J. M. Tomlinson, acting vice-president and general auditor of the New York, New Haven & Hartford Railroad since the retirement of Mr. H. M. Kochorsperger, vice-president, has been elected vice-president and comptroller of the company.

Mr. A. Mackrille, assistant general auditor, has been appointed general auditor of the New York, New Haven & Hartford Railroad with office at New Haven, and Mr. T. M. Prentice, assistant auditor, has been appointed auditor of the company with office at New Haven.

Mr. C. C. Collins has resigned as traffic manager of the Lehigh Valley Transit Company, Allentown, Pa., effective on Jan. 1, 1915. Before becoming connected with the Lehigh Valley Transit Company Mr. Collins was traffic manager of the Western Ohio Railroad, Lima, Ohio.

Lieutenant-Colonel G. S. Rennie, M.D., surgeon in chief of the Dominion Power & Transmission Company, Hamilton, Ont., and the Toronto, Hamilton & Buffalo Railway, will be in command of one of the field artillery batteries being mobilized in Toronto for overseas service.

Mr. Daniel L. Turner, deputy engineer of subway construction of the Public Service Commission of the First District of New York, has been appointed to serve on the advisory commission on city planning, which is to assist and co-operate with the committee on city plan of the Board of Estimate, New York City.

Mr. A. E. Beck, one of the permanent counsel of the British Columbia Electric Railway, Vancouver, B. C., and its claim agent, will leave the company's service at the end of the year to practice law on his own account in Vancouver. The company's legal and claims departments will be consolidated under the control of the other permanent counsel, Mr. V. Laursen.

Mr. C. H. Christensen has been appointed manager of the Missoula (Mont.) Street Railway, the Missoula Light & Water Company and the Clark Missoula Power Company, to succeed Mr. George R. Brown, deceased. Mr. Christensen has been connected with the Missoula Light & Power Company in various capacities for twenty years. During the last four years he held the position of superintendent of the Missoula Light & Water Company's Bitter-Root Valley System.

Mr. W. O. Demoss, who has been appointed master mechanic of the Wilmington & Philadelphia Traction Company, Wilmington, Del., and the Southern Pennsylvania Traction Company, was for ten years foreman of the West Baltimore Street and the Retreat Street carhouses of the United Railways & Electric Company, Baltimore, Md. On Feb. 27, 1911, he became maintenance foreman of the Delaware Avenue carhouse of the Wilmington & Philadelphia Traction Company and in March, 1912, was appointed general foreman of the Wilmington shops of the latter company.

Mr. John W. Graham, Twin Falls, Idaho, will fill the vacancy left on the Idaho Public Utilities Commission by the recent resignation of Judge D. W. Standrod. Mr. Graham has been practicing law in Idaho for the last four years. He is forty-one years of age and a native of Canada, but was educated at the University of Nebraska. He practiced his profession in Fremont, Dodge County, Neb., and was for four years prosecuting attorney of that county, and had altogether fifteen years' experience as a lawyer. The appointment which he has just accepted will hold until January, 1919.

Mr. H. R. LaMontagne has been appointed general agent of the express department of the Worcester (Mass.) Consolidated Street Railway to succeed Mr. F. E. Wood, whose appointment to the Cumberland County Power & Light Company, Portland, Maine, is referred to elsewhere in this column. Mr. LaMontagne entered the service of the passenger department of the Worcester Consolidated Street

Railway after graduation from a technical school. Later he became connected with the freight department, finally being made traveling auditor, from which position he was appointed to succeed Mr. Wood.

Mr. M. H. Bronsdon, chief engineer of the Rhode Island Company, Providence, R. I., from March, 1907, until August, 1912, has returned to that post, succeeding Mr. William Pestell, who recently resigned to accept a position with the B. F. Sturtevant Company of Boston, at Chicago. Mr. Bronsdon has been doing general engineering work in San Francisco since leaving Providence. Mr. Bronsdon was born in San Francisco and he had his first experience in engineering construction on a cable road in Los Angeles. In 1889 he became superintendent of the Providence Cable Tramway. He later was chief engineer at the Eddy Street power plant in Providence, having charge of the installation there. He later went to Duluth as designing and construction engineer of the Duluth-Superior Traction Company, and was afterward appointed engineer for the Old Colony Street Railway, Boston, Mass. His next engagement was with the United Railroads, San Francisco, where he remained until March, 1907, when he succeeded Mr. Fred N. Bushnell as chief engineer of the Rhode Island Company.

Mr. M. A. Tatum, who was appointed superintendent of the southern division of the Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, recently, began his career in electric railway work in the express and freight department of the Eastern Ohio Traction Company in 1905. In 1906 he resigned this position to enter the engineering department of the Roberts & Abbott Company, Cleveland. About a year later he accepted a position with the Washington, Baltimore & Annapolis Railroad as clerk to Mr. W. E. Slaughter, the superintendent. After the electrification of the road and the completion of the main line between Washington and Baltimore in 1908, Mr. Tatum was appointed clerk to Mr. Joseph O'Hara, superintendent of transportation. During 1909 he was employed in the carhouses and substations of the company, and in 1910 he was made inspector at Washington. During 1911 and 1912 he occupied the position of trainmaster and in 1913 he became general passenger and freight agent of the road. He resigned from the company in September to become connected with the Cleveland, Southwestern & Columbus Railway.

Mr. F. E. Wood has been appointed general freight agent of the Cumberland County Power & Light Company, Portland, Maine, operating the Portland Railroad and the Lewiston, Augusta & Waterville Street Railway. Mr. Wood entered the service of the Springfield (Mass.) Street Railway in 1909 and worked in the repair shop and the pit. Subsequently he entered the express department as general clerk and spare messenger. In February, 1910, on the opening of the express service on the Interstate Consolidated Street Railway operating through Attleboro and North Attleboro, Mass., to Providence, R. I., over the Rhode Island Company's line, Mr. Wood accepted the position of agent at Attleboro in charge of that division. This express service was later extended over the Milford, Attleboro & Woonsocket Street Railway, operating through Franklin and Milford, Mass. In March, 1912, he was transferred to Worcester, Mass. Express service was established on the Worcester Consolidated Street Railway in December, 1912, and in 1913 Mr. Wood was appointed general agent of the Worcester Consolidated Street Railway with headquarters at Worcester and jurisdiction over all the lines previously mentioned, together with the Springfield Street Railway. He resigned from the Worcester Consolidated Street Railway on Nov. 28, 1914, to become connected with the Cumberland County Power & Light Company. Before Mr. Wood left Worcester a banquet was tendered to him at the Hotel Bancroft, that city, by his fellow employees and he was presented with a watch fob by them as a token of their esteem.

OBITUARY

Morris G. Condon, president of H. B. Underwood & Company, Philadelphia, Pa., machinists and engineers, who was shot by an intruder in his room in the Hotel Adelphia in that city on Nov. 25, died from the effects of his wound.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Edmonton Northwestern Radial Railway, Edmonton, Alta.**—Application for a charter has been made by this company in Alberta to build an interurban electric railway from Edmonton northwest to the Pembina River. Messrs. Short, Woods, Bigger & Collison, 14 Howard Avenue, Edmonton, are said to be interested in the project.

***Albion, Charlotte & Northern Railway, Lansing, Mich.**—Chartered in Michigan to build a 53-mile electric railway. Capital stock, $100,000.

***Shelby (N. C.) Northern Railway.**—Chartered in North Carolina to build an electric or steam railway from Shelby to Casar, via Beams, Mills, Fallston, Belwood, Boggs and Warlicks. Capital stock, $400,000. Incorporators: S. S. Royster, Shelby, president, and L. M. Elam, Shelby, secretary and treasurer.

FRANCHISES

Calgary, Alta.—The Chestermere & Calgary Suburban Railway has received an extension of time on its franchise for the completion of its line in Calgary.

Vallejo, Cal.—A. D. Bowen, representing the Benicia Land & Terminal Company, will ask the Council for a franchise to build an electric railway in Vallejo. This is part of a plan to build an electric line to connect Benicia and Vallejo. [E. R. J., Oct. 24, '14.]

Tarpon Springs, Fla.—James H. Murphy, St. Petersburg, has asked the Council for a franchise in Tarpon Springs.

Macon, Ga.—The Macon Railway & Light Company has asked the Council for an extension of time on its franchise in which to remove its tracks from the south side of Tattnall Square Park to the center of College Street in Macon.

***Lewiston, Idaho.**—The State Highway Board has voted approval of a franchise to A. G. Nortz, Lewiston, to build an electric railway across interstate Lewiston-Clarkston bridge.

St. Peter, Minn.—The Electric Short Line Railroad has accepted the forty-nine-year franchise granted it by the Council in October for the use of so much of the levee as lies east of Front Street, between Chestnut Street and Park Row Street, and also to build a line along the entire length of Front Street to the north city limits of St. Peter.

Lockport, N. Y.—The Niagara River & Eastern Railroad had asked the Council for a franchise to use certain streets in the east and south of Lockport to build a line to connect the Buffalo, Lockport & Rochester Railway and the International Railway lines with a new line into Niagara Falls. [E. R. J., Oct. 17, '14.]

Youngstown, Ohio.—The Mahoning & Shenango Railway & Light Company has asked the Council for a franchise to extend its Mahoning Avenue line to Perkins Corners in Youngstown.

Cincinnati, Ohio.—The Street Railway Committee of the Cincinnati City Council has recommended the ordinance granting a twenty-five-year franchise to the Cincinnati, Newport & Covington Railway to be advanced to a second reading, following which a public hearing will be called to discuss its merits.

Cleveland, Ohio.—Mayor Baker of Cleveland has signed the amended franchise granted by the Council to the Cleveland & Youngstown Railroad to make certain necessary changes in its grade. [E. R. J., Oct. 5, '14.]

Findlay, Ohio.—The City Council of Findlay has before it ordinances giving the Toledo, Bowling Green & Southern Railway a twenty-five-year franchise on its streets and also a franchise for furnishing current for light and power purposes. They provide that the company shall pay to the city 2 per cent of the gross receipts from the business.

Guelph, Ont.—The Board of Railway Commissioners has authorized the Guelph Radial Railway to construct an inter-

change track with the Grand Trunk Railway on Suffolk Street, Guelph.

Medford, Ore.—S. Bullis, of the Southern Oregon Electric Railway Company, has asked the City Council and the Southern Pacific Railway Company for permission to cross the tracks of the Southern Pacific on Main Avenue. In case the Southern Pacific refuses to grant the request for crossing rights, the application will be presented to the State Railway Commission for final settlement. An extension of not less than 3500 ft. will be made as soon as the preliminary details are settled.

Philadelphia, Pa.—Peter E. Costello, Philadelphia, has received a franchise from the Council for a two-track elevated railway from Front Street and Arch Street to Rhawn Street, Holmesburg.

Montreal, Que.—The Montreal & Southern Counties Railway has received an extension of time on its franchise in which to complete its lines in Montreal.

Beaumont, Tex.—A petition was presented to the City Council asking that the Council take steps to induce the extension of the Beaumont Traction Company's line to the Magnolia Petroleum Company's refinery south of Beaumont.

Seattle, Wash.—The Puget Sound Traction, Light & Power Company in Seattle will not be allowed to change the terminus of its Yesler Way cable line from its present location, between First and Second Avenues, as it had petitioned, according to a decision rendered by the City Council franchise committee. The company argued that the operation of its cable cars over Second Avenue hindered the headway of its cars north and south on the arterial highway.

TRACK AND ROADWAY

Lacombe & Blindman Valley Electric Railway, Lacombe, Alta.—W. L. McKinnon & Company, Toronto, advertised recently inviting bids for $206,700 of this company's first mortgage bonds, maturing in 1943. The Alberta government has guaranteed the principal and interest of the bonds for $7,000 a mile, or $273,700 for 39.1 miles. They bear 5 per cent interest.

Argenta (Ark.) Railway.—Work on the extension from Washington Avenue and Hazel Street to Rock Island station, at Fourth Street and Beech Street in Argenta, has been begun.

Central California Traction Company, San Francisco, Cal.—Negotiations are pending by which portions of the city lines of this company will be abandoned and a universal transfer privilege established between this company's line and the lines of the Stockton Electric Railway.

San Francisco (Cal.) Municipal Railway.—Bids for another branch of this railway are being considered by the Works Board, which has received the offers to construct the California-Street municipal railway line and the Seventeenth-Street carhouse. The line will begin at Geary Street and Second Avenue and run over Second Avenue, Cornwall and California Streets to Thirty-third Avenue.

Marin County Electric Railway, San Francisco, Cal.—This company has received permission from the Railroad Commission of California to construct a line in Sausalito, Cal., on the condition that the present franchise shall be amended so as to give the municipality the right to purchase the system after five years. The company is granted authority to issue 185½ shares of capital stock at par, and it is provided that this stock shall be sold only to property owners and residents of Marin County. It is also provided that all moneys obtained from the sale of stock shall be deposited by the railway company in Marin County banks as trust funds, with the understanding that if a total sum of $18,550 is not deposited within six months, these moneys shall be repaid to subscribers. [E. R. J., Nov. 21, '14.]

Connecticut Company, New Haven, Conn.—Plans are being made by this company to extend its tracks along Railroad Avenue to the station in Westport.

***Havana, Cuba.**—Work has been begun on an electric line between Havana and Guanabacoa in Cuba.

Central Illinois Traction Company, Paris, Ill.—An extension between Charleston and Paris, 30 miles, will be constructed by this company during 1915.

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—This company will complete the construction of the Minnesota Street line, between Shelby Street and Churchman Avenue, for operation before Dec. 24. The special work at the corner of Shelby and Minnesota Streets will be completed sixty days fater the opening of the new year.

Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan.—This company has completed the survey and secured the right-of-way for the second section of the projected interurban railway between Kansas City and Topeka, Kan. The first section, from Kansas City to Bonner Springs, is now in operation and its business has considerably exceeded expectations. The second section is 21 miles from Bonner Springs to Lawrence. It probably will be in operation within a year. The third section, Lawrence to Topeka, will be built after the second section is in successful operation. Bids for the construction of the Bonner Springs-Lawrence section will probably be asked shortly. On the first section the company advertised for bids, but did with its own forces work for which it considered the bids unreasonable. The construction work which it is planned to start soon involves a bridge over the Kaw River at Lawrence. Carl G. Klemm, 1010 Commerce Building, is secretary of the company.

Kentucky Utilities Company, Somerset, Ky.—With this company disposing of $3,000,000 worth of bonds for needed improvements it is rumored that a part of the company's plans is to extend its line to Burnside, 7 miles south of Somerset, on the Cumberland River.

Winnipeg (Man.) Electric Railway.—Plans are being prepared for filing an application with the City Council for extensions in the northwest section of Winnipeg, in accordance with the City Engineer's directions.

Boston (Mass.) Elevated Railway.—This company is asked to consider plans to construct tracks on Pleasant Street, from the mouth of the subway to Washington Street in Boston.

Fitchburg & Leominster Street Railway, Fitchburg, Mass.—Surveys, which have been in progress for the extension of this railway to Townsend, have been suspended until spring. This line will ultimately be extended to Nashua, N. H.

Michigan Railway, Jackson, Mich.—This company has placed in operation its line between Kalamazoo and Monteith.

International Transit Company, Buffalo, N. Y.—The Board of Railway Commissioners has authorized the building of a bridge at Tagona, Sault Ste. Marie, Ont., to carry a highway and this company's tracks across the Algoma Central & Hudson Bay Railway. The cost of the bridge is to be borne by the electric railway company.

Cincinnati (Ohio) Traction Company.—A new crosstown line north of the present route on McMillan Street in Cincinnati is being considered by this company and may be built in the near future.

Ardmore & Western Interurban Railway, Ardmore, Okla.—As soon as negotiations are completed work will be begun by this company on the 100-mile line to connect Springer, Woodford, Poolville, Elmore City and Leon. Capital stock, authorized, $300,000. Bonds, authorized, $2,500,000. Officers: A. F. Costigan, Guaranty Bank Building, Ardmore, president; D. E. Allen, Ardmore, vice-president; A. L. Adath, Ardmore, secretary, and T. C. Bridgeman, treasurer. [E. R. J., May 30, '14.]

Forest Hill Electric Railway, Toronto, Ont.—The roadbed is now being prepared for this railway. Work has been begun at Bathurst Street, and the first stage from there to Dufferin Street will be proceeded with as rapidly as possible. The tracks will be laid on their entire route beginning near St. Clair Avenue. T. J. Glover is interested in this projected railway. [E. R. J., April 11, '14.]

Ottawa & St. Lawrence Electric Railway, Ottawa, Ont.—A contract has been awarded to Eastman, Kenny & Stearns, Russell, Ont., for grading about 6 miles of the projected line. About 2 miles of grading has been completed, and it is expected to have about 8 miles between Russell and Metcalfe completed and ready for the rails within the next three weeks. H. W. Pearson, Confederation Life Building, Toronto, Ont., secretary.

Toronto (Ont.) Civic Car Lines.—A by-law will be submitted to the ratepayers on Jan. 1, 1915, to provide for $455,000 for the extension of the civic car lines in Toronto.

Toronto, Ont.—City Solicitor Johnston advised the Board of Control on Nov. 27 it would be necessary to submit separate by-laws for each of the proposed new electric lines, consequently the board changed its recommendations. The Council will be asked to authorize the submission of a by-law for $105,000 for the proposed Lansdowne Avenue line, $317,000 for the North Toronto line, and $52,000 for the taking over of that portion of the Toronto & York Radial Railway Company's line within the city limits in the east end.

Electric Short Line Railroad, Minneapolis, Minn.—Plans are being considered by this company and the members of the Winthrop Commercial Club to build an electric railway through Winthrop and north as far as Winsted and south through Sleepy Eye to Jackson.

St. Louis, Mo.—The residents of South Lindenwood have submitted a petition to the Missouri Public Service Commission asking the United Railways for an extension of the Tower Grove line. The Tower Grove line terminus is 2½ miles away from the city limits in the Gratiot and Lindenwood section of the city.

Niobrara, Sioux City & Omaha Railway, Omaha, Neb.—Surveys have been completed by this company between Madison and Elgin. Right-of-way has been secured between Omaha and Norfolk via Madison. The Elgin line will be a branch proposition. Charles W. Baker, Omaha, is interested. [E. R. J., April 4, '14.]

Corry & Columbus Street Railway, Corry, Pa.—A 30-mile line from Corry, Pa., to Maysville, N. Y., via Columbus, Pa., Clymer and Sherman will be built by this company during 1915.

Slate Belt Electric Street Railway, Penn Argyl, Pa.—A 5-mile line between Wind Gap and Saylors Lake, Pa., will be constructed by this company during 1915.

***San Antonio, Tex.**—James L. Himrod, Thomas Moore, Austin, and others are making plans to build an electric railway to connect New Mexico, Lamesa, Robert Lee, San Angelo, Ballinger, San Antonio and other points with a port on the Gulf of Mexico.

Pittsburgh, Harmony, Butler & Newcastle Railway, Pittsburgh, Pa.—Within a few weeks this company will have completed its 6½ mile line between Evans City and Beaver Falls. In addition to passenger service the company announces that it will add trolley freight service over this line as well. The opening of this new line will give a direct electric railway line between Pittsburgh and Beaver Falls.

***Denison, Tex.**—Preliminary surveys are being made for a line betweeen Denison, Dexter and Locust. This is part of a plan to build an electric railway through Pottsboro, Locust, Gordonville, Dexter and Denison.

Houston, Laporte & Bay Shore Railway, Houston, Tex.—Preliminary arrangements are being made and work will be begun some time within the next six months on this line to connect Houston, Pasedana, Deepwater, Deer Park, San Jesenta City, Laporte, Seabrook, Webster, Friendswood and Pearland. The power station will be located at Houston and the repair shops at Pearland. The company will furnish power for lighting purposes. Capital stock, authorized, $2,000,000. Samuel F. George, Houston, president and general manager, and John H. Stoner, Houston, chief engineer.

Houston & Southern Railway, Houston, Tex.—Preliminary arrangements are being made to incorporate this company, which plans to begin work in the spring on its 55-mile electric railway to connect Houston, Pearland, Manville, Danbury, Belasco and Freeport. The company will furnish power for lighting purposes and will locate its power house in Houston and its repair shops at Pearland. It will also have amusement parks at Laporte and at Velasco. Samuel F. George, Dayton, Ohio, president, and John H. Stoner, Houston, chief engineer.

Glen Rose & Walnut Springs Railway, Walnut Springs, Tex.—Grading has been completed by this company for its 14-mile line to connect Glen Rose and Walnut Springs, via Seven Knobs. Officers: J. H. Farr, president; F S. Williams, vice-president; John Shields, treasurer, and F. B. Kirby, secretary, all of Glen Rose. [E. R. J., Sept. 12, '14.]

Rutland Railway, Light & Power Company, Rutland, Vt.—This company, a subsidiary of the General Gas & Electric Company, has begun construction under its plans for the conservation of the water supply at Chittenden Dam, near Rutland, Vt. The plans include the construction of two dams, a canal 3000 ft. long, and wood and steel penstocks. When completed, the reservoirs will furnish a large reserve supply of water for the new power station of the company at East Pittsford. Through this plan the water will be used twice for generation of power, once at the East Pittsford station, and once at the Mendon generating station.

Mercer Electric Railway, Athens, W. Va.—The tracks are being laid by this company on its line between Bluefield and Princeton. This line will connect Bluefield, Princeton and Athens. R. G. Meador, Athens, president. [E. R. J., Oct. 17, '14.]

SHOPS AND BUILDINGS

Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.—This company opened its new depot in Clinton, Ind., on Dec. 3.

Orleans-Kenner Electric Railway, New Orleans, La.—Plans have been prepared by this company to build sixteen shelter houses and way stations along its line between New Orleans and Kenner. The buildings will be on brick construction with tile roofs.

Moncton Tramways, Electricity & Gas Company, Moncton, N. B.—A temporary carhouse was erected to replace the building which was destroyed by fire recently. This building is 30 ft. x 80 ft., with accommodation for five cars, and is on the same site as the one burned. It is the intention of the company to build a steel and brick carhouse in the summer, on a new site which has not yet been acquired.

Brooklyn (N. Y.) Rapid Transit Company.—The Public Service Commission for the First District has approved the award by the New York Municipal Railway Corporation to the P. J. Carlin Construction Company, the lowest bidder, of a contract for the construction of six stations on the Liberty Avenue elevated railroad extension. The contract price is $232,000.

Brantford (Ont.) Municipal Railway.—This company is building a new passenger station and freight house at Paris. The cost is estimated to be $3,000.

Toronto (Ont.) Civic Car Lines.—The City Council has authorized Commissioner Harris to build a temporary carhouse near Dorval Road to house the cars of the new Bloor Street line in Toronto.

Milwaukee Northern Railway, Cedarburg, Wis.—Work will be begun at once by this company on a new terminal building on Fifth Street between Cedar Street and Wells Street in Milwaukee. The structure will be of brick, fireproof, one story high and will be divided into separate waiting rooms, a ticket office and baggage room. The cost is estimated to be about $40,000.

POWER HOUSES AND SUBSTATIONS

Bay State Street Railway, Boston, Mass.—This company has installed a new engine and generator at its Mason Street plant.

Ottawa (Ont.) Electric Ry.—This company's new auxiliary power plant has been put in operation. It cost $200,000 and has a generating capacity of 5000 hp. The equipment includes three Babcock & Wilcox boilers and a Westinghouse double-flow steam turbine.

West Penn Traction Company, Pittsburgh, Pa.—This company has just placed in operation a 19-000-kva, 6600-volt, three-phase, sixty-cycle, turbo generator, built by the Westinghouse Electric & Manufacturing Company.

Monongahela Valley Traction Company, Mairmont, W. Va.—This company is installing three 1500-kva, water-cooled, sixty-cycle, 22,000-volt high-tension Westinghouse transformers, and a complete electrically-equipped remote-control switchboard in its power house near Fairmont, W. Va.

Manufactures and Supplies

ROLLING STOCK

Sheboygan Railway & Electric Company, Sheboygan, Wis., expects to order two new steel cars for city service, double-end operation, pay-as-you-enter, double-truck, to seat forty passengers. The cars will be equipped with baby motors and 24-in. wheels.

Philadelphia & Reading Railroad, Philadelphia, Pa. is making an investigation into the advisability of establishing storage-battery car operation on branch lines of its Winslow Junction-Cape May division.

Empire United Railways, Syracuse, N. Y., has ordered twelve more cars from the St. Louis Car Company in addition to the twelve cars ordered last summer. These twelve cars are to be the same type as those on the previous order.

London & Port Stanley Railway, London, Ont., has ordered three electric locomotives and electrical equipment for five motor cars from the Canadian General Electric Company. The contracts approximate $135,000. The locomotives will be 1000 hp, capable of hauling a trainload of 1000 tons. The cars will have a four-motor electrical equipment of about 600 hp per car. The motor cars and trailers, of which there will be five each, will be of one pattern and steel construction throughout. Tenders on the car bodies were invited up to Dec. 2.

TRADE NOTES

Thomas A. Edison, Inc., West Orange, N. J., in a fire which started early in the evening of Dec. 9, suffered much damage to its property, calculated at something less than $1,000,000. Part of the phonograph works was destroyed by fire, but Mr. Edison's private laboratory, the Storage Battery Company and the Edison primary-battery department were not affected. The company emphasizes the fact that the business of both battery departments of the company will not be interfered with in any way by the fire and that it is prepared to continue business as usual.

Albert Lawrence Smith has been admitted as a partner in the firm of E. B. Smith & Company, public utility bankers, Philadelphia, Pa. Mr. Smith is a son of the senior member of the firm. He attended Harvard University and began his business career with the Franklin National Bank, Philadelphia. For several years he has been associated with the firm of which he is now a partner. He is a director of the Buffalo & Susquehanna Railroad and of the Easton (Pa.) Consolidated Electric Company.

Kerr Turbine Company, Wellsville, N. Y., builder of "Economy" steam turbines, has appointed A. E. Seelig as general sales manager, and John A. Hense as St. Louis representative. Mr. Seelig for several years held a similar position with the L. J. Wing Manufacturing Company, and more recently has managed the new machine tool department in the New York office of Schuchardt & Schutte. Mr. Hense was formerly with the National Malleable Castings Company, Chicago, and later with the Dravo-Doyle Company, Philadelphia.

Walter A. Zelnicker Company, St. Louis, Mo., has appointed Arthur E. Jackman as manager of its machinery department to succeed J. J. Hilpirt, resigned to become storekeeper of the Compania Mexicana de Petroleo "El Aguila," S. A., Tampico, Mexico. Mr. Jackman has had wide experience, gained as general manager of the Sea View Railroad and Narragansett Pier Electric Light & Power Company. He was several years in the railway and lighting department of the Westinghouse Electric & Manufacturing Company, and lately superintendent of the East St. Louis, Columbia & Waterloo Railway, which position he left to assume his present duties.

W. S. Miller has resigned as general superintendent of the St. Louis Car Company, after being connected with this company about fifteen years. Mr. Miller's first position with the company was superintendent of the brass foundry departments, two years after which he became general foreman of the blacksmith, machine and truck departments. After holding this position for three years he was appointed superintendent of machinery and tools. In 1907 Mr. Miller became works manager and later general superintendent, which position he has held up to the time of his resignation, Nov. 9, 1914. He was formerly a student of Washington University, New York.

Edison Storage Battery Company, Orange, N. J., has appointed Francis V. McGinness, formerly sales engineer, as assistant manager of the railway department, the position formerly held by William F. Bauer, who was recently made manager of the company's Chicago office. Mr. McGinness is a graduate of Columbia University's Schools of Applied Science, class of 1910, and before graduation had considerable practical experience with the New York & New Jersey Telephone Company. After a few months in the engineering department of the New York & Queens Electric Light & Power Company, Long Island City, he joined the sales force of the Edison Storage Battery Company. For the past two years he has been identified with the railway department.

National Corrugated Culvert Manufacturers' Association, Chicago, Ill., announces that the large number of manufacturers operating under the Watson corrugated culvert patent have just been informed by their attorney, Wallace R. Lane, Chicago, that the United States Court of Appeals for the Second Circuit, which has final jurisdiction, has just handed down a mandate reversing the lower court and holding this patent valid and infringed by another culvert which was recently installed. The court says, in part: "The patented culvert is cheap, strong, durable, easily transported, quickly laid down and easily repaired. We cannot believe that the man who gave such a structure to the world should be denied the title of an inventor." The manufacturers of corrugated culverts under this important patent make them out of Armco American ingot iron.

ADVERTISING LITERATURE

Fargo Manufacturing Company, Inc., Poughkeepsie, N. Y., has issued a bulletin describing its straight connector, cable lug, signal connection, ground point and ground meter, "L," "Y" and "T" and terminal connections.

NEW PUBLICATION

Bonds and Stocks—The Elements of Successful Investing. by Roger W. Babson. Babson Statistical Organization, Inc., Wellesley Hills, Mass. 422 pages and three charts. $2 net.

This is the second book of its kind intended for investors received this year for review by the ELECTRIC RAILWAY JOURNAL and written by an authority of national reputation. There are many excellent books planned primarily for the student of corporation finance, but there has been a dearth of books about the science of investing money. Mr. Babson has in his volume rendered a real service to the man unacquainted with security issues who has money to invest, and in addition he has furnished a volume very entertaining aside from its practicable value. Very hazy ideas are frequently held about securities by men otherwise well informed, and to such men the present volume should be more than welcome. It is all very well for the man unacquainted with finance who intends to invest to be sure of the reputation of the house through which he deals, but there is no excuse now that "Bonds and Stocks" has been issued for such a man not to understand the fundamentals of investing. The strong and weak points of stocks and bonds are pointed out with reasons why some classes of securities are attractive and why others are not attractive. Mr. Babson has divided his work into twenty-four chapters. The first four deal with introductory suggestions, the next fifteen with elements of successful investing and the five concluding chapters with supplementary suggestions. There is a chapter on electric railway securities as distinct from lighting, telephone and water power securities. A chapter on the investor's vocabulary contains an explanation of ten phrases, the meaning of which should be understood by every investor. These phrases are the technical ones used frequently by bankers in seeking subscriptions from the public, through the newspapers. Mr. Babson certainly is justified in saying in his conclusion that "if the reader has absorbed all that has gone before he should have in his mind a clear idea of the different kinds and groups of securities and the various questions and terms involved therewith."

Electric Railway Journal

Vol. XLIV NEW YORK, SATURDAY DECEMBER 12, 1914 No. 24

LET SHOPMEN HELP DESIGN

On several occasions we have called attention to errors in maintenance structure design which might have been avoided had the shop employees been taken into consultation. The bad consequences of leaving everything to the man at the drafting board were noted again lately in a certain New England carshop. The building was laid out for aisle sprinklers, but after these were installed it was discovered that thereafter trolley poles on cars would have to be turned in the open air. Another part of the building was confidently laid out as a paint shop, but when car painting began it was found that a painter could not possibly work in the narrow space which had been left between the painting track and the wall. In general, the provision of satisfactory working clearances for a car shop requires more foresight than may reasonably be expected even from the combined experience of the draftsman, the shop superintendent and general manager. A hint or two from the men closest to the job may avoid many distressing incidents of the nature cited.

THE SKIP-STOP IDEA

One of the reforms which seem a long time in coming is the skip-stop for city service. Railway managers who have studied the plan approve of it, but the inertia of the public in matters of this kind is so great that this reform has been adopted in very few places. Chicago is now reported to be contemplating a trial of the plan. An account of the Denver experience has been published in recent issues. In Los Angeles, where the skip-stop has also been tried, there seems to be some doubt as to the advisability of its continuance. On the other hand, in Cleveland and in Kansas City, where the skip-stop appears to have been originally introduced in the year 1911, it has been continued in operation with every evidence of success. The increase in schedule speed has been reported to be nearly 10 per cent but since half of the cars stop at "odd" streets and the other half at the "even" streets, only about half of the people that collect at a corner board the first car that arrives. Thus the load is distributed more evenly among the cars on the route. There is no doubt that the public would be greatly benefited by the skip-stop because it materially increases the average speed by cutting out the number of stops and yet does not greatly increase the distance which the passengers have to walk to catch a car. In a number of cities the near-side stop has recently been introduced without creating public opposition. Perhaps this change will make the general adoption of the skip-stop more of a possibility.

AUTOMOBILES IN CITY TRAFFIC

Automobiles for private use have now become so common that it is not surprising they should have invaded the passenger transportation field, and several electric railway companies on the Western Coast report considerable competition from automobiles which carry passengers over certain routes for nickel fares. We have no fear that such cars, with the tire cost and other depreciation inseparable from automobile service, can ever be commercial competitors on the same terms with an electric railway system. The report of Mr. McCullom to the Board of Estimate and Apportionment of New York, abstracted in this paper about a year ago, presents ample evidence to this effect. Nevertheless, experience has shown that this fact will not prevent the owners of cars from attempting a service of this kind. In a free country like this, electric railway companies cannot suppress this competition even if they would, but it is only fair to them as large taxpayers and also to the public as a whole, whose patronage is solicited by these buses, that both classes of transportation should be placed under similar regulations in regard to responsibility, and that strict traffice regulations should be enforced. The Merchants & Manufacturers Association of Los Angeles has called the attention of the City Council of that city to the tremendous liability of street accidents from these irresponsible automobiles, and Long Beach, Cal., has imposed a license fee of $25 a year and has required taking out of a $10,000 liability insurance for every such car. Charges of short changing by irresponsible automobile conductors is also made in some of the Western cities. Railway companies can ask no more than a free field and fair play for all, but both they and the public should demand that fair play means an equal degree of responsibility from the operators of both classes of service.

STREET RAILWAY LOADS ON SOILS

A part of the discussion of the way committee's report on track at the convention was devoted to the distribution of railway loads over the ballast and sub-grade. While this subject is of vital importance to steam railroad engineers, owing to the great increase in the weight of locomotives as well as the adoption of higher scheduled speeds of trains, neither of these factors has any bearing on the study of track foundations in paved streets. Moreover, the conditions governing the depth of loose, unconfined ballast are hardly comparable with those surrounding a foundation of concrete or compactly-rolled ballast, such as is required by a modern electric railway. In steam

road, or even interurban road open-track construction, a certain amount of flexibility is required, while track in paved streets must be as rigid as is consistent with economical operation. To obtain rigidity the foundation must be made much heavier than that actually necessary to carry the track loads. In other words, one should determine the average soil-bearing power condition and then select a foundation which will distribute the track loads well within the safe limit. It would be impractical to change the character of foundation with every slight change in the bearing quality of the soil. On the other hand, it is necessary to change the character of foundation when there is a marked change in the soil-bearing power, such as might be found where track is constructed over filled-in areas or where the soil contains excessive moisture. Of course, a drainage system would go far toward improving the latter condition, while rolling the sub-grade will often be all that is necessary to prepare filled-in areas for foundation construction. To sum up, it appears impossible to calculate exactly the distribution of track loads over the foundation and sub-soil. Hence, the selection of the foundation must be based largely on experience, after such mathematical checks as may be required have been made to determine the relation of the load to be carried to the bearing power of the sub-soil.

SNOW REMOVAL

That the removal of snow from city streets should constitute one of the most exasperating of the unsolved engineering problems of long standing is really remarkable when it is considered that the cost of the fuel necessary to melt the snow would be hardly 15 per cent of the expense of removal involved under present methods, the latter consisting, almost without exception, in shoveling the snow into wagons and carting it away. It may be, of course, that snow storms will have to be fought for some time by this primitive scheme, yet in this age of flying machines and wireless telegraphy one must be a true conservative at heart to accept this as a fact, even though the recommendations of the committee on resolutions of the snow removal conference, which were presented before the American Society of Mechanical Engineers last week, approved no new process except the limited use of the sewer system to get the snow off the streets.

The reasons that prevented the general use of sewers, as outlined in the report, could be summed up in the one generality—insufficient sewage flow. In New York, during the last winter, experiments demonstrated that the large trunk sewers with a continuous and fairly rapid flow were not clogged by any snow that might be shoveled into them. The small sewers, however, of about 12-in. diameter required flushing with hydrant water and even then had to be treated with considerable care.

The same idea has been suggested for Philadelphia, where the contractors are supposed to commence the work of plowing or sweeping the snow to the sides of the streets within one hour after a storm begins, the work of carting the piles away being aided by the use of certain sewer manholes for dumps. It is now planned to extend the use of the sewers by having water connections placed inside of the manholes, thus increasing the flow in the sewer and permitting the flushing away of accumulations of snow.

Removal of snow by flushing the streets with cold water naturally seems like carrying coals to Newcastle, but the experience in Scranton has demonstrated that with proper temperature conditions the scheme is capable of reducing the expense of removal to one-half that of cartage. However, when a cold snap follows a snow storm, the presence of great quantities of water on the streets might easily become fraught with considerable danger. This fact, indeed, is implied in the recommendations of the committee. Considerable hope is also held out in regard to the disposal of snow by melting in a furnace. The committee estimates that with a perfect furnace the cost of the coal required would be 3 cents, or with a furnace efficiency of 33 per cent, 9 cents, per cubic yard, against the present cost of carting of about 50 cents. This difference provides a considerable margin from which, of course, the cost of apparatus, labor and maintenance must be deducted. The problem should be an attractive one to the inventor, because there are many objections to carting besides its cost. One is its slowness, another is the congestion caused in the streets by the carts, and a third is the increasing scarcity in most cities of carts suitable for this purpose, owing to the growing tendency to substitute in commercial work for the horse-drawn cart a specialized motor truck not suitable for snow removal.

Surface railways, of course, are not so much interested in the manner of snow removal as in the provisions for operating their lines during and after snow storms. The matters of complaints from the public and of decreased receipts, which are the invariable accompaniments of heavy snow falls, are of serious importance, and at least one road, the New York Railways, is going to great expense to develop a wing sweeper that will clear a passageway beside the track. This has been planned solely to provide space for vehicular traffic which, during snow storms, utilizes the street railway tracks because these provide the only clear space in the street. Obviously the consequent congestion practically prevents the railway company from moving cars. To meet this difficulty wing brooms have also been suggested for Philadelphia and wing plows have been in successful use in Montreal for several years, a layer of snow being intentionally left on the streets in the latter city. It seems unfair to require a railway company, which is responsible only for the clearing of its tracks, to take care of the snow elsewhere on the street. But in many cases, owing to the slowness of the city force, this appears to be necessary for the railways, purely as a means for self-protection, and the development of wing brooms and wing plows seems to constitute peculiarly the railways' share in the problem, just as much as the prompt removal of the snow piles constitutes the share of the municipality.

FEDERAL AND STATE JURISDICTION OVER CITY RAILWAYS

It is not surprising, in view of the recent establishment of commission regulation in this country, that there should be many unsettled questions as to the powers and duties of regulatory commissions. One of the most important of those which remain to be settled is where the power of the federal commission should end and that of the state commissions begin. It would seem that with all of the problems in connection with valuation of steam railroads and the establishment of freight rates that the Interstate Commerce Commission has enough to occupy its time during the next few years, and that to the various state commissions could be assigned the adjudication of all of the intrastate matters which arise in connection with the operation of electric railways. This was the view which a committee of the American Electric Railway Association urged before a sub-committee of the House committee on interstate and foreign commerce last January in a hearing on several bills which would have brought certain equipment of all electric roads which do any interstate business under the jurisdiction of the Interstate Commerce Commission. The protestants at that hearing called attention to the fact that only a small percentage of their business, averaging in most cases less than 1 per cent, was interstate in character.

Now the question has come up again through an order to the Detroit United Railway, which owns about 800 miles of track in Michigan and 2 miles in Ohio, to make reports to the Interstate Commerce Commission on all accidents including, of course, all of those on its large city system in Detroit. If this policy should be adopted as standard, very few urban companies, certainly among those which haul freight and so issue through bills of lading, would be exempt. Moreover, if the jurisdiction of the Interstate Commerce Commission covers this case, it is likely to cover almost any other detail of city operation, and we should then have a centralized government control of our public utilities in addition to state control.

At the last meeting in Washington the railway managers present did not question the good intentions or the ability of the Interstate Commerce Commission in dealing with these matters, as compared with the state commissions. The principal grounds urged were the absence of knowledge of local conditions and the immense amount of work which would be entailed on a central commission and also on the railways themselves in taking up all of these subjects at the federal capital as well as at the state capitals.

If precedent can count for anything, the decision of the Supreme Court in the opinion on the case of the Omaha & Council Bluffs Street Railway vs. the Interstate Commerce Commission (230 U. S. 324) would indicate that that court does not believe that the interstate commerce law covers cases of this kind. At Omaha the situation was somewhat different because the question was one of rates on street railways which happened also to be interstate roads. The conclusion reached then by the court was that the character of the service was the criterion of whether a road is embraced under the interstate commerce law, and certainly the character of the accidents in city service and the means to be taken to avoid them by fenders or otherwise bears little relation to what is generally understood as interstate commerce. We hope that the hearing at Washington next Friday, to which a letter from Arthur W. Brady in our "Communication's" column this week calls attention, will be effective in impressing this fact upon the Interstate Commerce Commission.

HUMANIZING DISCIPLINE

A casual study of a number of bulletins issued to platform men indicates an often unnecessary brusqueness in many of the instructions and little or nothing of a commendatory nature. Of course, the purpose of the merit and demerit system in disciplining trainmen has taken this into account to a certain extent, but attention is here directed to the day-to-day bulletins. Would not the suggestive effect of a meritorious act spread on these bulletins be of much value in disciplining and at the same time offer relief from the constant repetition of "do" and "don't"? Orders must, of course, be issued, but occasional commendation and a mixing of the "sweet" with the "bitter" will help greatly toward better service. The iron hand of discipline might well be covered with the silk glove of consideration. In other words, the human side of disciplining must be recognized.

The frailties of the human mind and body have been thoroughly safeguarded in the operation of trains, so as to make the man as nearly as possible an automaton. All of these precautions have done much to make operation more safe, but they cannot make a machine out of the human body. Hence disciplining in various forms is necessary to make up for this deficiency, and the point we have in mind is that, in disciplinary methods, full cognizance should be taken of the human factor. To illustrate what we mean, take the case of the application of discipline after accidents have occurred. After a serious accident the superintendent's first tendency is to discharge the offenders if they prove to have been guilty of lack of attention or lapse of memory. It is worth while in such cases to go behind the facts and consider some of the contributing causes and thus possibly justify the retention in service of men who will afterward be much more valuable on account of the accident. A momentary mental lapse during a run may result in disaster. Yet we all have mental lapses and the very fact that a man has had no accidents or "near" accidents during his railway career may in itself have made him subject to a false sense of security. As he ages in service his alertness is apt to become sluggish. But this defect may be more than made up, so far as his value of the company is concerned, by better knowledge of local conditions and clearer judgment. This fact should receive consideration when his case is decided. After he gets his "nerve" back he may be a safer man than one with no accident to his credit.

of the court of last resort may be obtained. The application for the injunction is based upon the allegation that the provision of the labor law forbidding the employment of non-citizens upon public work is unconstitutional and a violation of the treaty between the United States and the Kingdom of Italy and similar treaties with other nations in the most favored nations class.

Reports Requested Regarding Seattle Purchase.—Preliminary to further consideration of the proposition for the purchase of the Seattle, Renton & Southern Railway by the city of Seattle for a consideration of $200,000 in municipal railway bonds and 20 per cent of the gross earnings for a period of twenty-eight years, payable annually, Mayor H. C. Gill recently conferred with the heads of the various departments of the city government on the various phases of the project. The Mayor has asked A. L. Valentine, superintendent of public utilities, to report on the cost of operation of the line by the municipality, the cost of such reconstruction as will be necessary in bringing the tracks to the established grades, and matters of like nature. A. H. Dimock, city engineer, has been requested to furnish an estimate of the cost of grading and regrading the 18 ft. of Rainier Avenue now occupied by the tracks of the Seattle, Renton & Southern Railway. J. D. Ross, lighting superintendent, will report on the estimated cost of current sufficient to operate the line in connection with Division A and the Highland Park & Lake Burien Line, Division C, as well as the advantages that will accrue to the light and power department by city operation of the line. James E. Bradford, corporation counsel, will report on the various suits against the Seattle, Renton & Southern Railway, now in court.

PROGRAMS OF ASSOCIATION MEETINGS

New England Street Railway Club

The regular monthly meeting of the New England Street Railway Club will be held at the American House, Boston, Mass., on Dec. 17. H. A. Bullock, staff assistant to the president of the Brooklyn (N. Y.) Rapid Transit Company, will speak on "The Employee's Welfare." His address will be followed by a discussion in which it is expected that representatives of large corporations in other kinds of business who have had extended experience along this line will take part. The dinner which precedes the meeting will be served at 6 p. m.

American Wood Preservers' Association

The eleventh annual convention of the American Wood Preservers' Association will be held at the Congress Hotel and Annex, Chicago, on Jan. 19, 20 and 21, 1915. The subjects to be treated in papers are as follows:

"Treated Timber for Factory Construction," by F. J. Hoxie, engineer and special inspector of the Associated Factory Mutual Fire Insurance Companies.

"Temperature Changes in Wood under Treatment," by George M. Hunt of the Forest Products Laboratory, Madison, Wis.

"Sill Ties," by F. J. Angier, secretary-treasurer of the association.

"New Data on Properties of Creosote Oil," by Dr. Herman von Schrenk.

"Facts on Treated Ties," by J. H. Waterman, superintendent of timber preservation of the Chicago, Burlington & Quincy Railroad.

"Bleeding and Swelling of Paving Blocks," by Clyde H. Teesdale, in charge of wood preservation at the Forest Products Laboratory, Madison, Wis.

"Economical Use of Steam in Connection with Wood Preserving Plants," by A. M. Lockett, mechanical engineer, New Orleans, La.

"Mechanical Life of Ties as Affected by Ballast," by Earl Stimson, engineer maintenance of way of the Baltimore & Ohio Railroad.

"Determining the Soundness of Timber before Treatment," by C. M. Taylor, superintendent of the Port Reading Creosoting Plant.

"Facts on Creosoted Piling," by T. G. Townsend, piling inspector of the Southern Railway.

"A Problem in Air Seasoning Ties," by A. H. Noyes, assistant treasurer of the Ayer & Lord Tie Company.

Financial and Corporate

RECENT FINANCIAL TENDENCY

The sales of bonds on the New York Stock Exchange on Dec. 9 totaled $1,736,000, par value, as compared with $1,395,500, par value, for the same day last year. This is much the largest day's business in bonds since public trading was resumed. Price movements on the average showed a further gain, but there were reactions in some securities which have lately experienced unnatural advances. Despite the approaching opening of the Stock Exchange for trading in stocks, sterling rates remain normal. Money continues easy. It is not regarded as likely that rates will be materially affected by any borrowing which may be made following the reopening of the exchange for public trading in stocks. Trading in stocks through the clearing house, according to the reports issued on Dec. 9 by the New York Stock Exchange, presented many interesting features. The most important changes reported during the day were in the railroad issues.

CHICAGO TRACTION ACCOUNTING CONTROVERSY

The report of the special audit of the books of the Chicago Railways and the Chicago City Railway being made by the city administration has just been published. That for the Chicago Railways was made by M. & L. W. Scudder, of New York, and that for the Chicago City Railway by Barrow, Wade, Guthrie & Company. In both cases the books were found without important error. The corporation counsel of the city, however, has recommended certain changes in the accounts to which paving and the removal of obstructions should be charged, although both of these questions have either been covered by specific provisions in the ordinance or publicly discussed and decided by the Board of Supervising Engineers, which has had the sole authority under the ordinance in these matters. It has been estimated that these changes, if made, would reduce the Chicago Railways' capital account $6,945,130 and make it necessary to pay the city traction fund $584,264, and that the company should also credit its renewal account with $531,965, and, similarly, that the capital account of the Chicago City Railway would have to be reduced approximately $5,138,000.

Regarding this controversy Henry A. Blair is quoted as saying, in an interview, that the books of the two railway companies have been audited each year by accountants selected by the city and approved by the companies. Through these audits the city comptroller was familiar with the methods of the Board of Supervising Engineers in charging every item which is now sought to be questioned by the Mayor. On these audits the companies have made seven annual settlements with the city, having turned into the traction fund more than $13,000,000,

On the special audits during Mayor Busse's administration the city and the companies had expended approximately $100,000, of which the city has borne 55 per cent. In the audit just completed the city again appropriated $50,000 of its own funds for the work. It would seem that this constituted a liberal expenditure for auditing purposes. Moreover all these firms have reported that the railway companies were conforming to the terms of the 1907 ordinances and the decisions of the Board of Supervising Engineers. The accountants engaged on the work at the present time were not called upon to show what would have been the results of operation during this seven-year period if the companies had followed the ordinance and the decisions, but if they had followed the opinions rendered by corporation counsel. Mr. Blair did not consider these criticisms therefore worthy of serious consideration. Speaking from the standpoint of a financial representative he did not believe that the controversies of this nature were at all helpful either to the city or to the railway companies.

Mr. Blair is also quoted as saying that during the seven-year period the companies had never at any time earned more than a fair rate of return upon the capital fixed by the actual purchase price of the city. The rate of return has been about 7 per cent, which includes the 5 per cent return upon the purchase price, the companies' 45 per cent of the visible net receipts and all construction profits. This rate of return he stated was less than that earned by other public utilities in the city of Chicago.

ANNUAL REPORTS

Eastern Pennsylvania Railways

The consolidated statement of income, profit and loss of the Eastern Pennsylvania Railways, Pottsville, Pa., for the twelve months ended June 30, 1914, follows:

Gross earnings	$826,415
Operating expenses and taxes	503,487
Net earnings from operation	$322,928
Deduct underlying companies charges	45,525
Balance	$277,403
Interest on bonds	$164,863
Other interest and rentals	13,630
Total	$178,493
Surplus for year	$98,909

As compared with the year ended June 30, 1913, the gross earnings increased $56,735, or 7.37 per cent, and the operating expenses increased $67,483, or 15.48 per cent. The net earnings, therefore, decreased $10,748, or 3.22 per cent, while the net profit for the year decreased $19,463. The various departments showed the following earnings results: Railway, an increase of $13,576; electric, an increase of $43,415; gas, a decrease of $55, and park, a decrease of $201. The increased operating expenses were partly caused by higher cost of labor and extra maintenance. Railway maintenance increased by $23,900 to a total of $88,390 for the year, while the cost of transportation increased $13,000. There was charged to capital accounts during the year $115,689, of which $57,666 was for the railway department and $58,023 for the electric department.

San Francisco-Oakland Terminal Railways

Price, Waterhouse & Company recently completed an audit of the books of the San Francisco-Oakland Terminal Railways for the fiscal year ended June 30, 1914, and submitted the following income statement for that period:

Operating revenues	$4,515,798
Operating expenses:	
Maintenance of way and structures	$400,972
Maintenance of equipment	284,081
Traffic	25,398
Conducting transportation	1,923,966
General and miscellaneous	295,503
Total operating expenses	$2,929,920
Net operating revenue	$1,585,878
Deduct:	
Taxes and licenses	239,000
Net revenue	$1,346,878
Add:	
Miscellaneous income	125,964
Net income before charging interest, amortization of premiums and discount on bonds and notes, and depreciation of road and equipment	$1,472,842
Deduct:	
Interest on bonds	$859,268
Interest on collateral trust notes	175,000
Miscellaneous	23,232
Total	$1,057,500
Profit after charging all interest, but before providing for amortization of premiums, and discount on bonds purchased, and depreciation of road and equipment.	$415,342
Deduct:	
Amortization of premiums and discount on bonds purchased	10,491
Profit after charging all interest, but before providing for depreciation of road and equipment	$404,851
Add:	
Interest charged by company to capital assets	240,101
Balance carried to surplus account	$644,952

The operating expenses of the company for the fiscal year consumed 64.9 per cent of the operating revenues, divided as follows: maintenance of way and structures, 8.9 per cent; maintenance of equipment, 6.3 per cent; traffic, 0.6 per cent; conducting transportation, 42.6 per cent, and general and miscellaneous, 6.5 per cent. Taxes and licenses absorbed 5.3 per cent of the operating revenues, leaving net revenue of 29.8 per cent. Miscellaneous income constituted 2.8 per cent of the operating revenues, so that the net income before charging interest, amortization and depreciation was 32.6 per cent of the operating revenues.

The auditors report net additions to capital account of $510,927 for road and $105,923 for equipment, a total of $616,850. These amounts are those existing after considerable writing down of the value of land and writing off of the value of abandoned structures. The total amount of bonds outstanding as of June 30, 1914, is certified to amount to $16,656,000 in the hands of the public and $3,256,000 pledged as security for the Oakland Railway notes, making a total outstanding amount of $19,912,000.

The profit of $404,851 after charging all interest, including the interest properly chargeable to capital, does not provide for sinking fund payments. While amply able to maintain itself in excellent operating condition, therefore, the property evidently is not in a position to undertake new construction until, through refinancing, new capital has been obtained.

Barcelona Traction & Light Company, Barcelona, Spain.—Owing to the present European war, the Barcelona Traction, Light & Power Company was unable to meet the semi-annual interest coupons due on Dec. 1 on its outstanding £1,500,000 of first mortgage 5 per cent bonds. According to a statement from the Toronto office, the war has rendered it impossible to continue the arrangement made last June for providing the funds required for the completion of the present program of construction. The board, however, has under consideration a plan which would provide the company the necessary funds for completing the work under construction and for adjusting computing interest. The enterprises of the company at present in operation are said to show satisfactory results, with a steadily increasing revenue. This company was formed in 1911 by F. S. Pearson and associates and it either owns or controls virtually the entire tramway, light and power business of not only the city of Barcelona but the whole district of Cataluna, the industrial center of Spain.

California Street Cable Railroad, San Francisco, Cal.—J. Barth & Company, San Francisco, have purchased the $384,000 of new general first mortgage 6 per cent serial refunding gold bonds of the California Street Cable Railroad, dated Jan. 1, 1915, and due in twelve annual installments beginning Jan. 1, 1916, and ending Jan. 1, 1927. These bonds were referred to in the ELECTRIC RAILWAY JOURNAL of Oct. 31, Nov. 21 and Dec. 5.

Chicago (Ill.) Elevated Railways.—At the annual meeting of the Chicago Elevated Railways collateral trust the trustees reduced the governing board from seven to five members. Ira M. Cobe and F. A. Delano, who joined the Federal Reserve Board in Washington, withdrew. It was not thought necessary to fill their places. The board now stands: Frank A. Vanderlip, Henry A. Blair, Samuel Insull, E. W. Harden and Samuel McRoberts. The governing committee will elect the executive committee at a later meeting. There are three members of that body, Samuel Insull, Henry A. Blair and Ira M. Cobe. Mr. Cobe has tendered his resignation, but his successor has not as yet been selected.

Cumberland County Power & Light Company, Portland, Maine.—It was stated in the ELECTRIC RAILWAY JOURNAL of Nov. 21 that the Cumberland County Power & Light Company has certified and guaranteed, principal and interest, $500,000 of bonds of the York County Power Company, a subsidiary. Of this amount $315,500 are outstanding in the hands of the public, $150,000 are in the treasury of the Cumberland County Power & Light Company and $34,500 are in the treasury of the York County Power Company. The $315,000 outstanding includes $100,500 of bonds which have been exchanged for an equal amount of underlying liens. There has been no offering of these bonds.

Federal Light & Traction Company, New York, N. Y.—E. N. Sanderson, president Federal Light & Traction Company, has issued a circular regarding the recent deferring of dividends on the company's $2,500,000 of 6 per cent cumulative preferred stock, as noted in the ELECTRIC RAILWAY JOURNAL of Dec. 5. The net income of all companies for the twelve months beginning September, 1913,

is said to have been adversely affected by the disastrous fire at Hot Springs, the serious strike in the Trinidad coal fields, and the drastic rate schedules in Tucson, Ariz., and Springfield, Mo. In the opinion of the board, however, the turning point has been passed, and from now on the company will enjoy increased gross and net earnings. During the last twelve months the gross earnings showed an increase over the corresponding previous period, and only the net earnings suffered substantially from the adverse condition. Since July the net income has been constantly improving, so that during the three months ended Oct. 31 the dividend on the preferred stock has been more than earned.

Fresno (Cal.) Interurban Railway.—The Railroad Commission of California has granted the application of the Fresno Interurban Railway for permission to make three stock and bond issues to provide for twenty-six miles of new line at an estimated cost of $17,300 per mile.

Interborough Rapid Transit Company, New York, N. Y.—An extra dividend of 5 per cent has been declared on the $35,000,000 of stock of the Interborough Rapid Transit Company, along with the regular quarterly payment of 2½ per cent, both payable on Jan. 2 to holders of record on Dec. 21. Since the Interborough-Metropolitan Company owns $33,912,800 of the stock, its income from the extra disbursements is $1,695,640. The committee on listings of the New York Stock Exchange has received an application from the Interborough-Metropolitan Company to list $17,942,000 of 5 per cent cumulative preferred stock. This is the stock that was formerly in the hands of the voting trust and does not represent an increase in the capitalization of the company.

Joliet & Eastern Traction Company, Joliet, Ill.—The bondholders of the defunct Joliet & Southern Traction Company have almost unanimously decided to accept stock in the Joliet & Eastern Traction Company in exchange for their holdings. The formation of this new company was described in the Electric Railway Journal of Nov. 21. The greater part of the $80,000 fund paid into court during the period of bankruptcy of the Joliet & Southern Traction Company will be practically all turned into the treasury of the new company.

Kentucky Securities Corporation, Lexington, Ky.—The annual report of the Kentucky Securities Corporation for the fiscal year ended June 30 is made up principally of a report for the Kentucky Traction & Terminal Company and the Lexington Utilities Company, all the stocks of which are owned by the Kentucky Securities Corporation. The combined operating revenue of the two subsidiary companies, exclusive of inter-company charges, amounted to $782,272 for the last fiscal year, as compared to $742,884 for the previous year, an increase of 5.3 per cent. Operating expenses in the two years were $412,509 and $401,507, an increase of 2.7 per cent. Miscellaneous income increased from $29,941 to $32,022 and fixed charges from $225,268 to $245,184, while the final surplus increased from $146,049 to $156,600, or 7.2 per cent. The operating companies as of June 30 had a credit balance in the reserve for accidents and damages of $27,550, and it was directed that $24,000 should be credited to the depreciation reserve as of June 30. A fixed proportion of gross earnings is set aside monthly on account of maintenance, amounting for the current year to 16½ per cent.

Lehigh Traction Company, Hazelton, Pa.—The Lehigh Traction Company, reversing its previous decision as noted in the Electric Railway Journal of Nov. 28, paid on Dec. 1 the interest due on its first mortgage 5 per cent bonds. The protective committee representing the bondholders refused to accept the offer of President Markle to purchase the bonds for his personal account, as they had done in connection with the interest default on June 1.

Long Island Railroad, New York, N. Y.—The 5 per cent equipment trust series A of the Long Island Railroad, the authorization of which by the Public Service Commission for the Second District of New York was noted in the Electric Railway Journal of Oct. 24, consist of a total authorized issue of $1,060,000. Of this amount $1,050,000 is issued and outstanding. The trusts are dated June 1, 1914, and mature $106,000 on June 1, 1915, and June 1 of each succeeding year to 1923, inclusive, and $96,000 on June 1, 1924. The principal and the interest are payable in gold and are guaranteed by the Long Island Railroad. The cost of equipment is $1,175,262, of which the railroad has paid to the trustees $125,000.

Massachusetts Electric Companies, Boston, Mass.—George C. Lee has been elected a trustee of the Massachusetts Electric Companies, succeeding the late Gardiner M. Lane.

Massachusetts Northeastern Street Railway, Haverhill, Mass.—The Massachusetts Northeastern Street Railway on Nov. 28 filed a mortgage for $2,000,000 at Lawrence to the American Trust Company, Boston, Mass., as trustee. This mortgage takes the place of an original one issued in 1903 to the New York Trust Company, New York, which is discharged. The filing of the new mortgage simply provides for a change in the fiscal agent of the corporation.

Mexico Tramways, Mexico City, Mexico.—Officers of the Mexican Light & Power Company, a subsidiary of the Mexico Tramways, recently notified the holders of the $9,733,333 of second mortgage fifty-year sinking fund bonds that the payment of the interest coupons due on Dec. 1 would be deferred. The rate of exchange has been falling continuously in the last few months and the Mexican government officials, who are now in control of the operations of the Mexico Tramways, have prohibited further remittance of funds from Mexico until the rate of exchange improves.

New York (N. Y.) Railway.—At the annual meeting of the New York Railways on Dec. 7 Darwin P. Kingsley, F. S. Witherbee, Henry Ollesheimer, F. L. Leland and J. C. Cobb were elected directors to represent the holders of the 5 per cent income bonds. Harry Bronner, Guy E. Tripp, A. J. Hemphill and E. S. Marsten retired. Mr. Cobb was reelected. A statement of the company's income for the four months ended Oct. 31, last, was read by T. P. Shonts, president. It showed that the gross revenue for the period, October being partly estimated, was $4,618,000, as against $4,828,000 last year, and a surplus over interest charges available for the income bonds of $425,000, against $508,000 last year. The so-called Kingsley insurance company interests already have a suit pending in the courts to decide what constitutes a proper allowance for injury and damage claims or whether or not all surplus revenue not actually paid out in any given year shall be applicable to the adjustment of income bonds. The contention of certain bondholders has been that all surplus revenues not actually paid out during any year should be applicable to the payment of interest on the income bonds. Darwin P. Kingsley is president of the New York Life Insurance Company, F. S. Witherbee is a director of the Equitable Life Assurance Society. Henry Ollesheimer is vice-president of the Metropolitan Bank, New York, F. L. Leland is president of the New York County Bank, and J. C. Cobb resides in Boston. The movement to change the present income bondholders' representation on the board has been under way for a year. A total of $18,000,000 of bonds was voted, of which the so-called Kingsley committee cast $14,000,000 and the so-called Hemphill committee $4,000,000.

Oakland, Antioch & Eastern Railway, Oakland, Cal.—The Railroad Commission of California has rendered a decision authorizing the Oakland, Antioch & Eastern Railway to issue promissory notes of the total face value of $295,345. It is made a condition of the commission's order that these notes shall bear interest at not to exceed 7 per cent per annum.

Rochester Railway & Light Company, Rochester, N. Y.—The Rochester Railway & Light Company has been authorized to issue $250,000 of its 5 per cent fifty-year consolidated trust mortgage bonds for the purpose of refunding a like amount of the underlying bonds of the Brush Electric Light Company, maturing on Jan. 15, 1915. The new bonds are to be sold or exchanged at not less than 95. Should the holders of the underlying bonds not prove willing to exchange for the new bonds at not less than 95, the company has been authorized by the Public Service Commission of the Second District of New York to enter into agreement with such holders whereby an extension of the time for the

payment of the principal may be obtained for one year at an increase from 5 per cent to 6 per cent in interest during that time on the old bonds.

Springfield (Mass.) Street Railway.—The Springfield Street Railway has applied to the Massachusetts Public Service Commission for authority to issue $1,041,000 of additional stock at 110 to pay floating debt. This is part of an issue of $1,290,000 authorized by the stockholders. There is now $3,708,100 of stock outstanding.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.—E. W. Clark & Company, Philadelphia, Pa., are offering for subscription $1,118,000 of St. Joseph Railway, Light, Heat & Power Company 6 per cent sinking fund trust stock certificates due on May 30, 1917, and redeemable at par and accrued dividend on any dividend date. The certificates will be issued by the Guaranty Trust Company, New York, as trustee under an agreement with the Cities Service Company. This agreement provides for the deposit with the trustee of 31,948 shares out of a total of 35,000 shares of the common stock of the St. Joseph Railway, Light, Heat & Power Company. A sinking fund will operate monthly to retire certificates before maturity. The rate at which this fund will work will be $450,000 a year, giving the issue an average life of not more than fifteen months. If the certificates are not obtainable for purchase for the sinking fund at par and accrued dividend or better in the open market, they will be called by lot monthly. All certificates taken up in the sinking fund will be cancelled. The certificates are being offered at 97½ and accrued dividend, yielding more than 7 per cent to maturity and more than 8 per cent on their average life.

Toronto (Ont.) Railway.—William A. Read & Company, New York, N. Y., have sold $1,500,000 of 6 per cent gold bonds of the Toronto Railway, dated Dec. 1, 1914, and due half on Dec. 1, 1915, and half on Dec. 1, 1916, at 100¼ for the former and par for the latter. The purchase of these notes by the bankers was noted in the ELECTRIC RAILWAY JOURNAL of Dec. 5.

Washington Railway & Electric Company, Washington, D. C.—Notice has been served on the Washington Railway & Electric Company that because the purchase by the company of 740 shares of stock of the Washington & Rockville Railway was not authorized in writing by the Public Utilities Commission that body recognizes the transaction as void. The purchase was made from the Potomac Electric Power Company for a consideration said to have been $37,000.

West End Street Railway, Boston, Mass.—The Massachusetts Public Service Commission has received an application from the West End Street Railway for authority to sell at public auction the $650,000 of stock authorized by the stockholders on Nov. 24, as noted in the ELECTRIC RAILWAY JOURNAL of Nov. 28.

Wisconsin-Minnesota Light & Power Company, Eau Claire, Wis.—The Railroad Commission of Wisconsin has authorized the Wisconsin-Minnesota Light & Power Company, a subsidiary of the American Public Utilities Company, to issue preferred stock to the amount of $367,000 and common stock to the amount of $244,000. The company has authority to issue $300,000 in preferred and $200,000 in common stock for the purpose of acquiring the property of the Winona Gas, Light & Coke Company, Winona, Minn., the Red Wing, Gas, Light & Power Company, Red Wing, Minn., the Minnesota-Wisconsin Power Corporation, which furnished electric light to Wabasha and Lake City, Minn., and the Eau Claire Gas Light Company. Under this authorization, stock to the amount of $94,000 may be issued for improvements and extensions to the plants, and preferred stock to the amount of $17,000 may be issued to acquire all property including the accounts receivable of the Neillsville (Wis.) Electric Company.

Worcester (Mass.) Consolidated Street Railway.—The Worcester Consolidated Street Railway has applied to the Massachusetts Public Service Commission for authority to issue $1,880,000 of additional stock to pay floating debt. This is part of an issue of $2,350,000 authorized by the stockholders. The amount of stock already outstanding is $5,112,000.

DIVIDENDS DECLARED

Arkansas Valley Railway, Light & Power Company, Pueblo, Col., quarterly, 1¾ per cent, preferred.

Brazilian Traction, Light & Power Company, Toronto, Ont., quarterly, 1½ per cent, preferred.

California Railway & Power Company, San Francisco, Cal., quarterly, 1¾ per cent, prior preferred.

Cleveland (Ohio) Railway, quarterly, 1½ per cent.

Columbus (Ga.) Electric Company, 3 per cent, preferred.

Continental Passenger Railway, Philadelphia, Pa., $3.

Eastern Power & Light Corporation, New York, N. Y., quarterly, 1½ per cent, preferred.

Indianapolis (Ind.) Street Railway, 3 per cent.

Manila Electric Railroad & Light Corporation, Manila, P. I., quarterly, 1¾ per cent.

Union Traction Company, Philadelphia, Pa., $1.50.

United Light & Railways Company, Grand Rapids, Mich., quarterly, 1½ per cent, first preferred quarterly, three-fourths of 1 per cent, second preferred.

United Railways & Electric Company, Baltimore, Md., 2 per cent, preferred.

United Traction & Electric Company, Providence, R. I., quarterly, 1¼ per cent.

West End Street Railway, Boston, Mass., $2, preferred.

Traffic and Transportation

AUTO BUS COMPETITION IN SOUTHERN CALIFORNIA

Auto Bus Invades San Francisco—Los Angeles Railway, Losing $600 a Day, Has Withdrawn Twenty-One Cars

The "jitney" bus, as the nickel-a-passenger automobile is popularly referred to in southern California cities, has invaded San Francisco. On Dec. 1 six automobiles were put in regular service on Market Street, carrying passengers between the ferry and outlying points for 5-cent fares. As yet no special license has been placed upon these vehicles in San Francisco, but the fact that in that city they will be in competition with a municipal street railway may present the matter in a new light. While an increase in local passenger capacity during the exposition would be welcomed it is conceded that enfranchised street railways should not be deprived of their most profitable traffic by companies free from any obligation to serve in unprofitable districts and that automobiles should be subject to regulation, including a guarantee for damages in case of accident.

Long Beach, Cal., recently imposed a license fee of $25 a year on the "jitney" buses, compels the taking out of a $10,000 liability insurance for every car engaged in transporting passengers, and requires the buses to operate over designated routes and maintain reasonable schedules. On the day that this ordinance went into effect only forty-one out of 130 automobiles carrying passengers in competition with the street cars were continued in service. Prior to the passage of this ordinance in Long Beach the Pacific Electric Railway threatened to discontinue its East Ocean Avenue line altogether unless some regulation was placed upon the 5-cent automobile. Legislation is still pending on the matter in Los Angeles. According to the Los Angeles Railway Corporation its loss in revenue on account of the automobile competition amounts to $600 a day, and has caused the company to withdraw twenty-one cars on six lines and eighty-four motormen and conductors. Up to Dec. 1 the secretary of the Los Angeles police commission had issued a total of 1520 permits to chauffeurs to operate auto buses in competition with street cars, and that the rate of increase is rapid is shown by the record of over sixty additional permits issued on Dec. 2.

So serious has the auto bus matter become in Los Angeles that on Dec. 4 the directors of the local association of merchants and manufacturers addressed a letter in part as follows to the City Council:

"We believe that the time has arrived when your honorable body should take some action regulating the passenger traffic of the 5-cent automobile buses. If these buses can run through the city without proper regulation and protection to the lives of not only patrons but the public in general, we will soon be confronted with a number of accidents. In addition, with several hundred of these buses running up and down the main streets the traffic congestion is greatly increased, and the progress of other machines correspondingly retarded. To allow these machines unrestricted freedom is a menace to the entire community, and we believe that no good reason exists why they should not be placed under strict traffic regulations, and we therefore request that this matter receive the early attention of your honorable body."

NEW COMPANY PUBLICATION

The Hudson & Manhattan Railroad, which operates under the Hudson River between New York and New Jersey, has begun the publication of the *H. & M. Review*. The first issue, dated December, contains eight pages, 6 in. x 9 in. in size. In an article entitled "Object and Future of the *H. & M. Review*," Wilbur C. Fisk, president of the company, says in part:

"The need has been felt for months back for a means of intercommunication between all of us who are employed by the company and also between the departments to which we may be assigned. To accomplish this end, it has finally been decided to issue the *H. & M. Review*.

"The prime purpose to be achieved by the publication is the further promotion and cementation of the good fellowship already existing among the employees of the company. This can only be achieved by the hearty co-operation of all and by keeping the editor posted on all news items which are entitled to publication. The editor will always welcome contributions, but will not publish anything not prompted by the best of motives.

"It must not be forgotten that at times the company and your president may have a message which is meant for all of you, and the columns of the *Review* will be open to any officer of the company who has a message, either for the men of his own department, or which he believes will be beneficial to all. It is needless to say that events occurring during any one month will be faithfully reported in the paper.

"I earnestly request not only the officers but all employees of the company to lend the editor their assistance in his efforts to make the *Review* of real value."

The editor of the *H. & M. Review* is J. J. Scovern.

INTERURBAN SAFETY

The Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, of which E. F. Schneider is general manager, is continuing unabated its campaign of safety begun more than five years ago. The custom of the company has been to cover each year the entire system of 250 miles with talks to the 63,000 school children in the territory contiguous to the company's lines. Ben B. Casson of the company in a talk which he delivered recently to the grammar and primary grade pupils at the German Lutheran Parochial School at Elyria, Ohio, reviewed the activity of the company along these lines. In addressing the grammar grade pupils he said that in the year prior to the inauguration of the safety movement eleven children were injured and three killed, but that since then not a child had been injured or killed while going to or from school. He impressed the children with the necessity of exercising care not only as regards street cars but also as regards automobiles, motorcycles, wagons, bicycles and steam railroads. He emphasized the sad task which confronts the officers of the company in going into the homes of parents of children who had been injured or killed and witnessing the grief in the household. Mr. Casson also reviewed his own experiences during the four years that he operated a car over the Cleveland, Southwestern & Columbus Railway. The great problem before the American people to-day was the preservation of the lives of the people. He advised the school children to discuss safety among themselves and suggested similar discussions in the homes. The address to pupils of the primary grade was, of course, a modification of the one made to the grammar grade pupils. Heretofore the safety addresses to the school children have been made by officers of the company. Mr. Casson is a motorman, and his talks have presented a different viewpoint, and possibly for this reason have been especially valuable.

COMPLYING WITH THE NEW REVENUE PROVISION

A circular letter sent out several days before Dec. 1 to the regular shippers over the Louisville & Interurban Railroad, and a supply of stamps laid in by R. H. Wyatt, general freight and passenger agent of the company, enabled that company to start out under the new revenue tax on the first of the month without confusion. The circular letter reviewed briefly the nature and purposes of the revenue measure, explained what were the duties of the shippers, and then added that for the convenience of the patrons of the Louisville & Interurban Railroad stamps had been supplied to all conductors on freight trains, to agents of the company wherever stations were maintained and that the company would gladly obtain for shippers such supplies of stamps as they needed for use in shipments over its lines. As a consequence every shipper knew beforehand just what was expected of him, as, in addition, copies of the letters which were sent out were posted prominently at every shipping point. The company will continue, while the law is in effect, to have conductors and the various freight offices handle stamps for use of the shippers. Since postmasters are not paid for handling the stamps many of them are refusing to do so. The service which the company has installed in regard to stamps also enables the company to keep its records free from charge accounts of numerous shippers with small entries relating to the stamps.

Lifting Jacks in Pennsylvania.—The Lehigh Valley Transit Company, Allentown, Pa., has equipped all of its cars with lifting jacks conforming with the Pennsylvania statute effective on Dec. 1. The jacks are slung on special hang-

ers from the sides of the cars, and special instructions have been issued to the employees on the handling of the jacks in case of personal injury or derailment.

Increase in Fares in Eastern New Jersey.—The proposed increase in fares between Atlantic City and Pleasantville, N. J., referred to in the ELECTRIC RAILWAY JOURNAL of Dec. 5, page 1274, does not apply to the Atlantic City & Shore Railroad. The steam roads operating between the points mentioned plan, however, to put a higher rate of fare into effect on Dec. 15.

Serious Accident on New York Elevated.—In a rear-end collision between two northbound trains on the Ninth Avenue line of the Manhattan Elevated Railway in New York at 116th Street and Eighth Avenue at 6:30 p. m. on Dec. 9, two men were crushed and received burns from which they died, and more than a score of others were injured in the panic which ensued.

Vermont Fare Matter.—The Barre & Montpelier Traction & Power Company, Montpelier, Vt., has filed with the Public Service Commission of that State a proposed tariff increasing the fare over the line between the cities from 10 cents to 15 cents. The Supreme Court of the State recently held that the company was required to maintain a fare not to exceed 5 cents within the limits of each of the cities in which it operates.

Commutation Fare Order.—The Public Service Commission of Missouri on Dec. 7 issued an order to the Kansas City, Clay County & St. Joseph Railroad to begin on Jan. 1, 1915, issuing commutation tickets on definite rate schedules established by the commission, which figure out at about 1.1 cents per mile. Five days from the receipt of the order are allowed for an answer, which will carry until Dec. 14. A request for a rehearing is to be filed.

Car Advertising in Toronto.—Despite the objection of Works Commissioner Harris the Board of Control of Toronto, Ont., has decided to permit street car advertising in the cars on the city's own line. Last spring the commissioner reported against the proposal and it was dropped for the time being. It has been recommended that the contract be awarded to the Canadian Street Car Advertising Company.

Time-Table Prize.—The offer of a $25 prize for the best time-table to be submitted by one of its trainmen, which was published in the September number of the *United Railroads Magazine*, published by the United Railroads, San Francisco, Cal., aroused considerable interest and resulted in five time-tables being submitted by four contestants, one of whom submitted two tables. The prize was awarded to D. W. Sutlief, a conductor in the Twenty-eighth Street carhouse.

Far-Side Stops at Rock Island.—The City Council of Rock Island, Ill., insists that the Tri-City Railway discontinue the near-side stop and adopt the far-side stop. A plan to stop on the far side was suggested by John G. Huntoon, the general manager of the company, a year ago, but the people of Davenport did not favor the change and the matter was dropped. Now the cities of Rock Island and Moline are insisting on the far-side stop, irrespective of the attitude of the city of Davenport toward the proposal.

Company Relations in Galveston.—For many years the Galveston (Tex.) Electric Company has required a deposit of $30 from each of its trainmen as an assurance of good faith. A new policy, however, is now being put into effect. The deposits are being returned to the trainmen and 6 per cent interest is being paid each man for the time the money has been on deposit. The records for most of the deposits date back no further than 1900. Under the new plan the company has its trainmen under bond, the company itself paying the premium.

Market Transfers.—The Edmonton (Alberta) Radial Railway has adopted a special "market transfer," in order to promote business at the newly-opened civic market. Passengers going direct to the market, on market days, receive a "market transfer," which enables them to make the return trip on a single fare. J. H. Larmouth, superintendent of the railway, a municipal line, is reported to have expressed the opinion to the civic authorities that a portion of the cost of the transfer should be borne by the market committee of the City Council.

Transfer Changes in Savannah.—With a view to giving additional transfer privileges to its patrons, the Savannah (Ga.) Electric Company put into effect on Dec. 1 certain changes in its transfer system. Several important transfer points have been relocated and the system of issuing transfers as regards these points has been changed. The company asked the co-operation of its patrons in inaugurating the changes and announced that misunderstanding regarding the changes would be explained over the telephone or in person at the company's office.

Police in Safety Campaign.—The city of Montreal, Que., has decided to co-operate with the Montreal Tramways in the "safety first" campaign inaugurated by A. Gaboury, superintendent of the company. The chief of police is to work with Mr. Gaboury, and later a committee of civic officials is to be formed to study the entire question as it relates to Montreal. The chief of police has sent out thousands of circulars to owners of vehicles referring to the urgency of observing traffic regulations and making suggestions as to how to avoid accidents.

Height of Steps in New Hampshire.—The Public Service Commission of New Hampshire held a hearing in Concord on Dec. 1 to determine whether steps on the electric cars in the State are reasonably safe and low. Various estimates of the cost of changing the height of steps were made. They ranged from $30 to $150 a car, according to the rolling stock operated. All of the roads were represented except the Concord & Manchester Electric Branch of the Boston & Maine Railroad, which has already complied with an order of the commission in regard to steps.

Operating Changes in Vancouver.—Several of the city lines of the British Columbia Electric Railway in Vancouver, B. C., have been rerouted in order to provide greater economy of operation and still meet existing traffic conditions. The general plan affects the service on stub lines slightly. The company's owl service is also being operated in closer accordance with traffic requirements. The trainmen have made an arrangement among themselves providing for a certain lay-off each week in order to enable a larger force to be kept on than would otherwise be possible.

"Safety First" in St. Louis.—Bruce Cameron, superintendent of transportation of the United Railways, St. Louis, Mo., is quoted as follows in regard to the "safety first" campaign of the company: "I believe when the public has been impressed fully with the necessity for caution, we will find the number of persons injured in street car accidents far less than heretofore. There seems to be a general disposition to heed the warning of our signs. If wagon drivers will obey the traffic laws and pedestrians cross the streets only at street corners, instead of in the middle of the block, we will have few accidents."

Not Within Commission Jurisdiction.—Chairman McCall of the Public Service Commission for the First District of New York replied on Dec. 9 to Health Commissioner Goldwater of New York, who had written to the commissioner calling attention to alleged unsanitary conditions on the transit lines due to overcrowding. Mr. McCall pointed out that breathing, coughing and sneezing by persons in the cars were not matters subject to the jurisdiction of the Public Service Commission, and referred to the expenditure of $325,000,000 now being made for rapid transit lines intended to relieve the congestion of which Dr. Goldwater complained. There has been considerable other gentle persiflage in this connection recently.

Hunters Beware.—An appeal to hunters to be careful in handling firearms while on street cars has been made by the Detroit (Mich.) United Lines based upon a bulletin to conductors issued by the operating department. The bulletin follows: "Attention is called to the matter of firearms, particularly guns used for hunting purposes, carried by passengers. If at any time a passenger is examining a firearm, or handling it carelessly, or in such a way that it might imperil the lives of other passengers, caution him to desist and explain that this is a rule of the company for the protection of passengers. Also, so far as a conductor is able to do so, he must see that firearms carried by passengers are not loaded."

Passengers Carried in Greater New York.—The number of passengers using the transit systems of Greater New York for the year ending June 30, according to tables compiled by the Public Service Commission of the First District of New York, was 1,813,204,692, an increase over the previous twelve months of 43,328,184. They paid out in fares $89,361,262. The number of passengers carried by the Brooklyn Heights Railroad, the principal surface railway subsidiary of the Brooklyn Rapid Transit Company, fell off by 1,140,585, by the New York Railways by 1,742,267. The Second Avenue Railroad carried 858,189 fewer passengers than the year before, the Third Avenue 75,039, the Forty-second Street, Manhattanville & St. Nicholas Company lost 175,443, and the Dry Dock, East Broadway & Battery Company 1,297,743 passengers.

Chicago Drafts Electric Railway Freight Ordinance.—In an effort to further the recommendations of the Chicago Municipal Markets Commission relative to the advantage of permitting all the electric railways which enter Chicago to handle freight, an ordinance granting this privilege is being prepared. At a preliminary conference between a sub-committee of the Chicago City Council's local transportation committee, the officials of the surface and elevated lines, representatives of the city law department and the Chicago Municipal Markets' Commission, the preliminaries were arranged. According to the city legal department there was nothing to hinder the electric lines from carrying freight within the corporate limits. Upon being questioned regarding their attitude toward a proposition including the right to carry freight, the representatives of the surface and elevated lines expressed a willingness to co-operate in the matter.

Ten Months of Safety in Detroit.—W. C. Cann, chairman of the general safety board of the Detroit (Mich.) United Railway, reports that during the first ten months of this year more than 900 safety suggestions were submitted to the division and general safety board and that favorable action has been secured on 95 per cent of the suggestions. So far this year the number of cars in collision has decreased 47.7 per cent, derailments 7.7 per cent, running over crossings 30 per cent, and passengers hurt in boarding and alighting 32 per cent. The only reports showing any appreciable increase are those covering automobiles struck. These have increased 30.9 per cent. Mr. Cann expresses the opinion that the showing which the company had made in decreasing all accidents other than those in which automobiles are involved indicates that the burden of responsibility for the increase of automobile accidents is on the automobile driver and not on the men operating the street cars.

New Traffic Ordinance in Canton.—A new traffic ordinance was passed by the City Council of Canton, Ohio, on Nov. 9. It is provided that automobiles and horse-drawn vehicles shall cross the center of the intersecting street before turning into it rather than follow a diagonal course from one street into the other. No person under sixteen years of age shall be allowed to operate a motorcycle or automobile on the streets of the city. There are strict regulations with regard to automobiles being allowed to stand along the curb in the business district. A rate of speed exceeding 15 m.p.h. is to be taken as evidence of careless driving, and a rate of speed exceeding 20 m.p.h. is prohibited. Drivers of vehicles passing a street car stopping to discharge or to take on passengers, when said vehicle is going in a direction opposite to that from which the street car is moving, shall slow down and exercise due care so as not to endanger the safety of pedestrians. The driver of every vehicle approaching a street car stopping for the purpose of taking on or discharging passengers shall give some signal plainly visible or audible to such passengers, and shall keep such vehicle at least 6 ft. from the running board or lower step of such car. If it is not possible to preserve such distance from such running board or lower step, the driver or operator shall stop until the street car has again started. All vehicles upon a track in front of a street car shall turn out upon the near approach of the car. The penalty for violating the traffic ordinance is a fine not to exceed $100 and costs. In the section regulating the movement of pedestrians, it is provided that pedestrians shall have the right-of-way over drivers of vehicles at street crossings only.

Personal Mention

Sir George S. Gibb, chairman of the Metropolitan District Railway, London, has been appointed a civil member of the Army Council and will be charged with the supervision of army contracts.

Mr. J. M. Tomlinson, acting vice-president and general auditor of the New York, New Haven & Hartford Railroad since the retirement of Mr. H. M. Kochorsperger, vice-president, has been elected vice-president and comptroller of the company.

Mr. A. Mackrille, assistant general auditor, has been appointed general auditor of the New York, New Haven & Hartford Railroad with office at New Haven, and **Mr. T. M. Prentice**, assistant auditor, has been appointed auditor of the company with office at New Haven.

Mr. C. C. Collins has resigned as traffic manager of the Lehigh Valley Transit Company, Allentown, Pa., effective on Jan. 1, 1915. Before becoming connected with the Lehigh Valley Transit Company Mr. Collins was traffic manager of the Western Ohio Railroad, Lima, Ohio.

Lieutenant-Colonel G. S. Rennie, M.D., surgeon in chief of the Dominion Power & Transmission Company, Hamilton, Ont., and the Toronto, Hamilton & Buffalo Railway, will be in command of one of the field artillery batteries being mobilized in Toronto for overseas service.

Mr. Daniel L. Turner, deputy engineer of subway construction of the Public Service Commission of the First District of New York, has been appointed to serve on the advisory commission on city planning, which is to assist and co-operate with the committee on city plan of the Board of Estimate, New York City.

Mr. A. E. Beck, one of the permanent counsel of the British Columbia Electric Railway, Vancouver, B. C., and its claim agent, will leave the company's service at the end of the year to practice law on his own account in Vancouver. The company's legal and claims departments will be consolidated under the control of the other permanent counsel, Mr. V. Laursen.

Mr. C. H. Christensen has been appointed manager of the Missoula (Mont.) Street Railway, the Missoula Light & Water Company and the Clark Missoula Power Company, to succeed Mr. George R. Brown, deceased. Mr. Christensen has been connected with the Missoula Light & Power Company in various capacities for twenty years. During the last four years he held the position of superintendent of the Missoula Light & Water Company's Bitter-Root Valley System.

Mr. W. O. Demoss, who has been appointed master mechanic of the Wilmington & Philadelphia Traction Company, Wilmington, Del., and the Southern Pennsylvania Traction Company, was for ten years foreman of the West Baltimore Street and the Retreat Street carhouses of the United Railways & Electric Company, Baltimore, Md. On Feb. 27, 1911, he became maintenance foreman of the Delaware Avenue carhouse of the Wilmington & Philadelphia Traction Company and in March, 1912, was appointed general foreman of the Wilmington shops of the latter company.

Mr. John W. Graham, Twin Falls, Idaho, will fill the vacancy left on the Idaho Public Utilities Commission by the recent resignation of Judge D. W. Standrod. Mr. Graham has been practicing law in Idaho for the last four years. He is forty-one years of age and a native of Canada, but was educated at the University of Nebraska. He practiced his profession in Fremont, Dodge County, Neb., and was for four years prosecuting attorney of that county, and had altogether fifteen years' experience as a lawyer. The appointment which he has just accepted will hold until January, 1919.

Mr. H. R. LaMontagne has been appointed general agent of the express department of the Worcester (Mass.) Consolidated Street Railway to succeed Mr. F. E. Wood, whose appointment to the Cumberland County Power & Light Company, Portland, Maine, is referred to elsewhere in this column. Mr. LaMontagne entered the service of the passenger department of the Worcester Consolidated Street

Railway after graduation from a technical school. Later he became connected with the freight department, finally being made traveling auditor, from which position he was appointed to succeed Mr. Wood.

Mr. M. H. Bronsdon, chief engineer of the Rhode Island Company, Providence, R. I., from March, 1907, until August, 1912, has returned to that post, succeeding Mr. William Pestell, who recently resigned to accept a position with the B. F. Sturtevant Company of Boston, at Chicago. Mr. Bronsdon has been doing general engineering work in San Francisco since leaving Providence. Mr. Bronsdon was born in San Francisco and he had his first experience in engineering construction on a cable road in Los Angeles. In 1889 he became superintendent of the Providence Cable Tramway. He later was chief engineer at the Eddy Street power plant in Providence, having charge of the installation there. He later went to Duluth as designing and construction engineer of the Duluth-Superior Traction Company, and was afterward appointed engineer for the Old Colony Street Railway, Boston, Mass. His next engagement was with the United Railroads, San Francisco, where he remained until March, 1907, when he succeeded Mr. Fred N. Bushnell as chief engineer of the Rhode Island Company.

Mr. M. A. Tatum, who was appointed superintendent of the southern division of the Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, recently, began his career in electric railway work in the express and freight department of the Eastern Ohio Traction Company in 1905. In 1906 he resigned this position to enter the engineering department of the Roberts & Abbott Company, Cleveland. About a year later he accepted a position with the Washington, Baltimore & Annapolis Railroad as clerk to Mr. W. E. Slaughter, the superintendent. After the electrification of the road and the completion of the main line between Washington and Baltimore in 1908, Mr. Tatum was appointed clerk to Mr. Joseph O'Hara, superintendent of transportation. During 1909 he was employed in the carhouses and substations of the company, and in 1910 he was made inspector at Washington. During 1911 and 1912 he occupied the position of trainmaster and in 1913 he became general passenger and freight agent of the road. He resigned from the company in September to become connected with the Cleveland, Southwestern & Columbus Railway.

Mr. F. E. Wood has been appointed general freight agent of the Cumberland County Power & Light Company, Portland, Maine, operating the Portland Railroad and the Lewiston, Augusta & Waterville Street Railway. Mr. Wood entered the service of the Springfield (Mass.) Street Railway in 1909 and worked in the repair shop and the pit. Subsequently he entered the express department as general clerk and spare messenger. In February, 1910, on the opening of the express service on the Interstate Consolidated Street Railway operating through Attleboro and North Attleboro, Mass., to Providence, R. I., over the Rhode Island Company's line, Mr. Wood accepted the position of agent at Attleboro in charge of that division. This express service was later extended over the Milford, Attleboro & Woonsocket Street Railway, operating through Franklin and Milford, Mass. In March, 1912, he was transferred to Worcester, Mass. Express service was established on the Worcester Consolidated Street Railway in December, 1912, and in 1913 Mr. Wood was appointed general agent of the Worcester Consolidated Street Railway with headquarters at Worcester and jurisdiction over all the lines previously mentioned, together with the Springfield Street Railway. He resigned from the Worcester Consolidated Street Railway on Nov. 28, 1914, to become connected with the Cumberland County Power & Light Company. Before Mr. Wood left Worcester a banquet was tendered to him at the Hotel Bancroft, that city, by his fellow employees and he was presented with a watch fob by them as a token of their esteem.

OBITUARY

Morris G. Condon, president of H. B. Underwood & Company, Philadelphia, Pa., machinists and engineers, who was shot by an intruder in his room in the Hotel Adelphia in that city on Nov. 25, died from the effects of his wound.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Edmonton Northwestern Radial Railway, Edmonton, Alta.**—Application for a charter has been made by this company in Alberta to build an interurban electric railway from Edmonton northwest to the Pembina River. Messrs. Short, Woods, Bigger & Collison, 14 Howard Avenue, Edmonton, are said to be interested in the project.

***Albion, Charlotte & Northern Railway, Lansing, Mich.**—Chartered in Michigan to build a 53-mile electric railway. Capital stock, $100,000.

***Shelby (N. C.) Northern Railway.**—Chartered in North Carolina to build an electric or steam railway from Shelby to Casar, via Beams, Mills, Fallston, Belwood, Boggs and Warlicks. Capital stock, $400,000. Incorporators: S. S. Royster, Shelby, president, and L. M. Elam, Shelby, secretary and treasurer.

FRANCHISES

Calgary, Alta.—The Chestermere & Calgary Suburban Railway has received an extension of time on its franchise for the completion of its line in Calgary.

Vallejo, Cal.—A. D. Bowen, representing the Benicia Land & Terminal Company, will ask the Council for a franchise to build an electric railway in Vallejo. This is part of a plan to build an electric line to connect Benicia and Vallejo. [E. R. J., Oct. 24, '14.]

Tarpon Springs, Fla.—James H. Murphy, St. Petersburg, has asked the Council for a franchise in Tarpon Springs.

Macon, Ga.—The Macon Railway & Light Company has asked the Council for an extension of time on its franchise in which to remove its tracks from the south side of Tattnall Square Park to the center of College Street in Macon.

***Lewiston, Idaho.**—The State Highway Board has voted approval of a franchise to A. G. Nortz, Lewiston, to build an electric railway across interstate Lewiston-Clarkston bridge.

St. Peter, Minn.—The Electric Short Line Railroad has accepted the forty-nine-year franchise granted it by the Council in October for the use of so much of the levee as lies east of Front Street, between Chestnut Street and Park Row Street, and also to build a line along the entire length of Front Street to the north city limits of St. Peter.

Lockport, N. Y.—The Niagara River & Eastern Railroad had asked the Council for a franchise to use certain streets in the east and south of Lockport to build a line to connect the Buffalo, Lockport & Rochester Railway and the International Railway lines with a new line into Niagara Falls. [E. R. J., Oct. 17, '14.]

Youngstown, Ohio.—The Mahoning & Shenango Railway & Light Company has asked the Council for a franchise to extend its Mahoning Avenue line to Perkins Corners in Youngstown.

Cincinnati, Ohio.—The Street Railway Committee of the Cincinnati City Council has recommended the ordinance granting a twenty-five-year franchise to the Cincinnati, Newport & Covington Railway to be advanced to a second reading, following which a public hearing will be called to discuss its merits.

Cleveland, Ohio.—Mayor Baker of Cleveland has signed the amended franchise granted by the Council to the Cleveland & Youngstown Railroad to make certain necessary changes in its grade. [E. R. J., Oct. 5, '14.]

Findlay, Ohio.—The City Council of Findlay has before it ordinances giving the Toledo, Bowling Green & Southern Railway a twenty-five-year franchise on its streets and also a franchise for furnishing current for light and power purposes. They provide that the company shall pay to the city 2 per cent of the gross receipts from the business.

Guelph, Ont.—The Board of Railway Commissioners has authorized the Guelph Radial Railway to construct an inter-

change track with the Grand Trunk Railway on Suffolk Street, Guelph.

Medford, Ore.—S. Bullis, of the Southern Oregon Electric Railway Company, has asked the City Council and the Southern Pacific Railway Company for permission to cross the tracks of the Southern Pacific on Main Avenue. In case the Southern Pacific refuses to grant the request for crossing rights, the application will be presented to the State Railway Commission for final settlement. An extension of not less than 3500 ft. will be made as soon as the preliminary details are settled.

Philadelphia, Pa.—Peter E. Costello, Philadelphia, has received a franchise from the Council for a two-track elevated railway from Front Street and Arch Street to Rhawn Street, Holmesburg.

Montreal, Que.—The Montreal & Southern Counties Railway has received an extension of time on its franchise in which to complete its lines in Montreal.

Beaumont, Tex.—A petition was presented to the City Council asking that the Council take steps to induce the extension of the Beaumont Traction Company's line to the Magnolia Petroleum Company's refinery south of Beaumont.

Seattle, Wash.—The Puget Sound Traction, Light & Power Company in Seattle will not be allowed to change the terminus of its Yesler Way cable line from its present location, between First and Second Avenues, as it had petitioned, according to a decision rendered by the City Council franchise committee. The company argued that the operation of its cable cars over Second Avenue hindered the headway of its cars north and south on the arterial highway.

TRACK AND ROADWAY

Lacombe & Blindman Valley Electric Railway, Lacombe, Alta.—W. L. McKinnon & Company, Toronto, advertised recently inviting bids for $206,700 of this company's first mortgage bonds, maturing in 1943. The Alberta government has guaranteed the principal and interest of the bonds for $7,000 a mile, or $273,700 for 39.1 miles. They bear 5 per cent interest.

Argenta (Ark.) Railway.—Work on the extension from Washington Avenue and Hazel Street to Rock Island station, at Fourth Street and Beech Street in Argenta, has been begun.

Central California Traction Company, San Francisco, Cal.—Negotiations are pending by which portions of the city lines of this company will be abandoned and a universal transfer privilege established between this company's line and the lines of the Stockton Electric Railway.

San Francisco (Cal.) Municipal Railway.—Bids for another branch of this railway are being considered by the Works Board, which has received the offers to construct the California-Street municipal railway line and the Seventeenth-Street carhouse. The line will begin at Geary Street and Second Avenue and run over Second Avenue, Cornwall and California Streets to Thirty-third Avenue.

Marin County Electric Railway, San Francisco, Cal.—This company has received permission from the Railroad Commission of California to construct a line in Sausalito, Cal., on the condition that the present franchise shall be amended so as to give the municipality the right to purchase the system after five years. The company is granted authority to issue 185½ shares of capital stock at par, and it is provided that this stock shall be sold only to property owners and residents of Marin County. It is also provided that all moneys obtained from the sale of stock shall be deposited by the railway company in Marin County banks as trust funds, with the understanding that if a total sum of $18,550 is not deposited within six months, these moneys shall be repaid to subscribers. [E. R. J., Nov. 21, '14.]

Connecticut Company, New Haven, Conn.—Plans are being made by this company to extend its tracks along Railroad Avenue to the station in Westport.

***Havana, Cuba.**—Work has been begun on an electric line between Havana and Guanabacoa in Cuba.

Central Illinois Traction Company, Paris, Ill.—An extension between Charleston and Paris, 30 miles, will be constructed by this company during 1915.

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—This company will complete the construction of the Minnesota Street line, between Shelby Street and Churchman Avenue, for operation before Dec. 24. The special work at the corner of Shelby and Minnesota Streets will be completed sixty days fater the opening of the new year.

Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan.—This company has completed the survey and secured the right-of-way for the second section of the projected interurban railway between Kansas City and Topeka, Kan. The first section, from Kansas City to Bonner Springs, is now in operation and its business has considerably exceeded expectations. The second section is 21 miles from Bonner Springs to Lawrence. It probably will be in operation within a year. The third section, Lawrence to Topeka, will be built after the second section is in successful operation. Bids for the construction of the Bonner Springs-Lawrence section will probably be asked shortly. On the first section the company advertised for bids, but did with its own forces work for which it considered the bids unreasonable. The construction work which it is planned to start soon involves a bridge over the Kaw River at Lawrence. Carl G. Klemm, 1010 Commerce Building, is secretary of the company.

Kentucky Utilities Company, Somerset, Ky.—With this company disposing of $3,000,000 worth of bonds for needed improvements it is rumored that a part of the company's plans is to extend its line to Burnside, 7 miles south of Somerset, on the Cumberland River.

Winnipeg (Man.) Electric Railway.—Plans are being prepared for filing an application with the City Council for extensions in the northwest section of Winnipeg, in accordance with the City Engineer's directions.

Boston (Mass.) Elevated Railway.—This company is asked to consider plans to construct tracks on Pleasant Street, from the mouth of the subway to Washington Street in Boston.

Fitchburg & Leominster Street Railway, Fitchburg, Mass.—Surveys, which have been in progress for the extension of this railway to Townsend, have been suspended until spring. This line will ultimately be extended to Nashua, N. H.

Michigan Railway, Jackson, Mich.—This company has placed in operation its line between Kalamazoo and Monteith.

International Transit Company, Buffalo, N. Y.—The Board of Railway Commissioners has authorized the building of a bridge at Tagona, Sault Ste. Marie, Ont., to carry a highway and this company's tracks across the Algoma Central & Hudson Bay Railway. The cost of the bridge is to be borne by the electric railway company.

Cincinnati (Ohio) Traction Company.—A new crosstown line north of the present route on McMillan Street in Cincinnati is being considered by this company and may be built in the near future.

Ardmore & Western Interurban Railway, Ardmore, Okla.—As soon as negotiations are completed work will be begun by this company on the 100-mile line to connect Springer, Woodford, Poolville, Elmore City and Leon. Capital stock, authorized, $300,000. Bonds, authorized, $2,500,000. Officers: A. F. Costigan, Guaranty Bank Building, Ardmore, president; D. E. Allen, Ardmore, vice-president; A. L. Adath, Ardmore, secretary, and T. C. Bridgeman, treasurer. [E. R. J., May 30, '14.]

Forest Hill Electric Railway, Toronto, Ont.—The roadbed is now being prepared for this railway. Work has been begun at Bathurst Street, and the first stage from there to Dufferin Street will be proceeded with as rapidly as possible. The tracks will be laid on their entire route beginning near St. Clair Avenue. T. J. Glover is interested in this projected railway. [E. R. J., April 11, '14.]

Ottawa & St. Lawrence Electric Railway, Ottawa, Ont.—A contract has been awarded to Eastman, Kenny & Stearns, Russell, Ont., for grading about 6 miles of the projected line. About 2 miles of grading has been completed, and it is expected to have about 8 miles between Russell and Metcalfe completed and ready for the rails within the next three weeks. H. W. Pearson, Confederation Life Building, Toronto, Ont., secretary.

Toronto (Ont.) Civic Car Lines.—A by-law will be submitted to the ratepayers on Jan. 1, 1915, to provide for $455,000 for the extension of the civic car lines in Toronto.

Toronto, Ont.—City Solicitor Johnston advised the Board of Control on Nov. 27 it would be necessary to submit separate by-laws for each of the proposed new electric lines, consequently the board changed its recommendations. The Council will be asked to authorize the submission of a by-law for $105,000 for the proposed Lansdowne Avenue line, $317,000 for the North Toronto line, and $52,000 for the taking over of that portion of the Toronto & York Radial Railway Company's line within the city limits in the east end.

Electric Short Line Railroad, Minneapolis, Minn.—Plans are being considered by this company and the members of the Winthrop Commercial Club to build an electric railway through Winthrop and north as far as Winsted and south through Sleepy Eye to Jackson.

St. Louis, Mo.—The residents of South Lindenwood have submitted a petition to the Missouri Public Service Commission asking the United Railways for an extension of the Tower Grove line. The Tower Grove line terminus is 2½ miles away from the city limits in the Gratiot and Lindenwood section of the city.

Niobrara, Sioux City & Omaha Railway, Omaha, Neb.—Surveys have been completed by this company between Madison and Elgin. Right-of-way has been secured between Omaha and Norfolk via Madison. The Elgin line will be a branch proposition. Charles W. Baker, Omaha, is interested. [E. R. J., April 4, '14.]

Corry & Columbus Street Railway, Corry, Pa.—A 30-mile line from Corry, Pa., to Maysville, N. Y., via Columbus, Pa., Clymer and Sherman will be built by this company during 1915.

Slate Belt Electric Street Railway, Penn Argyl, Pa.—A 5-mile line between Wind Gap and Saylors Lake, Pa., will be constructed by this company during 1915.

***San Antonio, Tex.**—James L. Himrod, Thomas Moore, Austin, and others are making plans to build an electric railway to connect New Mexico, Lamesa, Robert Lee, San Angelo, Ballinger, San Antonio and other points with a port on the Gulf of Mexico.

Pittsburgh, Harmony, Butler & Newcastle Railway, Pittsburgh, Pa.—Within a few weeks this company will have completed its 6½ mile line between Evans City and Beaver Falls. In addition to passenger service the company announces that it will add trolley freight service over this line as well. The opening of this new line will give a direct electric railway line between Pittsburgh and Beaver Falls.

***Denison, Tex.**—Preliminary surveys are being made for a line betweeen Denison, Dexter and Locust. This is part of a plan to build an electric railway through Pottsboro, Locust, Gordonville, Dexter and Denison.

Houston, Laporte & Bay Shore Railway, Houston, Tex.—Preliminary arrangements are being made and work will be begun some time within the next six months on this line to connect Houston, Pasedana, Deepwater, Deer Park, San Jesenta City, Laporte, Seabrook, Webster, Friendswood and Pearland. The power station will be located at Houston and the repair shops at Pearland. The company will furnish power for lighting purposes. Capital stock, authorized, $2,000,000. Samuel F. George, Houston, president and general manager, and John H. Stoner, Houston, chief engineer.

Houston & Southern Railway, Houston, Tex.—Preliminary arrangements are being made to incorporate this company, which plans to begin work in the spring on its 55-mile electric railway to connect Houston, Pearland, Manville, Danbury, Belasco and Freeport. The company will furnish power for lighting purposes and will locate its power house in Houston and its repair shops at Pearland. It will also have amusement parks at Laporte and at Velasco. Samuel F. George, Dayton, Ohio, president, and John H. Stoner, Houston, chief engineer.

Glen Rose & Walnut Springs Railway, Walnut Springs, Tex.—Grading has been completed by this company for its 14-mile line to connect Glen Rose and Walnut Springs, via Seven Knobs. Officers: J. H. Farr, president; F S. Williams, vice-president; John Shields, treasurer, and F. B. Kirby, secretary, all of Glen Rose. [E. R. J., Sept. 12, '14.]

Rutland Railway, Light & Power Company, Rutland, Vt.—This company, a subsidiary of the General Gas & Electric Company, has begun construction under its plans for the conservation of the water supply at Chittenden Dam, near Rutland, Vt. The plans include the construction of two dams, a canal 3000 ft. long, and wood and steel penstocks. When completed, the reservoirs will furnish a large reserve supply of water for the new power station of the company at East Pittsford. Through this plan the water will be used twice for generation of power, once at the East Pittsford station, and once at the Mendon generating station.

Mercer Electric Railway, Athens, W. Va.—The tracks are being laid by this company on its line between Bluefield and Princeton. This line will connect Bluefield, Princeton and Athens. R. G. Meador, Athens, president. [E. R. J., Oct. 17, '14.]

SHOPS AND BUILDINGS

Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.—This company opened its new depot in Clinton, Ind., on Dec. 3.

Orleans-Kenner Electric Railway, New Orleans, La.—Plans have been prepared by this company to build sixteen shelter houses and way stations along its line between New Orleans and Kenner. The buildings will be on brick construction with tile roofs.

Moncton Tramways, Electricity & Gas Company, Moncton, N. B.—A temporary carhouse was erected to replace the building which was destroyed by fire recently. This building is 30 ft. x 80 ft., with accommodation for five cars, and is on the same site as the one burned. It is the intention of the company to build a steel and brick carhouse in the summer, on a new site which has not yet been acquired.

Brooklyn (N. Y.) Rapid Transit Company.—The Public Service Commission for the First District has approved the award by the New York Municipal Railway Corporation to the P. J. Carlin Construction Company, the lowest bidder, of a contract for the construction of six stations on the Liberty Avenue elevated railroad extension. The contract price is $232,000.

Brantford (Ont.) Municipal Railway.—This company is building a new passenger station and freight house at Paris. The cost is estimated to be $3,000.

Toronto (Ont.) Civic Car Lines.—The City Council has authorized Commissioner Harris to build a temporary carhouse near Dorval Road to house the cars of the new Bloor Street line in Toronto.

Milwaukee Northern Railway, Cedarburg, Wis.—Work will be begun at once by this company on a new terminal building on Fifth Street between Cedar Street and Wells Street in Milwaukee. The structure will be of brick, fireproof, one story high and will be divided into separate waiting rooms, a ticket office and baggage room. The cost is estimated to be about $40,000.

POWER HOUSES AND SUBSTATIONS

Bay State Street Railway, Boston, Mass.—This company has installed a new engine and generator at its Mason Street plant.

Ottawa (Ont.) Electric Ry.—This company's new auxiliary power plant has been put in operation. It cost $200,000 and has a generating capacity of 5000 hp. The equipment includes three Babcock & Wilcox boilers and a Westinghouse double-flow steam turbine.

West Penn Traction Company, Pittsburgh, Pa.—This company has just placed in operation a 19-000-kva, 6600-volt, three-phase, sixty-cycle, turbo generator, built by the Westinghouse Electric & Manufacturing Company.

Monongahela Valley Traction Company, Mairmont, W. Va.—This company is installing three 1500-kva, water-cooled, sixty-cycle, 22,000-volt high-tension Westinghouse transformers, and a complete electrically-equipped remote-control switchboard in its power house near Fairmont, W. Va.

Manufactures and Supplies

ROLLING STOCK

Sheboygan Railway & Electric Company, Sheboygan, Wis., expects to order two new steel cars for city service, double-end operation, pay-as-you-enter, double-truck, to seat forty passengers. The cars will be equipped with baby motors and 24-in. wheels.

Philadelphia & Reading Railroad, Philadelphia, Pa. is making an investigation into the advisability of establishing storage-battery car operation on branch lines of its Winslow Junction-Cape May division.

Empire United Railways, Syracuse, N. Y., has ordered twelve more cars from the St. Louis Car Company in addition to the twelve cars ordered last summer. These twelve cars are to be the same type as those on the previous order.

London & Port Stanley Railway, London, Ont., has ordered three electric locomotives and electrical equipment for five motor cars from the Canadian General Electric Company. The contracts approximate $135,000. The locomotives will be 1000 hp, capable of hauling a trainload of 1000 tons. The cars will have a four-motor electrical equipment of about 600 hp per car. The motor cars and trailers, of which there will be five each, will be of one pattern and steel construction throughout. Tenders on the car bodies were invited up to Dec. 2.

TRADE NOTES

Thomas A. Edison, Inc., West Orange, N. J., in a fire which started early in the evening of Dec. 9, suffered much damage to its property, calculated at something less than $1,000,000. Part of the phonograph works was destroyed by fire, but Mr. Edison's private laboratory, the Storage Battery Company and the Edison primary-battery department were not affected. The company emphasizes the fact that the business of both battery departments of the company will not be interfered with in any way by the fire and that it is prepared to continue business as usual.

Albert Lawrence Smith has been admitted as a partner in the firm of E. B. Smith & Company, public utility bankers, Philadelphia, Pa. Mr. Smith is a son of the senior member of the firm. He attended Harvard University and began his business career with the Franklin National Bank, Philadelphia. For several years he has been associated with the firm of which he is now a partner. He is a director of the Buffalo & Susquehanna Railroad and of the Easton (Pa.) Consolidated Electric Company.

Kerr Turbine Company, Wellsville, N. Y., builder of "Economy" steam turbines, has appointed A. E. Seelig as general sales manager, and John A. Hense as St. Louis representative. Mr. Seelig for several years held a similar position with the L. J. Wing Manufacturing Company, and more recently has managed the new machine tool department in the New York office of Schuchardt & Schutte. Mr. Hense was formerly with the National Malleable Castings Company, Chicago, and later with the Dravo-Doyle Company, Philadelphia.

Walter A. Zelnicker Company, St. Louis, Mo., has appointed Arthur E. Jackman as manager of its machinery department to succeed J. J. Hilpirt, resigned to become storekeeper of the Compania Mexicana de Petroleo "El Aguila," S. A., Tampico, Mexico. Mr. Jackman has had wide experience, gained as general manager of the Sea View Railroad and Narragansett Pier Electric Light & Power Company. He was several years in the railway and lighting department of the Westinghouse Electric & Manufacturing Company, and lately superintendent of the East St. Louis, Columbia & Waterloo Railway, which position he left to assume his present duties.

W. S. Miller has resigned as general superintendent of the St. Louis Car Company, after being connected with this company about fifteen years. Mr. Miller's first position with the company was superintendent of the brass foundry departments, two years after which he became general foreman of the blacksmith, machine and truck departments. After holding this position for three years he was appointed superintendent of machinery and tools. In 1907 Mr. Miller became works manager and later general superintendent, which position he has held up to the time of his resignation, Nov. 9, 1914. He was formerly a student of Washington University, New York.

Edison Storage Battery Company, Orange, N. J., has appointed Francis V. McGinness, formerly sales engineer, as assistant manager of the railway department, the position formerly held by William F. Bauer, who was recently made manager of the company's Chicago office. Mr. McGinness is a graduate of Columbia University's Schools of Applied Science, class of 1910, and before graduation had considerable practical experience with the New York & New Jersey Telephone Company. After a few months in the engineering department of the New York & Queens Electric Light & Power Company, Long Island City, he joined the sales force of the Edison Storage Battery Company. For the past two years he has been identified with the railway department.

National Corrugated Culvert Manufacturers' Association, Chicago, Ill., announces that the large number of manufacturers operating under the Watson corrugated culvert patent have just been informed by their attorney, Wallace R. Lane, Chicago, that the United States Court of Appeals for the Second Circuit, which has final jurisdiction, has just handed down a mandate reversing the lower court and holding this patent valid and infringed by another culvert which was recently installed. The court says, in part: "The patented culvert is cheap, strong, durable, easily transported, quickly laid down and easily repaired. We cannot believe that the man who gave such a structure to the world should be denied the title of an inventor." The manufacturers of corrugated culverts under this important patent make them out of Armco American ingot iron.

ADVERTISING LITERATURE

Fargo Manufacturing Company, Inc., Poughkeepsie, N. Y., has issued a bulletin describing its straight connector, cable lug, signal connection, ground point and ground meter, "L," "Y" and "T" and terminal connections.

NEW PUBLICATION

Bonds and Stocks—The Elements of Successful Investing. by Roger W. Babson. Babson Statistical Organization, Inc., Wellesley Hills, Mass. 422 pages and three charts. $2 net.

This is the second book of its kind intended for investors received this year for review by the ELECTRIC RAILWAY JOURNAL and written by an authority of national reputation. There are many excellent books planned primarily for the student of corporation finance, but there has been a dearth of books about the science of investing money. Mr. Babson has in his volume rendered a real service to the man unacquainted with security issues who has money to invest, and in addition he has furnished a volume very entertaining aside from its practicable value. Very hazy ideas are frequently held about securities by men otherwise well informed, and to such men the present volume should be more than welcome. It is all very well for the man unacquainted with finance who intends to invest to be sure of the reputation of the house through which he deals, but there is no excuse now that "Bonds and Stocks" has been issued for such a man not to understand the fundamentals of investing. The strong and weak points of stocks and bonds are pointed out with reasons why some classes of securities are attractive and why others are not attractive. Mr. Babson has divided his work into twenty-four chapters. The first four deal with introductory suggestions, the next fifteen with elements of successful investing and the five concluding chapters with supplementary suggestions. There is a chapter on electric railway securities as distinct from lighting, telephone and water power securities. A chapter on the investor's vocabulary contains an explanation of ten phrases, the meaning of which should be understood by every investor. These phrases are the technical ones used frequently by bankers in seeking subscriptions from the public, through the newspapers. Mr. Babson certainly is justified in saying in his conclusion that "if the reader has absorbed all that has gone before he should have in his mind a clear idea of the different kinds and groups of securities and the various questions and terms involved therewith."

Vol. XLIV NEW YORK, SATURDAY DECEMBER 12, 1914 No. 24

LET SHOPMEN HELP DESIGN

On several occasions we have called attention to errors in maintenance structure design which might have been avoided had the shop employees been taken into consultation. The bad consequences of leaving everything to the man at the drafting board were noted again lately in a certain New England carshop. The building was laid out for aisle sprinklers, but after these were installed it was discovered that thereafter trolley poles on cars would have to be turned in the open air. Another part of the building was confidently laid out as a paint shop, but when car painting began it was found that a painter could not possibly work in the narrow space which had been left between the painting track and the wall. In general, the provision of satisfactory working clearances for a car shop requires more foresight than may reasonably be expected even from the combined experience of the draftsman, the shop superintendent and general manager. A hint or two from the men closest to the job may avoid many distressing incidents of the nature cited.

THE SKIP-STOP IDEA

One of the reforms which seem a long time in coming is the skip-stop for city service. Railway managers who have studied the plan approve of it, but the inertia of the public in matters of this kind is so great that this reform has been adopted in very few places. Chicago is now reported to be contemplating a trial of the plan. An account of the Denver experience has been published in recent issues. In Los Angeles, where the skip-stop has also been tried, there seems to be some doubt as to the advisability of its continuance. On the other hand, in Cleveland and in Kansas City, where the skip-stop appears to have been originally introduced in the year 1911, it has been continued in operation with every evidence of success. The increase in schedule speed has been reported to be nearly 10 per cent but since half of the cars stop at "odd" streets and the other half at the "even" streets, only about half of the people that collect at a corner board the first car that arrives. Thus the load is distributed more evenly among the cars on the route. There is no doubt that the public would be greatly benefited by the skip-stop because it materially increases the average speed by cutting out the number of stops and yet does not greatly increase the distance which the passengers have to walk to catch a car. In a number of cities the near-side stop has recently been introduced without creating public opposition. Perhaps this change will make the general adoption of the skip-stop more of a possibility.

AUTOMOBILES IN CITY TRAFFIC

Automobiles for private use have now become so common that it is not surprising they should have invaded the passenger transportation field, and several electric railway companies on the Western Coast report considerable competition from automobiles which carry passengers over certain routes for nickel fares. We have no fear that such cars, with the tire cost and other depreciation inseparable from automobile service, can ever be commercial competitors on the same terms with an electric railway system. The report of Mr. McCullom to the Board of Estimate and Apportionment of New York, abstracted in this paper about a year ago, presents ample evidence to this effect. Nevertheless, experience has shown that this fact will not prevent the owners of cars from attempting a service of this kind. In a free country like this, electric railway companies cannot suppress this competition even if they would, but it is only fair to them as large taxpayers and also to the public as a whole, whose patronage is solicited by these buses, that both classes of transportation should be placed under similar regulations in regard to responsibility, and that strict traffice regulations should be enforced. The Merchants & Manufacturers Association of Los Angeles has called the attention of the City Council of that city to the tremendous liability of street accidents from these irresponsible automobiles, and Long Beach, Cal., has imposed a license fee of $25 a year and has required taking out of a $10,000 liability insurance for every such car. Charges of short changing by irresponsible automobile conductors is also made in some of the Western cities. Railway companies can ask no more than a free field and fair play for all, but both they and the public should demand that fair play means an equal degree of responsibility from the operators of both classes of service.

STREET RAILWAY LOADS ON SOILS

A part of the discussion of the way committee's report on track at the convention was devoted to the distribution of railway loads over the ballast and sub-grade. While this subject is of vital importance to steam railroad engineers, owing to the great increase in the weight of locomotives as well as the adoption of higher scheduled speeds of trains, neither of these factors has any bearing on the study of track foundations in paved streets. Moreover, the conditions governing the depth of loose, unconfined ballast are hardly comparable with those surrounding a foundation of concrete or compactly-rolled ballast, such as is required by a modern electric railway. In steam

road, or even interurban road open-track construction, a certain amount of flexibility is required, while track in paved streets must be as rigid as is consistent with economical operation. To obtain rigidity the foundation must be made much heavier than that actually necessary to carry the track loads. In other words, one should determine the average soil-bearing power condition and then select a foundation which will distribute the track loads well within the safe limit. It would be impractical to change the character of foundation with every slight change in the bearing quality of the soil. On the other hand, it is necessary to change the character of foundation when there is a marked change in the soil-bearing power, such as might be found where track is constructed over filled-in areas or where the soil contains excessive moisture. Of course, a drainage system would go far toward improving the latter condition, while rolling the sub-grade will often be all that is necessary to prepare filled-in areas for foundation construction. To sum up, it appears impossible to calculate exactly the distribution of track loads over the foundation and sub-soil. Hence, the selection of the foundation must be based largely on experience, after such mathematical checks as may be required have been made to determine the relation of the load to be carried to the bearing power of the sub-soil.

SNOW REMOVAL

That the removal of snow from city streets should constitute one of the most exasperating of the unsolved engineering problems of long standing is really remarkable when it is considered that the cost of the fuel necessary to melt the snow would be hardly 15 per cent of the expense of removal involved under present methods, the latter consisting, almost without exception, in shoveling the snow into wagons and carting it away. It may be, of course, that snow storms will have to be fought for some time by this primitive scheme, yet in this age of flying machines and wireless telegraphy one must be a true conservative at heart to accept this as a fact, even though the recommendations of the committee on resolutions of the snow removal conference, which were presented before the American Society of Mechanical Engineers last week, approved no new process except the limited use of the sewer system to get the snow off the streets.

The reasons that prevented the general use of sewers, as outlined in the report, could be summed up in the one generality—insufficient sewage flow. In New York, during the last winter, experiments demonstrated that the large trunk sewers with a continuous and fairly rapid flow were not clogged by any snow that might be shoveled into them. The small sewers, however, of about 12-in. diameter required flushing with hydrant water and even then had to be treated with considerable care.

The same idea has been suggested for Philadelphia, where the contractors are supposed to commence the work of plowing or sweeping the snow to the sides of the streets within one hour after a storm begins, the work of carting the piles away being aided by the use of certain sewer manholes for dumps. It is now planned to extend the use of the sewers by having water connections placed inside of the manholes, thus increasing the flow in the sewer and permitting the flushing away of accumulations of snow.

Removal of snow by flushing the streets with cold water naturally seems like carrying coals to Newcastle, but the experience in Scranton has demonstrated that with proper temperature conditions the scheme is capable of reducing the expense of removal to one-half that of cartage. However, when a cold snap follows a snow storm, the presence of great quantities of water on the streets might easily become fraught with considerable danger. This fact, indeed, is implied in the recommendations of the committee. Considerable hope is also held out in regard to the disposal of snow by melting in a furnace. The committee estimates that with a perfect furnace the cost of the coal required would be 3 cents, or with a furnace efficiency of 33 per cent, 9 cents, per cubic yard, against the present cost of carting of about 50 cents. This difference provides a considerable margin from which, of course, the cost of apparatus, labor and maintenance must be deducted. The problem should be an attractive one to the inventor, because there are many objections to carting besides its cost. One is its slowness, another is the congestion caused in the streets by the carts, and a third is the increasing scarcity in most cities of carts suitable for this purpose, owing to the growing tendency to substitute in commercial work for the horse-drawn cart a specialized motor truck not suitable for snow removal.

Surface railways, of course, are not so much interested in the manner of snow removal as in the provisions for operating their lines during and after snow storms. The matters of complaints from the public and of decreased receipts, which are the invariable accompaniments of heavy snow falls, are of serious importance, and at least one road, the New York Railways, is going to great expense to develop a wing sweeper that will clear a passageway beside the track. This has been planned solely to provide space for vehicular traffic which, during snow storms, utilizes the street railway tracks because these provide the only clear space in the street. Obviously the consequent congestion practically prevents the railway company from moving cars. To meet this difficulty wing brooms have also been suggested for Philadelphia and wing plows have been in successful use in Montreal for several years, a layer of snow being intentionally left on the streets in the latter city. It seems unfair to require a railway company, which is responsible only for the clearing of its tracks, to take care of the snow elsewhere on the street. But in many cases, owing to the slowness of the city force, this appears to be necessary for the railways, purely as a means for self-protection, and the development of wing brooms and wing plows seems to constitute peculiarly the railways' share in the problem, just as much as the prompt removal of the snow piles constitutes the share of the municipality.

FEDERAL AND STATE JURISDICTION OVER CITY RAILWAYS

It is not surprising, in view of the recent establishment of commission regulation in this country, that there should be many unsettled questions as to the powers and duties of regulatory commissions. One of the most important of those which remain to be settled is where the power of the federal commission should end and that of the state commissions begin. It would seem that with all of the problems in connection with valuation of steam railroads and the establishment of freight rates that the Interstate Commerce Commission has enough to occupy its time during the next few years, and that to the various state commissions could be assigned the adjudication of all of the intrastate matters which arise in connection with the operation of electric railways. This was the view which a committee of the American Electric Railway Association urged before a sub-committee of the House committee on interstate and foreign commerce last January in a hearing on several bills which would have brought certain equipment of all electric roads which do any interstate business under the jurisdiction of the Interstate Commerce Commission. The protestants at that hearing called attention to the fact that only a small percentage of their business, averaging in most cases less than 1 per cent, was interstate in character.

Now the question has come up again through an order to the Detroit United Railway, which owns about 800 miles of track in Michigan and 2 miles in Ohio, to make reports to the Interstate Commerce Commission on all accidents including, of course, all of those on its large city system in Detroit. If this policy should be adopted as standard, very few urban companies, certainly among those which haul freight and so issue through bills of lading, would be exempt. Moreover, if the jurisdiction of the Interstate Commerce Commission covers this case, it is likely to cover almost any other detail of city operation, and we should then have a centralized government control of our public utilities in addition to state control.

At the last meeting in Washington the railway managers present did not question the good intentions or the ability of the Interstate Commerce Commission in dealing with these matters, as compared with the state commissions. The principal grounds urged were the absence of knowledge of local conditions and the immense amount of work which would be entailed on a central commission and also on the railways themselves in taking up all of these subjects at the federal capital as well as at the state capitals.

If precedent can count for anything, the decision of the Supreme Court in the opinion on the case of the Omaha & Council Bluffs Street Railway vs. the Interstate Commerce Commission (230 U. S. 324) would indicate that that court does not believe that the interstate commerce law covers cases of this kind. At Omaha the situation was somewhat different because the question was one of rates on street railways which happened also to be interstate roads. The conclusion reached then by the court was that the character of the service was the criterion of whether a road is embraced under the interstate commerce law, and certainly the character of the accidents in city service and the means to be taken to avoid them by fenders or otherwise bears little relation to what is generally understood as interstate commerce. We hope that the hearing at Washington next Friday, to which a letter from Arthur W. Brady in our "Communication's" column this week calls attention, will be effective in impressing this fact upon the Interstate Commerce Commission.

HUMANIZING DISCIPLINE

A casual study of a number of bulletins issued to platform men indicates an often unnecessary brusqueness in many of the instructions and little or nothing of a commendatory nature. Of course, the purpose of the merit and demerit system in disciplining trainmen has taken this into account to a certain extent, but attention is here directed to the day-to-day bulletins. Would not the suggestive effect of a meritorious act spread on these bulletins be of much value in disciplining and at the same time offer relief from the constant repetition of "do" and "don't"? Orders must, of course, be issued, but occasional commendation and a mixing of the "sweet" with the "bitter" will help greatly toward better service. The iron hand of discipline might well be covered with the silk glove of consideration. In other words, the human side of disciplining must be recognized.

The frailties of the human mind and body have been thoroughly safeguarded in the operation of trains, so as to make the man as nearly as possible an automaton. All of these precautions have done much to make operation more safe, but they cannot make a machine out of the human body. Hence disciplining in various forms is necessary to make up for this deficiency, and the point we have in mind is that, in disciplinary methods, full cognizance should be taken of the human factor. To illustrate what we mean, take the case of the application of discipline after accidents have occurred. After a serious accident the superintendent's first tendency is to discharge the offenders if they prove to have been guilty of lack of attention or lapse of memory. It is worth while in such cases to go behind the facts and consider some of the contributing causes and thus possibly justify the retention in service of men who will afterward be much more valuable on account of the accident. A momentary mental lapse during a run may result in disaster. Yet we all have mental lapses and the very fact that a man has had no accidents or "near" accidents during his railway career may in itself have made him subject to a false sense of security. As he ages in service his alertness is apt to become sluggish. But this defect may be more than made up, so far as his value of the company is concerned, by better knowledge of local conditions and clearer judgment. This fact should receive consideration when his case is decided. After he gets his "nerve" back he may be a safer man than one with no accident to his credit.

New Cars of Seattle Municipal Railway

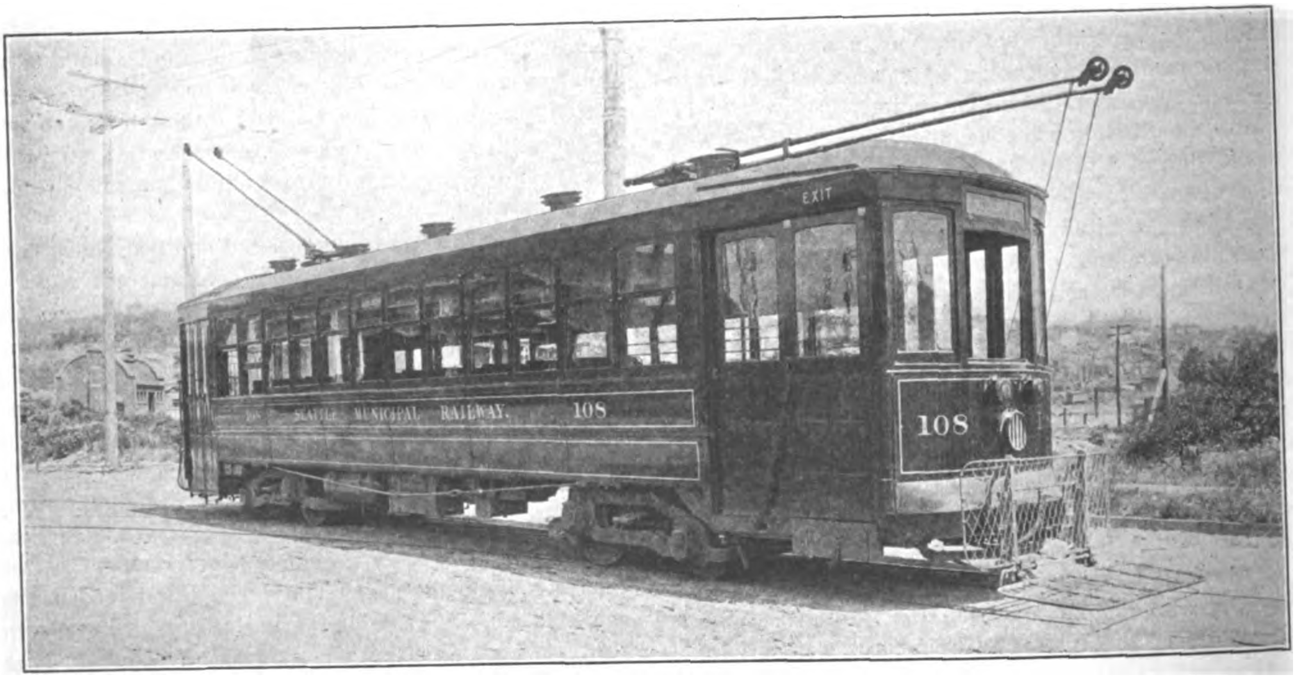
Multiple-Unit Control Arranged for a Double Trolley Wire System, Gearless Air Compressors and Air-Operated Fenders Are Among the Unusual Features of These Cars

BY H. J. KENNEDY, ELECTRICAL AND MECHANICAL ENGINEER

In the ELECTRIC RAILWAY JOURNAL, April 26, 1913, and June 20, 1914, some general accounts were given of the municipal railway construction in Seattle. In the present article the new cars built for this railway by the Cincinnati Car Company are described.

The twelve cars are of the double-end, semi-convertible "pay-within" type, having composite-type framing, exterior doors on platforms, and no interior bulkheads. They have arch roofs, are mounted on maximum-traction trucks, and have the following general dimensions:

Length of car over bumpers	44 ft. 5 in.
Length of car over vestibules	43 ft. 1 in.
Length of car over end posts	31 ft. 1 in.
Spacing of transverse seats	2 ft. 5½ in.
Width of car over posts	8 ft. 5 in.
Height of car over trolley boards	11 ft. 2 in.
Distance between truck centers	23 ft. 1 in.
Seating capacity	48
Weight of car empty, approximately	42,000 lb.
Weight empty, per passenger seat	875 lb.



SEATTLE MUNICIPAL CAR—GENERAL VIEW OF CAR IN OPERATION

The 75-hp motors which are of the Westinghouse 310-C type, were tested at the builders' works by coupling two together, running one as motor and the other as generator, on 125 per cent and 100 per cent loads. In addition, an overspeed test of 1800 r.p.m. and 2600-volt one-minute insulation tests on field and armature were made. One out of each twelve motors had a one-hour A. I. E. E. temperature run, at full load. Commutation was also tested at 200 per cent load. On the one-hour run at 500 volts, a current of 107 amp was applied at 460 r.p.m. to 475 r.p.m., heating the series field (the hottest part) to 79 deg. Cent., the air being 23 deg. Cent.

Among the other items of equipment on the cars are "Utility" ventilators, "Standard" motor trucks, Agasote ceiling, Hale & Kilburn seats, Crouse-Hinds headlights, Earll trolley retrievers, Pantasote curtains, Johnson fare boxes and Forged Steel Wheel Company's rolled steel wheels. The interior lighting of the car is effected by 23-watt, Mazda, half-frosted, incandescent lamps, one lamp being placed over each seat and three being located in each vestibule. The latter are connected in series with the destination sign and headlight at the opposite end of the car.

CONTROL SYSTEM AND WIRING

The control system is Westinghouse type HL, electro-pneumatic, with master controllers at each end of the car. Train line receptacles have not been provided, but they can be added at any time when it is desired to arrange for running multiple-unit trains. At the time the cars were ordered, the future conditions of operation of the road were so uncertain that it was felt to be an advantage to have cars which could, if needed, be used in multiple-unit train operation by the addition of the train line receptacles. At present, with the exception of the third-rail interurban line to Tacoma, electric cars for passenger service in Seattle rarely haul trailers or run in trains. However, the Seattle, Renton & Southern Railway, which connects with the new line is, in conditions affecting rolling-stock, almost an interurban and it is difficult to foretell what future conditions may be.

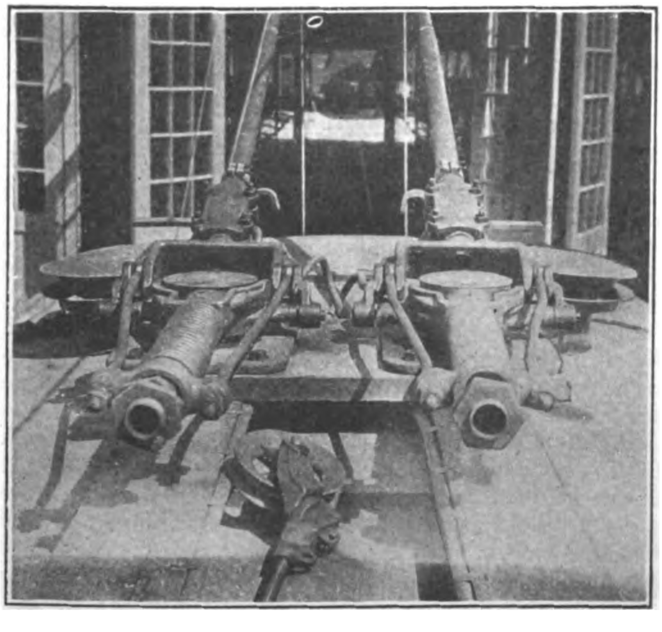
The standard control system has been modified for the double-trolley system which has been installed on the Seattle Municipal Railway, by the addition of an extra line switch in the unit-switch group with corresponding contacts in the master controllers and by an additional control switch in the hood connected on the negative side of the circuit. The overload trip relays on the line switches, positive and negative, of the unit switch groups are set at 325 amp. Instead of one control-

reset switch in the hood, as usual in the unit-switch system, there are two switches, one with fuses on the positive side and one on the negative side of the car circuit, the former being double-throw, the latter single-throw. It may be noted that the apparatus will work if polarity be reversed, the signs mentioned indicating the normal method of operation.

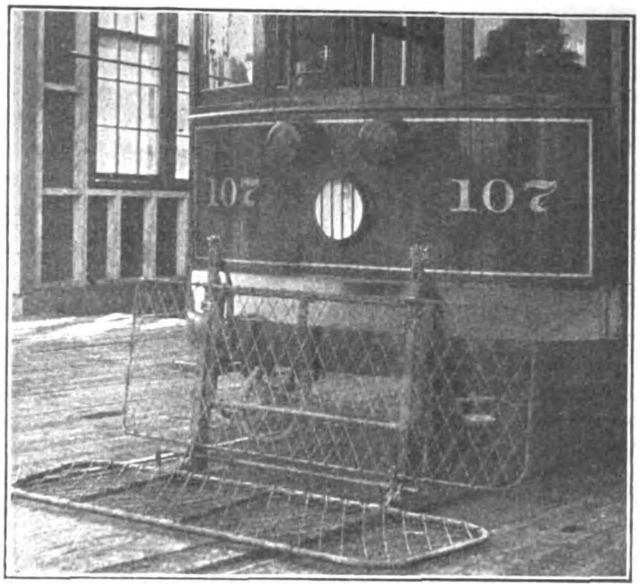
A feature of the wiring peculiar to these cars is the installation under the hood at each end of the car of a single-pole double-throw knife switch encased in a box. The blade of the switch is connected at the hinge to ground to truck, and the terminals to the positive and negative trolleys, respectively. In running from a double-trolley to a single-trolley track, one trolley pole is hooked down and the grounding or transfer switch is thrown to connect the truck with it. It is possible to make the change without stopping the car. For the cars that are in continuous service on the single-trolley Lake Burien Division, however, the negative trolley poles have been entirely removed.

An interesting feature to note in this connection is that, in case of the use of a grounded neutral for the three-wire generators which have been installed in the substation, as soon as a car passes from the double-trolley to the single-trolley line, the position of the ground relative to the outside of circuit moves over by 300 volts, assuming 600 volts total emf. In other words, the potential on the single-trolley wire would be 300 volts higher than that on the positive double-trolley wire, when measured with reference to the ground. Hence there must be an insulated break between the two systems, although, if the car should run past the break with the controller on, the grounding switch being instantly thrown at the same time, there would be no change in the emf impressed on the motors, since the grounding switch raises the negative potential 300 volts simultaneously with the raising of the positive, so that the difference of potential between outside terminals is the same as before. Even if it were possible to perform this experiment, it would not, of course, be made an operating practice because of the consequences in case of failure to perform it successfully. It should be noted that up to date the line has been operated without grounding the direct-current neutral. The three-wire generators are for probable commercial loads.

The trolley bases were designed especially for these cars. The base casting is rectangular, 12 in. x 18 in., the two being mounted side by side on wood trolley boards so as to have a 6-in. air gap between them. The base castings are not themselves live, the trolley poles being insulated from the sockets by a ¼-in. thickness of insulating bushing. The roof cables are connected, not to the bases as is usual but to the poles by flexible pig tails. The poles on diagonally opposite corners of the car are connected to each other, so that the right hand one is positive independent of direction of running, assuming that the overhead system is connected up that way. However, in certain cases of special work, the polarity on the trolley wires is reversed for a short distance. The bases are ball bearing and have one spring.



SEATTLE MUNICIPAL CAR—VIEW SHOWING POSITIVE AND NEGATIVE TROLLEYS AND BASES



SEATTLE MUNICIPAL CAR—VIEW SHOWING FENDER HELD DOWN ON CURVED TRACK BY AIR PRESSURE IN CYLINDERS

GEARLESS AIR COMPRESSOR

An interesting feature of the brake equipment is the gearless air compressor, made by the Allis-Chalmers Manufacturing Company. This is remarkable for its compactness and small weight of 425 lb. including suspension cage. It has three cylinders which are approximately horizontal and are connected to the same shaft with a four-pole 600-volt motor, the latter taking 5.7 amp, 3.42 kw, when delivering 18 cu. ft. of free air per minute against 90 lb. pressure, with a temperature rise not exceeding 50 deg. Cent., when operation does not continue over thirty minutes out of an hour. The cylinders are provided with sliding sleeve intake valves of the type used in the Knight automobile engine. These valves are operated by eccentrics on the crank shaft, compelling the opening and closing to be at exactly the proper instant, and insuring large port openings.

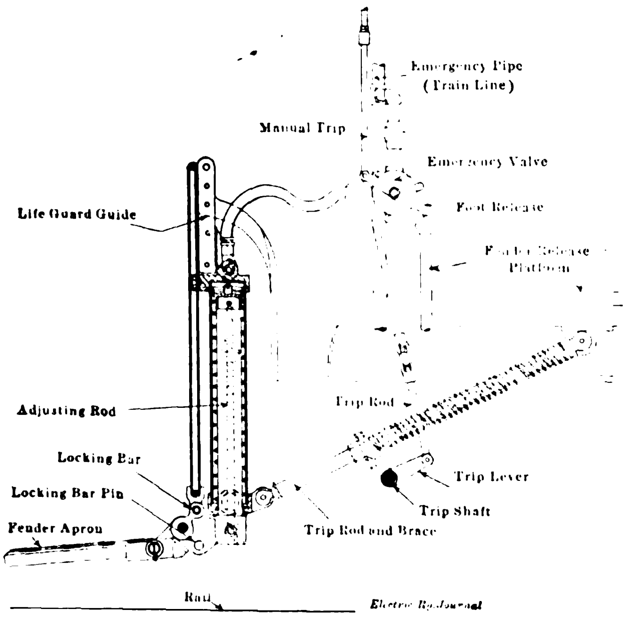
The compressor is 21⅝ in. from the cylinder head to outside of motor casing, and 29⅜ in. long over all measured parallel to shaft. In spite of its speed it operates without any disagreeable vibration. Instead of the noticeable pulsation of the usual geared compressor, the sound takes the form of a hum, due to the speed of rotation and the use of three cylinders instead of two. The motor brushes are readily accessible from the outside of the car by opening the cover located just below the side sill.

PNEUMATIC FENDERS

The fenders on these cars are of the Nelson pneumatically-operated type, generally similar to those used in Portland, Ore., and other places, but of a design improved in several particulars. The fender, both apron

and lifeguard, is hung on slides and kept at its normal height by helical springs contained in two vertical cylinders of 3-in. boiler tube, attached to the bumper beam of the car by brackets. The springs are 2 11/16 in. in outside diameter, 22 in. in free height and have about twenty-three coils of ¼-in. steel. The weight of the moving parts is about 180 lb. Upon admission of air to the cylinders, the springs are compressed and the sliding parts forced down upon the track very quickly and held down with strong pressure so as to scoop up anything lying thereon. The apron is framed of ¾-in. standard wrought-iron pipe and is 78 in. wide over all, and 26 in. deep over all. The frame is filled in with mesh of No. 7 steel wire, 3½-in. diamond mesh. The lifeguard or vertical screen is framed of ¼-in. round iron, is 78 in. wide over all and 27 in. high over all, and is filled in with mesh similar to the apron. The projection of the apron in front of the bumper beam is approximately 33 in. The front edge of the apron is suspended so that it clears the track by about 6 in.

A few inches above the platform floor is placed a special rotary fender valve with axis horizontal. On the stem is a lever with a pedal, and with a link connection to the swinging fender, which is hung on pins on the brackets. Impact with some body on the track will therefore throw the fender back and operate the fender valve. The fender valve can also be operated by a bronze handle placed beside the motorman's brake valve and connected by link with the fender valve. In an emergency, when confronted with the danger of running over someone, the motorman uses this handle instead of the air-brake handle, pushing it away from him in practically the same direction as in moving the brake valve handle to emergency. This results not only in dropping the fender on the rails but also in making an emergency application of the air brakes, by admitting air through the fender valve independent of the regular brake valve. Pressure on the pedal releases the air from the fender cylinders and allows the springs again to raise the fender. The air brake is then released by the brake valve in the ordinary way, a check valve preventing the air from running back through the fender valve, although permitting air to be fed through fender valve to brake cylinders, with brake valve in "lap" position.



SEATTLE MUNICIPAL CAR—ELEVATION SHOWING FENDER MECHANISM

A fender is permanently attached to the bumper beam at each end of car, the fender not in use being folded up against the dashboard, allowing freedom of motion for the drawbars. There is a double articulation for folding, the first motion merely folding the apron against the lifeguard, the second doubling both of them up and back against the dash. The weight specified for each fender is not in excess of 210 lb., and the pressure on the travel stops of the moving part which drops on the track is specified to be at least 500 lb., but not in excess of 1000 lb., with a pressure of 60 lb. per square inch in the air cylinder.

Electric Sign in Street Railway Competition

As a stranger in the city of Topeka emerges from the union railway station, he is greeted with the shouts of hackmen and cabmen seeking business. If he is alert and is inclined to be thrifty, his eye soon catches sight of a small but concisely worded electric sign on a pole across the street. This sign is shown in the accompanying illustration. Its legend reads "Cars Leave This Point Every Five Minutes Reaching All Parts of City."

CARS LEAVE THIS POINT EVERY FIVE MINUTES REACHING ALL PARTS OF CITY

TOPEKA ELECTRIC SIGN WHICH ATTRACTS THE TRAVELER'S CUSTOM

The Topeka Street Railway, operated by the McKinley Syndicate, has chosen electrical advertising as the most efficient method of attracting the attention of the traveling public and thereby bringing the nickels to the company's purse. It is noticeable that in Topeka the bus and cab business is less flourishing than in the neighboring towns and cities.

Passenger Traffic to Illinois State Fair

The Springfield Consolidated Railways Company of Springfield, Ill., reports that 67,000 less passengers were handled in 1914 than in 1913, to and from the Illinois state fair grounds in that city. In 1913 the company handled to the fair grounds a total of 798,000 passengers and in 1914 the number dropped to 731,000. These figures include all transfers from other lines in the city, police passes and all other forms of free transportation allowed by law. The largest day in the state fair week this year was Thursday when 115,000 fares were collected. This is a falling off of 29,000 fares from the largest day in 1913. The company has not sought to ascertain the reason aside from the fact that the state fair of Illinois in 1914 was not as well attended as was the exposition in 1913 and in previous years. The ticket sales at the fair grounds gates showed a decided falling off from the previous year and the receipts of the Springfield Consolidated Railway Company showed a similar decline.

Fair Interest on Investment in Public Utilities

The Author Discusses the Claim that Rates Should Be Based on Depreciated Values and Points Out that the True Criterion Is the Principal Invested—Different Values Also for Rate-Making and Taxation

BY H. J. DAVIES, TREASURER CLEVELAND RAILWAY

John B. Geijsbeek, C.P.A., contributed an article to the April, 1914, number of the *Journal of Accountancy* on "Fair Return to Public Utilities," in which he undertook to show the normal value of a public utility plant to be about 54.55 per cent of its original cost, or half-way between cost and scrap value. Mr. Geijsbeek says that this premise is not new and was described in a report made in September, 1912, to the Public Service Commission of St. Louis by James B. Allison, its chief engineer.

The operating efficiency of a traction plant is probably as high as that of a telephone plant, used by Mr. Geijsbeek for illustration, and higher than 54.55 per cent of its original cost. In a growing city a public utility plant never stands still, never is finished, never stops growing. Demand for additional service requires an increased supply of capital. And so the investment, the amount of "original cost," becomes legitimately larger, annually, monthly, almost daily. And the cost of the additional property is so large a proportion of the total investment that always more than half the property is less than half worn out—has lived less than half its life. The value of such a property, therefore, never falls to an average or "normal" of 54.55 per cent, or half-way from its original cost to its selling price as scrap.

Public utility companies usually own land, and the value of land in a growing community usually appreciates instead of depreciates as the value of all other property does. This enhancement in the value of land tends to keep the average value of the whole property above the half-way point on the road from first cost to final junk pile.

A "normal value line" of 50 per cent or 55 per cent can only apply to or be true of a utility that is neither increasing nor decreasing its plant or its service. Every public service company that is adding to its property to meet the increasing demands and needs of the public has, and must necessarily have, a property worth more than 54.55 per cent of its cost.

DEPRECIATED VALUE STILL IN PROPERTY

Mr. Geijsbeek says that "if depreciation is charged in addition to repairs and renewals, the public, or the consumer, has paid back to the utility company that amount for immediately existing reduction in the value of the property due to wear and tear not yet made good by renewals. That is either in the pockets of investors or stockholders or is in a reserve fund; if not in the fund, then it is in the reserve account and has been used to purchase additional plant. This, the depreciated plant value, added to earned surplus either on hand or paid to stockholders, will equal the original investment. In such a case a fair return can be only on the depreciated value of the original cash investment, and not on the cost of reproduction. Therefore, if depreciation is allowed in addition to repairs and replacements, the cash investment upon which a fair return is allowed is reduced each year by the amount of depreciation so allowed."

This is not so, unless the amount of the depreciation is returned to the investors as part of their principal. If the amount of all depreciation is returned to the investors as part of their principal, then, when replacements are needed, it will be necessary to invest new capital, which also must be returned with full interest.

If the stockholders have received from earnings, in addition to a fair return of interest upon their investment, a part of the investment itself, and if the contract between the utility and the municipality limits the rate of interest upon investment, it may be proper to reduce the capitalization, or the amount upon which interest shall be paid; but if the principal of the stockholders is kept in the business, whether a depreciation reserve adequate to provide for the disappearing value of the physical property is set up or not, the stockholders should receive interest upon the entire amount and not merely on the depreciated value of the property. Mr. Geijsbeek seems to see this in his "Conclusions as to Deterioration," for he says "Instead of paying this depreciation item to its stockholders in dividends out of surplus, this amount may be held by the company in a reserve account or, sometimes, a reserve fund, in order to keep the investment always at 100 per cent, i.e., present value (or, ultimately, normal value) plus unconsumed depreciation reserve, must always equal original cost." He further says, and truly, that it is difficult to divide the difference between "cost new" and "present value" into renewals and what he says is called depreciation, viz., "that unknown portion of plant value lying between reproduction and normal values that will never be replaced by renewals and which should remain in the reserve accounts or funds to be given to the stockholder at the cessation of operations in order to return to him the 100 per cent he originally invested."

In the meantime, and until the cessation of operations, or at least until he gets his money, or some of it, back, the stockholder should receive interest on the entire amount of his original investment and not merely on the remaining value of the property purchased with his money.

INTEREST SHOULD BE PAID ON ENTIRE PRINCIPAL

Again, under the heading "Fair Return on Investment," Mr. Geijsbeek writes: "Having decided the subject of depreciation, the question of fair return on the investment comes up. It seems almost impossible to find any two men who agree on what amount the interest considered to be the fair return should be charged. Especially is there a great difference of opinion as to whether the fair return should be calculated on the original cost value or the cost to reproduce the property, or whether it shall be the depreciated value, or the present value, which ultimately will become the normal value."

On the contrary, it is difficult to see how any two men can disagree as to the amount on which interest should be charged. It should be the full amount of honest investment, not the depreciated or present value of the physical property. The toll or rate of fares should be high enough to pay expenses, taxes, a fair interest on original cost, i.e., investment, and to set up a maintenance reserve equal to the difference between cost and present value. If this reserve, which may be

in cash, securities or other physical property (cash and securities are as much property as cars or telephone wires), is adequate, then the value of the company's property will be equal to the investment—as it should be. If, instead of providing for such a reserve, and then keeping it in cash or investing it in additional physical property or in securities, the company uses it to return to its stockholders a part of their principal, calling in some of the outstanding stock or bonds, it may be argued that, the investment having been reduced, the rate thereafter should be based upon so much of the original amount as is still invested. In no case should the rate be based upon present (depreciated) value—unless the stockholders have received, in addition to their interest, the entire difference between cost and present value. If a part of the investment of the stockholders has been returned from earnings and the amount of stock or bonds originally issued has been correspondingly reduced, or if additional property has been purchased from earnings and the difference between investment and present value has been thus lessened, the ratepayers who have contributed to the earnings so used have paid more than should have been charged them; and the ratepayers of the future will be charged less than they ought to pay, because they will pay upon a valuation smaller than the amount of money invested for their benefit.

For illustration, suppose an investment of $1,000,000 in an electric railway property, under an agreement between the company and the municipality that 10 per cent per annum on the investment shall be paid to the stockholders of the company, and suppose that a depreciation of 20 per cent, or $200,000, ensues, the remaining value of the property being $800,000. The company ought then to have, in addition to the $800,000 worth of physical property, a reserve of $200,000 to take care of the 20 per cent depreciation. If, instead of keeping this reserve in cash or investing it in bonds or other property, the company should pay it to the stockholders, in addition to interest at the rate of 10 per cent per annum, then 10 per cent interest on the remaining $800,000, instead of on the original investment of $1,000,000, may be the fair return thereafter, because 20 per cent of that investment has been returned to the investors. In that case $200,000 of the stock or bonds should be called in.

This transaction is perfectly fair and just to the investors and the company; but is it fair to the car-riders of the period in which the depreciation occurred or the reserve was accumulated? Should they have paid for their rides $200,000 in addition to 10 per cent ($100,000) upon the original investment? And should the car-riders of the future have the benefit of that contribution to capital by the car-riders of the earlier period and receive their rides for 10 per cent ($80,000) on only $800,000? If so, then when the property is worn out, or becomes inadequate or obsolete, and is replaced by other property, the cost of the new property must be provided from new capital, on which interest must be paid. And so, instead of paying off a part of capital as physical property depreciates and calling for additional capital when the time for replacement comes, the practice has been to set aside a reserve for maintenance or for depreciation and replacement of physical property and to invest the reserve, or some part of it, in securities or additional physical property. It is not necessary that the reserve be kept in cash. Invested in securities or physical property it should earn a larger return than savings bank interest. This practice is a better security for the investment than alternate payments of principal and demands or calls for new principal.

The car-riders of each month or year should pay a toll or rate of fare sufficient to enable the company to pay its operating expenses, its taxes and a fair rate on its investment, and, in addition, to set up out of the earnings of the month or year a reserve sufficient to take care of the depreciation, as nearly as it can be estimated, in the value of the physical property in the month or the year. The reserve ought not to be less than the depreciation. It ought not greatly to exceed it. Of course, the depreciation is not susceptible of exact ascertainment in advance; but it is possible to make a reasonable estimate, based on the experience of the company and the known experience of other companies in the same business. The reserve should be ample—too large rather than too small. It is easier to reduce the rate of fare to correct an overestimate than to raise the rate to make good an underestimate.

If it were practicable, from the beginning of such an enterprise as an electric railroad, to pay to the stockholders as a partial return of the investment the amount of the increasing difference between the original cost and the present value of their property until the average or "normal" value, or a still lower value, was reached, calling in outstanding stock or bonds as partial return of investment was made, then it would be necessary, whenever renewals or replacements were required, to call on the investors or the public for additional capital to pay for new property to take the place of the obsolete, inadequate or worn-out equipment.

A reserve to provide for repairs as well as for renewals and depreciation would seem to be better than a reserve for depreciation merely, or for depreciation and renewals. It may be called a maintenance reserve. It should be large enough to provide for the difference between cost and the remaining value, at any time, of the physical property. An amount should be set aside in cash each month or each year, or by other periods, equal to the estimated difference between cost and present value in the period, and charged to expense. This reserve should be used for repairs and renewals. The excess above expenditures may be invested.

DIFFERENT VALUES FOR RATE-MAKING AND TAXATION

Public utility managers and taxing officials have been embarrassed and confused by attempts to fix one value of physical property for rate-making purposes and another value for purposes of taxation. There should be no confusion. The value for rate-making purposes may be greater than the value for taxing purposes without inconsistency. The value for rate-making purposes should be cost or reproduction value; the value for purposes of taxation should be the value at the time of the tax assessment. If the maintenance reserve is sufficient to make good the difference between cost and present value, the tax value will be the same as the value for rate determination. The property taxed will include the maintenance reserve, whether the reserve is in cash, securities or plant. If the reserve is not as large as the difference between the original cost and the present value of the property, the loss is not the public's but the company's. It indicates that the fare is not high enough to secure the entire investment and a fair return upon it. The public gains, therefore, rather than loses.

The company should not be taxed on the amount of its loss by reason of the insufficiency of the fare to provide for depreciation and reasonable dividends; it is enough that it be taxed on the fair value of its property, including whatever is in its maintenance reserve. It should not be taxed upon its capitalization, unless its physical property and its reserve are equal to its capitalization; and even then the basis of taxation should

be expressed as the value of the property and not as the capitalization. It should not be taxed on the capitalized value of its supposed or actual net earnings, as has been attempted in Ohio. If the rate of fare is inelastic—fixed by contract for a term of years—and the company cannot pay reasonable dividends and provide a sufficient reserve to take care of the difference between cost and present value, it must forego the dividends or a part of them, or, at the end of the contract, lose the difference between cost and the value at that time of its property. But the value of the property, including the value of the reserve, should be the basis of taxation. If the combined value of the existing property and the reserve is equal to the investment, the value for taxation and the value for rate-making will be the same. If the reserve is too small, the loss of the difference between cost and present value, or any part of that difference, will be, as before stated, the investor's loss, and not the public's, in the case of a franchise with a fixed rate of fare. If the reserve is too large under such a contract, the company will gain, but the public will pay only the rate of fare it contracted to pay and will gain in taxes on the excess of value. In the case of a franchise providing for an elastic fare, like the Cleveland franchise, if the company cannot earn its fixed rate of interest and a sufficient reserve at the going rate of fare, the fare may, and ought to be, raised. If the earnings are more than sufficient to pay the stipulated interest and provide a sufficient reserve for maintaining the property at a value equal to its cost or agreed "capital value," then the rate of fare may be reduced. Capital should equal cost—should be neither more nor less than cost. Conversely, cost should equal capital. Present value, plus reserve, should equal cost. But whether capitalization, original cost and present value plus reserve are equal to each other or not, the basis of taxation should be the present value of the property, including the reserve. That value may be more or less than the original cost or the outstanding capital. In either case, it, and it only, should be taxed.

I do not mean that there should be excluded from cost any proper "overhead charge," using that phrase in its widest application, nor the value at the time of its acquisition or subsequently of any land, money or other property donated to the company.

Chicago Elevated Safety Rule Book

As a part of its general safety movement, the Chicago Elevated Railways has issued a book of safety rules. In the preface President Budd states that the purpose of these rules and regulations is to induce habits of caution and cultivate in every employee the thought of being careful of his own safety as well as that of his fellow employees. The rules and cautionary instructions are the result of experience, and putting them in printed form merely places general information in definite and convenient shape for reference by employees.

The book contains about eighty pages of safety rules applying to all departments, and others intended specifically for the transportation department, trainmen, motormen, guardmen, towermen, crossing flagmen and gatemen, and the shop, road and electrical departments. In addition to these rules the book contains a set of first-aid instructions, a list of the first-aid relief stations on the elevated system and the contents and use of the first-aid boxes. In the back of the book several pages are devoted to a telephone directory of the various offices and departments of the road, as well as the telephone numbers and addresses of the company's physicians.

Discussion on Government Ownership

The National Civic Federation Devoted One Session to Discussion of This Subject

One session of the fifteenth annual meeting of the National Civic Federation, held at the Hotel Astor, New York, on Dec. 4 and 5, was devoted to discussion on the subject of "Governmental versus Private Enterprise." Samuel Gompers, president American Federation of Labor, presided at this meeting which was held on the afternoon of Dec. 4. In opening the meeting Mr. Gompers spoke of the committee of the American Federation of Labor which went to Europe to investigate the subject of public ownership and its relations to workers in the endeavor to reach proper conclusions on this much-mooted question. An abstract of this report was published in the issue of this paper for Nov. 21. Mr. Gompers added that the question was not merely academic, but the claims of each side should be critically examined to disclose whether the proposal is practicable or impracticable, wise or unwise.

DISCUSSION BY PROFESSOR JENKS

The first speaker was Prof. Jeremiah W. Jenks, New York University, who said that the post-office department, so far as anyone can learn, has made no statement of cost accounting in connection with the parcel post, so that one can determine whether it is really carrying cheaper than do the express companies or whether, as seems not improbable, the difference in charges to shippers is made up by the low rates forced upon the railroads against their will or by shifting the burden upon other branches of the postal service or upon the taxpayers. Concerning the question of whether municipal utilities shall be owned and managed by the municipality or by private companies under municipal control, Professor Jenks thought the advocates of this plan should declare what they considered should be guiding principles. Is it to be better service, cheaper service, even free service, or revenue? Whatever the principles may be, the facts should be known. If we are to compare costs, let us have identical systems of cost accounting. If the question is service, let us know whether the people prefer seats or to wait for half an hour before they get a ride, as passengers often have to do in continental cities. If the government is to take the telephone and telegraph, is it to secure better service or cheaper service or for the protection of the people? The state ought to undertake nothing without definite knowledge of the facts to guide it.

Professor Jenks said that in the discussion of the subway situation in New York City which preceded the settlement and the recent contracts, much time was given to the consideration of the matter by public officials. If this had been the time of the officials of a private corporation their salaries and the interest on the capital would be charged as part of the cost of the undertaking. He had never heard it suggested that if there was to be proper cost accounting these costs should be included under the existing subway arrangement, or that the rent for quarters in the City Hall should be so apportioned that part of the charge should be allocated for the time thus spent. All of these considerations were dropped. If private and public operations are to be compared all of these should be included. There is not now sufficient knowledge to permit careful consideration, and this will not be obtainable until systematic cost accounting is introduced.

DISCUSSION BY CONGRESSMAN LEWIS

Congressman David J. Lewis spoke in favor of public ownership of the telephone and telegraph service.

Passengers Carried in Greater New York.—The number of passengers using the transit systems of Greater New York for the year ending June 30, according to tables compiled by the Public Service Commission of the First District of New York, was 1,813,204,692, an increase over the previous twelve months of 43,328,184. They paid out in fares $89,361,262. The number of passengers carried by the Brooklyn Heights Railroad, the principal surface railway subsidiary of the Brooklyn Rapid Transit Company, fell off by 1,140,585, by the New York Railways by 1,742,267. The Second Avenue Railroad carried 858,189 fewer passengers than the year before, the Third Avenue 75,039, the Forty-second Street, Manhattanville & St. Nicholas Company lost 175,443, and the Dry Dock, East Broadway & Battery Company 1,297,743 passengers.

Chicago Drafts Electric Railway Freight Ordinance.—In an effort to further the recommendations of the Chicago Municipal Markets Commission relative to the advantage of permitting all the electric railways which enter Chicago to handle freight, an ordinance granting this privilege is being prepared. At a preliminary conference between a sub-committee of the Chicago City Council's local transportation committee, the officials of the surface and elevated lines, representatives of the city law department and the Chicago Municipal Markets' Commission, the preliminaries were arranged. According to the city legal department there was nothing to hinder the electric lines from carrying freight within the corporate limits. Upon being questioned regarding their attitude toward a proposition including the right to carry freight, the representatives of the surface and elevated lines expressed a willingness to co-operate in the matter.

Ten Months of Safety in Detroit.—W. C. Cann, chairman of the general safety board of the Detroit (Mich.) United Railway, reports that during the first ten months of this year more than 900 safety suggestions were submitted to the division and general safety board and that favorable action has been secured on 95 per cent of the suggestions. So far this year the number of cars in collision has decreased 47.7 per cent, derailments 7.7 per cent, running over crossings 30 per cent, and passengers hurt in boarding and alighting 32 per cent. The only reports showing any appreciable increase are those covering automobiles struck. These have increased 30.9 per cent. Mr. Cann expresses the opinion that the showing which the company had made in decreasing all accidents other than those in which automobiles are involved indicates that the burden of responsibility for the increase of automobile accidents is on the automobile driver and not on the men operating the street cars.

New Traffic Ordinance in Canton.—A new traffic ordinance was passed by the City Council of Canton, Ohio, on Nov. 9. It is provided that automobiles and horse-drawn vehicles shall cross the center of the intersecting street before turning into it rather than follow a diagonal course from one street into the other. No person under sixteen years of age shall be allowed to operate a motorcycle or automobile on the streets of the city. There are strict regulations with regard to automobiles being allowed to stand along the curb in the business district. A rate of speed exceeding 15 m.p.h. is to be taken as evidence of careless driving, and a rate of speed exceeding 20 m.p.h. is prohibited. Drivers of vehicles passing a street car stopping to discharge or to take on passengers, when said vehicle is going in a direction opposite to that from which the street car is moving, shall slow down and exercise due care so as not to endanger the safety of pedestrians. The driver of every vehicle approaching a street car stopping for the purpose of taking on or discharging passengers shall give some signal plainly visible or audible to such passengers, and shall keep such vehicle at least 6 ft. from the running board or lower step of such car. If it is not possible to preserve such distance from such running board or lower step, the driver or operator shall stop until the street car has again started. All vehicles upon a track in front of a street car shall turn out upon the near approach of the car. The penalty for violating the traffic ordinance is a fine not to exceed $100 and costs. In the section regulating the movement of pedestrians, it is provided that pedestrians shall have the right-of-way over drivers of vehicles at street crossings only.

Personal Mention

Sir George S. Gibb, chairman of the Metropolitan District Railway, London, has been appointed a civil member of the Army Council and will be charged with the supervision of army contracts.

Mr. J. M. Tomlinson, acting vice-president and general auditor of the New York, New Haven & Hartford Railroad since the retirement of Mr. H. M. Kochorsperger, vice-president, has been elected vice-president and comptroller of the company.

Mr. A. Mackrille, assistant general auditor, has been appointed general auditor of the New York, New Haven & Hartford Railroad with office at New Haven, and Mr. T. M. Prentice, assistant auditor, has been appointed auditor of the company with office at New Haven.

Mr. C. C. Collins has resigned as traffic manager of the Lehigh Valley Transit Company, Allentown, Pa., effective on Jan. 1, 1915. Before becoming connected with the Lehigh Valley Transit Company Mr. Collins was traffic manager of the Western Ohio Railroad, Lima, Ohio.

Lieutenant-Colonel G. S. Rennie, M.D., surgeon in chief of the Dominion Power & Transmission Company, Hamilton, Ont., and the Toronto, Hamilton & Buffalo Railway, will be in command of one of the field artillery batteries being mobilized in Toronto for overseas service.

Mr. Daniel L. Turner, deputy engineer of subway construction of the Public Service Commission of the First District of New York, has been appointed to serve on the advisory commission on city planning, which is to assist and co-operate with the committee on city plan of the Board of Estimate, New York City.

Mr. A. E. Beck, one of the permanent counsel of the British Columbia Electric Railway, Vancouver, B. C., and its claim agent, will leave the company's service at the end of the year to practice law on his own account in Vancouver. The company's legal and claims departments will be consolidated under the control of the other permanent counsel, Mr. V. Laursen.

Mr. C. H. Christensen has been appointed manager of the Missoula (Mont.) Street Railway, the Missoula Light & Water Company and the Clark Missoula Power Company, to succeed Mr. George R. Brown, deceased. Mr. Christensen has been connected with the Missoula Light & Power Company in various capacities for twenty years. During the last four years he held the position of superintendent of the Missoula Light & Water Company's Bitter-Root Valley System.

Mr. W. O. Demoss, who has been appointed master mechanic of the Wilmington & Philadelphia Traction Company, Wilmington, Del., and the Southern Pennsylvania Traction Company, was for ten years foreman of the West Baltimore Street and the Retreat Street carhouses of the United Railways & Electric Company, Baltimore, Md. On Feb. 27, 1911, he became maintenance foreman of the Delaware Avenue carhouse of the Wilmington & Philadelphia Traction Company and in March, 1912, was appointed general foreman of the Wilmington shops of the latter company.

Mr. John W. Graham, Twin Falls, Idaho, will fill the vacancy left on the Idaho Public Utilities Commission by the recent resignation of Judge D. W. Standrod. Mr. Graham has been practicing law in Idaho for the last four years. He is forty-one years of age and a native of Canada, but was educated at the University of Nebraska. He practiced his profession in Fremont, Dodge County, Neb., and was for four years prosecuting attorney of that county, and had altogether fifteen years' experience as a lawyer. The appointment which he has just accepted will hold until January, 1919.

Mr. H. R. LaMontagne has been appointed general agent of the express department of the Worcester (Mass.) Consolidated Street Railway to succeed Mr. F. E. Wood, whose appointment to the Cumberland County Power & Light Company, Portland, Maine, is referred to elsewhere in this column. Mr. LaMontagne entered the service of the passenger department of the Worcester Consolidated Street

Railway after graduation from a technical school. Later he became connected with the freight department, finally being made traveling auditor, from which position he was appointed to succeed Mr. Wood.

Mr. M. H. Bronsdon, chief engineer of the Rhode Island Company, Providence, R. I., from March, 1907, until August, 1912, has returned to that post, succeeding Mr. William Pestell, who recently resigned to accept a position with the B. F. Sturtevant Company of Boston, at Chicago. Mr. Bronsdon has been doing general engineering work in San Francisco since leaving Providence. Mr. Bronsdon was born in San Francisco and he had his first experience in engineering construction on a cable road in Los Angeles. In 1889 he became superintendent of the Providence Cable Tramway. He later was chief engineer at the Eddy Street power plant in Providence, having charge of the installation there. He later went to Duluth as designing and construction engineer of the Duluth-Superior Traction Company, and was afterward appointed engineer for the Old Colony Street Railway, Boston, Mass. His next engagement was with the United Railroads, San Francisco, where he remained until March, 1907, when he succeeded Mr. Fred N. Bushnell as chief engineer of the Rhode Island Company.

Mr. M. A. Tatum, who was appointed superintendent of the southern division of the Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, recently, began his career in electric railway work in the express and freight department of the Eastern Ohio Traction Company in 1905. In 1906 he resigned this position to enter the engineering department of the Roberts & Abbott Company, Cleveland. About a year later he accepted a position with the Washington, Baltimore & Annapolis Railroad as clerk to Mr. W. E. Slaughter, the superintendent. After the electrification of the road and the completion of the main line between Washington and Baltimore in 1908, Mr. Tatum was appointed clerk to Mr. Joseph O'Hara, superintendent of transportation. During 1909 he was employed in the carhouses and substations of the company, and in 1910 he was made inspector at Washington. During 1911 and 1912 he occupied the position of trainmaster and in 1913 he became general passenger and freight agent of the road. He resigned from the company in September to become connected with the Cleveland, Southwestern & Columbus Railway.

Mr. F. E. Wood has been appointed general freight agent of the Cumberland County Power & Light Company, Portland, Maine, operating the Portland Railroad and the Lewiston, Augusta & Waterville Street Railway. Mr. Wood entered the service of the Springfield (Mass.) Street Railway in 1909 and worked in the repair shop and the pit. Subsequently he entered the express department as general clerk and spare messenger. In February, 1910, on the opening of the express service on the Interstate Consolidated Street Railway operating through Attleboro and North Attleboro, Mass., to Providence, R. I., over the Rhode Island Company's line, Mr. Wood accepted the position of agent at Attleboro in charge of that division. This express service was later extended over the Milford, Attleboro & Woonsocket Street Railway, operating through Franklin and Milford, Mass. In March, 1912, he was transferred to Worcester, Mass. Express service was established on the Worcester Consolidated Street Railway in December, 1912, and in 1913 Mr. Wood was appointed general agent of the Worcester Consolidated Street Railway with headquarters at Worcester and jurisdiction over all the lines previously mentioned, together with the Springfield Street Railway. He resigned from the Worcester Consolidated Street Railway on Nov. 28, 1914, to become connected with the Cumberland County Power & Light Company. Before Mr. Wood left Worcester a banquet was tendered to him at the Hotel Bancroft, that city, by his fellow employees and he was presented with a watch fob by them as a token of their esteem.

OBITUARY

Morris G. Condon, president of H. B. Underwood & Company, Philadelphia, Pa., machinists and engineers, who was shot by an intruder in his room in the Hotel Adelphia in that city on Nov. 25, died from the effects of his wound.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Edmonton Northwestern Radial Railway, Edmonton, Alta.**—Application for a charter has been made by this company in Alberta to build an interurban electric railway from Edmonton northwest to the Pembina River. Messrs. Short, Woods, Bigger & Collison, 14 Howard Avenue, Edmonton, are said to be interested in the project.

***Albion, Charlotte & Northern Railway, Lansing, Mich.**—Chartered in Michigan to build a 53-mile electric railway. Capital stock, $100,000.

***Shelby (N. C.) Northern Railway.**—Chartered in North Carolina to build an electric or steam railway from Shelby to Casar, via Beams, Mills, Fallston, Belwood, Boggs and Warlicks. Capital stock, $400,000. Incorporators: S. S. Royster, Shelby, president, and L. M. Elam, Shelby, secretary and treasurer.

FRANCHISES

Calgary, Alta.—The Chestermere & Calgary Suburban Railway has received an extension of time on its franchise for the completion of its line in Calgary.

Vallejo, Cal.—A. D. Bowen, representing the Benicia Land & Terminal Company, will ask the Council for a franchise to build an electric railway in Vallejo. This is part of a plan to build an electric line to connect Benicia and Vallejo. [E. R. J., Oct. 24, '14.]

Tarpon Springs, Fla.—James H. Murphy, St. Petersburg, has asked the Council for a franchise in Tarpon Springs.

Macon, Ga.—The Macon Railway & Light Company has asked the Council for an extension of time on its franchise in which to remove its tracks from the south side of Tattnall Square Park to the center of College Street in Macon.

***Lewiston, Idaho.**—The State Highway Board has voted approval of a franchise to A. G. Nortz, Lewiston, to build an electric railway across interstate Lewiston-Clarkston bridge.

St. Peter, Minn.—The Electric Short Line Railroad has accepted the forty-nine-year franchise granted it by the Council in October for the use of so much of the levee as lies east of Front Street, between Chestnut Street and Park Row Street, and also to build a line along the entire length of Front Street to the north city limits of St. Peter.

Lockport, N. Y.—The Niagara River & Eastern Railroad had asked the Council for a franchise to use certain streets in the east and south of Lockport to build a line to connect the Buffalo, Lockport & Rochester Railway and the International Railway lines with a new line into Niagara Falls. [E. R. J., Oct. 17, '14.]

Youngstown, Ohio.—The Mahoning & Shenango Railway & Light Company has asked the Council for a franchise to extend its Mahoning Avenue line to Perkins Corners in Youngstown.

Cincinnati, Ohio.—The Street Railway Committee of the Cincinnati City Council has recommended the ordinance granting a twenty-five-year franchise to the Cincinnati, Newport & Covington Railway to be advanced to a second reading, following which a public hearing will be called to discuss its merits.

Cleveland, Ohio.—Mayor Baker of Cleveland has signed the amended franchise granted by the Council to the Cleveland & Youngstown Railroad to make certain necessary changes in its grade. [E. R. J., Oct. 5, '14.]

Findlay, Ohio.—The City Council of Findlay has before it ordinances giving the Toledo, Bowling Green & Southern Railway a twenty-five-year franchise on its streets and also a franchise for furnishing current for light and power purposes. They provide that the company shall pay to the city 2 per cent of the gross receipts from the business.

Guelph, Ont.—The Board of Railway Commissioners has authorized the Guelph Radial Railway to construct an inter-

change track with the Grand Trunk Railway on Suffolk Street, Guelph.

Medford, Ore.—S. Bullis, of the Southern Oregon Electric Railway Company, has asked the City Council and the Southern Pacific Railway Company for permission to cross the tracks of the Southern Pacific on Main Avenue. In case the Southern Pacific refuses to grant the request for crossing rights, the application will be presented to the State Railway Commission for final settlement. An extension of not less than 3500 ft. will be made as soon as the preliminary details are settled.

Philadelphia, Pa.—Peter E. Costello, Philadelphia, has received a franchise from the Council for a two-track elevated railway from Front Street and Arch Street to Rhawn Street, Holmesburg.

Montreal, Que.—The Montreal & Southern Counties Railway has received an extension of time on its franchise in which to complete its lines in Montreal.

Beaumont, Tex.—A petition was presented to the City Council asking that the Council take steps to induce the extension of the Beaumont Traction Company's line to the Magnolia Petroleum Company's refinery south of Beaumont.

Seattle, Wash.—The Puget Sound Traction, Light & Power Company in Seattle will not be allowed to change the terminus of its Yesler Way cable line from its present location, between First and Second Avenues, as it had petitioned, according to a decision rendered by the City Council franchise committee. The company argued that the operation of its cable cars over Second Avenue hindered the headway of its cars north and south on the arterial highway.

TRACK AND ROADWAY

Lacombe & Blindman Valley Electric Railway, Lacombe, Alta.—W. L. McKinnon & Company, Toronto, advertised recently inviting bids for $206,700 of this company's first mortgage bonds, maturing in 1943. The Alberta government has guaranteed the principal and interest of the bonds for $7,000 a mile, or $273,700 for 39.1 miles. They bear 5 per cent interest.

Argenta (Ark.) Railway.—Work on the extension from Washington Avenue and Hazel Street to Rock Island station, at Fourth Street and Beech Street in Argenta, has been begun.

Central California Traction Company, San Francisco, Cal.—Negotiations are pending by which portions of the city lines of this company will be abandoned and a universal transfer privilege established between this company's line and the lines of the Stockton Electric Railway.

San Francisco (Cal.) Municipal Railway.—Bids for another branch of this railway are being considered by the Works Board, which has received the offers to construct the California-Street municipal railway line and the Seventeenth-Street carhouse. The line will begin at Geary Street and Second Avenue and run over Second Avenue, Cornwall and California Streets to Thirty-third Avenue.

Marin County Electric Railway, San Francisco, Cal.—This company has received permission from the Railroad Commission of California to construct a line in Sausalito, Cal., on the condition that the present franchise shall be amended so as to give the municipality the right to purchase the system after five years. The company is granted authority to issue 185½ shares of capital stock at par, and it is provided that this stock shall be sold only to property owners and residents of Marin County. It is also provided that all moneys obtained from the sale of stock shall be deposited by the railway company in Marin County banks as trust funds, with the understanding that if a total sum of $18,550 is not deposited within six months, these moneys shall be repaid to subscribers. [E. R. J., Nov. 21, '14.]

Connecticut Company, New Haven, Conn.—Plans are being made by this company to extend its tracks along Railroad Avenue to the station in Westport.

***Havana, Cuba.**—Work has been begun on an electric line between Havana and Guanabacoa in Cuba.

Central Illinois Traction Company, Paris, Ill.—An extension between Charleston and Paris, 30 miles, will be constructed by this company during 1915.

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—This company will complete the construction of the Minnesota Street line, between Shelby Street and Churchman Avenue, for operation before Dec. 24. The special work at the corner of Shelby and Minnesota Streets will be completed sixty days fater the opening of the new year.

Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan.—This company has completed the survey and secured the right-of-way for the second section of the projected interurban railway between Kansas City and Topeka, Kan. The first section, from Kansas City to Bonner Springs, is now in operation and its business has considerably exceeded expectations. The second section is 21 miles from Bonner Springs to Lawrence. It probably will be in operation within a year. The third section, Lawrence to Topeka, will be built after the second section is in successful operation. Bids for the construction of the Bonner Springs-Lawrence section will probably be asked shortly. On the first section the company advertised for bids, but did with its own forces work for which it considered the bids unreasonable. The construction work which it is planned to start soon involves a bridge over the Kaw River at Lawrence. Carl G. Klemm, 1010 Commerce Building, is secretary of the company.

Kentucky Utilities Company, Somerset, Ky.—With this company disposing of $3,000,000 worth of bonds for needed improvements it is rumored that a part of the company's plans is to extend its line to Burnside, 7 miles south of Somerset, on the Cumberland River.

Winnipeg (Man.) Electric Railway.—Plans are being prepared for filing an application with the City Council for extensions in the northwest section of Winnipeg, in accordance with the City Engineer's directions.

Boston (Mass.) Elevated Railway.—This company is asked to consider plans to construct tracks on Pleasant Street, from the mouth of the subway to Washington Street in Boston.

Fitchburg & Leominster Street Railway, Fitchburg, Mass.—Surveys, which have been in progress for the extension of this railway to Townsend, have been suspended until spring. This line will ultimately be extended to Nashua, N. H.

Michigan Railway, Jackson, Mich.—This company has placed in operation its line between Kalamazoo and Monteith.

International Transit Company, Buffalo, N. Y.—The Board of Railway Commissioners has authorized the building of a bridge at Tagona, Sault Ste. Marie, Ont., to carry a highway and this company's tracks across the Algoma Central & Hudson Bay Railway. The cost of the bridge is to be borne by the electric railway company.

Cincinnati (Ohio) Traction Company.—A new crosstown line north of the present route on McMillan Street in Cincinnati is being considered by this company and may be built in the near future.

Ardmore & Western Interurban Railway, Ardmore, Okla.—As soon as negotiations are completed work will be begun by this company on the 100-mile line to connect Springer, Woodford, Poolville, Elmore City and Leon. Capital stock, authorized, $300,000. Bonds, authorized, $2,500,000. Officers: A. F. Costigan, Guaranty Bank Building, Ardmore, president; D. E. Allen, Ardmore, vice-president; A. L. Adath, Ardmore, secretary, and T. C. Bridgeman, treasurer. [E. R. J., May 30, '14.]

Forest Hill Electric Railway, Toronto, Ont.—The roadbed is now being prepared for this railway. Work has been begun at Bathurst Street, and the first stage from there to Dufferin Street will be proceeded with as rapidly as possible. The tracks will be laid on their entire route beginning near St. Clair Avenue. T. J. Glover is interested in this projected railway. [E. R. J., April 11, '14.]

Ottawa & St. Lawrence Electric Railway, Ottawa, Ont.—A contract has been awarded to Eastman, Kenny & Stearns, Russell, Ont., for grading about 6 miles of the projected line. About 2 miles of grading has been completed, and it is expected to have about 8 miles between Russell and Metcalfe completed and ready for the rails within the next three weeks. H. W. Pearson, Confederation Life Building, Toronto, Ont., secretary.

Toronto (Ont.) Civic Car Lines.—A by-law will be submitted to the ratepayers on Jan. 1, 1915, to provide for $455,000 for the extension of the civic car lines in Toronto.

Toronto, Ont.—City Solicitor Johnston advised the Board of Control on Nov. 27 it would be necessary to submit separate by-laws for each of the proposed new electric lines, consequently the board changed its recommendations. The Council will be asked to authorize the submission of a by-law for $105,000 for the proposed Lansdowne Avenue line, $317,000 for the North Toronto line, and $52,000 for the taking over of that portion of the Toronto & York Radial Railway Company's line within the city limits in the east end.

Electric Short Line Railroad, Minneapolis, Minn.—Plans are being considered by this company and the members of the Winthrop Commercial Club to build an electric railway through Winthrop and north as far as Winsted and south through Sleepy Eye to Jackson.

St. Louis, Mo.—The residents of South Lindenwood have submitted a petition to the Missouri Public Service Commission asking the United Railways for an extension of the Tower Grove line. The Tower Grove line terminus is 2½ miles away from the city limits in the Gratiot and Lindenwood section of the city.

Niobrara, Sioux City & Omaha Railway, Omaha, Neb.—Surveys have been completed by this company between Madison and Elgin. Right-of-way has been secured between Omaha and Norfolk via Madison. The Elgin line will be a branch proposition. Charles W. Baker, Omaha, is interested. [E. R. J., April 4, '14.]

Corry & Columbus Street Railway, Corry, Pa.—A 30-mile line from Corry, Pa., to Maysville, N. Y., via Columbus, Pa., Clymer and Sherman will be built by this company during 1915.

Slate Belt Electric Street Railway, Penn Argyl, Pa.—A 5-mile line between Wind Gap and Saylors Lake, Pa., will be constructed by this company during 1915.

***San Antonio, Tex.**—James L. Himrod, Thomas Moore, Austin, and others are making plans to build an electric railway to connect New Mexico, Lamesa, Robert Lee, San Angelo, Ballinger, San Antonio and other points with a port on the Gulf of Mexico.

Pittsburgh, Harmony, Butler & Newcastle Railway, Pittsburgh, Pa.—Within a few weeks this company will have completed its 6½ mile line between Evans City and Beaver Falls. In addition to passenger service the company announces that it will add trolley freight service over this line as well. The opening of this new line will give a direct electric railway line between Pittsburgh and Beaver Falls.

***Denison, Tex.**—Preliminary surveys are being made for a line betweeen Denison, Dexter and Locust. This is part of a plan to build an electric railway through Pottsboro, Locust, Gordonville, Dexter and Denison.

Houston, Laporte & Bay Shore Railway, Houston, Tex.—Preliminary arrangements are being made and work will be begun some time within the next six months on this line to connect Houston, Pasedana, Deepwater, Deer Park, San Jesenta City, Laporte, Seabrook, Webster, Friendswood and Pearland. The power station will be located at Houston and the repair shops at Pearland. The company will furnish power for lighting purposes. Capital stock, authorized, $2,000,000. Samuel F. George, Houston, president and general manager, and John H. Stoner, Houston, chief engineer.

Houston & Southern Railway, Houston, Tex.—Preliminary arrangements are being made to incorporate this company, which plans to begin work in the spring on its 55-mile electric railway to connect Houston, Pearland, Manville, Danbury, Belasco and Freeport. The company will furnish power for lighting purposes and will locate its power house in Houston and its repair shops at Pearland. It will also have amusement parks at Laporte and at Velasco. Samuel F. George, Dayton, Ohio, president, and John H. Stoner, Houston, chief engineer.

Glen Rose & Walnut Springs Railway, Walnut Springs, Tex.—Grading has been completed by this company for its 14-mile line to connect Glen Rose and Walnut Springs, via Seven Knobs. Officers: J. H. Farr, president; F S. Williams, vice-president; John Shields, treasurer, and F. B. Kirby, secretary, all of Glen Rose. [E. R. J., Sept. 12, '14.]

Rutland Railway, Light & Power Company, Rutland, Vt.—This company, a subsidiary of the General Gas & Electric Company, has begun construction under its plans for the conservation of the water supply at Chittenden Dam, near Rutland, Vt. The plans include the construction of two dams, a canal 3000 ft. long, and wood and steel penstocks. When completed, the reservoirs will furnish a large reserve supply of water for the new power station of the company at East Pittsford. Through this plan the water will be used twice for generation of power, once at the East Pittsford station, and once at the Mendon generating station.

Mercer Electric Railway, Athens, W. Va.—The tracks are being laid by this company on its line between Bluefield and Princeton. This line will connect Bluefield, Princeton and Athens. R. G. Meador, Athens, president. [E. R. J., Oct. 17, '14.]

SHOPS AND BUILDINGS

Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.—This company opened its new depot in Clinton, Ind., on Dec. 3.

Orleans-Kenner Electric Railway, New Orleans, La.—Plans have been prepared by this company to build sixteen shelter houses and way stations along its line between New Orleans and Kenner. The buildings will be on brick construction with tile roofs.

Moncton Tramways, Electricity & Gas Company, Moncton, N. B.—A temporary carhouse was erected to replace the building which was destroyed by fire recently. This building is 30 ft. x 80 ft., with accommodation for five cars, and is on the same site as the one burned. It is the intention of the company to build a steel and brick carhouse in the summer, on a new site which has not yet been acquired.

Brooklyn (N. Y.) Rapid Transit Company.—The Public Service Commission for the First District has approved the award by the New York Municipal Railway Corporation to the P. J. Carlin Construction Company, the lowest bidder, of a contract for the construction of six stations on the Liberty Avenue elevated railroad extension. The contract price is $232,000.

Brantford (Ont.) Municipal Railway.—This company is building a new passenger station and freight house at Paris. The cost is estimated to be $3,000.

Toronto (Ont.) Civic Car Lines.—The City Council has authorized Commissioner Harris to build a temporary carhouse near Dorval Road to house the cars of the new Bloor Street line in Toronto.

Milwaukee Northern Railway, Cedarburg, Wis.—Work will be begun at once by this company on a new terminal building on Fifth Street between Cedar Street and Wells Street in Milwaukee. The structure will be of brick, fireproof, one story high and will be divided into separate waiting rooms, a ticket office and baggage room. The cost is estimated to be about $40,000.

POWER HOUSES AND SUBSTATIONS

Bay State Street Railway, Boston, Mass.—This company has installed a new engine and generator at its Mason Street plant.

Ottawa (Ont.) Electric Ry.—This company's new auxiliary power plant has been put in operation. It cost $200,000 and has a generating capacity of 5000 hp. The equipment includes three Babcock & Wilcox boilers and a Westinghouse double-flow steam turbine.

West Penn Traction Company, Pittsburgh, Pa.—This company has just placed in operation a 19-000-kva, 6600-volt, three-phase, sixty-cycle, turbo generator, built by the Westinghouse Electric & Manufacturing Company.

Monongahela Valley Traction Company, Mairmont, W. Va.—This company is installing three 1500-kva, water-cooled, sixty-cycle, 22,000-volt high-tension Westinghouse transformers, and a complete electrically-equipped remote-control switchboard in its power house near Fairmont, W. Va.

Manufactures and Supplies

ROLLING STOCK

Sheboygan Railway & Electric Company, Sheboygan, Wis., expects to order two new steel cars for city service, double-end operation, pay-as-you-enter, double-truck, to seat forty passengers. The cars will be equipped with baby motors and 24-in. wheels.

Philadelphia & Reading Railroad, Philadelphia, Pa. is making an investigation into the advisability of establishing storage-battery car operation on branch lines of its Winslow Junction-Cape May division.

Empire United Railways, Syracuse, N. Y., has ordered twelve more cars from the St. Louis Car Company in addition to the twelve cars ordered last summer. These twelve cars are to be the same type as those on the previous order.

London & Port Stanley Railway, London, Ont., has ordered three electric locomotives and electrical equipment for five motor cars from the Canadian General Electric Company. The contracts approximate $135,000. The locomotives will be 1000 hp, capable of hauling a trainload of 1000 tons. The cars will have a four-motor electrical equipment of about 600 hp per car. The motor cars and trailers, of which there will be five each, will be of one pattern and steel construction throughout. Tenders on the car bodies were invited up to Dec. 2.

TRADE NOTES

Thomas A. Edison, Inc., West Orange, N. J., in a fire which started early in the evening of Dec. 9, suffered much damage to its property, calculated at something less than $1,000,000. Part of the phonograph works was destroyed by fire, but Mr. Edison's private laboratory, the Storage Battery Company and the Edison primary-battery department were not affected. The company emphasizes the fact that the business of both battery departments of the company will not be interfered with in any way by the fire and that it is prepared to continue business as usual.

Albert Lawrence Smith has been admitted as a partner in the firm of E. B. Smith & Company, public utility bankers, Philadelphia, Pa. Mr. Smith is a son of the senior member of the firm. He attended Harvard University and began his business career with the Franklin National Bank, Philadelphia. For several years he has been associated with the firm of which he is now a partner. He is a director of the Buffalo & Susquehanna Railroad and of the Easton (Pa.) Consolidated Electric Company.

Kerr Turbine Company, Wellsville, N. Y., builder of "Economy" steam turbines, has appointed A. E. Seelig as general sales manager, and John A. Hense as St. Louis representative. Mr. Seelig for several years held a similar position with the L. J. Wing Manufacturing Company, and more recently has managed the new machine tool department in the New York office of Schuchardt & Schutte. Mr. Hense was formerly with the National Malleable Castings Company, Chicago, and later with the Dravo-Doyle Company, Philadelphia.

Walter A. Zelnicker Company, St. Louis, Mo., has appointed Arthur E. Jackman as manager of its machinery department to succeed J. J. Hilpirt, resigned to become storekeeper of the Compania Mexicana de Petroleo "El Aguila," S. A., Tampico, Mexico. Mr. Jackman has had wide experience, gained as general manager of the Sea View Railroad and Narragansett Pier Electric Light & Power Company. He was several years in the railway and lighting department of the Westinghouse Electric & Manufacturing Company, and lately superintendent of the East St. Louis, Columbia & Waterloo Railway, which position he left to assume his present duties.

W. S. Miller has resigned as general superintendent of the St. Louis Car Company, after being connected with this company about fifteen years. Mr. Miller's first position with the company was superintendent of the brass foundry departments, two years after which he became general foreman of the blacksmith, machine and truck departments. After holding this position for three years he was appointed superintendent of machinery and tools. In 1907 Mr. Miller became works manager and later general superintendent, which position he has held up to the time of his resignation, Nov. 9, 1914. He was formerly a student of Washington University, New York.

Edison Storage Battery Company, Orange, N. J., has appointed Francis V. McGinness, formerly sales engineer, as assistant manager of the railway department, the position formerly held by William F. Bauer, who was recently made manager of the company's Chicago office. Mr. McGinness is a graduate of Columbia University's Schools of Applied Science, class of 1910, and before graduation had considerable practical experience with the New York & New Jersey Telephone Company. After a few months in the engineering department of the New York & Queens Electric Light & Power Company, Long Island City, he joined the sales force of the Edison Storage Battery Company. For the past two years he has been identified with the railway department.

National Corrugated Culvert Manufacturers' Association, Chicago, Ill., announces that the large number of manufacturers operating under the Watson corrugated culvert patent have just been informed by their attorney, Wallace R. Lane, Chicago, that the United States Court of Appeals for the Second Circuit, which has final jurisdiction, has just handed down a mandate reversing the lower court and holding this patent valid and infringed by another culvert which was recently installed. The court says, in part: "The patented culvert is cheap, strong, durable, easily transported, quickly laid down and easily repaired. We cannot believe that the man who gave such a structure to the world should be denied the title of an inventor." The manufacturers of corrugated culverts under this important patent make them out of Armco American ingot iron.

ADVERTISING LITERATURE

Fargo Manufacturing Company, Inc., Poughkeepsie, N. Y., has issued a bulletin describing its straight connector, cable lug, signal connection, ground point and ground meter, "L," "Y" and "T" and terminal connections.

NEW PUBLICATION

Bonds and Stocks—The Elements of Successful Investing, by Roger W. Babson. Babson Statistical Organization, Inc., Wellesley Hills, Mass. 422 pages and three charts. $2 net.

This is the second book of its kind intended for investors received this year for review by the Electric Railway Journal and written by an authority of national reputation. There are many excellent books planned primarily for the student of corporation finance, but there has been a dearth of books about the science of investing money. Mr. Babson has in his volume rendered a real service to the man unacquainted with security issues who has money to invest, and in addition he has furnished a volume very entertaining aside from its practicable value. Very hazy ideas are frequently held about securities by men otherwise well informed, and to such men the present volume should be more than welcome. It is all very well for the man unacquainted with finance who intends to invest to be sure of the reputation of the house through which he deals, but there is no excuse now that "Bonds and Stocks" has been issued for such a man not to understand the fundamentals of investing. The strong and weak points of stocks and bonds are pointed out with reasons why some classes of securities are attractive and why others are not attractive. Mr. Babson has divided his work into twenty-four chapters. The first four deal with introductory suggestions, the next fifteen with elements of successful investing and the five concluding chapters with supplementary suggestions. There is a chapter on electric railway securities as distinct from lighting, telephone and water power securities. A chapter on the investor's vocabulary contains an explanation of ten phrases, the meaning of which should be understood by every investor. These phrases are the technical ones used frequently by bankers in seeking subscriptions from the public, through the newspapers. Mr. Babson certainly is justified in saying in his conclusion that "if the reader has absorbed all that has gone before he should have in his mind a clear idea of the different kinds and groups of securities and the various questions and terms involved therewith."

LET SHOPMEN HELP DESIGN

On several occasions we have called attention to errors in maintenance structure design which might have been avoided had the shop employees been taken into consultation. The bad consequences of leaving everything to the man at the drafting board were noted again lately in a certain New England carshop. The building was laid out for aisle sprinklers, but after these were installed it was discovered that thereafter trolley poles on cars would have to be turned in the open air. Another part of the building was confidently laid out as a paint shop, but when car painting began it was found that a painter could not possibly work in the narrow space which had been left between the painting track and the wall. In general, the provision of satisfactory working clearances for a car shop requires more foresight than may reasonably be expected even from the combined experience of the draftsman, the shop superintendent and general manager. A hint or two from the men closest to the job may avoid many distressing incidents of the nature cited.

THE SKIP-STOP IDEA

One of the reforms which seem a long time in coming is the skip-stop for city service. Railway managers who have studied the plan approve of it, but the inertia of the public in matters of this kind is so great that this reform has been adopted in very few places. Chicago is now reported to be contemplating a trial of the plan. An account of the Denver experience has been published in recent issues. In Los Angeles, where the skip-stop has also been tried, there seems to be some doubt as to the advisability of its continuance. On the other hand, in Cleveland and in Kansas City, where the skip-stop appears to have been originally introduced in the year 1911, it has been continued in operation with every evidence of success. The increase in schedule speed has been reported to be nearly 10 per cent but since half of the cars stop at "odd" streets and the other half at the "even" streets, only about half of the people that collect at a corner board the first car that arrives. Thus the load is distributed more evenly among the cars on the route. There is no doubt that the public would be greatly benefited by the skip-stop because it materially increases the average speed by cutting out the number of stops and yet does not greatly increase the distance which the passengers have to walk to catch a car. In a number of cities the near-side stop has recently been introduced without creating public opposition. Perhaps this change will make the general adoption of the skip-stop more of a possibility.

AUTOMOBILES IN CITY TRAFFIC

Automobiles for private use have now become so common that it is not surprising they should have invaded the passenger transportation field, and several electric railway companies on the Western Coast report considerable competition from automobiles which carry passengers over certain routes for nickel fares. We have no fear that such cars, with the tire cost and other depreciation inseparable from automobile service, can ever be commercial competitors on the same terms with an electric railway system. The report of Mr. McCullom to the Board of Estimate and Apportionment of New York, abstracted in this paper about a year ago, presents ample evidence to this effect. Nevertheless, experience has shown that this fact will not prevent the owners of cars from attempting a service of this kind. In a free country like this, electric railway companies cannot suppress this competition even if they would, but it is only fair to them as large taxpayers and also to the public as a whole, whose patronage is solicited by these buses, that both classes of transportation should be placed under similar regulations in regard to responsibility, and that strict traffice regulations should be enforced. The Merchants & Manufacturers Association of Los Angeles has called the attention of the City Council of that city to the tremendous liability of street accidents from these irresponsible automobiles, and Long Beach, Cal., has imposed a license fee of $25 a year and has required taking out of a $10,000 liability insurance for every such car. Charges of short changing by irresponsible automobile conductors is also made in some of the Western cities. Railway companies can ask no more than a free field and fair play for all, but both they and the public should demand that fair play means an equal degree of responsibility from the operators of both classes of service.

STREET RAILWAY LOADS ON SOILS

A part of the discussion of the way committee's report on track at the convention was devoted to the distribution of railway loads over the ballast and sub-grade. While this subject is of vital importance to steam railroad engineers, owing to the great increase in the weight of locomotives as well as the adoption of higher scheduled speeds of trains, neither of these factors has any bearing on the study of track foundations in paved streets. Moreover, the conditions governing the depth of loose, unconfined ballast are hardly comparable with those surrounding a foundation of concrete or compactly-rolled ballast, such as is required by a modern electric railway. In steam

road, or even interurban road open-track construction, a certain amount of flexibility is required, while track in paved streets must be as rigid as is consistent with economical operation. To obtain rigidity the foundation must be made much heavier than that actually necessary to carry the track loads. In other words, one should determine the average soil-bearing power condition and then select a foundation which will distribute the track loads well within the safe limit. It would be impractical to change the character of foundation with every slight change in the bearing quality of the soil. On the other hand, it is necessary to change the character of foundation when there is a marked change in the soil-bearing power, such as might be found where track is constructed over filled-in areas or where the soil contains excessive moisture. Of course, a drainage system would go far toward improving the latter condition, while rolling the sub-grade will often be all that is necessary to prepare filled-in areas for foundation construction. To sum up, it appears impossible to calculate exactly the distribution of track loads over the foundation and sub-soil. Hence, the selection of the foundation must be based largely on experience, after such mathematical checks as may be required have been made to determine the relation of the load to be carried to the bearing power of the sub-soil.

SNOW REMOVAL

That the removal of snow from city streets should constitute one of the most exasperating of the unsolved engineering problems of long standing is really remarkable when it is considered that the cost of the fuel necessary to melt the snow would be hardly 15 per cent of the expense of removal involved under present methods, the latter consisting, almost without exception, in shoveling the snow into wagons and carting it away. It may be, of course, that snow storms will have to be fought for some time by this primitive scheme, yet in this age of flying machines and wireless telegraphy one must be a true conservative at heart to accept this as a fact, even though the recommendations of the committee on resolutions of the snow removal conference, which were presented before the American Society of Mechanical Engineers last week, approved no new process except the limited use of the sewer system to get the snow off the streets.

The reasons that prevented the general use of sewers, as outlined in the report, could be summed up in the one generality—insufficient sewage flow. In New York, during the last winter, experiments demonstrated that the large trunk sewers with a continuous and fairly rapid flow were not clogged by any snow that might be shoveled into them. The small sewers, however, of about 12-in. diameter required flushing with hydrant water and even then had to be treated with considerable care.

The same idea has been suggested for Philadelphia, where the contractors are supposed to commence the work of plowing or sweeping the snow to the sides of the streets within one hour after a storm begins, the work of carting the piles away being aided by the use of certain sewer manholes for dumps. It is now planned to extend the use of the sewers by having water connections placed inside of the manholes, thus increasing the flow in the sewer and permitting the flushing away of accumulations of snow.

Removal of snow by flushing the streets with cold water naturally seems like carrying coals to Newcastle, but the experience in Scranton has demonstrated that with proper temperature conditions the scheme is capable of reducing the expense of removal to one-half that of cartage. However, when a cold snap follows a snow storm, the presence of great quantities of water on the streets might easily become fraught with considerable danger. This fact, indeed, is implied in the recommendations of the committee. Considerable hope is also held out in regard to the disposal of snow by melting in a furnace. The committee estimates that with a perfect furnace the cost of the coal required would be 3 cents, or with a furnace efficiency of 33 per cent, 9 cents, per cubic yard, against the present cost of carting of about 50 cents. This difference provides a considerable margin from which, of course, the cost of apparatus, labor and maintenance must be deducted. The problem should be an attractive one to the inventor, because there are many objections to carting besides its cost. One is its slowness, another is the congestion caused in the streets by the carts, and a third is the increasing scarcity in most cities of carts suitable for this purpose, owing to the growing tendency to substitute in commercial work for the horse-drawn cart a specialized motor truck not suitable for snow removal.

Surface railways, of course, are not so much interested in the manner of snow removal as in the provisions for operating their lines during and after snow storms. The matters of complaints from the public and of decreased receipts, which are the invariable accompaniments of heavy snow falls, are of serious importance, and at least one road, the New York Railways, is going to great expense to develop a wing sweeper that will clear a passageway beside the track. This has been planned solely to provide space for vehicular traffic which, during snow storms, utilizes the street railway tracks because these provide the only clear space in the street. Obviously the consequent congestion practically prevents the railway company from moving cars. To meet this difficulty wing brooms have also been suggested for Philadelphia and wing plows have been in successful use in Montreal for several years, a layer of snow being intentionally left on the streets in the latter city. It seems unfair to require a railway company, which is responsible only for the clearing of its tracks, to take care of the snow elsewhere on the street. But in many cases, owing to the slowness of the city force, this appears to be necessary for the railways, purely as a means for self-protection, and the development of wing brooms and wing plows seems to constitute peculiarly the railways' share in the problem, just as much as the prompt removal of the snow piles constitutes the share of the municipality.

FEDERAL AND STATE JURISDICTION OVER CITY RAILWAYS

It is not surprising, in view of the recent establishment of commission regulation in this country, that there should be many unsettled questions as to the powers and duties of regulatory commissions. One of the most important of those which remain to be settled is where the power of the federal commission should end and that of the state commissions begin. It would seem that with all of the problems in connection with valuation of steam railroads and the establishment of freight rates that the Interstate Commerce Commission has enough to occupy its time during the next few years, and that to the various state commissions could be assigned the adjudication of all of the intrastate matters which arise in connection with the operation of electric railways. This was the view which a committee of the American Electric Railway Association urged before a sub-committee of the House committee on interstate and foreign commerce last January in a hearing on several bills which would have brought certain equipment of all electric roads which do any interstate business under the jurisdiction of the Interstate Commerce Commission. The protestants at that hearing called attention to the fact that only a small percentage of their business, averaging in most cases less than 1 per cent, was interstate in character.

Now the question has come up again through an order to the Detroit United Railway, which owns about 800 miles of track in Michigan and 2 miles in Ohio, to make reports to the Interstate Commerce Commission on all accidents including, of course, all of those on its large city system in Detroit. If this policy should be adopted as standard, very few urban companies, certainly among those which haul freight and so issue through bills of lading, would be exempt. Moreover, if the jurisdiction of the Interstate Commerce Commission covers this case, it is likely to cover almost any other detail of city operation, and we should then have a centralized government control of our public utilities in addition to state control.

At the last meeting in Washington the railway managers present did not question the good intentions or the ability of the Interstate Commerce Commission in dealing with these matters, as compared with the state commissions. The principal grounds urged were the absence of knowledge of local conditions and the immense amount of work which would be entailed on a central commission and also on the railways themselves in taking up all of these subjects at the federal capital as well as at the state capitals.

If precedent can count for anything, the decision of the Supreme Court in the opinion on the case of the Omaha & Council Bluffs Street Railway vs. the Interstate Commerce Commission (230 U. S. 324) would indicate that that court does not believe that the interstate commerce law covers cases of this kind. At Omaha the situation was somewhat different because the question was one of rates on street railways which happened also to be interstate roads. The conclusion reached then by the court was that the character of the service was the criterion of whether a road is embraced under the interstate commerce law, and certainly the character of the accidents in city service and the means to be taken to avoid them by fenders or otherwise bears little relation to what is generally understood as interstate commerce. We hope that the hearing at Washington next Friday, to which a letter from Arthur W. Brady in our "Communication's" column this week calls attention, will be effective in impressing this fact upon the Interstate Commerce Commission.

HUMANIZING DISCIPLINE

A casual study of a number of bulletins issued to platform men indicates an often unnecessary brusqueness in many of the instructions and little or nothing of a commendatory nature. Of course, the purpose of the merit and demerit system in disciplining trainmen has taken this into account to a certain extent, but attention is here directed to the day-to-day bulletins. Would not the suggestive effect of a meritorious act spread on these bulletins be of much value in disciplining and at the same time offer relief from the constant repetition of "do" and "don't"? Orders must, of course, be issued, but occasional commendation and a mixing of the "sweet" with the "bitter" will help greatly toward better service. The iron hand of discipline might well be covered with the silk glove of consideration. In other words, the human side of disciplining must be recognized.

The frailties of the human mind and body have been thoroughly safeguarded in the operation of trains, so as to make the man as nearly as possible an automaton. All of these precautions have done much to make operation more safe, but they cannot make a machine out of the human body. Hence disciplining in various forms is necessary to make up for this deficiency, and the point we have in mind is that, in disciplinary methods, full cognizance should be taken of the human factor. To illustrate what we mean, take the case of the application of discipline after accidents have occurred. After a serious accident the superintendent's first tendency is to discharge the offenders if they prove to have been guilty of lack of attention or lapse of memory. It is worth while in such cases to go behind the facts and consider some of the contributing causes and thus possibly justify the retention in service of men who will afterward be much more valuable on account of the accident. A momentary mental lapse during a run may result in disaster. Yet we all have mental lapses and the very fact that a man has had no accidents or "near" accidents during his railway career may in itself have made him subject to a false sense of security. As he ages in service his alertness is apt to become sluggish. But this defect may be more than made up, so far as his value of the company is concerned, by better knowledge of local conditions and clearer judgment. This fact should receive consideration when his case is decided. After he gets his "nerve" back he may be a safer man than one with no accident to his credit.

New Cars of Seattle Municipal Railway

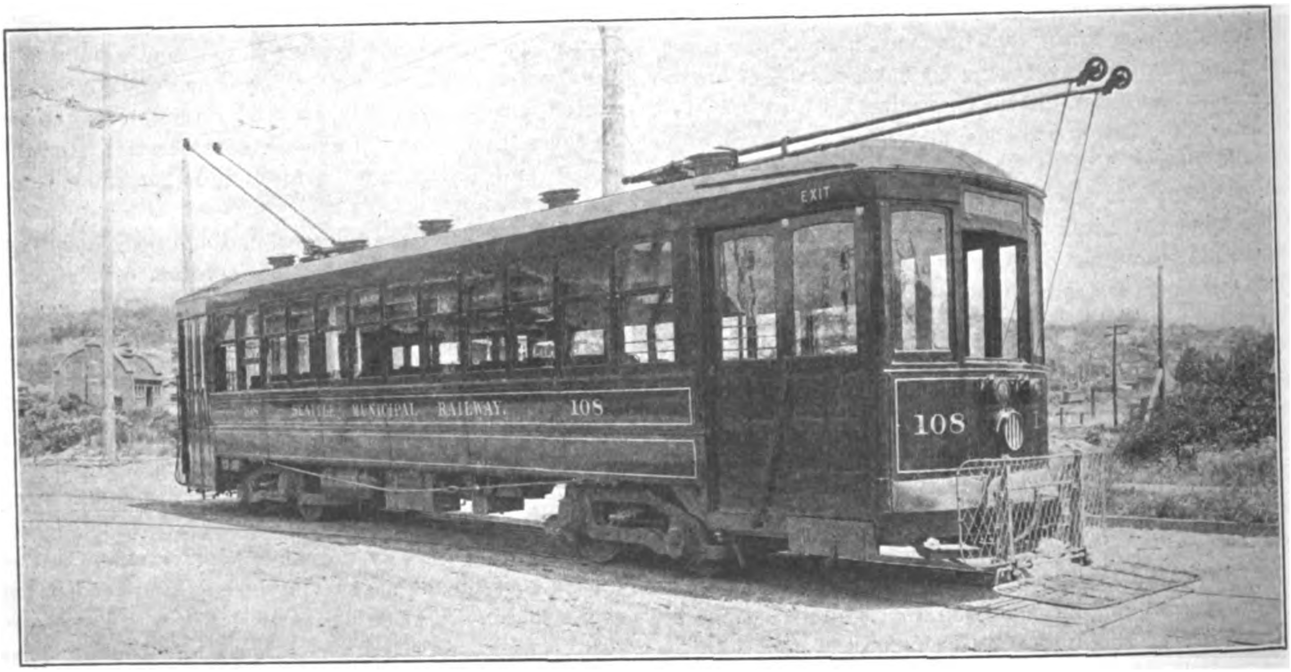
Multiple-Unit Control Arranged for a Double Trolley Wire System, Gearless Air Compressors and Air-Operated Fenders Are Among the Unusual Features of These Cars

BY H. J. KENNEDY, ELECTRICAL AND MECHANICAL ENGINEER

In the ELECTRIC RAILWAY JOURNAL, April 26, 1913, and June 20, 1914, some general accounts were given of the municipal railway construction in Seattle. In the present article the new cars built for this railway by the Cincinnati Car Company are described.

The twelve cars are of the double-end, semi-convertible "pay-within" type, having composite-type framing, exterior doors on platforms, and no interior bulkheads. They have arch roofs, are mounted on maximum-traction trucks, and have the following general dimensions:

Length of car over bumpers	44 ft. 5 in.
Length of car over vestibules	43 ft. 1 in.
Length of car over end posts	31 ft. 1 in.
Spacing of transverse seats	2 ft. 5½ in.
Width of car over posts	8 ft. 5 in.
Height of car over trolley boards	11 ft. 2 in.
Distance between truck centers	23 ft. 1 in.
Seating capacity	48
Weight of car empty, approximately	42,000 lb.
Weight empty, per passenger seat	875 lb.



SEATTLE MUNICIPAL CAR—GENERAL VIEW OF CAR IN OPERATION

The 75-hp motors which are of the Westinghouse 810-C type, were tested at the builders' works by coupling two together, running one as motor and the other as generator, on 125 per cent and 100 per cent loads. In addition, an overspeed test of 1800 r.p.m. and 2600-volt one-minute insulation tests on field and armature were made. One out of each twelve motors had a one-hour A. I. E. E. temperature run, at full load. Commutation was also tested at 200 per cent load. On the one-hour run at 500 volts, a current of 107 amp was applied at 460 r.p.m. to 475 r.p.m., heating the series field (the hottest part) to 79 deg. Cent., the air being 23 deg. Cent.

Among the other items of equipment on the cars are "Utility" ventilators, "Standard" motor trucks, Agasote ceiling, Hale & Kilburn seats, Crouse-Hinds headlights, Earll trolley retrievers, Pantasote curtains, Johnson fare boxes and Forged Steel Wheel Company's rolled steel wheels. The interior lighting of the car is effected by 23-watt, Mazda, half-frosted, incandescent lamps, one lamp being placed over each seat and three being located in each vestibule. The latter are connected in series with the destination sign and headlight at the opposite end of the car.

CONTROL SYSTEM AND WIRING

The control system is Westinghouse type HL, electro-pneumatic, with master controllers at each end of the car. Train line receptacles have not been provided, but they can be added at any time when it is desired to arrange for running multiple-unit trains. At the time the cars were ordered, the future conditions of operation of the road were so uncertain that it was felt to be an advantage to have cars which could, if needed, be used in multiple-unit train operation by the addition of the train line receptacles. At present, with the exception of the third-rail interurban line to Tacoma, electric cars for passenger service in Seattle rarely haul trailers or run in trains. However, the Seattle, Renton & Southern Railway, which connects with the new line is, in conditions affecting rolling-stock, almost an interurban and it is difficult to foretell what future conditions may be.

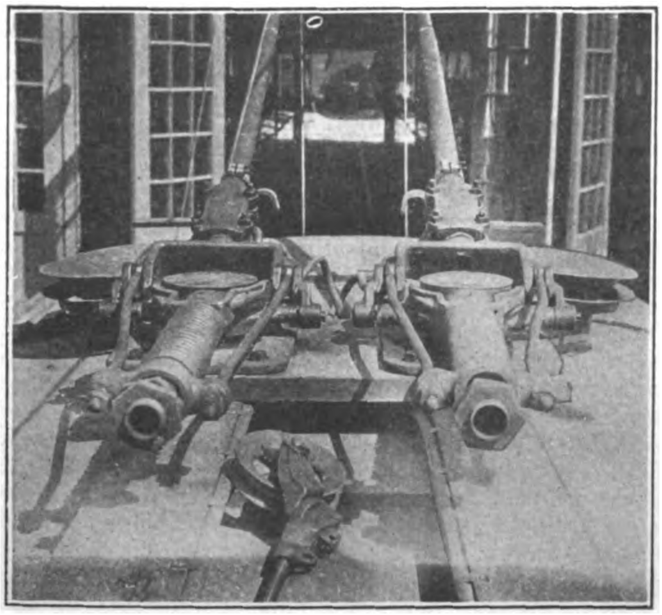
The standard control system has been modified for the double-trolley system which has been installed on the Seattle Municipal Railway, by the addition of an extra line switch in the unit-switch group with corresponding contacts in the master controllers and by an additional control switch in the hood connected on the negative side of the circuit. The overload trip relays on the line switches, positive and negative, of the unit switch groups are set at 325 amp. Instead of one control-

reset switch in the hood, as usual in the unit-switch system, there are two switches, one with fuses on the positive side and one on the negative side of the car circuit, the former being double-throw, the latter single-throw. It may be noted that the apparatus will work if polarity be reversed, the signs mentioned indicating the normal method of operation.

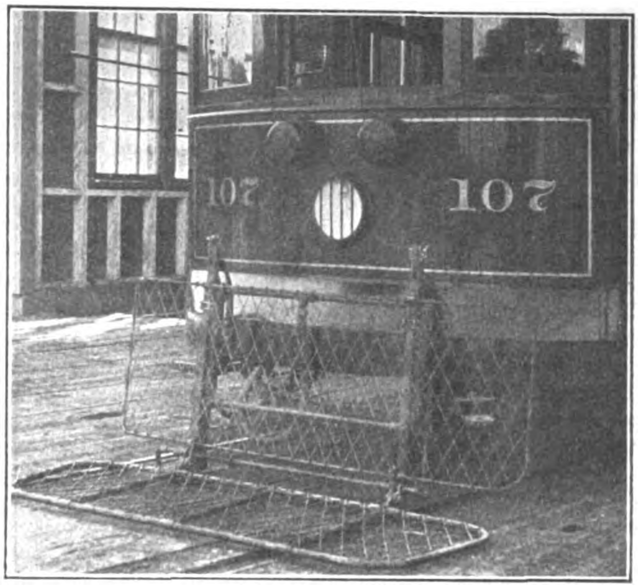
A feature of the wiring peculiar to these cars is the installation under the hood at each end of the car of a single-pole double-throw knife switch encased in a box. The blade of the switch is connected at the hinge to ground to truck, and the terminals to the positive and negative trolleys, respectively. In running from a double-trolley to a single-trolley track, one trolley pole is hooked down and the grounding or transfer switch is thrown to connect the truck with it. It is possible to make the change without stopping the car. For the cars that are in continuous service on the single-trolley Lake Burien Division, however, the negative trolley poles have been entirely removed.

An interesting feature to note in this connection is that, in case of the use of a grounded neutral for the three-wire generators which have been installed in the substation, as soon as a car passes from the double-trolley to the single-trolley line, the position of the ground relative to the outside of circuit moves over by 300 volts, assuming 600 volts total emf. In other words, the potential on the single-trolley wire would be 300 volts higher than that on the positive double-trolley wire, when measured with reference to the ground. Hence there must be an insulated break between the two systems, although, if the car should run past the break with the controller on, the grounding switch being instantly thrown at the same time, there would be no change in the emf impressed on the motors, since the grounding switch raises the negative potential 300 volts simultaneously with the raising of the positive, so that the difference of potential between outside terminals is the same as before. Even if it were possible to perform this experiment, it would not, of course, be made an operating practice because of the consequences in case of failure to perform it successfully. It should be noted that up to date the line has been operated without grounding the direct-current neutral. The three-wire generators are for probable commercial loads.

The trolley bases were designed especially for these cars. The base casting is rectangular, 12 in. x 18 in., the two being mounted side by side on wood trolley boards so as to have a 6-in. air gap between them. The base castings are not themselves live, the trolley poles being insulated from the sockets by a ¼-in. thickness of insulating bushing. The roof cables are connected, not to the bases as is usual but to the poles by flexible pig tails. The poles on diagonally opposite corners of the car are connected to each other, so that the right hand one is positive independent of direction of running, assuming that the overhead system is connected up that way. However, in certain cases of special work, the polarity on the trolley wires is reversed for a short distance. The bases are ball bearing and have one spring.



SEATTLE MUNICIPAL CAR—VIEW SHOWING POSITIVE AND NEGATIVE TROLLEYS AND BASES



SEATTLE MUNICIPAL CAR—VIEW SHOWING FENDER HELD DOWN ON CURVED TRACK BY AIR PRESSURE IN CYLINDERS

GEARLESS AIR COMPRESSOR

An interesting feature of the brake equipment is the gearless air compressor, made by the Allis-Chalmers Manufacturing Company. This is remarkable for its compactness and small weight of 425 lb. including suspension cage. It has three cylinders which are approximately horizontal and are connected to the same shaft with a four-pole 600-volt motor, the latter taking 5.7 amp, 3.42 kw, when delivering 18 cu. ft. of free air per minute against 90 lb. pressure, with a temperature rise not exceeding 50 deg. Cent., when operation does not continue over thirty minutes out of an hour. The cylinders are provided with sliding sleeve intake valves of the type used in the Knight automobile engine. These valves are operated by eccentrics on the crank shaft, compelling the opening and closing to be at exactly the proper instant, and insuring large port openings.

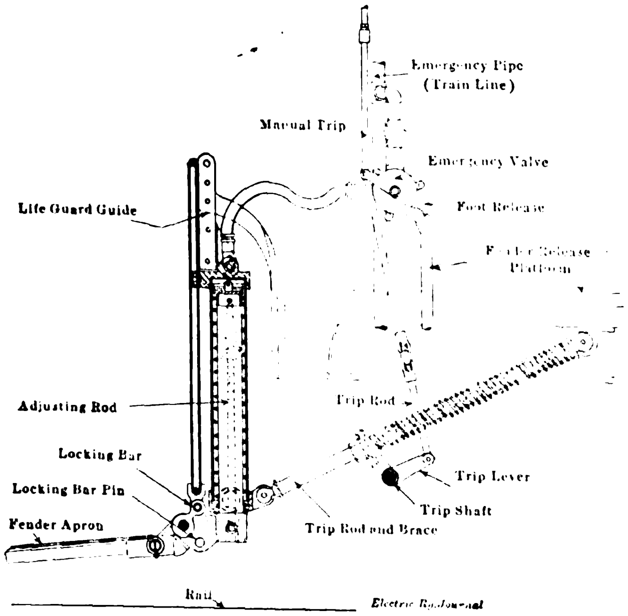
The compressor is 21⅝ in. from the cylinder head to outside of motor casing, and 29⅜ in. long over all measured parallel to shaft. In spite of its speed it operates without any disagreeable vibration. Instead of the noticeable pulsation of the usual geared compressor, the sound takes the form of a hum, due to the speed of rotation and the use of three cylinders instead of two. The motor brushes are readily accessible from the outside of the car by opening the cover located just below the side sill.

PNEUMATIC FENDERS

The fenders on these cars are of the Nelson pneumatically-operated type, generally similar to those used in Portland, Ore., and other places, but of a design improved in several particulars. The fender, both apron

and lifeguard, is hung on slides and kept at its normal height by helical springs contained in two vertical cylinders of 3-in. boiler tube, attached to the bumper beam of the car by brackets. The springs are 2 11/16 in. in outside diameter, 22 in. in free height and have about twenty-three coils of ¼-in. steel. The weight of the moving parts is about 180 lb. Upon admission of air to the cylinders, the springs are compressed and the sliding parts forced down upon the track very quickly and held down with strong pressure so as to scoop up anything lying thereon. The apron is framed of ¾-in. standard wrought-iron pipe and is 78 in. wide over all, and 26 in. deep over all. The frame is filled in with mesh of No. 7 steel wire, 3½-in. diamond mesh. The lifeguard or vertical screen is framed of ¼-in. round iron, is 78 in. wide over all and 27 in. high over all, and is filled in with mesh similar to the apron. The projection of the apron in front of the bumper beam is approximately 33 in. The front edge of the apron is suspended so that it clears the track by about 6 in.

A few inches above the platform floor is placed a special rotary fender valve with axis horizontal. On the stem is a lever with a pedal, and with a link connection to the swinging fender, which is hung on pins on the brackets. Impact with some body on the track will therefore throw the fender back and operate the fender valve. The fender valve can also be operated by a bronze handle placed beside the motorman's brake valve and connected by link with the fender valve. In an emergency, when confronted with the danger of running over someone, the motorman uses this handle instead of the air-brake handle, pushing it away from him in practically the same direction as in moving the brake valve handle to emergency. This results not only in dropping the fender on the rails but also in making an emergency application of the air brakes, by admitting air through the fender valve independent of the regular brake valve. Pressure on the pedal releases the air from the fender cylinders and allows the springs again to raise the fender. The air brake is then released by the brake valve in the ordinary way, a check valve preventing the air from running back through the fender valve, although permitting air to be fed through fender valve to brake cylinders, with brake valve in "lap" position.



SEATTLE MUNICIPAL CAR—ELEVATION SHOWING FENDER MECHANISM

A fender is permanently attached to the bumper beam at each end of car, the fender not in use being folded up against the dashboard, allowing freedom of motion for the drawbars. There is a double articulation for folding, the first motion merely folding the apron against the lifeguard, the second doubling both of them up and back against the dash. The weight specified for each fender is not in excess of 210 lb., and the pressure on the travel stops of the moving part which drops on the track is specified to be at least 500 lb., but not in excess of 1000 lb., with a pressure of 60 lb. per square inch in the air cylinder.

Electric Sign in Street Railway Competition

As a stranger in the city of Topeka emerges from the union railway station, he is greeted with the shouts of hackmen and cabmen seeking business. If he is alert and is inclined to be thrifty, his eye soon catches sight of a small but concisely worded electric sign on a pole across the street. This sign is shown in the accompanying illustration. Its legend reads "Cars Leave This Point Every Five Minutes Reaching All Parts of City."

CARS LEAVE THIS POINT EVERY FIVE MINUTES REACHING ALL PARTS OF CITY
H. B. MOBERG JEWELER

TOPEKA ELECTRIC SIGN WHICH ATTRACTS THE TRAVELER'S CUSTOM

The Topeka Street Railway, operated by the McKinley Syndicate, has chosen electrical advertising as the most efficient method of attracting the attention of the traveling public and thereby bringing the nickels to the company's purse. It is noticeable that in Topeka the bus and cab business is less flourishing than in the neighboring towns and cities.

Passenger Traffic to Illinois State Fair

The Springfield Consolidated Railways Company of Springfield, Ill., reports that 67,000 less passengers were handled in 1914 than in 1913, to and from the Illinois state fair grounds in that city. In 1913 the company handled to the fair grounds a total of 798,000 passengers and in 1914 the number dropped to 731,000. These figures include all transfers from other lines in the city, police passes and all other forms of free transportation allowed by law. The largest day in the state fair week this year was Thursday when 115,000 fares were collected. This is a falling off of 29,000 fares from the largest day in 1913. The company has not sought to ascertain the reason aside from the fact that the state fair of Illinois in 1914 was not as well attended as was the exposition in 1913 and in previous years. The ticket sales at the fair grounds gates showed a decided falling off from the previous year and the receipts of the Springfield Consolidated Railway Company showed a similar decline.

Fair Interest on Investment in Public Utilities

The Author Discusses the Claim that Rates Should Be Based on Depreciated Values and Points Out that the True Criterion Is the Principal Invested—Different Values Also for Rate-Making and Taxation

BY H. J. DAVIES, TREASURER CLEVELAND RAILWAY

John B. Geijsbeek, C.P.A., contributed an article to the April, 1914, number of the *Journal of Accountancy* on "Fair Return to Public Utilities," in which he undertook to show the normal value of a public utility plant to be about 54.55 per cent of its original cost, or half-way between cost and scrap value. Mr. Geijsbeek says that this premise is not new and was described in a report made in September, 1912, to the Public Service Commission of St. Louis by James B. Allison, its chief engineer.

The operating efficiency of a traction plant is probably as high as that of a telephone plant, used by Mr. Geijsbeek for illustration, and higher than 54.55 per cent of its original cost. In a growing city a public utility plant never stands still, never is finished, never stops growing. Demand for additional service requires an increased supply of capital. And so the investment, the amount of "original cost," becomes legitimately larger, annually, monthly, almost daily. And the cost of the additional property is so large a proportion of the total investment that always more than half the property is less than half worn out—has lived less than half its life. The value of such a property, therefore, never falls to an average or "normal" of 54.55 per cent, or half-way from its original cost to its selling price as scrap.

Public utility companies usually own land, and the value of land in a growing community usually appreciates instead of depreciates as the value of all other property does. This enhancement in the value of land tends to keep the average value of the whole property above the half-way point on the road from first cost to final junk pile.

A "normal value line" of 50 per cent or 55 per cent can only apply to or be true of a utility that is neither increasing nor decreasing its plant or its service. Every public service company that is adding to its property to meet the increasing demands and needs of the public has, and must necessarily have, a property worth more than 54.55 per cent of its cost.

DEPRECIATED VALUE STILL IN PROPERTY

Mr. Geijsbeek says that "if depreciation is charged in addition to repairs and renewals, the public, or the consumer, has paid back to the utility company that amount for immediately existing reduction in the value of the property due to wear and tear not yet made good by renewals. That is either in the pockets of investors or stockholders or is in a reserve fund; if not in the fund, then it is in the reserve account and has been used to purchase additional plant. This, the depreciated plant value, added to earned surplus either on hand or paid to stockholders, will equal the original investment. In such a case a fair return can be only on the depreciated value of the original cash investment, and not on the cost of reproduction. Therefore, if depreciation is allowed in addition to repairs and replacements, the cash investment upon which a fair return is allowed is reduced each year by the amount of depreciation so allowed."

This is not so, unless the amount of the depreciation is returned to the investors as part of their principal. If the amount of all depreciation is returned to the investors as part of their principal, then, when replacements are needed, it will be necessary to invest new capital, which also must be returned with full interest.

If the stockholders have received from earnings, in addition to a fair return of interest upon their investment, a part of the investment itself, and if the contract between the utility and the municipality limits the rate of interest upon investment, it may be proper to reduce the capitalization, or the amount upon which interest shall be paid; but if the principal of the stockholders is kept in the business, whether a depreciation reserve adequate to provide for the disappearing value of the physical property is set up or not, the stockholders should receive interest upon the entire amount and not merely on the depreciated value of the property. Mr. Geijsbeek seems to see this in his "Conclusions as to Deterioration," for he says "Instead of paying this depreciation item to its stockholders in dividends out of surplus, this amount may be held by the company in a reserve account or, sometimes, a reserve fund, in order to keep the investment always at 100 per cent, i.e., present value (or, ultimately, normal value) plus unconsumed depreciation reserve, must always equal original cost." He further says, and truly, that it is difficult to divide the difference between "cost new" and "present value" into renewals and what he says is called depreciation, viz., "that unknown portion of plant value lying between reproduction and normal values that will never be replaced by renewals and which should remain in the reserve accounts or funds to be given to the stockholder at the cessation of operations in order to return to him the 100 per cent he originally invested."

In the meantime, and until the cessation of operations, or at least until he gets his money, or some of it, back, the stockholder should receive interest on the entire amount of his original investment and not merely on the remaining value of the property purchased with his money.

INTEREST SHOULD BE PAID ON ENTIRE PRINCIPAL

Again, under the heading "Fair Return on Investment," Mr. Geijsbeek writes: "Having decided the subject of depreciation, the question of fair return on the investment comes up. It seems almost impossible to find any two men who agree on what amount the interest considered to be the fair return should be charged. Especially is there a great difference of opinion as to whether the fair return should be calculated on the original cost value or the cost to reproduce the property, or whether it shall be the depreciated value, or the present value, which ultimately will become the normal value."

On the contrary, it is difficult to see how any two men can disagree as to the amount on which interest should be charged. It should be the full amount of honest investment, not the depreciated or present value of the physical property. The toll or rate of fares should be high enough to pay expenses, taxes, a fair interest on original cost, i.e., investment, and to set up a maintenance reserve equal to the difference between cost and present value. If this reserve, which may be

in cash, securities or other physical property (cash and securities are as much property as cars or telephone wires), is adequate, then the value of the company's property will be equal to the investment—as it should be. If, instead of providing for such a reserve, and then keeping it in cash or investing it in additional physical property or in securities, the company uses it to return to its stockholders a part of their principal, calling in some of the outstanding stock or bonds, it may be argued that, the investment having been reduced, the rate thereafter should be based upon so much of the original amount as is still invested. In no case should the rate be based upon present (depreciated) value—unless the stockholders have received, in addition to their interest, the entire difference between cost and present value. If a part of the investment of the stockholders has been returned from earnings and the amount of stock or bonds originally issued has been correspondingly reduced, or if additional property has been purchased from earnings and the difference between investment and present value has been thus lessened, the ratepayers who have contributed to the earnings so used have paid more than should have been charged them; and the ratepayers of the future will be charged less than they ought to pay, because they will pay upon a valuation smaller than the amount of money invested for their benefit.

For illustration, suppose an investment of $1,000,000 in an electric railway property, under an agreement between the company and the municipality that 10 per cent per annum on the investment shall be paid to the stockholders of the company, and suppose that a depreciation of 20 per cent, or $200,000, ensues, the remaining value of the property being $800,000. The company ought then to have, in addition to the $800,000 worth of physical property, a reserve of $200,000 to take care of the 20 per cent depreciation. If, instead of keeping this reserve in cash or investing it in bonds or other property, the company should pay it to the stockholders, in addition to interest at the rate of 10 per cent per annum, then 10 per cent interest on the remaining $800,000, instead of on the original investment of $1,000,000, may be the fair return thereafter, because 20 per cent of that investment has been returned to the investors. In that case $200,000 of the stock or bonds should be called in.

This transaction is perfectly fair and just to the investors and the company; but is it fair to the car-riders of the period in which the depreciation occurred or the reserve was accumulated? Should they have paid for their rides $200,000 in addition to 10 per cent ($100,000) upon the original investment? And should the car-riders of the future have the benefit of that contribution to capital by the car-riders of the earlier period and receive their rides for 10 per cent ($80,000) on only $800,000? If so, then when the property is worn out, or becomes inadequate or obsolete, and is replaced by other property, the cost of the new property must be provided from new capital, on which interest must be paid. And so, instead of paying off a part of capital as physical property depreciates and calling for additional capital when the time for replacement comes, the practice has been to set aside a reserve for maintenance or for depreciation and replacement of physical property and to invest the reserve, or some part of it, in securities or additional physical property. It is not necessary that the reserve be kept in cash. Invested in securities or physical property it should earn a larger return than savings bank interest. This practice is a better security for the investment than alternate payments of principal and demands or calls for new principal.

The car-riders of each month or year should pay a toll or rate of fare sufficient to enable the company to pay its operating expenses, its taxes and a fair rate on its investment, and, in addition, to set up out of the earnings of the month or year a reserve sufficient to take care of the depreciation, as nearly as it can be estimated, in the value of the physical property in the month or the year. The reserve ought not to be less than the depreciation. It ought not greatly to exceed it. Of course, the depreciation is not susceptible of exact ascertainment in advance; but it is possible to make a reasonable estimate, based on the experience of the company and the known experience of other companies in the same business. The reserve should be ample—too large rather than too small. It is easier to reduce the rate of fare to correct an overestimate than to raise the rate to make good an underestimate.

If it were practicable, from the beginning of such an enterprise as an electric railroad, to pay to the stockholders as a partial return of the investment the amount of the increasing difference between the original cost and the present value of their property until the average or "normal" value, or a still lower value, was reached, calling in outstanding stock or bonds as partial return of investment was made, then it would be necessary, whenever renewals or replacements were required, to call on the investors or the public for additional capital to pay for new property to take the place of the obsolete, inadequate or worn-out equipment.

A reserve to provide for repairs as well as for renewals and depreciation would seem to be better than a reserve for depreciation merely, or for depreciation and renewals. It may be called a maintenance reserve. It should be large enough to provide for the difference between cost and the remaining value, at any time, of the physical property. An amount should be set aside in cash each month or each year, or by other periods, equal to the estimated difference between cost and present value in the period, and charged to expense. This reserve should be used for repairs and renewals. The excess above expenditures may be invested.

DIFFERENT VALUES FOR RATE-MAKING AND TAXATION

Public utility managers and taxing officials have been embarrassed and confused by attempts to fix one value of physical property for rate-making purposes and another value for purposes of taxation. There should be no confusion. The value for rate-making purposes may be greater than the value for taxing purposes without inconsistency. The value for rate-making purposes should be cost or reproduction value; the value for purposes of taxation should be the value at the time of the tax assessment. If the maintenance reserve is sufficient to make good the difference between cost and present value, the tax value will be the same as the value for rate determination. The property taxed will include the maintenance reserve, whether the reserve is in cash, securities or plant. If the reserve is not as large as the difference between the original cost and the present value of the property, the loss is not the public's but the company's. It indicates that the fare is not high enough to secure the entire investment and a fair return upon it. The public gains, therefore, rather than loses.

The company should not be taxed on the amount of its loss by reason of the insufficiency of the fare to provide for depreciation and reasonable dividends; it is enough that it be taxed on the fair value of its property, including whatever is in its maintenance reserve. It should not be taxed upon its capitalization, unless its physical property and its reserve are equal to its capitalization; and even then the basis of taxation should

be expressed as the value of the property and not as the capitalization. It should not be taxed on the capitalized value of its supposed or actual net earnings, as has been attempted in Ohio. If the rate of fare is inelastic—fixed by contract for a term of years—and the company cannot pay reasonable dividends and provide a sufficient reserve to take care of the difference between cost and present value, it must forego the dividends or a part of them, or, at the end of the contract, lose the difference between cost and the value at that time of its property. But the value of the property, including the value of the reserve, should be the basis of taxation. If the combined value of the existing property and the reserve is equal to the investment, the value for taxation and the value for rate-making will be the same. If the reserve is too small, the loss of the difference between cost and present value, or any part of that difference, will be, as before stated, the investor's loss, and not the public's, in the case of a franchise with a fixed rate of fare. If the reserve is too large under such a contract, the company will gain, but the public will pay only the rate of fare it contracted to pay and will gain in taxes on the excess of value. In the case of a franchise providing for an elastic fare, like the Cleveland franchise, if the company cannot earn its fixed rate of interest and a sufficient reserve at the going rate of fare, the fare may, and ought to be, raised. If the earnings are more than sufficient to pay the stipulated interest and provide a sufficient reserve for maintaining the property at a value equal to its cost or agreed "capital value," then the rate of fare may be reduced. Capital should equal cost—should be neither more nor less than cost. Conversely, cost should equal capital. Present value, plus reserve, should equal cost. But whether capitalization, original cost and present value plus reserve are equal to each other or not, the basis of taxation should be the present value of the property, including the reserve. That value may be more or less than the original cost or the outstanding capital. In either case, it, and it only, should be taxed.

I do not mean that there should be excluded from cost any proper "overhead charge," using that phrase in its widest application, nor the value at the time of its acquisition or subsequently of any land, money or other property donated to the company.

Chicago Elevated Safety Rule Book

As a part of its general safety movement, the Chicago Elevated Railways has issued a book of safety rules. In the preface President Budd states that the purpose of these rules and regulations is to induce habits of caution and cultivate in every employee the thought of being careful of his own safety as well as that of his fellow employees. The rules and cautionary instructions are the result of experience, and putting them in printed form merely places general information in definite and convenient shape for reference by employees.

The book contains about eighty pages of safety rules applying to all departments, and others intended specifically for the transportation department, trainmen, motormen, guardmen, towermen, crossing flagmen and gatemen, and the shop, road and electrical departments. In addition to these rules the book contains a set of first-aid instructions, a list of the first-aid relief stations on the elevated system and the contents and use of the first-aid boxes. In the back of the book several pages are devoted to a telephone directory of the various offices and departments of the road, as well as the telephone numbers and addresses of the company's physicians.

Discussion on Government Ownership

The National Civic Federation Devoted One Session to Discussion of This Subject

One session of the fifteenth annual meeting of the National Civic Federation, held at the Hotel Astor, New York, on Dec. 4 and 5, was devoted to discussion on the subject of "Governmental versus Private Enterprise." Samuel Gompers, president American Federation of Labor, presided at this meeting which was held on the afternoon of Dec. 4. In opening the meeting Mr. Gompers spoke of the committee of the American Federation of Labor which went to Europe to investigate the subject of public ownership and its relations to workers in the endeavor to reach proper conclusions on this much-mooted question. An abstract of this report was published in the issue of this paper for Nov. 21. Mr. Gompers added that the question was not merely academic, but the claims of each side should be critically examined to disclose whether the proposal is practicable or impracticable, wise or unwise.

DISCUSSION BY PROFESSOR JENKS

The first speaker was Prof. Jeremiah W. Jenks, New York University, who said that the post-office department, so far as anyone can learn, has made no statement of cost accounting in connection with the parcel post, so that one can determine whether it is really carrying cheaper than do the express companies or whether, as seems not improbable, the difference in charges to shippers is made up by the low rates forced upon the railroads against their will or by shifting the burden upon other branches of the postal service or upon the taxpayers. Concerning the question of whether municipal utilities shall be owned and managed by the municipality or by private companies under municipal control, Professor Jenks thought the advocates of this plan should declare what they considered should be guiding principles. Is it to be better service, cheaper service, even free service, or revenue? Whatever the principles may be, the facts should be known. If we are to compare costs, let us have identical systems of cost accounting. If the question is service, let us know whether the people prefer seats or to wait for half an hour before they get a ride, as passengers often have to do in continental cities. If the government is to take the telephone and telegraph, is it to secure better service or cheaper service or for the protection of the people? The state ought to undertake nothing without definite knowledge of the facts to guide it.

Professor Jenks said that in the discussion of the subway situation in New York City which preceded the settlement and the recent contracts, much time was given to the consideration of the matter by public officials. If this had been the time of the officials of a private corporation their salaries and the interest on the capital would be charged as part of the cost of the undertaking. He had never heard it suggested that if there was to be proper cost accounting these costs should be included under the existing subway arrangement, or that the rent for quarters in the City Hall should be so apportioned that part of the charge should be allocated for the time thus spent. All of these considerations were dropped. If private and public operations are to be compared all of these should be included. There is not now sufficient knowledge to permit careful consideration, and this will not be obtainable until systematic cost accounting is introduced.

DISCUSSION BY CONGRESSMAN LEWIS

Congressman David J. Lewis spoke in favor of public ownership of the telephone and telegraph service.

"Postalization" of telephone and telegraph service would bring under the control of the government the only outstanding means of communication. Manifestly competition in electrical means of communication is wasteful. On economic grounds that field belongs to monopoly which alone can discharge the functions with proper regard to the price. The speaker pointed out one difference between the express companies, which have been affected by the parcel post, and the telephone and telegraph companies, which would be affected by public ownership. He said that the express companies were really only preferred shippers on the railroad while the telephone and telegraph companies had large investments of their own capital in plants.

DISCUSSION BY MR. GORDON

F. R. G. Gordon, organizer American Federation of Labor, Boston, gave facts and statistics to controvert the argument and statements of Congressman Lewis. He said that practically every telephone and telegraph government system abroad is run with extraordinarily poor service, although paying about one-third of the wages to operatives that are paid by the American Telephone & Telegraph Company and the Western Union Telegraph Company. He said that the so-called wonderful post-office department of the government is the worst managed big business in the country. The post-office department is the recipient of very large favors from other departments of the government because of the failure to introduce cost accounting principles between the various departments. The post-office department does not pay for either use or care of many buildings which it occupies. Mr. Gordon said that the reason why the post-office department is able to claim a success in the parcel post is that it does not pay the railroads what it should pay them for carrying packages. The United States pays less than any other government for transportation of its mail. To take over the telephone and telegraph system would mean that all of the people would be taxed for the benefit of the 5 per cent or 6 per cent who use the service and are best able to pay the bills therefor. He declared that public ownership was cursed by red tape and was characterized by inefficient service, poor wages and large deficits. Governments have always been extravagant and wasteful.

DISCUSSION BY DR. HOWE

Dr. Frederick C. Howe, commissioner of immigration of New York, in his argument in favor of public ownership, declared that probably the political and moral gains would be even more important than the financial and social gains. Public ownership removes one of the principal causes of corruption from politics.

DISCUSSION BY MR. SULLIVAN

J. W. Sullivan, member of Typographical Union, New York, made an address on "Municipalization or a Just Regulation, a Plea for the Facts." Mr. Sullivan was a member of the National Civic Federation commission which studied the subject of municipal ownership abroad in 1907. He also spent last summer in Europe and rendered assistance to the committee of the American Federation of Labor which studies electric railway labor conditions abroad.

He said that comparisons of British and American street railway fares were usually misleading because the British municipal tramways rarely give transfers and that a passenger changing from one line to another paid another fare and was counted as a second passenger. For all distances beyond 5.8 miles the fares in Glasgow are higher than the American 5-cent fare, and Glasgow has only 1 mile of track per 6779 of its population, whereas Philadelphia has 1 mile per 2533, or three times the accommodations. For most British cities, fares beyond 3½ miles are higher than the standard American fare and transfer. The British systems also invariably stand second to American systems in speed, headway, car lighting and in an all-night service. European tramway managers are now abandoning the rule of a seat for every passenger, borrowing from America the practical idea, especially in rush hours, when all the cars possible are run, that the extra people want to travel speedily to their destination standing in the cars rather than to lose time and endanger their health standing on the street corners waiting exposed to the weather. Mr. Sullivan quoted a number of failures of British municipal enterprises, including the municipal Thames River boat system with a loss of $2,500,000, and the Glasgow municipal telephone system with a loss of $275,000, and said that the municipal ferry system of New York was a grand object lesson in municipal ownership.

In discussing the labor situation on municipal roads abroad he said in part: "Strikers against municipalized undertakings are treated as mutineers; the position of the municipal wage-working employee is that of a common soldier directed by a drill sergeant, whose whip is a discharge which closes to the man other municipal employment everywhere. Among the assumed certainties of the early theoretical municipalizers was set down the one that municipal employees would not or could not strike. But bitterly contested tramway strikes, viewed by the authorities as rebellions, have taken place in the last four years in Leeds, Stockport, Blackburn, Cardiff, Oldham, Liverpool and Glasgow. After the Glasgow strike of 1911, 400 of the strikers were victimized and never allowed to return to the service, and after the strike in Leeds in 1913 practically the entire tramway force was similarly victimized. In Glasgow, in the seven years, 1901-1908, 1228 traffic employees were dismissed and 2384 resigned, a number equivalent to a change of the entire traffic force every four years, testimony to an unhappy situation. The Glasgow tramway management, maintaining an open shop, permits no labor union of employees to exist. Were all Britain to imitate the attitude of Glasgow's municipal committee and managers toward labor, no employee would be permitted to be active in politics, no man would be taken on at work without a civil service examination, no trade agreement could be thought of, no liberty of association among the wage-workers could exist, no work at his trade could be found by a man once blacklisted, and no labor movement would be tolerated in the country."

After referring to the report of Messrs. Mahon and Bland on labor conditions abroad, abstracted in a recent issue of this paper, Mr. Sullivan said: "Municipalism breaks down trade union principles; it substitutes for them a one-sided dictation which strips labor of independent action in its own behalf, clothes managers with the powers of an upper caste, backed by the forces of law, and to the extent that it prevails establishes in society a condition destructive of democracy. On that score alone the American wage-worker needs only to have experience with it to reject it. But the American wage-worker, a citizen with the cause of his country at heart, may be depended on to weigh the facts in general relative to municipalism, when he finally obtains access to them, and render fair judgment in the case. Further, whatever is to be said of contests over wages or of the social unrest, it is usually a fact that American employees regard their employers as friends for whose rights they will contend as they would for their own, and if municipalism is to be built up on abuse of the employer and depriving him of any of his just rights, it to-day stands small chance of success."

B. R. T. Safety Work for Employees

Moving Pictures as a Safety Lesson for the Mechanical Department's Men—Safety Programs of Mechanical and Transportation Departments, Including List of Suggestions Adopted by the Former and Employees' Committee—Organization of the Latter

The thorough safety campaign which the Brooklyn Rapid Transit System has carried on for a year or more among the general public, and particularly among the schools, has lately been extended to its employees. As one feature to secure the interest of the men a safety rally was held for the employees of the mechanical department at the East New York headquarters of the B. R. T. Employees' Benefit Association on Saturday night, Dec. 5. The meeting was under the chairmanship of W. G. Gove, superintendent of equipment mechanical department, who introduced as the speakers of the evening H. A. Bullock, chairman of the company's central safety committee, and Dr. Francis D. Patterson, director of the department of sanitation and accident prevention formed jointly by The J. G. Brill Company, Harrison Brothers Paint Company and Electric Storage Battery Company, all of Philadelphia. A concert by the B. R. T. Employees' Band preceded the addresses.

Mr. Gove told what the mechanical department had already done for safe operation. It had occurred to him, however, that a face to face meeting with the men would accomplish even more than correspondence and bulletins. He emphasized the fact that mechanical protection was not everything. Real safety could be achieved only with the co-operation of the individual workers.

Mr. Bullock, after being introduced by Mr. Gove, said that the object of the company was to make the endeavor for safety continuous and permanent. Working rules were just as necessary to maintain the morale of a shop as of an army. He then gave a résumé of the growth of the "safety first" movement and showed particularly how electric railway hazards had been increased by the introduction of heavier, faster cars and the congestion of city tracks. Discussing safety from the psychological standpoint, Mr. Bullock told how custom breeds such indifference to danger that a soldier will risk his life to get a light for his pipe. The same characteristic leads a workman to become careless in doing things that always have an element of danger, such as climbing ladders, serving rip-saws and steam hammers, etc. Co-operative action as well as the physical resistance embodied in rules and devices was necessary to combat this tendency. In conclusion, Mr. Bullock asked every man to appoint himself a safety inspector to aid in the removal of dangerous conditions, and to resolve furthermore that if any casualties did occur to a fellow-worker he would make use of the company's first-aid treatment instead of trying to carry out the cure himself.

Following the showing of the company's well-known safety film, "The Price of Thoughtlessness," the audience was addressed by Dr. Patterson. The speaker first presented some statistics of railway and individual accidents in the United States, and followed this with a splendid collection of slides which illustrated the wrong and right way of doing scores of building, yard and machine tool jobs. As an example of what safety work could do, he said that accidents at the Brill shops had been cut from 260 to thirty a month. One of the most prolific sources of accident had been protruding nails. This evil had been scotched so thoroughly that during the past six months not one nail wound had occurred to a Brill workman. It was a good thing to have employees' safety committees, for a man who had once served on such a committee was likely to retain his interest in the work. Dr. Patterson's pictures and his comments on them were well received.

In taking the floor again, Mr. Gove said that the mechanical department had done much to attain safety, but more remained to be done. He wanted the men to understand that he was just as anxious to have safe and satisfactory working conditions for them as he was to have safe and satisfactory cars. As an individual he could do much for their welfare and he knew that he could rely upon co-operation of the office staff with which he was in daily contact, but his goal would not be attained unless the man behind the tool was also determined to help. Without clean shops, clean floors and clean machines, and without due regard by each man for the welfare of his fellow-employee, the organization would never get anywhere. In analyzing the shop accident reports covering the preceding six months he had been deeply impressed to find that 75 per cent of them could have been avoided had the injured man used ordinary care. In conclusion, Mr. Gove mentioned the probable early formation of employee's safety committees at each shop. He also assured the men that every suggestion for betterment would receive due attention.

The meeting concluded with a display of several moving pictures by Dr. Patterson, one of which told the story of an old-fashioned workman whose ill-timed counsel to remove a safety device on gearing was responsible for a serious injury to his future son-in-law.

DEPARTMENTAL SAFETY COMMITTEE OF THE MECHANICAL DEPARTMENT

The departmental safety committee organized for the mechanical department has already submitted a report for the first three months of its existence, July 1 to Sept. 30, 1914, and will hereafter continue to submit similar quarterly reports. The committee is composed of the following officials: superintendent of equipment, chairman; superintendent Fifty-second Street surface shop, vice-chairman; division shop foreman Southern division; foreman Crosstown surface carhouse shop, and the superintendent of electric car equipment. The chairman serves continuously while the other members hold office for one year from June 30, 1914. The plan is to appoint those holding similar positions in the mechanical department as members of the succeeding committees. Local shop committees, if appointed, will report to the departmental committee. Regular meetings are held at 3 p. m. every Monday in the office of the superintendent of equipment. Special meetings are held at the different shops whenever called by the vice-chairman.

The following is an abstract of the first quarterly report which was distributed in an edition of 3500 to employees of the department. The next edition will total 12,000 copies and will be distributed to all employees of the company. The report was produced by the department with a motor-driven American Multigraph.

SAFETY REPORT OF THE MECHANICAL DEPARTMENT

The first work of the departmental safety committee was to make the following recommendations:

Place mail boxes in all shops for safety suggestions, providing frames to post pictorial matter in reference to safety work; supply supporting beams at maintenance

shops in jacking cars; provide on all air hoists cylinder head with jaw for hanging in place of heads with hook upset inside of head, thereby permitting more ready and easy inspection; take photographs to illustrate accidents that frequently occur and that are due to carelessness; use sheet metal non-slip slings for handling armatures; paint red all safety appliances and devices installed at shops, attached to or placed around machinery.

The following work has already been undertaken:

Installed safeguards around machinery at Thirty-ninth Street elevated shop on Sept. 21 for $397.83; at Southern Division elevated shop on Aug. 13 for $344.35, and at Fifty-second Street surface shop (under way) for about $133; purchased four hydraulic jacks for De-Kalb Avenue shop (under way) for about $460; constructed four hooks for hoisting open cars at the Ninth Avenue shop on July 23 for $188.07; constructed and installed mail boxes for safety suggestions, and frames for pictorial matter, at all shops (under way) for about $112.78.

The accidents during the quarter under report are classified in the accompanying table.

SUMMARY OF ACCIDENTS

Class	Injuries	52d St. Srf. Shop	Ea. Div. El. Shop	39th St. El. Shop	El. Mtce. Shops	S. C. H. Shops	Totals
A	Cuts	8	28	87	9	20	152
B	Burns	2	3	3	2	7	17
C	Bruises	6	11	44	9	15	85
D	Bones broken...	..	..	..	..	1	1
E	Sprains and strains	6	..	5	2	1	14
F	Electric shocks.	..	..	1	1	..	2
G	Foot punctures.	1	..	5	..	..	6
H	Nails torn off..	1	2	1	..	..	4
J	Eye	1	5	3	..	..	9
K	Loss of member	1	..	..	..	..	1
L	Internal	..	1	1	..	..	2
	Totals	26	50	150	23	44	293

Attention is specifically directed to the large number of miscellaneous accidents which consist principally of accidents that occurred to employees while they were engaged in their regular duties and which, in most cases, were the result of carelessness, such as striking hand against projecting nails or sharp corners, dropping material which struck the person handling same or others, jumping from car or truck to floor, etc. The figures cover a total of 2000 employees. The comparatively large number of accidents at the Thirty-ninth Street shops were due to the extraordinary reconstruction of 2411 surface cars for air-brake service as described in the ELECTRIC RAILWAY JOURNAL for Oct. 31, 1914.

SURFACE TRANSPORTATION DEPARTMENT

Bulletin No. 11, just issued from the office of William Siebert, superintendent of surface lines, outlines the safety work of the surface transportation department. The safety committee of this department consists of the following: superintendent of surface lines, chairman; chief of the time-table department, supervisor of instruction, supervisor of line inspection, superintendent of employment, general inspector and two assistant superintendents. All the assistant superintendents will serve in turn on the committee.

In every depot there has been organized a depot safety committee, consisting of the following: Assistant superintendent in charge of the depot, chairman; day depot master, night depot master, one starter, one inspector, three motormen and three conductors. The starter and the inspector will be designated in rotation, so that all starters and inspectors will serve in turn. On Dec. 7, 1914, the motormen and conductors were elected by all the motormen and conductors at the depot in the following way:

The twenty motormen longest in service at the depot on the regular list and the five motormen longest in service at the depot on the extra list were the nominees in the first election, and each motorman in the depot force voted for three out of the twenty-five nominees. The same practice was carried out for conductors. The men who led in the vote received will serve six months on the depot safety committee, while those who secured the second largest number of votes will serve four months and the third highest men, two months.

At the future elections which will be held every two months, one motorman and one conductor will be chosen from a list of twenty-five motormen and twenty-five conductors as in the first election. In this way membership of the depot safety committee will rotate.

Membership is voluntary. Members who are paid by the hour are allowed compensation at their regular rate for time actually spent in assignments of safety work made by the departmental committee. The names of those elected are posted in the extra room, together with the names of the other members of the committee. The stenographer attached to the assistant superintendent's office serves as secretary of the committee. Regular meetings will be held weekly.

For the safety suggestion box the company has provided two forms as follows: Form A to cover suggestions submitted for consideration by the depot safety committee and departmental safety committee, but not requiring immediate consideration; Form B to cover suggestions relating to safety matters requiring immediate consideration, and submitted to the assistant superintendent, depot master or other official in charge of the depot at the time such suggestions are made.

Safety suggestions submitted on Form A are considered by the depot safety committee and the departmental safety committee. They are written on a special form (not reproduced), showing the name, class of employment of the man who makes the suggestion, and the badge number, all written above a perforated line, while the suggestion itself is written below a perforated line. These suggestions are deposited in the safety suggestion box, from which they are removed each day by the assistant superintendent, who forwards them to the office of the superintendent of surface lines, where the portion of each form above the perforated line is detached and placed in a file. The portion of each blank below the perforated line will be returned to the safety committee of the originating depot, which will approve or disapprove them without knowing the names of the writers. The depot safety committee's report on the suggestions is transmitted to the departmental safety committee, which reviews the report and recommends to the superintendent of surface lines for immediate or ultimate adoption, any suggestions which it approves. As each part of the form has a serial number, the names of the men whose suggestions are adopted can be readily determined by headquarters and due credit given.

No discipline is administered to any employee on account of facts revealed by safety suggestions submitted, and employees are asked to feel entirely free to discuss in these suggestions any conditions which bear upon the problem of safety without regard to the question of reflecting upon the work of any other employee. The same credit is given to employees who make meritorious suggestions on Form B as in the case of suggestions on Form A submitted through the safety suggestion box.

The following outline of topics for safety suggestions has been prepared for the guidance of employees:

A—Reports of conditions which are observed to be the cause of accidents. B—Reports of conditions which in the judgment of the employee submitting them may be the cause of accidents. C—Changes of methods which will tend to prevent accidents occurring or likely to occur as reported under (A) or (B). D—Changes in track construction or equipment which will tend to prevent accidents occurring or likely to occur as reported under (A) or (B). E—Any idea which in the judgment of an employee will promote safety in operation.

The safety bulletin board which carries bulletins, pictures and other data relating to safe operation is under the jurisdiction of the depot safety committee.

Convention of Pennsylvania Association

A Full Report of This Meeting in Harrisburg, Abstracts of the Various Reports and Papers Presented are Published—The Topics Considered Included Questions Relating to Engineering, Accounting, Transportation and Public Relations

The winter meeting of the Pennsylvania Street Railway Association was held in the Board of Trade Building, Harrisburg, on Dec. 8 and 9. The opening session on Tuesday was called to order at 1:45 p. m. by C. L. S. Tingley, vice-president Scranton Railway, who then read his president's address. This was followed by an address by Prof. Emory R. Johnson, member Public Service Commission of Pennsylvania, on the subject of "Electric Railways and the Public." These addresses are abstracted elsewhere in this issue. At the conclusion of Professor Johnson's address, E. H. Davis, manager Williamsport (Pa.) Passenger Railway, moved a vote of thanks, which was duly seconded and carried, and President Tingley assured the commissioner that the officers and members of the association were always ready to co-operate with the commission along the lines indicated. H. M. Stine, secretary-treasurer, then rendered a report for the year, showing a balance of more than $2,200. On motion of T. A. Wright, vice-president and general manager Wilkes-Barre Railway, the report was referred to an auditing committee to be appointed by the chair.

President Tingley at this point remarked that he had been requested by C. Loomis Allen, president American Electric Railway Association, to remind the delegates of the winter conference of the American Association to be held in Washington on Jan. 29. For specific information he called upon E. B. Burritt, secretary-treasurer of the American Association, who said that a very attractive program had been provided for the Washington meeting. The meeting was being held in that city largely on account of the opportunity for added publicity. President Wilson had promised to receive the delegates at the White House, and the meeting topic of "Public Relations" would be ably discussed by T. S. Williams, president Brooklyn Rapid Transit Company, and other notable speakers. Mr. Burritt also urged attendance at San Francisco next autumn. In closing he emphasized the desirability of closer relations between the national and the state associations, in which he was cordially seconded by President Tingley.

W. A. Heindle, superintendent Southern Pennsylvania Traction Company, Chester, Pa., next presented eight problems that had been referred to the "Question Box" and urged a spirited discussion thereon at the next session. President Tingley appointed F. B. Musser, president and general manager Harrisburg (Pa.) Railways; C. H. Bishop, president Valley Railways, Lemoyne, Pa., and Thomas Cooper, Philadelphia representative Westinghouse Electric & Manufacturing Company, as members of the nominating committee to report on the following day. The meeting was then suspended while the stereopticon apparatus was being set up, after which W. R. Stinemetz, in connection with his paper on "The Latest Developments in Street Railway Equipment," presented pictures and charts to illustrate means of cutting operating expenses through saving power and of increasing revenues through doing a freight business. The paper by Mr. Stinemetz is published in abstract form in another column.

RATES AND TARIFFS

The progress report of the committee on preparing and filing rates and tariffs was read by C. B. Fairchild, Jr., executive assistant Philadelphia Rapid Transit Company. Mr. Fairchild said that the Interstate Commerce Commission tariff requirements were extremely voluminous, but that in consultation with the traffic bureau of the Public Service Commission of Pennsylvania the committee had endeavored to boil down the federal requirements for State use. He mentioned the necessity of filing exceptions to the official classification and the overlapping of fare zones as two matters requiring special attention. The tentative draft submitted by the committee for discussion was criticised by W. B. Rockwell, manager Eastern Pennsylvania Railways, Pottsville, Pa., on the ground that freight and express tariffs were classified under one head. In his opinion the two classes may easily be separated by remembering that all express is delivered and called for, which is not true of freight as regards rates. Mr. Rockwell said that he recently rented a car to the express companies at a fixed sum per car-mile. If electric railways took up the question of express rates, they should charge on the basis of the pound-mile, but the pound must be limited as regards its cubic contents.

President Tingley stated that it was not within the province of the committee to discuss the setting of rates, inasmuch as it was appointed to solve rather the vexatious problem of securing non-cumbersome rules for filing rates and tariffs. As regards the distinction between freight and express, he felt that the combination classification best recognized existing inconsistencies in such kinds of traffic on Pennsylvania electric railways and had the support of the Public Service Commission. Mr. Rockwell said that no company should carry freight or express in passenger cars or handle such traffic at all if it's business did not warrant special cars for such purposes. However, according to an analysis of the varieties of freight and express service in the State, made by Mr. Fairchild, many small companies secure both increased revenues and better public relations by offering a little express or light freight service, and the joint classification is well suited to all such railways. Mr. Rockwell moved the acceptance of the progress report and the continuation of the committee, which was duly seconded and carried.

With the meeting then open for new business, Secretary Stine read a letter from R. P. Stevens suggesting that the association follow the lead of the American Association and substitute "Electric" for "Street" in its name. President Tingley said that the committee which drafted the constitution had discussed this point but had deemed the change unwise on account of the prestige of the old name. Mr. Davis called attention to the fact that under the act of 1889 most companies in Pennsylvania are incorporated as "street" railways, and Mr. Fairchild quoted the new public service commission law to show further adherence to this practice. Mr. Wright moved that the letter be laid on the table, which was carried.

CLASSIFICATION OF VOLTAGES AND SAFETY RULES

Owing to the inability of Gordon Campbell, president York Railways, to be present on Wednesday, the report of the committee on classification of voltages, of which he is chairman, was moved ahead a day on the program. An abstract appears elsewhere.

J. W. Welsh, electrical engineer Pittsburgh Railways, stated that the proposed Pennsylvania rules for safety had been submitted to the American Institute of Electrical Engineers and had been referred to the code committee of this association. He attended the meetings of the code committee as a representative of the American Electric Railway Association. At two meetings in the last month the committee recommended several changes in the rules, especially with regard to striking out the classification of low potential as up to 300 volts, high potential as 300 volts to 3500 volts and extra-high potential as above 3500 volts. Mr. Welsh criticised the idea running through the code that less than 300 volts were harmless and more than 300 volts destructive, for such a classification was purely arbitrary and injurious to the public, and no reason existed for such voltage classification from the standpoint of safety. The rules were also modified to apply only to cases of new installation. The general requirements of the code were not stringent and would be acceptable to most electric railway companies.

Mr. Fairchild quoted a recent order on his company to provide a guard on the blank polished end of a converter shaft in a substation as showing how vital this question is. Mr. Davis urged every member to read Circular No. 49, for in his opinion the rules suggested will prevent companies from pleading customary reasonable care against accidents and will increase the physical space required for attachments. President Tingley said that at one conference in Philadelphia the State Department of Labor and Industry had admitted that it had not considered street railways in the voltage classification, and this led to the reference of the question to the American Institute of Electrical Engineers. F. R. Phillips, superintendent of equipment Pittsburgh Railways, said that the real sting of the proposed State code lay in the voltage classification and he desired the opinion of the practical operating men of the American Electric Railway Engineering Association on the subject.

EMPLOYERS' COMPENSATION ACT

President Tingley announced that the draft of the employers' compensation act made by a special commission appointed by the Governor was now in print and ready for distribution. The meeting was then adjourned. At 7:30 p. m. an informal dinner was served to the members of the association and guests at the Harrisburg Club.

WEDNESDAY'S SESSION

The last day's session was called to order on Wednesday at 10 a. m. President Tingley stated that he had been asked by Mr. Burritt to announce that a one-hour hearing on the subject of reporting accidents was to be held before the Interstate Commerce Commission in Washington on Dec. 18. The commission is attempting to require the Detroit (Mich.) United Railway to report all accidents in the city of Detroit because it has a spur line running into Ohio. In view of the fact that many urban lines have extensions crossing state borders, the American Electric Railway Association has taken this matter up. Although only one speaker will be allowed at the hearing, a general demonstration is desired, for the entering of appearances will be allowed by the Interstate Commerce Commission.

The report of the committee on a uniform crossing agreement was then presented by its chairman, R. P. Stevens, president Mahoning & Shenango Railway & Light Company, Youngstown, Ohio. In connection with the report Mr. Stevens said that at a conference in Philadelphia the previous day it seemed that a closer feeling was being manifested between electric railways and other utilities in the State. The telephone companies were showing more co-operation, and if the telegraph companies and the Pennsylvania Railroad could be led to see electric railway difficulties, an acceptable and workable crossing agreement could be devised. An abstract of Mr. Stevens' report is published in another column. On motion the report was accepted and the committee was continued.

HEIGHTS OF CAR STEPS

In the absence of the chairman, H. J. Crowley, vice-president Scranton Railway, the report of the committee on height of street car steps was read by P. N. Jones, general manager Pittsburgh Railways. This committee was appointed to take up with the Public Service Commission of Pennsylvania the matter of the height of car steps. A meeting was held with representatives of the commission during the last national convention, and a large amount of data from the national body was submitted to the commission. Later the committee conferred with car builders, who furnished considerable construction data covering the limitation of minimum height allowable. This, together with photographs taken underneath a car to show the necessary equipment for its operation and control, has been turned over to the commission, upon which now devolves the task of determining the maximum height in accordance therewith. On motion the report was received and filed with thanks.

On account of the unavoidable absence of H. S. Swift, treasurer West Penn Traction Company, Pittsburgh, Pa., his paper on "The Work of the Accounting Officer of Public Service Corporations" was read by Mr. Fairchild. An abstract of this paper is published elsewhere.

QUESTION BOX

In taking over the meeting for the discussion of "Question Box" problems, Mr. Heindle said that fuller information should henceforth be presented with questions so as to cover all essential local conditions. Regarding the first question on what is the best automatic signal system for a medium sized single track interurban line operating at not very high speed, Mr. Heindle said that in times of rigid economy the old hand throw signal of five lights in series would be the most advisable system. With reference to automatic systems, P. T. Riley, Scranton Railways, described the three-year use of Nachod signals on a high speed 10-mile line with a 3 per cent grade, and P. F. Gerhart, electrical engineer Harrisburg Railways, said that on 20 miles of single track with twenty-two blocks the company had fairly good results from Eureka automatic signals. He presented some figures on their performance and maintenance cost. T. A. Wright, Wilkes-Barre Railway, then described the modified Ramsey signal used on part of that line and the Nachod system, which is used on 16 miles. His preference was for the latter system.

R. P. Stevens brought out the point that there is a large personal element in signal operation. After fifteen years' experience with all signals, he had decided that the Nachod system was best for and most satisfactory to his employees. Some trouble had been experienced with the contactor, but on his new Ohio properties there were high speed sections controlled by Nachod signals, and the service was smooth and reliable. The men were trained to use such signals and were in sympathy with them.

W. B. Rockwell was of the opinion that the so-called hand signal should be abolished. He criticised signal manufacturers for saying that their systems would run themselves but also said that electric railway operators had often failed to give signals fair treatment by not having an inspector to keep them in shape.

Mr. Stevens mentioned an absolutely "fool-proof" hand throw target signal, a few of which are used by the Lehigh Valley Transit Company, Allentown, Pa. One man is unable to put his key in the hole until the preceding man has gone through the block to unlock the box. While not advocating a hand-throw system, Mr. Stevens advised companies having such a system and desiring new equipment to investigate these signals.

On the subject of using in cars a small number of large-capacity lamps with reflectors and selector switch, Mr. Phillips said that recent investigations in Cleveland and Indianapolis at first impression showed the economy of such a practice, but that it was now beginning to be believed that small wattage lamps would give more economical service as well as correct illumination. He advised careful consideration of the subject before large lamps were installed. To determine losses in car circuits from trolley to motor and motor to ground, Mr. Phillips advised the use of a voltmeter and the temperature drop method.

The next query dealt with smoking regulations in closed cars. Mr. Heindles' company permits smoking on the rear platform in Delaware, but prohibits the practice in Pennsylvania. President Tingley said that his company in Dayton, Ohio, had tried ejectment proceedings, but after adverse court decisions efforts to stop smoking were abandoned. Mr. Rockwell favored prohibiting smoking on city lines and short suburban runs of fifteen and twenty minutes, but on long lines felt that the practice should be allowed. Mr. Heindle said that in Baltimore smoking is allowed on the rear seats of semi-convertible cars when the windows are open. Mr. Fairchild stated that the Philadelphia lines had prohibited smoking, mostly on account of its unsanitary features. Passengers were not permitted to carry lighted cigars on the cars. Regarding the loss of short riders as a result of such rulings, Mr. Fairchild believed that Chicago and Buffalo experience showed passengers soon chose to save time by riding rather than to walk and smoke.

The discussion on the advisability of concrete poles, especially in city work, was opened by Mr. Heindle, who said that his company had installed about fifty at $12 apiece, including frames and setting expenses. Such poles were often demanded by the public in select districts, but were not advisable for general city use when chestnut poles could be bought for $3.50 or $4. In reply to a question by President Tingley, Mr. Heindle said that concrete poles might well be used in fine districts, being cheaper than steel poles and yet long-lived.

Another question dealt with the use of a 5/8-in. wheel flange instead of a 3/4-in. flange in cases where the deeper flanges wear or become chipped before full life is secured. J. H. Yardley stated that a 5/8-in. flange is used in Philadelphia, and Mr. Fairchild called attention to the investigations on this subject of the American Electric Railway Engineering Association.

STANDARDIZATION OF ACCOUNTS

At this point Dr. John Price Jackson, Commissioner of Labor and Industry of Pennsylvania, delivered an address, which is abstracted elsewhere. Following this, C. J. Joyce, head of the Bureau of Accounts and Statistics of the State Public Service Commission, spoke a few words in connection with the uniform system of accounts yet to be adopted by the commission for electric railways. He said that not all accountants would agree with some details of the new Interstate Commerce Commission uniform system, but that this was quite workable. Moreover, by law it must be used by the interstate electric railways in Pennsylvania, and the adoption of a different system for intrastate lines would make it inconvenient to prepare intelligible statistics for all railways. Mr. Joyce stated that a recent circular letter suggesting the adoption of the national system had resulted in a few replies, all favorable. The State commission will take no action nor set a hearing until all companies have had sufficient time to study the system. If sufficient criticisms come up, the commission will call a meeting of electric railway accountants to thresh the matter out.

PUBLICITY

An additional query was at this point submitted to the "Question Box" on the subject of how far companies should go in giving out construction and operating costs to the public. Mr. Heindle felt that there was a point beyond which facts and figures were unintelligible to the public mind, both on account of lack of education and biased attitude. Mr. Rockwell thought that the greatest trouble was caused by facts being handled by reporters not acquainted with the technique of the industry.

President Tingley then recited how his company had in the last three years secured municipal grants in limited-franchise States by means of publicity. To make the situation more easily understood financial figures should be reduced to divisions of the nickel. Safety campaigns used by the company have been adopted as reading lessons in the public schools of two cities. In one case a good impression was created by showing the cost of an extension, the selling price of adjacent lots before the extension, operating receipts from the opening of the extension and enhanced sales value of lots as a result of the extension.

CONCLUDING BUSINESS

Owing to the recent severe sleet storm in eastern Pennsylvania, E. C. Spring, Lehigh Valley Transit Company, Allentown, Pa., was unable to be present and give his paper on "Efficiency Through Conservation of Time in Interurban Traffic." The auditing committee, W. S. Bell, assistant secretary and treasurer Wilkes-Barre Railway, and John O'Connell, secretary and treasurer Harrisburg Railways, reported on Mr. Stine's financial statements for the year, which were ordered filed.

President Tingley brought up the appointment of a committee to study auto buses, mentioned in his president's address. On Mr. Musser's motion, the matter was referred to the executive committee to prepare a report for next year and to work in conjunction with the committee of the American Association on the same topic. Mr. Heindle moved a vote of thanks to the Westinghouse, Electric & Manufacturing Company for sending a representative to give a paper.

The report of the nominating committee named the following men for office during the ensuing year: President, C. L. S. Tingley, vice-president Scranton Railway; vice-president, T. A. Wright, vice-president and general manager Wilkes-Barre Railway; secretary, H. M. Stine; executive committee, P. N. Jones, general manager Pittsburgh (Pa.) Railways; T. B. Donnelly, claim agent West Penn Traction Company, Pittsburgh, Pa.; Gordon Campbell, president York (Pa.) Railways, and Thomas Cooper, Philadelphia manager Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa. The secretary was instructed to cast one ballot for the above nominees and the meeting was then adjourned.

PRESIDENTIAL ADDRESS

BY C. L. S. TINGLEY, VICE-PRESIDENT AMERICAN RAILWAYS COMPANY

President Tingley stated that the work of the association has grown steadily in volume and value, the membership now including thirty-eight active members and thirty-six associates. The only resignation during the past year was caused by a merger. The fortnightly bulletin issued from the secretary's office is giving valuable service.

The work in collaboration with the state departments is of particular importance. Conferences have been held with representatives of the Public Service Commission. A conference on the question of agreement upon a general form for filing rates and tariffs was followed by the appointment of a committee, which has held several conferences with George P. Wilson, chief of the bureau of rates and tariffs. Another conference on the height of car steps was held between Dr. F. Herbert Snow, chief engineer, and J. P. Dohoney, investigator of accidents, representing the commission, and a committee of the association. Still another conference on the subject of wire crossings resulted in a joint conference with other utilities interested. The association has also co-operated with the Department of Labor and Industry with respect to reporting industrial accidents and to safety rules and regulations. These State departments have extended courtesy and consideration to the representatives of the Railway Association at all times.

Mr. Tingley quoted the Code of Principles adopted at the Atlantic City convention and recommended its adoption by the association. He called attention to the reflection of the business depression and unrest in electric railway receipts. Referring to the coming biennial session of the State Legislature he directed special attention to the problems of vital interest to electric railways which will come before that body. The Republican platform contains recommendations in regard to a workmen's compensation law, to changes in the laws governing corporation taxation and to amendments to the public service commission law. He anticipates a demand for "municipal home rule," which would produce a return to the conditions existing prior to the passage of the public service commission law. The Railway Association and its members should oppose any tinkering with the present law, which should be given time to work out and develop efficiency.

Mr. Tingley favored co-operation in connection with the workmen's compensation legislation provided that a reasonable and equitable bill can be secured. In the matter of corporate taxation he feared that an effort will be made to increase such taxes. This should be resisted as corporations are already taxed out of proportion to other property in the State.

Among other topics touched upon by Mr. Tingley were the satisfactory financial condition of the association and the increasing importance of the automobile bus, which is becoming a factor in the transportation problem. He recommended the appointment of a committee to study the latter subject. In closing he summed up an important phase of public relations as follows:

"There is one angle of our proposition which everybody seems prone to forget, namely, that these great utilities are, as a matter of fact, owned by the people. Every man who has a deposit in a savings bank is interested in the integrity of the great utilities corporations that serve this country because their bonds are held as investments by those banks. Every man who has a life insurance policy, and every woman and child who will become dependent upon a life insurance policy, is vitally interested in the prosperity of these great corporations. Four years ago all the railroad bonds owned by the New York State savings banks were worth $5,000,000 less than their par value; at the beginning of the present year these bonds were worth $41,000,000 less than their par value; to-day the depreciation is even greater. I believe that the last election indicated that the voter appreciated that there was something wrong. He realizes dimly that radicalism has gone too far, but he is not yet fully informed and the radicals are still wide awake and on the job; and it is up to us to do our part to enlighten the voter and to see that he is not again lulled to sleep by the siren song of the theorist."

LATEST DEVELOPMENTS IN RAILWAY EQUIPMENT

BY W. R. STINEMETZ, WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

Under the above title, Mr. Stinemetz discussed the ways in which the cost of maintaining and operating electric railway motors has been reduced, in spite of the more severe service requirements imposed by present operating conditions. Success in reducing maintenance cost is shown by the decrease from $14.63 per 1000 motor-miles, which was the maintenance cost for the Westinghouse No. 56 motor, to 23.2 cents, which is the cost for the Westinghouse No. 323-A motor. The saving in maintenance cost per year of the latter motor over the Westinghouse No. 12-A, assuming 30,000 car-miles per year, amounts to $267.84. As many roads do not keep accurate records of cost of maintaining old equipment, they do not realize what an important part this plays in their total operating cost. Owing to differences in operating conditions on different roads the figures for one road cannot be compared with those of another.

Modern equipment is not only cheaper in maintenance cost but it is more reliable. As a result the public can be kept satisfied through the elimination of delays on the road due to defective cars and at the same time all cars are available for service at all times. Reliability is particularly important during the rush hours when old equipment is likely to be pressed into service.

Modern equipment requires less power, particularly if the motors are properly geared. The development of the field control motor, reduction in weights, and the use of meters and coasting clocks to encourage proper handling of cars have all contributed to power saving.

Many of the older cars were geared too high. As an example of this Mr. Stinemetz referred to a test made in city service where a change from a gear ratio from 18:66, which was in use, to 15:69, resulted in a saving of 13.8 per cent in power under the same operating conditions. In interurban service high gear ratios have sometimes been made to compensate for voltage drop in the line, whereas redistribution of copper and the use of portable substations, if necessary, would have permitted the making of the required schedules with lower gear ratios.

The use of field control results in power saving, as has been shown from the results published from time to time. This form of control virtually provides an electrical means for changing gear ratio. Power can also be saved by a reduction in weight of equipment. Motors with cast-steel frames have reached the limit in weight reduction as further reduction means higher armature speeds, smaller shafts, thinner bearing shells and fewer commutator bars. All of these result in increased maintenance cost. By the use of pressed-steel frames a reduction in weight of 275 lb. has been secured in 40-hp motors, and at the same time there was greater uniformity in speed characteristics, due to the forged steel ring which is used. This motor weighs 2050 lb., has an armature speed of 540 r.p.m. at rated load, and is adapted for use with 26-in. wheels.

As an example of the saving in power which can be secured by the use of the proper gear ratio and of two-motor field-control equipment instead of four-motor, non-field-control equipment, with the permissibly lighter cars and higher schedule speeds, Mr. Stinemetz states that a road in Utica, N. Y., secured a power saving of nearly 50 per cent, as is shown by the following table:

	With Non-Field-Control	With Field-Control
Weight of car equipped but unloaded—pounds	51,000	36,800
Motors—horse-power	4—40	2—40
Gear ratio	17:69	15:69
Wheel diameter, inches	35	33
Schedule speed—miles per hour	9.8	10.13
Stops per mile	6.59	5.89
Duration of stops—seconds	10.88	10.43
Kilowatt-hours per car mile	3.588	1.892
Weight of loaded car—tons	28.52	21.0
Watt-hours per ton-mile	125.8	90.1
Reduction in watt-hours per car-mile—per cent		47.2

Power can also be saved by proper handling of cars. The use of instruments, such as watt-hour meters, coasting clocks, etc., together with the awarding of prizes for excellent performance, has resulted in savings from 2.7 per cent to 8.5 per cent.

The use of the newer forms of control also effects power saving. The Westinghouse "PK" control keeps down current peaks by regulating the rate of acceleration and the controller is more easily handled by the motorman than those of the older forms. The "HL" control has also proved very reliable in service.

THE ELECTRIC RAILWAYS AND THE PUBLIC

BY EMORY R. JOHNSON, PH.D., SC.D., PROFESSOR OF TRANSPORTATION AND COMMERCE, UNIVERSITY OF PENNSYLVANIA AND MEMBER OF PUBLIC SERVICE COMMISSION

The former antagonistic relationship between the electric railway companies and the public is fortunately changing for one of mutual understanding. The obligations of the service companies to the public and the duty of the public towards the companies are coming to be clearly recognized and to be defined more and more clearly by municipal ordinances and state legislation. It should be the purpose of the board of directors and officials of the service companies and also of all responsible public officials to place the relations of the companies and the public upon a permanent basis of mutual confidence. It is necessary that the companies and the public understand and trust each other, otherwise the companies will not prosper, the service will be poor and the public will suffer.

Electric railway and other public service companies can secure the confidence of the public, provided the companies adhere to methods of financiering and management that square with approved moral standards, provided the companies keep the public fully and accurately informed regarding the affairs of the corporations that serve the public, and provided the service rendered is adequate and efficient.

Little need be said as to the importance of adherence to approved moral standards in corporation management. From now on, the affairs of public service companies must be matters of public knowledge, and it will be impossible for a company successfully to conceal operations that would not meet with public approval. As a matter of fact, no well-managed public service company can afford to adopt business methods that need concealment. Sound financiering and wise accounting have everything to gain and nothing to lose from publicity in corporation management.

All public service companies need particularly to give the public information in order that those who patronize the company may understand what services the company is endeavoring to render and what is needed in order to perform those services adequately. More specifically stated—it is necessary that electric railway and other public service companies should keep accurate accounts according to uniform methods and that their financial obligations should be so straightforward that the public will be convinced that the companies are not resorting to the speculative methods of financiering which, though prevalent in the past, have now come to be condemned. It is also necessary that the companies should systematically publish information that will help the public to understand and correctly judge the financial and service operations of the companies.

Good service is fundamental and all-important. It is essential to the success of the company and is necessary to secure public approval of what the company does. If the public feels that utility companies are straightforward in their financial management and are rendering good service, it will not be opposed to the maintenance of charges that yield adequate profits. The public demand for good service is stronger than for low fares.

The policy of every utility company should be to study the service demands as fully as possible. Such a policy is to be commended, first of all, because it will give the public greater confidence in the companies; the policy is also wise because it may enable the companies to discover what changes are needed in service. It is human nature to keep on doing things as they have been done, and the longer established methods are adhered to, the harder it becomes to change to new, and possibly, better methods. Every electric railway company should seek constantly to discover how its service methods may be changed for the better. Careful attention to complaints as to service will be helpful to the company as well as gratifying to the public.

Many electric railway companies have been apprehensive because of the increasing degree of public regulation of their finances, services and charges, but I believe there is less apprehension now than there was ten years ago. Regulation of public service companies in increasing measure by states and municipal authorities has come about naturally and logically. It is necessary for each municipality to have a unified transportation service, and, with but few exceptions, there is now but one street railway company in each city. The requisite unified service is performed by a consolidated company.

The welfare of the municipality and of the electric railway company which serves the people of the municipality are linked together. The prosperity and development of the municipality require that the management of the public service company conform to the needs of the community served. Municipal regulation is necessary. Likewise, the larger interests of the people of a state as a whole demand that the state shall, by appropriate regulatory authority, supplement municipal regulation of public utilities. State regulation is necessary, first of all, because the public service company often serves more than one municipal area. The power that regulates must be as extensive as the object regulated. Moreover, state regulation is desirable because experience has clearly shown that in the supervision of accounts, finances, services and charges of public service companies there needs to be an executive body whose jurisdiction is state-wide and whose powers are as comprehensive as the tasks to be accomplished. If the regulation of electric railway and other public service companies were left entirely to municipalities, the regulation would be incomplete and would vary greatly as between different localities. Such a condition would be of disadvantage to the companies and not a benefit to the public.

Public service companies may well welcome, and most of them probably do welcome, intelligent public regulation, because the fundamental purpose of such regulation is to bring about an equitable adjustment of the relations of the companies and the public. Wise public regulation makes for the better management of the companies and for improved service; while it also enables the companies, by securing the confidence of the public, to obtain equitable returns upon the property devoted to the performance of their services.

WORK OF PUBLIC SERVICE ACCOUNTANTS

BY H. S. SWIFT, TREASURER WEST PENN TRACTION COMPANY, PITTSBURGH, PA.

In his address concerning the work of accounting officers of public service corporations, Mr. Swift stated that the public no longer regards electric railways and other public utilities as private enterprises to be conducted for the profit of their owners but rather as quasi-public undertakings whose operations, accounts and records are to a certain extent public property. The old order of things under which utilities operated their properties and kept their books as simply or as elaborately as seemed best to the officials, with little or no outside interference as long as they kept within the law, is past. Then the accounting was for the information of the officers, the directors and, lastly, the stockholders, but now the accounting officer has become responsible to governmental authorities and various regulatory bodies for the honesty and the correctness of his work.

Mr. Swift believed that the requirements for the success of public service accountants are many. They should have a general knowledge of what is going on in the operating department, in order to devise proper accounting methods in connection with new construction or reconstruction work. Moreover, a duty sometimes neglected is the inspection of all such undertakings so that accountants shall be prepared to consider intelligently what proportion of expenditures can properly be charged to capital account, as well as the proper amounts to be provided for cost of unproductive labor, cost of new money, interest during construction and similar items. At the present time complete data are probably not available from which to determine proper depreciation and overhead charges, for previous consideration of these subjects has been academic rather than practical. Such problems can best be solved by the collection of accurate historical data. Mr. Swift emphasized the fact that many items of construction cost tend to disappear when it comes to a valuation of physical property years after, but such items should be entered upon the books in sufficient detail to prevent their being overlooked at a later date.

The accounting officer should give some attention to a systematic analysis of the increased cost of operation. A statement to the general manager that a certain power house or carhouse employed so many more men this year as compared to last is much more impressive than the bare statement that the labor cost was greater. A similar analysis can be made of the amount of supplies used, showing the number of units and the cost. In the case of the purchase of the control over underlying companies, the interests of stockholders must sometimes be safeguarded by a careful consideration of the value of services and expenses incurred by each company on account of other companies associated with it under the same management. All expenses for inter-company services should be justly distributed so that the operating costs of each company may be correct.

Mr. Swift stated that the development of the accounting departments of electric railways has been rapid, although it has received less assistance from without than some other departments. One feature of this development was the perfecting and adopting of a suitable uniform system of accounts. Another indication of growth is found in the increasingly important position held by the accounting officers. This position, however, is not without its additional responsibilities. The accountant should have some knowledge of commercial law, particularly at this date in connection with income taxes and special war taxes. He should also be able to keep a record of contracts and agreements in so far as they affect accounting, and he should so study his company's financial affairs and history as to be in a position to offer plans for new financing or refunding existing obligations. In closing, Mr. Swift spoke of the present opportunity of electric railway accounting officers, but said that they should possess imagination, or that quality of grasping the problems that the future may bring and preparing for them.

CO-OPERATION IN ELECTRIC RAILWAY WORK

BY JOHN PRICE JACKSON, COMMISSIONER OF LABOR AND INDUSTRY, PENNSYLVANIA

Mr. Jackson stated that the four human elements in electric railway work are the patron, who uses the service; the stockholder, who placed his money in the enterprise; the employee, who performs the daily labor, and the government, which acts as the representative of the people. The problem of the present day is to instill the proper confidence in and co-operation among all of these elements. The old days of close personal relation between employer and workmen have gone and in their place exists a period of highly systematized organization dealing more and more with impersonal elements. The modern foreman is told to see that expenses are kept down in order to show a proper balance and as a result often deals in an impersonal and unjust manner with the men under him. On the other hand, the workmen have often looked upon their employer only as an insatiable blood-sucker.

In a similar fashion, the patron of an electric railway, in Mr. Jackson's opinion, sometimes believes that the company is deliberately making him unhappy in order to fill its own coffers, and the public official often assumes that a public utility is guilty without proof or reason. Such a lack of confidence and co-operation is largely caused by irresponsible statements made in the press and public places. In fact, ninety-nine out of every hundred of labor disputes arise from a misunderstanding with the management.

The work of the Bureau of Labor and Industry in devising standard safety rules, however, said Mr. Jackson, has proved that co-operation between some of these elements is possible. In about twelve industries, safety standards have been secured by the unanimous judgment of committees composed of capital, labor and bureau representatives. This marks a tendency toward the age to follow that of electricity—the age devoted to the perfection of the human machine and the proper correlation of co-operation between all of its elements.

In closing, Mr. Jackson offered some data gleaned from his recent European trip, to show that German roads are not so superior to American railways as often stated. The tracks are good, but this is largely a result of lightness of the cars. Many cars have no airbrakes, so that stopping is a long, slow process. The heating arrangements on most cars are of an antiquated type, and there is no vestibule, although the winter is quite severe. The cars, however, have large platforms at each end, on which the crowding exceeds that on American cars. No safety doors are used, and the passengers, both men and women, board and alight while the car is in motion. A notice to ladies, however, is carried on the rear platform, telling them to take hold with the left hand in alighting—a practice which Mr. Jackson thinks American railways might well adopt.

REPORT ON STANDARD SAFETY RULES FOR ELECTRICAL APPARATUS

This committee was appointed on Nov. 12, in connection with the Second Annual Pennsylvania Industrial Welfare and Efficiency Conference, conducted by the Department of Labor and Industry of the State. The matter of especial interest to the committee was suggested standard safety rules for electrical apparatus, which the department has under consideration for use throughout the State. On Nov. 19 a paper was presented by Dr. Rosa of the federal bureau of standards regarding Circular No. 49 of this bureau. This contained standardized safety rules suggested for use in the electrical industry. The rules now under preparation by the Pennsylvania Department of Labor and Industry are a move toward the single safety standard recommended by the bureau of standards. They will, it is understood, be submitted shortly to those interested for study and suggestions, and in the opinion of the committee there should be careful collaboration with electric railway operators in order to avoid imposing needless limitations or establishing hurtful precedents. The dividing lines in classifying voltages should be drawn at the proper points. It is the general practice of electric railways of Pennsylvania to operate at 550 volts, which in actual practice means 600 volts to 650 volts at the busbar, and if boosters are used to compensate for heavy loads, 600 volts to 750 volts to provide for line loss and thereby apply satisfactory voltage at the ends of long lines. This is essential to good service and these voltages are not ordinarily dangerous. Throughout the rules of the bureau of standards 750 volts is specified in overhead construction, above which special precautions are required. Direct current of the above voltage should not be classed with alternating current used for primary distribution, generally at 2200 volts. The committee feels, in general, that there is merit in the suggestion of the bureau of standards, for one standard for all states, but a careful study of proposed rules by all members is recommended.

Analysis of Stresses in Chicago Elevated Steel Car

BY H. A. JOHNSON, MASTER MECHANIC CHICAGO ELEVATED LINES

In connection with the methods employed in designing the new pressed steel cars for the Chicago Elevated Railroads, which were described in the ELECTRIC RAILWAY JOURNAL of Dec. 5, 1914, on page 1234, it may be that a detailed description of the stress analysis will be of general interest. As mentioned in the article describing the car, the minimum loads assumed included a standing and seated load of 150 passengers weighing 140 lb. each, or a total of 21,000 lb. To this the dead-load weight of the car body, amounting to 35,600 lb., was added. This weight was distributed 27,860 lb. between bolsters and 7740 lb. outside of the bolsters. In addition to the ordinary loads, the ends of the car were so designed as to support a total load of 28,500 lb. This is approximately the weight of a car body in a partially telescoped position, and the allowance provides for a condition which might occur in a collision.

Each side of the car body was designed as a continuous truss with intermediate supports at the two body bolsters. The entire carload between body bolsters was carried on side trusses while the platform load was distributed over the extended bottom sills, which form cantilevers. The bending moments due to the differently distributed components of the total load were computed and plotted to scale. The resulting diagram showed that the maximum unbalanced bending moment at the center of the car totalled approximately 900,240 in.-lb. on each of the two side trusses. A reproduction of this diagram is shown in one of the accompanying illustrations.

Having determined the general dimensions of the side truss, together with the number of posts required to give standard commercial sizes of window glass, and having calculated the maximum bending moment to be resisted, an analysis was made of the resulting stresses in all members of the side truss. These stresses are also shown in one of the accompanying diagrams, a detailed explanation of which may assist in an understanding of the methods used in the calculations. The side framing of the car, extending from body corner post to body corner post, was treated as a riveted truss. Since this side truss could not be extended effectively beyond the body corner posts of the car, the underframing was designed strong enough to support the loads beyond the

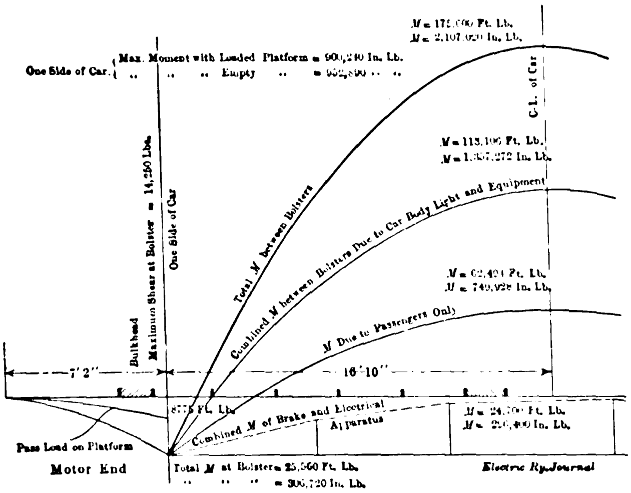
CHICAGO STEEL CAR—STRESS DIAGRAM SHOWING STRESSES IN THE VARIOUS SIDE-FRAME MEMBERS bolsters and to contribute a balancing bending moment to the side trusses, as noted on the bending moment diagram.

The maximum unbalanced bending moment of 900,240 in.-lb. in the side truss, which is 84⅜ in. in depth, results in a tension of 10,800 lb. in the bottom chord, or side sill, and an equal compression in the top chord, or deck plate. As there are no effective diagonals in this truss, the compression in the deck plate must be absorbed by the posts rigidly held in a vertical position by the side sheathing and belt rail to which they are riveted. The intermediate posts, together with the panel posts at the vestibules and flanking the center entrance, act as simple beams each rigidly supported at one end and with the total compression in the deck plate, applied to the other end.

In a cantilever beam of length l, the deflection is given by the formula, deflection $= \frac{Wl^3}{3EI}$ where E is the modulus of elasticity of the material and I is the moment of inertia of the section resisting the bending action. As all the side posts are deflected an approximately equal amount by the thrust of the deck plate to which they are riveted, the force each resists is proportional to its moment of inertia. This is true since all the other factors in the formula are constant when the deflection is the same for each post. These forces and the resulting maximum fiber stresses in the posts are noted on the stress diagram.



CHICAGO STEEL CAR—BENDING MOMENT DIAGRAM

The compression shown in the belt rail beside the center entrance is determined by multiplying the 6993-lb. thrust absorbed by the panel post by the depth of the truss and then dividing it by the distance between the belt rail and the base of the post. Similarly, the tension shown in the belt rail at the side of the body corner post is obtained by multiplying the outward thrust of 3615 lb. at the deck plate by the depth of the truss and dividing by the distance between the belt rail and the base of the post. With the completion of this analysis the problem was then one of selecting suitable and economical sizes for the side frame members.

As evidence of his confidence in the business future of this country, W. E. Hodges, vice-president in charge of purchases of the Santa Fé Railroad, announced the purchase of 66,000 tons of 90-lb. main track rail for spring delivery. In connection with this $2,000,000 contract he also announced in an interview that his company would spend $3,000,000 a month for the next few months for supplies and equipment.

COMMUNICATION

Hearing on Jurisdiction of I. C. C. Over Urban Railways

UNION TRACTION COMPANY OF INDIANA
ANDERSON, IND., Dec. 9, 1914.

To the Editors:

The Interstate Commerce Commission is insisting, in the case of certain urban electric railway companies having interstate connections of some sort, that accidents on purely urban lines of such companies be reported to it. The claim of the commission to jurisdiction over these companies appears to be opposed to the principles laid down by the Supreme Court of the United States in the Omaha & Council Bluffs case. Whether this particular question is of great practical importance or not, it is important that the general jurisdiction of the commission over purely urban companies and lines be confined to lawful limits.

A hearing before the commission at Washington on the question of the duty of urban companies of the kind mentioned to report such accidents has been arranged for Friday, Dec. 18, at 10:30 a. m. Argument is limited to one hour. James M. Barrett, president Fort Wayne & Northern Indiana Traction Company, has consented to make the presentation.

It is highly desirable that the commission appreciate the fact that electric railways regard the question as one of importance. The feelings of electric railways with regard to the matter will be partly judged by the interest displayed at the hearing.

It is the wish, therefore, of the committee on federal relations of the American Electric Railway Association, at whose instance the hearing has been arranged, that all electric railways interested be represented at the hearing. Representatives from several large urban companies of the Middle West have already signified their intention to attend.

ARTHUR W. BRADY,
President.

Dinner of Railway Business Association

The two speakers at the dinner of the Railway Business Association at the Waldorf-Astoria on Dec. 10 were Fairfax Harrison, president of the Southern Railway, and Warren G. Harding, Senator-elect from Ohio.

Mr. Harrison said: "In the controversy between the owners of railroads and the representatives of the public, the pendulum has now swung to an extreme on the side of irresponsible public power as it had previously swung to an extreme on the side of irresponsible ownership." In discussing commission regulation he said that one of the most dangerous weaknesses of the system is its inability to give prompt decisions. If a change of policy is demanded in the public interest, the power to pass upon the question must be capable of convenient and prompt exercise. The problem now before the country forms an opportunity for the statesman, who must have the power to impress his views upon his fellowmen. The speaker believed that President Wilson is equal to this great achievement.

Mr. Harding said that the railroads should be prosperous not so much to permit general prosperity but because it was a matter of justice. He believes that ninety-nine out of every 100 thinking people believe the railways are entitled to an increase in rates. He said the country needs to-day fewer legislative bills pending and more bills of lading. In conclusion, he urged managers to have a full understanding with the public.

At the business meeting of the Railway Business Association held during the afternoon George A. Post of New York was re-elected president.

American Association News

The Executive Committees of the Engineering Association and the Transportation & Traffic Association Assign Subjects to Various Committees—Hearing on I. C. C. Jurisdiction Over Electric Railways—Meeting of Joint Committee on Block Signals—Milwaukee Company Section Meeting

ENGINEERING ASSOCIATION COMMITTEE SUBJECT ASSIGNMENTS

The executive committee of the Engineering Association approved the following plan of work for the several committees at its last meeting.

The committee on buildings and structures will prepare general specifications and form of contract for railway structures. It will suggest proper provision for expansion and contraction in concrete structures, together with a provision for properly water-proofing and protecting them. This subject is to be considered along broad lines of application either to thin slab construction or to massive monolithic work, having in mind the carrying of reinforcement throughout either type of work. Further consideration will be given to the fire protection rules, especially with regard to the use of soldering or other heating equipment. The design of a standard fireproof substation building of 1000-kw capacity will also be studied.

The committee on electrolysis will continue its study of the general subject.

The committee on equipment will make a study of, and report upon, the need of a revision of the standard specification for heat treated carbon steel axles, shafts and similar parts, adopted in 1912, and will report upon a specification for gears and pinions, including tolerances. The committee will further make a study of difficulties with M. C. B. journal brasses in heavy electric traction service, by conducting such tests as may seem necessary and will collaborate with the M. C. B. Association and the committee on heavy electric traction. Attention will be given to wires and cables for car equipment, with special reference to fire protection. This subject will be considered jointly with the N. F. P. Association, especially as to the use of lighter conduits in car roofs. The specification for air-brake hose will be broadened to include smaller sizes. The committee will submit a design for a limit-of-wear gage for measuring flange thickness of the Association standard wheel. The steel wheel design will also be revised to include smaller diameters.

The committee on heavy electric traction will conduct a further joint study, with the various other railway associations, of the equipment clearance line shown on the third-rail equipment diagram adopted by this association at the 1912 convention, between the point FE and the gage line of the nearest running rail, and the location of the third-rail clearance line between point ET and the gage line of the nearest running rail. A study of the modern electric locomotive will also be made. Further consideration will be given to the definition of third-rail gage, with reference to the question whether it is advisable to have a definition of the term "Gage Line of Third-Rail." The protection of the contact rail, where an exposed third-rail is used in rapid transit operation, will be considered also.

The committee on lightning protection will take up the general subject as applied to car and line equipment.

The committee on power distribution will study the following specifications: for reinforced concrete poles, for sundry line materials, and for 600-volt d.c. overhead trolley construction with respect to lightning arrester location and grounds. A revision of the standard specification for tubular steel poles will also be prepared.

The committee on power generation will report on good practice in regard to smoke abatement from the standpoint of smoke observations, and in regard to appliances and devices used for determining smoke density. It will consider a specification for boiler tubes, including both open-hearth, seamless, hot-drawn steel tubing and charcoal iron tubes, and others for the purchase of fuel and of power station lubricants. The committee will also review the boiler code of the American Society of Mechanical Engineers with special reference to specifications for boiler tubes.

The committee on standards will determine what roads are using Association standards and recommendations, and will draft a style for the make-up of specifications.

The committee on way matters will continue the study of the proper foundation for tracks in paved streets, and of pavement for use in connection with girder and high T-rails. Traffic counts will be obtained from different companies in accordance with forms submitted in the 1914 report. The committee will prepare specifications, with definitions, for sundry track materials such as ties, track spikes, bolts, tie rods, tie plates, etc., with particular reference to physical characteristics, and a standard specification for special work. A revision will be made of the recommended designs of 7-in. and 9-in. joint plates with special reference to sizes of bolt holes and fits, as covered in Section Wm 4a in the *Engineering Manual.*

TRANSPORTATION & TRAFFIC ASSOCIATION COMMITTEE ASSIGNMENTS

The executive committee of this association recently approved the following list of subjects:

The committee on fares and transfers will continue the study of transfer issuing and collection devices; will study, report, and summarize the fare collection methods used with center-entrance cars; will study the problem of fare collection on prepayment cars on multiple fare lines, reporting on the advisability of stationing extra men at congested points and terminals to collect fares and so to increase the rate of loading on prepayment types of cars, and will investigate the subject of through collection versus zone collection on suburban and interurban lines.

The committee on express and freight traffic will make a further study of the organization of a freight department, giving further and more comprehensive details than were contained in the 1914 report; will investigate the matter of uniform class rates; will report on the relative cost of handling different classes of freight and the relative proportion of each class handled; will continue the investigation of laws, franchises and other restrictions relating to this traffic and will investigate the questions of handling express and of weighing and inspection. The committee will also analyze 1914 passenger and freight earnings as compared with those of 1913, with a view to determining whether, as some companies report, freight business is increasing while passenger business has fallen off. If so, such conclusions will be drawn as are pertinent to

LIBRARY OF THE UNIVERSITY

the building up of freight and express business by member companies to take the place of passenger revenue lost through the inroads of the automobile.

The committee on passenger traffic will continue the study of the motor bus and the trackless trolley, supplementing the report of the 1914 committee, summarizing the results obtained in European operation and recommending how electric railways can make use of these two modes of travel. Digests of laws and franchises showing specifically where additional restrictions have been imposed by the authorities on these companies will be prepared. The committee will examine into the results of one-man car operation from such standpoints as speed, accidents, equipment, maintenance and other cost, summarizing present practices, and will further study the effects of the increasing use of automobiles on passenger traffic, with particular reference to interurban and suburban roads, giving specific results as determined by studies made by individual companies.

The committee on rules will continue the consideration of markers in the light of the discussion at the 1914 convention; will compile a joint index of similar or identical rules in the two standard codes for the use of companies which desire to issue a joint code; will investigate and report on the flagging rule as instructed by the 1914 convention, and will develop for the approval of the executive committee and for the use of Association members a procedure for the interpretation of rules and train orders. The committee will report as to the state commissions that have approved the standard codes of the Association or have adopted codes of their own, in the latter case making a statement as to the logical points of difference between the adopted codes and the Association standard codes. The number of roads that have adopted the standard codes since the 1914 convention, up to June 1, 1915, will also be reported.

The committee on schedules and time-tables will continue the study of train dispatching in city service, making a summary of results obtained in the various cities in which this practice is in vogue, and the consideration of the problem of developing capable schedule makers. It will recommend methods of making and recording periodical traffic counts, and will make a study of the influence of frequency of stops on schedule speed and the influence of schedule speed on operating cost, possibly developing curves to show results. Other investigations to be made are those of the effect of the use of fully vestibuled cars on schedule speed and other operating factors, including accidents; of near-side stop practice, indicating the increase in this method of operation that has occurred by years for the past three or four years, and of the standard interurban time-table as adopted in 1911, to determine whether changes or modifications should be made.

The standards committee will undertake the formulation of a standard practice and policy for the adoption of standards for the Transportation & Traffic Association, and will issue a Transportation & Traffic syllabus during the present year.

The committee on the training of transportation employees will bring up to date the digest of laws and regulations affecting employment, last printed in the 1912 report. It will investigate the disciplining of new men where this is handled by the instruction department, and will outline a systematic program for improving courtesy on the part of trainmen, to include recommended bulletins and notices to the men as well as a general outline of practice. Another item of the year's work will be an investigation of watch inspection methods.

The committee on uniform definitions will recast and recompile the definitions submitted by the 1914 committee, with such additional definitions as are necessary, these to be submitted to member companies for specific criticism. A co-ordination of the definitions with the standard codes will follow and this is to be submitted to the Transportation & Traffic Association's standards committee in time to have that committee pass upon it before its submission to the next convention.

JOINT COMMITTEE ASSIGNMENTS

The executive committees concerned have approved the following programs of joint committee work:

The joint committee of the Engineering and Transportation & Traffic Associations on block signals for electric railways will prepare a digest of signal laws and rulings to show if any new rulings of state commissions have been made subsequent to the dates of information contained in the 1914 report. A bibliography on block signals installed subsequent to June 1, 1914, will also be compiled. Designs of standard signal apparatus will be prepared, the committee to co-operate with the Railway Signal Association committee on signaling for electric railways in the adoption of standard signal apparatus. The clearance diagram for semaphore signals is to be considered after conference with the committees on power distribution and heavy electric traction, and a revision of the block signal rules for contactor signals is to be considered jointly with the committee on rules of the Transportation & Traffic Association, Rule No. 10 covering this matter having been referred back to the committee. The subject of light signals for interurban railways is to receive further consideration with a view to the adoption of a definite standard for sizes of lenses for light signals operated by continuous track circuits or contactors. The advisability of changing the reading of the standard light aspects in three-position signaling from "Non-Car Counting" or "Car Counting" to "Non-Registering" or "Car Registering" signals, in view of the fact that the new contactor signal rules all read "Car Registering Signals," will also be considered. A study will be made of signal systems on roads that are signaled from end to end, to cover maintenance cost, efficiency of operation and effect on traffic. The remaining subjects listed are: An investigation of the question of a standard definition for signal failure, the general study and summary of highway crossing protection, and the preparation of a report as to the advisability of operating on single-track interurban line blocked by signals alone without dispatching.

The joint committee on engineering accounting will draft a set of standard forms for use with the cost accounting system recommended by the 1914 committee; will revise the subdivision of operating maintenance accounts to meet the new I. C. C. classification, and will develop a proper ledger, looking toward the maintenance of a continuous inventory. Other subjects will presumably be assigned to this committee by the Accountants' Association.

The joint committee of the Engineering and Accountants' Associations on the life of railway physical property will continue its study of the general subject.

The committee on transportation accounting has received the following partial list of assignments: To investigate the cost of handling baggage free to determine whether or not it brings business to the line, and if it does whether the cost of handling this baggage wipes out the profit resulting from the fare received; to investigate the sub-division of power cost among construction, maintenance and operation.

The committee on transportation engineering will study the operation of trains of two cars or more in interurban passenger and freight service to include cost of operation and comparative figures for single-car operation. A second investigation is into the effect of car and equipment design on duration of stops, in both passenger and freight service. Car design is to be studied from a traffic standpoint in all its phases, first standardizing the methods of determining results. The investigation is to include specimen data sheets showing information which should be obtained in order that member companies who desire to follow the recommendations may have full information before them. An investigation of braking distance on interurban cars is to be made with special reference to the location of block signals. In addition current saving devices will be studied and a summary prepared showing the results obtained, together with costs, including maintenance, etc.

STUDY OF A. I. E. E. STANDARDIZATION RULES

The new standardization rules of the American Institute of Electrical Engineers have been brought to the attention of the committees to which parts are of interest, with the recommendation that they be reviewed and considered.

HEARING ON I. C. C. JURISDICTION OVER ELECTRIC RAILWAYS

At the instance of the committee on federal relations of the American Electric Railway Association, of which A. W. Brady, president Union Traction Company of Indiana, is chairman, a hearing on the above subject will be held in Washington at 10:30 a. m. on Friday, Dec. 18. At this time, in the hour allotted by the commission, an argument will be presented by James M. Barrett, president Ft. Wayne & Northern indiana Traction Company, outlining the reasons against the commission order requiring interurban lines to file monthly reports of accidents in urban operation. The act of 1910 requires monthly reporting of accidents on the lines of interstate carriers by railroad. This has been interpreted by the commission, in the case of the Detroit United Railway and others, to cover urban lines operated by such roads which by virtue of their interurban lines come within the commission's jurisdiction. This is held to conflict with the decision of the United States Supreme Court in the Council Bluffs case. Secretary Burritt has sent out a circular letter inviting company members to be represented at the hearing.

MEETING OF JOINT COMMITTEE ON BLOCK SIGNALS FOR ELECTRIC RAILWAYS

A meeting of the joint committee of the Engineering and Transportation & Traffic Associations on the above subject was held at the offices of the Public Service Railway in Newark, N. J., on Dec. 10. The following members were present: Of the Engineering Association, J. M. Waldron, Interborough Rapid Transit Company, chairman; C. H. Morrison, New York, New Haven & Hartford Railroad; John Leisenring, Illinois Traction System; G. N. Brown, New York State Railways; of the Transportation & Traffic Association, J. W. Brown, Public Service Railway, co-chairman; C. D. Emmons, Chicago, South Bend & Northern Indiana Traction Company. There were also present by invitation H. W. Griffin, Union Switch & Signal Company, and H. H. Norris, ELECTRIC RAILWAY JOURNAL.

Mr. Waldron was elected chairman of the meeting and Mr. Norris secretary. A vote of thanks to the ELECTRIC RAILWAY JOURNAL for its practical interest in the work of the committee was unanimously passed.

The committee then considered the assignments made for the coming year's work, printed elsewhere in this issue, and delegated the work to the following sub-committees, in the lists of which the chairman's name is placed first in each case.

Digest of signal laws and rulings, A. E. Roome, Pacific Electric Railway Company.

Bibliography on block signal installations, H. H. Norris.

Design of standard apparatus, J. M. Waldron, C. H. Morrison.

Clearance diagram for semaphore signals, J. Leisenring, G. N. Brown.

Revision of block signal rules for contactor signals, C. D. Emmons, H. A. Nicholl.

Light signals for interurban railways, J. Leisenring, H. A. Nicholl, C. H. Morrison.

On certain changes in phraseology in regard to standard light aspects, J. W. Brown, C. D. Emmons.

Study of costs of maintenance, etc., of signal systems, G. N. Brown, J. W. Brown.

Review of block signal standards and recommendations, C. H. Morrison, J. M. Waldron.

Consideration of A. I. E. E. standardization rules, as they have bearing on signal matters, G. N. Brown, C. H. Morrison.

Preparation of a definition of "signal failure," A. E. Roome.

Study of highway crossing protection, J. Leisenring, H. A. Nicholl, J. W. Brown.

Report on advisability of operating single-track interurban signal-blocked lines without dispatchers, H. A. Nicholl, J. W. Brown, C. D. Emmons, J. Leisenring.

Preparation of a list of items of information needed in connection with block signal contracts; for trolley contact systems, J. M. Waldron; for track circuit systems, G. N. Brown, J. Leisenring, H. W. Griffin, S. N. Day, General Railway Signal Company.

After making the above assignments the committee considered them informally and discussed the general principles involved.

It was then decided to hold sub-committee meetings in New York on Jan. 4, 5 and 6, and in Chicago on Jan. 18. The next and probably the final meeting of the full committee will be held in Chicago on March 16 and 17 at the time of the meeting of the Railway Signal Association.

MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY SECTION

Company section No. 1 has elected the following officers: President, W. W. Cook, superintendent Cold Spring shops; vice-president, V. W. Dentz, engineer; secretary, H. G. Abendroth, valuation committee; treasurer, A. G. Schwenke, auditor railway receipts. E. W. Miller was elected director for a term of three years.

On Dec. 5 Secretary Burritt sent to all company members of the association copies of the war tax act of Congress, officially known as Public Act No. 217. This act affects electric railways in several particulars, principally in requiring a stamp tax to be paid on bonds, debentures and certificates of indebtedness and upon bills of lading. The act became operative on Oct. 23 and remains so to and including Dec. 31.

The merchants and manufacturers of Peoria, Ill., are arranging to establish in that city a traffic bureau which will have supervision over all switching charges and other shipping conditions. The Illinois Traction System has become one of the most important freight lines entering Peoria and it is proposed to include that company under the new arrangement.

An Ingenious Interline Register System

BY C. L. KELLER, ASSISTANT MASTER MECHANIC DETROIT UNITED RAILWAY

Through cars between Detroit, Mich., and Cleveland, Ohio, operate over the tracks of five different companies, namely, the Detroit United Railway, Detroit, Monroe & Toledo Short Line, Toledo Railway & Light Company, Lake Shore Electric Railway and the Cleveland Railways. A separate account must be kept of the fares collected on each line and, in so doing, the city fares collected in Detroit, Toledo and Cleveland are registered on three separate registers.

INSTALLATION OF REGISTERS FOR INTERLINE OPERATION

On a through car recently put in service by the Detroit United Railway, a simple, effective method of ringing each register was installed. The registers used were two Sterling-Meaker No. 8 and one International. Each register was marked with the name of the particular city in which it was to be used, although the illustration shows only two registers so marked. Instead of using separate cords or rods for operating each, the three registers were arranged to be operated by means of one ⅝-in. square cold-rolled steel shaft which extends the full length of the car and has a strap pull at each window.

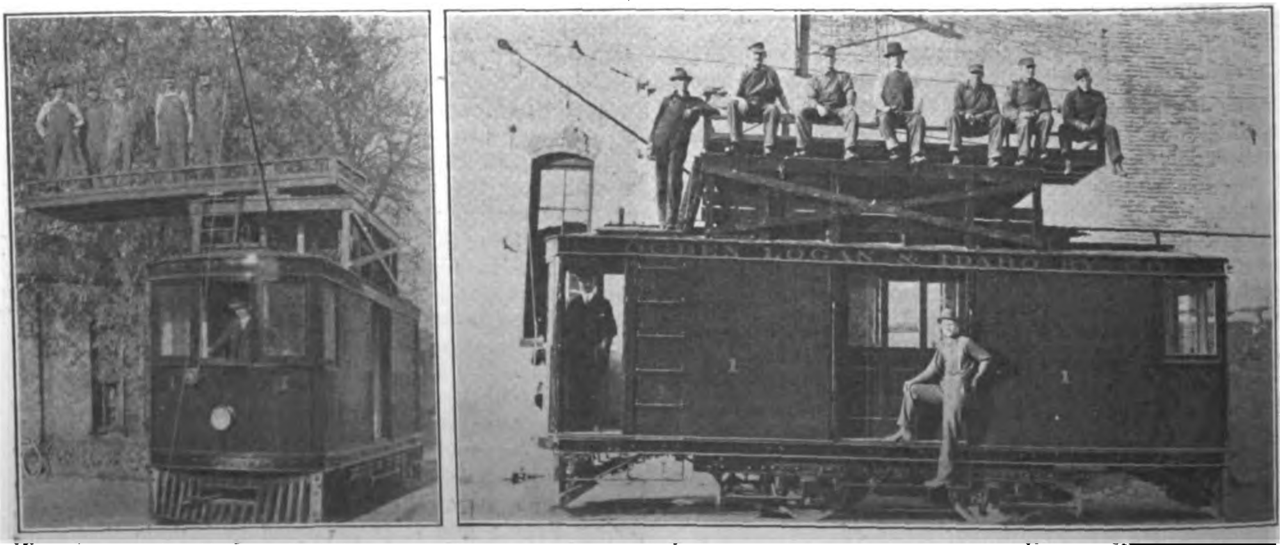
The register racks were placed side by side on the passenger compartment side of the partition between it and the smoking compartment. Just below the racks was placed a ¼-in. x ⅞-in. flat-steel bar. One end of this bar was connected to a clevis fastened to the register rod while the other end was passed through a guide. To the operating lever on each register a 2½-in. steel-wire screwhook was riveted and corresponding screw-eyes were riveted to the steel bar. To use any one of the registers, it is necessary only to unfasten one hook and connect up another. The accompanying halftone shows the mechanism as installed in a car.

A Home-Made Line Car

BY H. E. WURZBACH, MASTER MECHANIC OGDEN, LOGAN & IDAHO RAILWAY

The accompanying illustrations show a line car designed by the writer and built in the Ogden shops of the Ogden (Utah), Logan & Idaho Railway. In its construction we used an old truck from a single-truck car which had been out of service for some time and two GE-90 motors. The body we built. The principal dimensions of the car follow: Total length, 26 ft.; height from track to top railing, 14 ft. 6 in.; length of turntable platform, 15 ft.; length of turntable platform from center bearing, 12 ft., and width of car, 6 ft. 10 in.

An important feature is the channel iron which completely encircles the body. This channel greatly adds to the strength and rigidity of the car. As the channel flanges are turned outward the beam acts as an anti-climber at the bumper. The car is completely equipped



END AND SIDE VIEW OF LINE CAR MADE BY THE OGDEN, LOGAN & IDAHO RAILWAY with shelving, lockers and hooks for hanging wire and ropes. A place for long bars or shovels is arranged under the top platform. The speed of this car is about 35 m.p.h. It has been in operation since the middle of October.

Rebabbitting Journal Bearings

BY W. L. FULTON, CHIEF DRAFTSMAN OMAHA & COUNCIL BLUFFS STREET RAILWAY

In the rebabbitting of worn-out journal bearings the Omaha & Council Bluffs Street Railway uses molds of home manufacture. The details of three types of these bearings, namely, armature, motor axle and truck journal bearings, together with details of molds for rebabbitting the same, are shown in the accompanying figures.

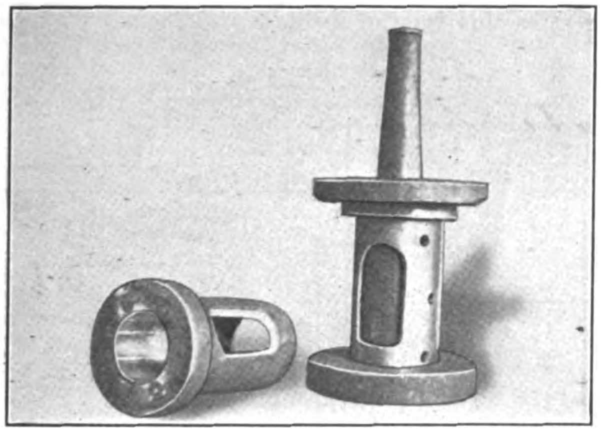


FIG. 3—FINISHED BEARING AND MOLD

Armature Bearings.—A bearing typical of this class is the commutator-end armature bearing for the GE-80 motor, the details of which are shown in Fig. 1. The mold for babbitting the same is shown in Fig. 2. This mold consists of two cast-iron plates and a round steel mandrel. The shell of the bearing forms the outside of the mold. The two cast-iron plates are machined to provide an even bearing for the mandrel and to give true surfaces to the babbitt. The upper plate contains two 11/16-in. holes for gate and air vent. Each plate also contains a hole through which the end of the mandrel projects. At the lower end of the bearing (Fig. 2) the mandrel has a shoulder which centers the bearing shell. Another shoulder, at the upper end of the bearing, supports the upper plate, giving the proper clearance between it and the end of the bearing shell. The projecting ends of the mandrel, and the taper of 1/32 in. in the length of the bearing, are made to facilitate the driving of the mandrel out of the bearing after the babbitt has cooled.

FIGS. 1, 2 AND 7—CAST-IRON ARMATURE BEARING FOR GE-80 MOTOR, MOLD FOR BABBITTING SAME AND MOLD FOR JOURNAL BEARINGS

Oil holes, etc., in the babbitt are made by the use of felt plugs, inserted in holes in the bearing shell and held in place by wires around the shell. A view of the mold and a finished bearing is shown in Fig. 3.

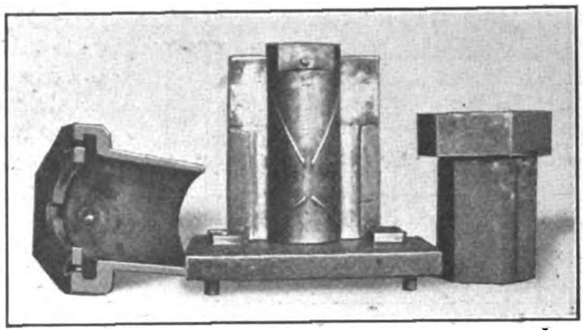

FIG. 6—MOLD FOR MOTOR AXLE BEARINGS WITH CORES IN PLACE AND BACKS REMOVED

After being babbitted, these bearings are machined to an exact fit.

Motor Axle Bearings.—Drawings illustrating this type of bearing and the molds for babbitting it are shown in Figs. 4 and 5, respectively. The mold was designed to cast the two halves of the bearing in one operation and consists of a stand, two cores and two backs. The stand is made of two smooth steel plates connected by cast-iron brackets which also serve to center the backs properly when the mold is being assembled. The cores are placed one on either side of the vertical plate, and are held in place by lugs in the base plate and by a tap bolt extending through the vertical plate. The cores are provided with ridges of the proper size and shape for the purpose of casting oil grooves in the babbitt.

The bearing shells are placed over the cores and the backs are then put in place, covering the shells. The shells and backs fit snugly, centering the shells properly when the backs have been put in place between the brackets of the stand. Each back is provided with a gate and air vent. A ¾-in. threaded hole is also made in each back to admit the crank used for forcing apart the mold and bearing after the babbitt has hardened. Oil holes, etc., are cast by the use of felt plugs of the proper shape and thickness placed in the bearing shell while the mold is being assembled. In Fig. 6 the mold is shown with the cores in place and the backs removed. Axle bearings are not machined after being babbitted.

Truck Journal Bearings.—The molds for babbitting truck journal bearings consist merely of mandrels, each one being shaped to fit one particular type of bearing. These mandrels are usually in the shape of cylinders with lugs or shoulders built out to meet the edges of the bearing shell and of a height to give the proper space between the mandrel and shell. Each mandrel is made to take two bearings at once, one on either side, a clamp being used to hold them in place while babbitt is being poured. Fig. 7, showing the details of the mold for the journal bearings of a Brill 39-E truck, illustrates this type of mold.

Equipment Defects—Control Apparatus and Connections—V

BY C. W. SQUIER, E.E.

Controllers for Electric Braking—Certain manually-operated controllers for railway equipments are arranged so that the motors may be used to stop the car as well as to propel it. This is accomplished by connecting the motors as series generators and using the current generated to operate magnetic brakeshoes, or by closing their circuit through a rheostat make use of them for dynamic or rheostatic braking.

It is an inherent characteristic of series motors that when they are connected to the line to work in a forward direction, with the same connections between armatures and fields and the working voltage removed they will work as generators if the armatures are caused to rotate in a direction opposite to that required for the forward movement of the car; or if the connections between the armatures and fields are reversed they will work as generators in the direction in which they car is moving.

Magnetic Braking.—When magnetic brakes are used the voltage generated by the motors is utilized to energize an electric track, wheel or axle brake. All the connections necessary for utilizing this current to actuate the magnetic brakes are made by the controller. Such controllers are provided with what is termed braking notches which are usually located so that a movement of the main or "power" handle in a direction opposite from that necessary to propel the car will bring the fingers into contact with the braking segments and make the necessary connections. By using the same handle continually both for "power" and "brake" the motorman acquires promptness and ease of manipulation. This is a most valuable feature because when emergencies do arise the motorman is never called upon to carry out consciously, yet with extreme promptness, an operation which is not in his regular practice. The simple action of moving the single controller handle in one direction for "power" and in the opposite direction for "brake" reduces to a minimum the "human element" which is so frequently responsible for accidents.

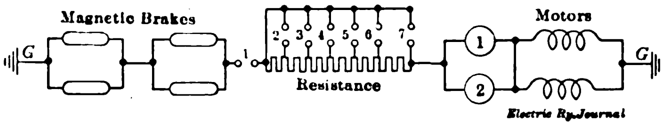

FIG. 14—CONNECTIONS FOR OPERATING MAGNETIC BRAKES

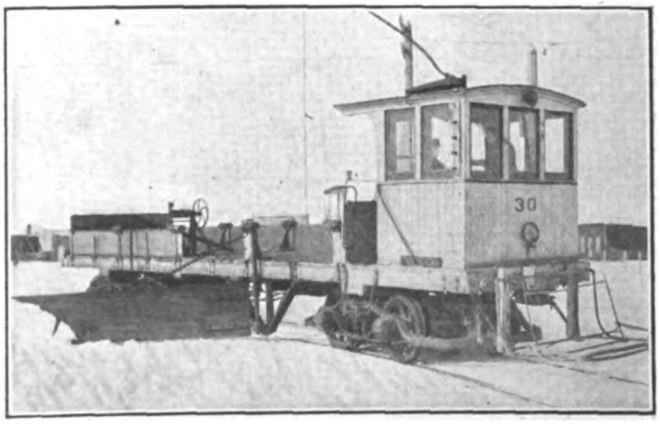
Fig. 14 shows the connections that are necessary to operate magnetic brakes. The motors and the coils of the brake magnets on opposite sides of the car are connected in parallel, and the regulating resistance is placed in series with both. Contacts 2, 3, 4, 5, 6 and 7 are provided for cutting out this resistance so that the amount of current produced by the motors may be varied as required. To apply the electric brakes it is necessary to move the controller handle to the brake notch which agrees with the speed at the moment, and then to move it again notch by notch as the car slows down so as to cut out resistance because the emf generated decreases as the speed of the car falls off. The brake magnets on opposite sides of the car are connected in parallel, as stated, so that the braking force will be the same on both sides.

Magnetic brakes are now seldom used in this country due to the difficulty of securing efficient track braking with the bad track conditions that are encountered on so many roads. In England and on the Continent the track magnets are adjusted so that they are about ¼ in. clear from the rail. It can be readily understood that it would be almost impossible on most American railways to operate with this scant clearance. This trouble could be overcome to a degree by using a less efficient brake magnet. I understand that there has now been developed a magnet which in ordinary service will operate with an adjustment of ¾ in. above the running rail. But even this clearance is much less than we expect for other truck parts.

Dynamic or Rheostatic Braking.—Any controller which is provided with the points necessary for magnetic braking can be used for dynamic or rheostatic braking without any change in the controller itself. No brakeshoes are used with this form of braking. The terminals of the motors are connected to the regulating resistance, and as the current flows there is produced in the motors a back torque (counter emf) which causes the armatures to hold back against their driving force. The greater the torque the quicker will be the stop. Since the armature speed is decreasing the torque will decrease in proportion unless the resistance in the external circuit is decreased as the speed falls off. Therefore, in order that the armatures may exert a uniform back torque while the car slows down, it is necessary that the controller handle be moved from point to point so as to cut out the resistance. As the motors generate current only while the car is in motion, the car will not remain stationary if stopped on a grade unless it is held by some other form of brake. Rheostatic braking uses the back torque alone for making stops. However, where some form of electromagnetic brake is used, the car is not only retarded by the work thrown on the motors, but the current generated is usefully employed in actuating the brakes on the trucks or wheels.

Snow Removal in Montreal

In Montreal the problem of snow removal is a very severe one and the methods used in meeting it have been thoroughly perfected by A. Gaboury, superintendent Montreal Tramway Company. The apparatus consists of the usual sweepers, and, in addition, there are salt cars (which are the equivalent of sand cars) and levelers which are regular motor freight cars fitted up with sheet-iron wings that swing out-board. The latter are for the purpose of pushing the snow into piles along the curbs after it has been thrown aside by the sweepers, thus providing a large clear space beside the track for vehicular traffic. The piles of snow are carted away from the city in sleighs furnished by the city, the cost of removal being borne in part by the company.



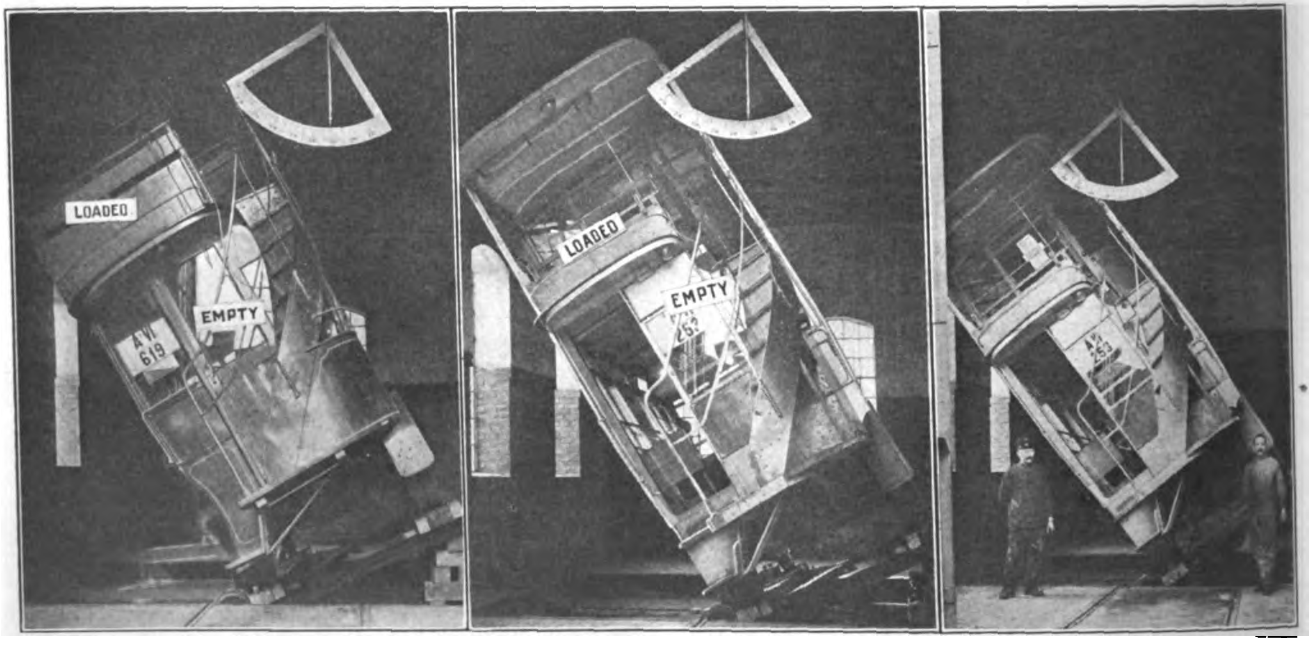
MONTREAL SNOW FIGHTING—FREIGHT CAR TRANSFORMED INTO A LEVELER FOR CLEARING SPACE BESIDES TRACKS

The use of salt has been found to be an absolute necessity during sleet storms or extreme cold weather, and salt cars consisting of old single-truck equipments have been fitted up with longitudinal boxes for holding coarse salt, the material being dropped on the switches through tubes opening from the center part of the bottom of each box.

In operation the snow-fighting equipment is assigned to definite routes so arranged as to have each one completely covered at intervals between forty-five minutes and one hour. In addition the routes provide central conveying points for three or four sweepers, so that one can be diverted if necessity arises on some other route. In addition to the equipment a force of from eighty to one hundred men is constantly employed during the winter on all hills to keep the rails and switches in a safe condition, and during heavy snows this force is augmented from the construction department. As soon as a snow storm begins men are also sent out to sweep and salt every switch and intersection on the system. One prolific source of danger of blockades has been found in the packing of snow on top of fenders in the cars, and to obviate this men are stationed at various points on the system to shovel the snow off of the fenders, and to clear the vestibule windows and destination signs.

Testing the Equilibrium of Double-Deck Buses at Vienna

In making studies for the operation of double-deck auto buses, Ludwig Spängler, director Vienna Tramways, gave particular attention to the question of equilibrium to secure buses that would not tip over when swerving at their highest speeds under the worst possible conditions of grade and curvature. To this end experiments were made to find the permissible angular deviations from the perpendicular for double-deck buses with and without a covering for the upper deck.



EQUILIBRIUM TESTS OF VIENNA BUSES—OPEN-TOP BUS LOADED ON UPPER DECK, EMPTY ON LOWER DECK, TIPPED 31 DEG.—CLOSED-TOP BUS LOADED ON UPPER DECK AND EMPTY ON LOWER DECK, TIPPED 33 DEG.—CLOSED-TOP BUS EMPTY ON BOTH DECKS, TIPPED 40 DEG.

As shown in the accompanying views, the allowable deviation was measured on a protractor fitted with a swinging pointer. One leg of the protractor was fastened at right angles to the side of the bus so that as the bus was tipped away from the perpendicular by putting blocks under one side of the body, the pointer swung away from 0 deg. accordingly.

When empty the center of gravity of the fully-inclosed double-deck bus is not so low, of course, as that of one with an open top deck, but it was found to be low enough for safe operation. When loaded, however, the inclosed type devised by Mr. Spängler has the lower center of gravity because the "well" construction of the upper floor permits the upper seats to be nearly 16 in. lower than the corresponding seats of the Daimler open-top bus.

The tests with the protractor showed that when the open-top bus carried an upper deck load of fourteen 165-lb. bags of sand, and with no load on the lower deck, unstable equilibrium was reached at 31 deg. from the perpendicular. The angle for the fully-inclosed bus when carrying fifteen 165-lb. bags of sand, and with no load on the lower deck, was 33 deg. and this was increased to 40 deg. when the load from the upper deck was removed. All tests were made with gasoline vehicles.

Better Car Illumination Effects Other Economies

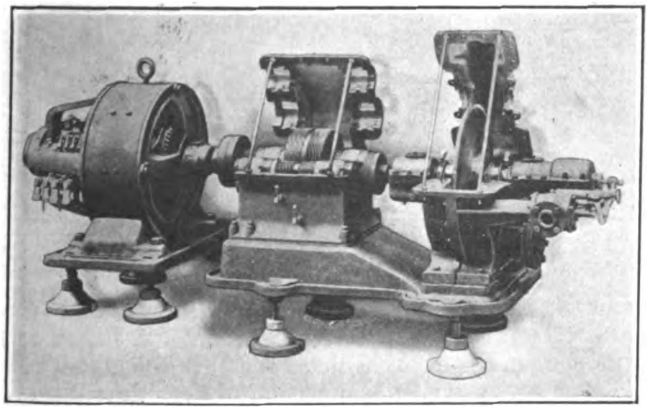
The original lighting scheme on the passenger cars of the Chicago, Lake Shore & South Bend Railway provided for fifty-two 23-watt, 120-volt lamps, five in series in a 600-volt circuit. These lamps were installed one over the back of each seat in a side-wall bracket attached to the window post and a row in the ceiling along the center line of the car. The improved lighting system includes seven 60-watt and five 25-watt Mazda lamps in a 98-volt circuit. The 60-watt lamps serve for general illumination while the 25-watt lamps are installed two in the destination sign, two on the rear platform and one in the toilet. The 60-watt lamps are placed in the ceiling along the center line of the car and are fitted with deep Alba shades set in locked sockets.

This change was a great improvement over the lighting scheme formerly used, which not only supplied too much light but did not distribute it properly. In fact, the light from the lamps in side-bracket fixtures on the window posts was right in the line of vision of seated passengers, and as the light was supplied through thin filaments with energy at twenty-five cycles it was also irritating to the eye. The accessible location of the side brackets also increased the percentage of thefts. In fact, during some months the combined number of lamps broken, stolen or burned out amounted to more than 50 per cent. With the new lighting scheme it is estimated that the savings in lamp replacements and energy consumption will more than pay for the entire installation within one year. All wiring in the new system is in conduit and the circuits are taken off the 98-volt tap of the transformer which forms a part of the 6600-volt, single-phase car equipment. One of the most expensive parts of the improvement was included in replacing the side brackets on the window posts with coat hooks.

Small Geared Turbo Units

The Westinghouse geared turbo-generator set recently brought out is designed to meet the demand for economical turbine units of small capacity. This development was made possible by the Westinghouse reduction gear which permits the efficient coupling of a high-speed turbine to a low-speed generator. These sets are built with either a d.c. or an a.c. generator in capacities from 25 kw to 200 kw, standard voltages. The turbine is designed for condensing or non-condensing operation, as may be desired.

The turbine rotor consists of a single disk, on the periphery of which the blades are carried. On entering the turbine casing the steam expands in a suitable nozzle, passes through these blades and delivers to them part of its velocity energy. On leaving the blades it enters a reversing chamber which redirects it to the blades. This process is repeated as many times as necessary to make efficient use of the energy in the steam.



GEARED TURBO-GENERATOR SET

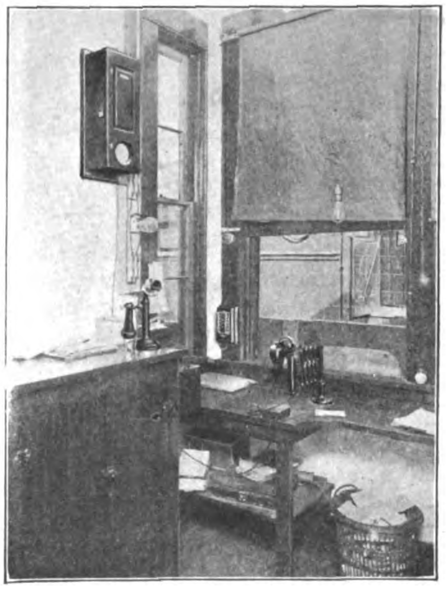
The gear and the pinion are of the split helical type, mounted in an oil-tight case. Ample lubrication is provided by running the gear in a bath of oil. To make inspection easy, both turbine and gear casings are horizontally split, and all steam nozzles and reversing chambers are mounted in the lower half of the turbine casing. The turbine and gear are mounted on a common bedplate. The bearings are all ring-oiled and self-aligning, and require little attention.

The speed of the turbine is controlled by a centrifugal type governor, mounted on the turbine shaft and connected by a simple lever direct to the stem of the valve. The connection between gear and generator is made by means of a flexible coupling.

Alternating current generators furnished with these sets are of the self-contained revolving field units similar to standard Westinghouse belted and coupled types. They can be wound for two or three-phase sixty-cycle service, and any standard potential between 240 volts and 2400 volts. The d.c. generators furnished are all self-contained similar to the standard Westinghouse belted type, and can be wound for 125 volts and 250 volts, two-wire, and 250 volts, three-wire.

Telephone Train Dispatching on the Cedar Rapids & Iowa City Railway

The Cedar Rapids & Iowa City Railway has recently placed in successful operation a telephone train dispatching equipment covering the entire line. This road runs from Cedar Rapids south to Iowa City, a distance of approximately 30 miles, with a branch going east from Cedar Rapids to Mt. Vernon, an additional distance of 15 miles. This includes some of the best farming land in Iowa, where interurban traffic is exceedingly heavy. The passenger trains on the line are operated by electricity and the freight trains by steam.



DISPATCHER'S OFFICE, CEDAR RAPIDS & IOWA CITY RAILWAY

Along the route ten open stations are equipped with telephones and selective signaling apparatus. Sets containing the Western Electric selectors are used for signaling station operators and self-contained, folding-gate, telephone arms are used for the operators' talking apparatus. Six way-station outfits are installed between Cedar Rapids and Iowa City and two between Cedar Rapids and Mt. Vernon. The power house, the superintendent's office and the shop are also connected with the telephone distpatching circuit. The dispatcher is located in the shop-office building 2 miles south of Cedar Rapids and is in control of all points on the line.

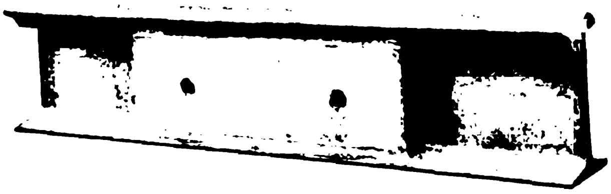
A portable telephone set has been furnished to each train crew so that communication may be established with headquarters from various points along the line. These telephones are fitted with cords and plugs arranged for plugging in pole jacks which are placed at a convenient height on the telephone poles along the right-of-way. This equipment is especially valuable in emergencies. Nine pole jacks are placed on the Cedar Rapids and Iowa City division and six on the line to Mt. Vernon.

The normal traffic on this railway system involves the operation of thirty-eight passenger trains and four scheduled freight trains daily between 5 a.m. and 1 a.m. on the Cedar Rapids & Iowa City line and eighteen passenger trains and two scheduled freight trains between 5 a.m. and 12 o'clock midnight on the Cedar Rapids & Mt. Vernon branch. The telephone dispatching system has now been in use for some months and excellent results from every point of view, notably those of economy and efficiency of operation, are reported.

Automatically Welded Electric Joints in Brooklyn

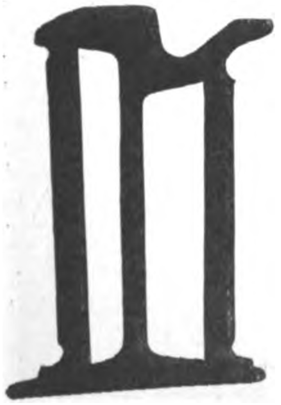
An entirely original method of carbon electrode rail welding was carried out between Nov. 7 and Nov. 18 for the Brooklyn Rapid Transit System by the Atlantic Welding Corporation, New York. The work comprised the installation of sixty-six joints in five-year old rail on the heavily-traveled downtown section of Fulton Street, between Court and Tillary Streets, Brooklyn. Owing to traffic conditions, all work was done between 10 p. m. and 5:30 a. m. and no work at all was permissible on Saturdays and Sundays.

The rails of Lorain 398 and 423 section had been set on steel ties incased in concrete and had been secured to the ties with clips. In substituting the new welded joint for the riveted type these clips were removed with a cold chisel and the rail was welded directly to the ties. The rectangular joint plates, which support the head as illustrated, were made in lengths of 31 in. and 19 in., several compromise joints with these lengths being, of course, included. Twenty-six of the joints included 12-in. inserts. A metallic electrode process was used to fill the heads of excessively worn rails at joints and at the dishes opposite the joints. The job was finished bv grinding to the original level.

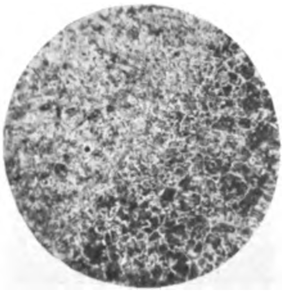


SAMPLE OF A COMPLETE WELD

The welding process itself is one which has already been used on a large and successful scale throughout Europe. Its salient features are two: The carbon electrode used is set in a carriage which is moved at a predetermined rate and in a manner which avoids all inequalities due to the varying skill of the welder himself; the welding current is not drawn through wasteful resistance but is taken at an efficiency of 90 per cent or more through a 550/70-volt European-Rosenberg motor-generator set which can withstand a short-circuit indefinitely.



EARLY WELD OF LORAIN NO. 395, 141-LB. RAIL



MICRO-PHOTOGRAPH OF SECTION THROUGH A WELD

A complete welding outfit consists of a covered wagon with the special motor-generator set mentioned, a marble switchboard of power-station type and two portable welding machines or carriages. In executing work, the carriages are operated inside of light-weight tents, which are readily set up or dismantled.

Each outfit has a crew comprising a foreman, two welders and two helpers, one welder and helper working at each carriage. While the special conditions in Brooklyn made work under the best conditions impossible, from twelve to fifteen joints have been made elsewhere per eight-hour day with one outfit and crew, so that the actual time necessary per joint is only twenty-five to thirty minutes. In numerous cases, eighteen joints per day have been made by five men. This rate will suffice to keep step with the tasks of the other track work gangs. If, however, it is necessary to increase the number means can be provided to make as many as twenty-five joints in one shift.

The welding process is purely automatic. After the beveled flat-bar plates have been adjusted, the welding carriage and the arcing element thereon are placed over the joint. The automatic feature lies in the condition that the carbon is set to travel at a predetermined rate over the line to be welded. The carriage is adjustable to any type of rail. The weld is obtained by making the arc fuse the two surfaces (plate and rail), a firm, composite structure being obtained with the help of feed-in material.

As shown in an accompanying micro-photograph of a weld made abroad, the transition in the composition of the metal from the plate to the material added and from that material to the head is very gradual and differs only in the percentage of carbon content. As the actual area welded is low in carbon, a junction of high ductility and great strength is obtained. In no case has a microscopic examination shown anything but a close-grained structure with an entire absence of "shoot offs" thus proving that the head had never reached a temperature high enough to change the molecular structure. The intrinsic value of the joints so produced is the firm support given to the head, and the tying together of the head and base to form a rigid box girder of solid section.

MOTOR-GENERATOR WAGON AND TENTS

In the plant of the United Water, Gas & Electric Company, at Hutchison, Kan., which furnishes power to the Hutchison Interurban Railway, the body of a mouse grounded some important circuits in the station which stopped the railway and put out all the lights in the city. Many other industries depending on electric motors for power were also without energy for about an hour. It appears that the assistant engineer of the plant discovered the mouse and while he was trying to dislodge it from its precarious position without shutting down the plant the little animal jumped into a connection that electrocuted it and caused a serious short-circuit.

News of Electric Railways

DECISION IN PASSAIC GAS CASE

Highest Court in New Jersey Declares Franchises Must Be Valued for Rate-Making Purposes

A decision was rendered on Dec. 9 by the Court of Errors and Appeals of New Jersey upsetting the order of the Board of Public Utility Commissioners requiring the Public Service Gas Company to establish a 90-cent rate for gas in its Passaic district. The interest of this decision to electric railway companies lies in the fact that this rate was based on a valuation in which the commission made an allowance for "going concern" value, but made no special allowance for the value of franchises. The decision of the commission in this case was published on page 35 of the issue of this paper for Jan. 4, 1913. The decision was upheld by the Supreme Court, but was appealed to the Court of Errors and Appeals by the gas company, which is one of the constituent companies of the Public Service Corporation.

The decision of the court, rendered just as this issue was about to go to press, includes the following statement:

"When a public utility corporation is in the enjoyment of privileges to use streets and public places in this State for the purposes of its business, whether such privileges be conferred by the State alone or partly by the State and partly by the municipality, and whether they be exclusive or subject to duplication, such privileges constitute a special franchise which is property, is subject to taxation and has normally a substantial value; and in making a valuation of the property of such corporation for the purpose of establishing a basis for the regulation of rates to be paid to it by the public for its product or service, it is erroneous to assign no value, or a merely nominal value, to such franchise when a substantial value is fairly reflected in the total market value of its securiites."

The report justifies this decision by many citations and also upon grounds of equity. It also considers the statement of the commission that it was the policy of the State not to allow the capitalization of franchises for an amount in excess of the actual cost involved in obtaining such franchises. The court says that even if the franchises are not capitalized this is no reason for the exclusion of the franchise from a valuation for rate-making purposes, because, while the value of the franchise may not be included in the par value of the capital stock it affects its market value.

DES MOINES FRANCHISE MATTER

The Des Moines (Ia.) City Railway is awaiting action by the City Council on its petitions for a special election to vote on the question of granting a franchise. About 10,000 of the voters in the city, or more than half, have signed one petition calling for such an election. The law requires only about 5000 names on this petition. About 1500 property owners have signed a second petition calling for the same election. The law requires only 175 names on this petition. Both petitions were secured so that the city might proceed with both and thus meet the different requirements of two sections of the law governing franchise elections. This was done in order that the date of the election might be fixed without the necessity of delay due to legal proceedings to determine which section of the law should apply.

Members of the City Council, and Mayor Hanna especially, have seen fit to delay the proposition indefinitely and continuously in spite of every effort on the part of the company for speedy action. When the Council refused action on the petitions the company finally took the question to the courts, and in the lower tribunal the decision was soon reached. An appeal has been made to the State Supreme Court and that body has advanced the hearing to Dec. 21. The company's only interest in this decision is to avoid any doubt about the legality of the proceedings. In the meanwhile the city might have proceeded under both sections so that there would be no uncertainty. Instead the city has refused to proceed under either.

Mayor Hanna has stated several times that he proposed to fix Jan. 16 as the date for the election, but he has not yet fixed any date. It has been proposed recently that a vote on the local saloon question be taken at the same time as the vote on the city railway franchise. Mayor Hanna also has proposed to submit a series of amendments to the proposed franchise at the time of the election, but it is thought unlikely that he will be able to do this since the petitions call for an election on the specific franchise called for by the company and none other.

MUNICIPAL OWNERSHIP IN SEATTLE

City Apparently Divided Over Question of Continuing Present System

As a culmination of the controversy waged in Seattle, Wash., the last three years over the question of municipal operation of electric railways, several members of the City Council now advocate disposing of the existing municipal railway system. The leader of the faction in favor of selling the lines was elected to the City Council last year largely on account of his advocacy of municipal ownership, but he is now arrayed on the other side. This state of affairs is attributed to a considerable extent to the filing of a suit on Nov. 27 by the State on behalf of the state board of accountancy against the City Council of Seattle, the Mayor, city treasurer, city comptroller and former Mayor Cotterill to recover money alleged to have been illegally appropriated for the rehabilitation and operation of the Lake Burien Railway outside of the city limits, the second unit in the city's railway system.

The Lake Burien line was accepted as an unincumbered gift from its promoters, property owners along the right-of-way, and $25,000 was appropriated by the City Council to rehabilitate the line. Later $9,000 was appropriated to form an operation fund for this line and Division A of the municipal lines. Since the beginning of operation there has been a deficit each month which has remained a charge against the general fund. Three miles of the Lake Burien line lie outside of the city limits. As if to anticipate the action for recovery of the appropriation a rider to abolish the accountancy board was placed on the ballots which went before the voters at the recent general election, but this issue was defeated at the polls. The attorney-general hopes to establish through the suit whether cities of the State can operate public utilities outside the city limits.

The municipal system of Seattle has been described previously in the ELECTRIC RAILWAY JOURNAL. It consists briefly of a line known as Division A, 4.2 miles long, running from the business district to the mill district of the city, and of the Lake Burien line, 9 miles, which extends from the extreme southern end of the city to Lake Burien. There is a distance of practically 2 miles between the two divisions. The advocates of the municipal railway system have proposed connecting the lines with a motor bus service, and have endeavored to add the Seattle, Renton & Southern Railway to the municipal system. This line traverses the Rainier Valley practically parallel with the Lake Burien line, but 2 miles or 3 miles distant. It crosses the business section of Seattle, however, and could be connected with Division A, but it could not be connected with the Lake Burien line except at considerable expense.

The constant heckling indulged in by members of the City Council has apparently served no purpose except to keep many of the outlying districts of the city without adequate transportation facilities. In five years no extensions of the lines of the Puget Sound Traction, Light & Power Company have been built in Seattle because of the unreasonable demands of a City Council which was determined upon converting the lines of the city into a municipal system.

A resolution since introduced in the Council by A. Allen Dale providing for the sale of Division A and C of the municipal railway has been tabled pending a decision in the suit of the State against the city alleging misappropriation of funds. Mr. Dale advocates the plan of placing the matter of selling the lines before the electorate at the municipal election in Seattle in March.

TOLEDO NEGOTIATIONS HALTED

Nothing has been done toward renewing the negotiations between the city of Toledo, Ohio, and the Toledo Railways & Light Company since the franchise committee of the City Council announced that it had completed a franchise similar in many ways to the one prepared by the company in the first place. It is understood, however, that the draft prepared by the franchise committee contains some requirements objectionable to the company. Copies of the ordinance are in the hands of the attorneys, but they have not as yet been made public.

In overruling the demurrer filed by the Toledo *News-Bee* in the case of the United States against the Toledo Newspaper Company and N. D. Cochran, Judge Killits announced on Dec. 4 that the case would go to trial on its merits on Dec. 28. This is the action in which the defendants were cited for contempt of the Federal Court because of certain publications relating to the receivership case of the Toledo Railways & Light Company, and meetings conducted by so-called agitators after the court had rendered a decision, restoring the old rate of fare pending a final settlement of the franchise question.

CLEVELAND SUBWAY AND LABOR MATTERS

It is stated that the freight subway project under East Fifty-fifth Street, Cleveland, Ohio, as planned by O. C. Barber, Barberton, will depend largely upon the establishment of the harbor line at the foot of the street where he has planned to erect extensive coal and ore docks. The subway would connect the proposed docks with the railroads in the Cuyahoga valley.

Cleveland motormen and conductors are arranging to request the State Industrial Commission to investigate working conditions in the city. They contend that the State law provides for eight hours of continuous rest out of each twenty-four for railway employees and that the commission has authority to investigate and enforce the law. They will, however, ask Attorney-General Hogan for an opinion on the State law before they appeal to the commission.

Several minor amendments to the proposed grant to the Cleveland Rapid Transit Company were submitted at the regular meeting of the City Council on the evening of Dec. 7 and the ordinance was placed back on its second reading.

PROGRESS ON BOSTON SUBWAY CONSTRUCTION

Steady progress is being made in the construction of the Dorchester tunnel and the East Boston tunnel extension, at Boston, Mass., under the direction of the Boston Transit Commission. The former is now completed from Tremont Street to Washington Street, under Winter Street, and the Washington Street station, between Washington and Arch Streets, is completed except for interior finish and equipment. This station is a two-story structure. Transfer between Cambridge subway and Washington Street tunnel and Dorchester trains will be made at the station through passageways or lobby connections. East of this station 270 ft. of tunnel built in open cut is completed, the remaining section of 760 ft. connecting with Dewey Square and the South Station being under construction by the tunneling method. Work has been started on the Dewey Square section, which is to be 800 ft. long.

The East Boston tunnel extension, which connects Scollay Square with the West End, will have stations with island platforms at Scollay and Bowdoin Squares. An inclined elevator will be provided at the former station, which is being built below the Tremont Street subway. The existing entrances will serve for both stations, with an additional entrance at the north side of the square. Between Scollay and Bowdoin Squares the tunnel is a double-barreled structure and throughout the entire extension space for two tracks is provided. West of the Bowdoin Square station an underground loop will be built to enable a portion of the East Boston cars to be turned back at this point, and a switch-back will be installed east of Scollay Square to reverse various Cambridge trips. The general work of construction is practically completed with the exception of the finishing of the stations and the reconstruction of the tunnel between Washington Street and Scollay Square.

MISGIVINGS IN SAN FRANCISCO

"Chronicle" Wants City to Apply Business Principles to Municipal Line

In the issue for Dec. 2 the San Francisco *Chronicle* said in part in an editorial headed "Our Municipal Railroads":

"The profit in owning and operating a street railroad system is made by a very trifling percentage of each fare paid. Now that this city has engaged in the railway business, we all wish it to be successful. The net income ought to be sufficient to make good all that we lose by taxes which private owners have paid, and in addition to pay off all indebtedness incurred in building the system within such a reasonable term as would be accepted by a private company as the period of a franchise. Extensions must be made only when they will pay for themselves during such a period. Upon any other basis, either the taxpayers or those who ride on the cars will have partly to pay for other people's rides. If any section of the city wants a railroad not likely to pay within a reasonable time, the property owners who will benefit by it ought to pay for it.

"In this city we already see different sections vigorously fighting each other before the Supervisors in regard to the location of new railroads. In no case does any faction present figures to show that the road they desire will be profitable. We are already operating lines which for the present are unprofitable, and are operated out of the profits of the paying properties. It is useless to ignore the fact that if the construction of new lines be left entirely to Supervisors their action will be largely determined by its probable ultimate effect on votes. And that is the very worst way there is to fix locations. This scramble for street railroad and other improvements is at the bottom of the movement to return to our old plan of electing Supervisors by wards. The present management of our municipal railroads is competent. Any management if left to itself will strive to make the best possible showing. Such city administrations as we have sometimes had would take care that there was a management to suit them, but that rests with the people. But there should be sufficient backbone in the government to run our street railroads on business principles."

CONSTRUCTION IN TENNESSEE AND KENTUCKY

The extension of existing electric interurban lines and the construction of several others which are definitely projected and some of which are surveyed, are engaging the attention of middle Tennessee and south-central Kentucky. These lines will radiate from Nashville, Tenn., and in connection with two lines already in operation will traverse some of the richest territory in the United States. As has been noted previously, the Nashville & Gallatin Railroad is to build a branch, leaving the main line at Goodlettsville and extending to Springfield, Robertson County, and ultimately to Clarksville, in Montgomery County, passing through Guthrie in southern Kentucky. All of this is a rich tobacco and grain growing section. The same company has outlined an extension northward from Gallatin to Bowling Green, in Warren County, Ky.

An important extension from the line of the Nashville & Franklin line is already under way. Known as the Middle Tennessee Interurban Railroad, it will extend from Franklin, through Eaglesville, Shelbyville, Fayetteville, all in Tennessee, to Huntsville, Ala. The 23 miles between Franklin and Eaglesville is already graded.

Of the new projects, the Tennessee & Kentucky Interurban Railroad is perhaps the most important. This line, as has been indicated, will extend from Nashville, across the State line to Adairville, in Logan County, thence connecting with Russellville, the county seat, and ultimately being extended to Franklin, seat of Simpson County, Ky. The Cumberland Valley Interurban Railway has its line surveyed through Wilson County to Watertown, Alexandria, Smithville, McMinnville and Sparta, from which branches are projected to Lebanon and the Hermitage, the old home of Andrew Jackson. The Nashville & Murfreesboro Interurban Railway is projected to pass through Davidson and Rutherford counties, extending ultimately to Woodbury, seat of Clinton County, while there are various other projects in process of organization, it is said, to build lines from Nashville to Ashland City and out the Charlotte Pike. The Nashville Traction Company is reported to be planning an interurban extension out the Murfreesboro Pike to Una.

The project to build the interurban railway to connect Lexington, Ky., and Richmond, Ky., has received further stimulus from the fact that Lexington's new Board of Commerce is considering it. Louis des Cognets, former president of the Lexington street railway system, said recently:

"Even should the Kentucky Traction & Terminal Company be disinclined to build the line, it has given assurance that it will co-operate in a most friendly spirit with any company operating cars into Lexington from Richmond. The line to Richmond is one of the most important definite plans for the benefit of the whole community that the Board of Commerce can take up."

Costly bridge construction necessary to span the Kentucky River, which has cut a wide deep channel between the two towns, has previously acted as a deterrent to the building of the line. Mr. des Cognets, however, urges that the state law permits toll bridges and that these tolls could be made to meet the fixed charges of such a structure, the cost of which is estimated at $250,000.

Third Track in State Street, Chicago.—The Chicago (Ill.) Surface Lines is asking permission to build an additional third track in State Street, in order to do away with "switchbacks" and to provide loops for cars from the west, northwest and southwest sides.

Washington Air-Brake Order.—The Public Service Commission of the District of Columbia has denied the application of the Washington Railway & Electric Company for an extension of sixty days from Dec. 31, 1914, in which to install air brakes on all cars weighing sixteen tons or more.

Employees Want New Laws.—On Jan. 11 representatives of electric railway employees from all sections of Ohio will meet at Columbus to plan a campaign for the enactment of laws for the regulation of working conditions on electric railways. The call for the meeting was sent out by the Amalgamated Association.

Transportation Commission Favored.—Mayor Hocken of Toronto, Ont., at the recent luncheon of the Municipal Improvement Association in that city, delivered a speech favoring the appointment early next year of a transportation commission to plan civic car line extensions with a view to their unification in 1921 with the present system as operated by the Toronto Railway.

Recovery of Benefit Fund Payments Allowed.—Chief Justice Shepard of the Court of Appeals of the District of Columbia decided on Dec. 9 that an employee of the Philadelphia & Baltimore Railroad was entitled after discharge by the company to recover from the railroad the amounts of money he had paid into the company's benefit fund. The man who sued for recovery had been in the employ of the company twenty years.

Toronto Suburban Railway Rights.—City Solicitor Johnston, of Toronto, Ont., reporting to the Board of Control on Dec. 3 on the rights and privileges held by the Toronto Suburban Railway pointed out that the company had what practically amounted to a perpetual franchise, as provisions were made for its renewal in September, 1929, and at the end of every twenty years thereafter. The only way the city can acquire the rights of the company is by purchase in 1929 or at the end of any other twenty-year period, either by agreement or arbitration.

Service Conference in Pittsburgh.—J. D. Callery, president, and P. N. Jones, general manager of the Pittsburgh (Pa.) Railways conferred with Mayor Joseph G. Armstrong and City Solicitor C. A. O'Brien on Dec. 11 relative to the points at issue between the company and the city. The matter of the suit brought during the term of Mayor Magee to enforce the payment of the car tax was not mentioned, as this is to be handled separately. While transfers, rerouting, street cleaning, track repairing and the establishment of a shuttle between downtown Pittsburgh and the North Side were discussed nothing definite was decided upon. Another conference will be held soon.

The New Haven Indictments.—The case of the indictments against a number of the directors of the New York, New Haven & Hartford Railroad was called in the United States District Court before Judge Rudkin on Dec. 4. Pleas of not guilty were entered for William Rockefeller, Robert W. Taft, Charles F. Brooker, Frederick F. Brewster, D. Newton Barney and Henry K. McHarg. Pleas claiming immunity were entered for William Skinner, James S. Elton and George F. Baker. A. Heaton Robertson and James S. Hemmingway also entered pleas of not guilty. John L. Billard, Edward A. Robins and Thomas De Witt Cuyler have also entered immunity pleas. The remainder of the twenty-one directors indicted for violation of the Sherman law have already entered pleas of not guilty.

Confiscation of Mexican Tramways Reported. — W. E. Pearson, at the New York office of the Pearson Engineering Corporation, Ltd., confirmed the statement recently attributed to Dr. F. S. Pearson, president of the Mexico Tramways, that the latter had received a cable on Dec. 2 from his representative to the effect that the property had been confiscated by the political factions now in control of the city government. The treasurer and other officers were ordered to leave the service forthwith. Both the British and the Brazilian authorities in Mexico City are said to have filed protests. No other advices regarding this matter had been received up to Dec. 9. According to recent reports the Zapatistas have not in any way disturbed the Mexican Light & Power Company, which supplies the tramway, the city and private customers with light and power.

Public Utility Commission Legislation Likely.—The question of a public utilities commission for Michigan, which was before the Legislature two years ago, will probably come up again at the session this winter. It is understood that Governor Ferris and the members of the Michigan Railroad Commission will back the bill, while the Republican state platform pledged the support of that party to such a bill. Two years ago two bills for a utilities commission were before the Legislature, one copied after the Indiana law and the other drawn up by Chairman Hemans of the State Railroad Commission. Both died in committee. Mr. Hemans is now at work on another bill for presentation at the coming Legislature, but his plans are tentative as to what it shall contain. Governor Ferris, it is understood, will make a special plea for a public utilities commission in his message to the Legislature.

Forestall Complaints.—In an editorial "Forestall Complaints Before They Happen," *Printers' Ink*, a journal for advertisers, after quoting from the article "The Importance of Good Public Relations," written by Theodore P. Shonts, president of the Interborough Rapid Transit Company, for the convention issue of the ELECTRIC RAILWAY JOURNAL, says in its isue of Dec. 10: "With Mr. Shonts we are in hearty accord, but *Printers' Ink* would go one step farther. A well-conducted advertising campaign along the general lines of that conducted by the American Telephone & Telegraph Company would forestall most of the complaints before they happen. The American public is not only a reading and a thinking public; it is a public pretty thoroughly alive to the sense of fair play. An understanding of the fundamental problems which 'big business' is forced to solve will go far toward removing hostility on the part of the great mass of the people. In no way can that understanding be given so easily and so quickly as by advertising."

New York's Subway Labor Problem.—The Public Service Commission for the First District of New York has been served with an injunction, otained by William E. Heim, a taxpayer of New York City, restraining it from taking any action to forfeit any construction contract on the new rapid transit lines on account of the alien labor clause of the State labor law, or from withholding payments to such contractors because of violations by them of this clause. Argument on the preliminary order was had in the Special Sessions Court on Dec. 4. It is expected that the decision of this court will be appealed to the Appellate Division and from there to the Court of Appeals, so that the judgment

of the court of last resort may be obtained. The application for the injunction is based upon the allegation that the provision of the labor law forbidding the employment of non-citizens upon public work is unconstitutional and a violation of the treaty between the United States and the Kingdom of Italy and similar treaties with other nations in the most favored nations class.

Reports Requested Regarding Seattle Purchase.—Preliminary to further consideration of the proposition for the purchase of the Seattle, Renton & Southern Railway by the city of Seattle for a consideration of $200,000 in municipal railway bonds and 20 per cent of the gross earnings for a period of twenty-eight years, payable annually, Mayor H. C. Gill recently conferred with the heads of the various departments of the city government on the various phases of the project. The Mayor has asked A. L. Valentine, superintendent of public utilities, to report on the cost of operation of the line by the municipality, the cost of such reconstruction as will be necessary in bringing the tracks to the established grades, and matters of like nature. A. H. Dimock, city engineer, has been requested to furnish an estimate of the cost of grading and regrading the 18 ft. of Rainier Avenue now occupied by the tracks of the Seattle, Renton & Southern Railway. J. D. Ross, lighting superintendent, will report on the estimated cost of current sufficient to operate the line in connection with Division A and the Highland Park & Lake Burien Line, Division C, as well as the advantages that will accrue to the light and power department by city operation of the line. James E. Bradford, corporation counsel, will report on the various suits against the Seattle, Renton & Southern Railway, now in court.

PROGRAMS OF ASSOCIATION MEETINGS

New England Street Railway Club

The regular monthly meeting of the New England Street Railway Club will be held at the American House, Boston, Mass., on Dec. 17. H. A. Bullock, staff assistant to the president of the Brooklyn (N. Y.) Rapid Transit Company, will speak on "The Employee's Welfare." His address will be followed by a discussion in which it is expected that representatives of large corporations in other kinds of business who have had extended experience along this line will take part. The dinner which precedes the meeting will be served at 6 p. m.

American Wood Preservers' Association

The eleventh annual convention of the American Wood Preservers' Association will be held at the Congress Hotel and Annex, Chicago, on Jan. 19, 20 and 21, 1915. The subjects to be treated in papers are as follows:

"Treated Timber for Factory Construction," by F. J. Hoxie, engineer and special inspector of the Associated Factory Mutual Fire Insurance Companies.

"Temperature Changes in Wood under Treatment," by George M. Hunt of the Forest Products Laboratory, Madison, Wis.

"Sill Ties," by F. J. Angier, secretary-treasurer of the association.

"New Data on Properties of Creosote Oil," by Dr. Herman von Schrenk.

"Facts on Treated Ties," by J. H. Waterman, superintendent of timber preservation of the Chicago, Burlington & Quincy Railroad.

"Bleeding and Swelling of Paving Blocks," by Clyde H. Teesdale, in charge of wood preservation at the Forest Products Laboratory, Madison, Wis.

"Economical Use of Steam in Connection with Wood Preserving Plants," by A. M. Lockett, mechanical engineer, New Orleans, La.

"A Problem in Air Seasoning Ties," by A. H. Noyes, assistant treasurer of the Ayer & Lord Tie Company.

Financial and Corporate

RECENT FINANCIAL TENDENCY

The sales of bonds on the New York Stock Exchange on Dec. 9 totaled $1,736,000, par value, as compared with $1,395,500, par value, for the same day last year. This is much the largest day's business in bonds since public trading was resumed. Price movements on the average showed a further gain, but there were reactions in some securities which have lately experienced unnatural advances. Despite the approaching opening of the Stock Exchange for trading in stocks, sterling rates remain normal. Money continues easy. It is not regarded as likely that rates will be materially affected by any borrowing which may be made following the reopening of the exchange for public trading in stocks. Trading in stocks through the clearing house, according to the reports issued on Dec. 9 by the New York Stock Exchange, presented many interesting features. The most important changes reported during the day were in the railroad issues.

CHICAGO TRACTION ACCOUNTING CONTROVERSY

The report of the special audit of the books of the Chicago Railways and the Chicago City Railway being made by the city administration has just been published. That for the Chicago Railways was made by M. & L. W. Scudder, of New York, and that for the Chicago City Railway by Barrow, Wade, Guthrie & Company. In both cases the books were found without important error. The corporation counsel of the city, however, has recommended certain changes in the accounts to which paving and the removal of obstructions should be charged, although both of these questions have either been covered by specific provisions in the ordinance or publicly discussed and decided by the Board of Supervising Engineers, which has had the sole authority under the ordinance in these matters. It has been estimated that these changes, if made, would reduce the Chicago Railways' capital account $6,945,130 and make it necessary to pay the city traction fund $584,264, and that the company should also credit its renewal account with $531,965, and, similarly, that the capital account of the Chicago City Railway would have to be reduced approximately $5,138,000.

Regarding this controversy Henry A. Blair is quoted as saying, in an interview, that the books of the two railway companies have been audited each year by accountants selected by the city and approved by the companies. Through these audits the city comptroller was familiar with the methods of the Board of Supervising Engineers in charging every item which is now sought to be questioned by the Mayor. On these audits the companies have made seven annual settlements with the city, having turned into the traction fund more than $13,000,000,

On the special audits during Mayor Busse's administration the city and the companies had expended approximately $100,000, of which the city has borne 55 per cent. In the audit just completed the city again appropriated $50,000 of its own funds for the work. It would seem that this constituted a liberal expenditure for auditing purposes. Moreover all these firms have reported that the railway companies were conforming to the terms of the 1907 ordinances and the decisions of the Board of Supervising Engineers. The accountants engaged on the work at the present time were not called upon to show what would have been the results of operation during this seven-year period if the companies had followed the ordinance and the decisions, but if they had followed the opinions rendered by corporation counsel. Mr. Blair did not consider these criticisms therefore worthy of serious consideration. Speaking from the standpoint of a financial representative he did not believe that the controversies of this nature were at all helpful either to the city or to the railway companies.

Mr. Blair is also quoted as saying that during the seven-year period the companies had never at any time earned more than a fair rate of return upon the capital fixed by the actual purchase price of the city. The rate of return has been about 7 per cent, which includes the 5 per cent return upon the purchase price, the companies' 45 per cent of the visible net receipts and all construction profits. This rate of return he stated was less than that earned by other public utilities in the city of Chicago.

ANNUAL REPORTS

Eastern Pennsylvania Railways

The consolidated statement of income, profit and loss of the Eastern Pennsylvania Railways, Pottsville, Pa., for the twelve months ended June 30, 1914, follows:

Gross earnings	$826,415
Operating expenses and taxes	503,487
Net earnings from operation	$322,928
Deduct underlying companies charges	45,525
Balance	$277,403
Interest on bonds	$164,863
Other interest and rentals	13,630
Total	$178,493
Surplus for year	$98,909

As compared with the year ended June 30, 1913, the gross earnings increased $56,735, or 7.37 per cent, and the operating expenses increased $67,483, or 15.48 per cent. The net earnings, therefore, decreased $10,748, or 3.22 per cent, while the net profit for the year decreased $19,463. The various departments showed the following earnings results: Railway, an increase of $13,576; electric, an increase of $43,415; gas, a decrease of $55, and park, a decrease of $201. The increased operating expenses were partly caused by higher cost of labor and extra maintenance. Railway maintenance increased by $23,900 to a total of $88,390 for the year, while the cost of transportation increased $13,000. There was charged to capital accounts during the year $115,689, of which $57,666 was for the railway department and $58,023 for the electric department.

San Francisco-Oakland Terminal Railways

Price, Waterhouse & Company recently completed an audit of the books of the San Francisco-Oakland Terminal Railways for the fiscal year ended June 30, 1914, and submitted the following income statement for that period:

Operating revenues		$4,515,798
Operating expenses:		
Maintenance of way and structures	$400,972	
Maintenance of equipment	284,081	
Traffic	25,398	
Conducting transportation	1,923,966	
General and miscellaneous	295,503	
Total operating expenses		$2,929,920
Net operating revenue		$1,585,878
Deduct:		
Taxes and licenses		239,000
Net revenue		$1,346,878
Add:		
Miscellaneous income		125,964
Net income before charging interest, amortization of premiums and discount on bonds and notes, and depreciation of road and equipment		$1,472,842
Deduct:		
Interest on bonds	$859,268	
Interest on collateral trust notes	175,000	
Miscellaneous	23,232	
Total		$1,057,500
Profit after charging all interest, but before providing for amortization of premiums, and discount on bonds purchased, and depreciation of road and equipment.		$415,342
Deduct:		
Amortization of premiums and discount on bonds purchased		10,491
Profit after charging all interest, but before providing for depreciation of road and equipment		$404,851
Add:		
Interest charged by company to capital assets		240,101
Balance carried to surplus account		$644,952

The operating expenses of the company for the fiscal year consumed 64.9 per cent of the operating revenues, divided as follows: maintenance of way and structures, 8.9 per cent; maintenance of equipment, 6.3 per cent; traffic, 0.6 per cent; conducting transportation, 42.6 per cent, and general and miscellaneous, 6.5 per cent. Taxes and licenses absorbed 5.3 per cent of the operating revenues, leaving net revenue of 29.8 per cent. Miscellaneous income constituted 2.8 per cent of the operating revenues, so that the net income before charging interest, amortization and depreciation was 32.6 per cent of the operating revenues.

The auditors report net additions to capital account of $510,927 for road and $105,923 for equipment, a total of $616,850. These amounts are those existing after considerable writing down of the value of land and writing off of the value of abandoned structures. The total amount of bonds outstanding as of June 30, 1914, is certified to amount to $16,656,000 in the hands of the public and $3,256,000 pledged as security for the Oakland Railway notes, making a total outstanding amount of $19,912,000.

The profit of $404,851 after charging all interest, including the interest properly chargeable to capital, does not provide for sinking fund payments. While amply able to maintain itself in excellent operating condition, therefore, the property evidently is not in a position to undertake new construction until, through refinancing, new capital has been obtained.

Barcelona Traction & Light Company, Barcelona, Spain.—Owing to the present European war, the Barcelona Traction, Light & Power Company was unable to meet the semi-annual interest coupons due on Dec. 1 on its outstanding £1,500,000 of first mortgage 5 per cent bonds. According to a statement from the Toronto office, the war has rendered it impossible to continue the arrangement made last June for providing the funds required for the completion of the present program of construction. The board, however, has under consideration a plan which would provide the company the necessary funds for completing the work under construction and for adjusting computing interest. The enterprises of the company at present in operation are said to show satisfactory results, with a steadily increasing revenue. This company was formed in 1911 by F. S. Pearson and associates and it either owns or controls virtually the entire tramway, light and power business of not only the city of Barcelona but the whole district of Cataluna, the industrial center of Spain.

California Street Cable Railroad, San Francisco, Cal.—J. Barth & Company, San Francisco, have purchased the $384,000 of new general first mortgage 6 per cent serial refunding gold bonds of the California Street Cable Railroad, dated Jan. 1, 1915, and due in twelve annual installments beginning Jan. 1, 1916, and ending Jan. 1, 1927. These bonds were referred to in the ELECTRIC RAILWAY JOURNAL of Oct. 31, Nov. 21 and Dec. 5.

Chicago (Ill.) Elevated Railways.—At the annual meeting of the Chicago Elevated Railways collateral trust the trustees reduced the governing board from seven to five members. Ira M. Cobe and F. A. Delano, who joined the Federal Reserve Board in Washington, withdrew. It was not thought necessary to fill their places. The board now stands: Frank A. Vanderlip, Henry A. Blair, Samuel Insull, E. W. Harden and Samuel McRoberts. The governing committee will elect the executive committee at a later meeting. There are three members of that body, Samuel Insull, Henry A. Blair and Ira M. Cobe. Mr. Cobe has tendered his resignation, but his successor has not as yet been selected.

Cumberland County Power & Light Company, Portland, Maine.—It was stated in the ELECTRIC RAILWAY JOURNAL of Nov. 21 that the Cumberland County Power & Light Company has certified and guaranteed, principal and interest, $500,000 of bonds of the York County Power Company, a subsidiary. Of this amount $315,500 are outstanding in the hands of the public, $150,000 are in the treasury of the Cumberland County Power & Light Company and $34,500 are in the treasury of the York County Power Company. The $315,000 outstanding includes $100,500 of bonds which have been exchanged for an equal amount of underlying liens. There has been no offering of these bonds.

Federal Light & Traction Company, New York, N. Y.—E. N. Sanderson, president Federal Light & Traction Company, has issued a circular regarding the recent deferring of dividends on the company's $2,500,000 of 6 per cent cumulative preferred stock, as noted in the ELECTRIC RAILWAY JOURNAL of Dec. 5. The net income of all companies for the twelve months beginning September, 1913,

is said to have been adversely affected by the disastrous fire at Hot Springs, the serious strike in the Trinidad coal fields, and the drastic rate schedules in Tucson, Ariz., and Springfield, Mo. In the opinion of the board, however, the turning point has been passed, and from now on the company will enjoy increased gross and net earnings. During the last twelve months the gross earnings showed an increase over the corresponding previous period, and only the net earnings suffered substantially from the adverse condition. Since July the net income has been constantly improving, so that during the three months ended Oct. 31 the dividend on the preferred stock has been more than earned.

Fresno (Cal.) Interurban Railway.—The Railroad Commission of California has granted the application of the Fresno Interurban Railway for permission to make three stock and bond issues to provide for twenty-six miles of new line at an estimated cost of $17,300 per mile.

Interborough Rapid Transit Company, New York, N. Y.—An extra dividend of 5 per cent has been declared on the $35,000,000 of stock of the Interborough Rapid Transit Company, along with the regular quarterly payment of 2½ per cent, both payable on Jan. 2 to holders of record on Dec. 21. Since the Interborough-Metropolitan Company owns $33,912,800 of the stock, its income from the extra disbursements is $1,695,640. The committee on listings of the New York Stock Exchange has received an application from the Interborough-Metropolitan Company to list $17,942,000 of 5 per cent cumulative preferred stock. This is the stock that was formerly in the hands of the voting trust and does not represent an increase in the capitalization of the company.

Joliet & Eastern Traction Company, Joliet, Ill.—The bondholders of the defunct Joliet & Southern Traction Company have almost unanimously decided to accept stock in the Joliet & Eastern Traction Company in exchange for their holdings. The formation of this new company was described in the Electric Railway Journal of Nov. 21. The greater part of the $80,000 fund paid into court during the period of bankruptcy of the Joliet & Southern Traction Company will be practically all turned into the treasury of the new company.

Kentucky Securities Corporation, Lexington, Ky.—The annual report of the Kentucky Securities Corporation for the fiscal year ended June 30 is made up principally of a report for the Kentucky Traction & Terminal Company and the Lexington Utilities Company, all the stocks of which are owned by the Kentucky Securities Corporation. The combined operating revenue of the two subsidiary companies, exclusive of inter-company charges, amounted to $782,272 for the last fiscal year, as compared to $742,884 for the previous year, an increase of 5.3 per cent. Operating expenses in the two years were $412,509 and $401,507, an increase of 2.7 per cent. Miscellaneous income increased from $29,941 to $32,022 and fixed charges from $225,268 to $245,184, while the final surplus increased from $146,049 to $156,600, or 7.2 per cent. The operating companies as of June 30 had a credit balance in the reserve for accidents and damages of $27,550, and it was directed that $24,000 should be credited to the depreciation reserve as of June 30. A fixed proportion of gross earnings is set aside monthly on account of maintenance, amounting for the current year to 16½ per cent.

Lehigh Traction Company, Hazelton, Pa.—The Lehigh Traction Company, reversing its previous decision as noted in the Electric Railway Journal of Nov. 28, paid on Dec. 1 the interest due on its first mortgage 5 per cent bonds. The protective committee representing the bondholders refused to accept the offer of President Markle to purchase the bonds for his personal account, as they had done in connection with the interest default on June 1.

Long Island Railroad, New York, N. Y.—The 5 per cent equipment trust series A of the Long Island Railroad, the authorization of which by the Public Service Commission for the Second District of New York was noted in the Electric Railway Journal of Oct. 24, consist of a total authorized issue of $1,060,000. Of this amount $1,050,000 is issued and outstanding. The trusts are dated June 1, 1914, and mature $106,000 on June 1, 1915, and June 1 of each succeeding year to 1923, inclusive, and $96,000 on June 1, 1924. The principal and the interest are payable in gold and are guaranteed by the Long Island Railroad. The cost of equipment is $1,175,262, of which the railroad has paid to the trustees $125,000.

Massachusetts Electric Companies, Boston, Mass.—George C. Lee has been elected a trustee of the Massachusetts Electric Companies, succeeding the late Gardiner M. Lane.

Massachusetts Northeastern Street Railway, Haverhill, Mass.—The Massachusetts Northeastern Street Railway on Nov. 28 filed a mortgage for $2,000,000 at Lawrence to the American Trust Company, Boston, Mass., as trustee. This mortgage takes the place of an original one issued in 1903 to the New York Trust Company, New York, which is discharged. The filing of the new mortgage simply provides for a change in the fiscal agent of the corporation.

Mexico Tramways, Mexico City, Mexico.—Officers of the Mexican Light & Power Company, a subsidiary of the Mexico Tramways, recently notified the holders of the $9,733,333 of second mortgage fifty-year sinking fund bonds that the payment of the interest coupons due on Dec. 1 would be deferred. The rate of exchange has been falling continuously in the last few months and the Mexican government officials, who are now in control of the operations of the Mexico Tramways, have prohibited further remittance of funds from Mexico until the rate of exchange improves.

New York (N. Y.) Railway.—At the annual meeting of the New York Railways on Dec. 7 Darwin P. Kingsley, F. S. Witherbee, Henry Ollesheimer, F. L. Leland and J. C. Cobb were elected directors to represent the holders of the 5 per cent income bonds. Harry Bronner, Guy E. Tripp, A. J. Hemphill and E. S. Marsten retired. Mr. Cobb was reelected. A statement of the company's income for the four months ended Oct. 31, last, was read by T. P. Shonts, president. It showed that the gross revenue for the period, October being partly estimated, was $4,618,000, as against $4,828,000 last year, and a surplus over interest charges available for the income bonds of $425,000, against $508,000 last year. The so-called Kingsley insurance company interests already have a suit pending in the courts to decide what constitutes a proper allowance for injury and damage claims or whether or not all surplus revenue not actually paid out in any given year shall be applicable to the adjustment of income bonds. The contention of certain bondholders has been that all surplus revenues not actually paid out during any year should be applicable to the payment of interest on the income bonds. Darwin P. Kingsley is president of the New York Life Insurance Company, F. S. Witherbee is a director of the Equitable Life Assurance Society. Henry Ollesheimer is vice-president of the Metropolitan Bank, New York, F. L. Leland is president of the New York County Bank, and J. C. Cobb resides in Boston. The movement to change the present income bondholders' representation on the board has been under way for a year. A total of $18,000,000 of bonds was voted, of which the so-called Kingsley committee cast $14,000,000 and the so-called Hemphill committee $4,000,000.

Oakland, Antioch & Eastern Railway, Oakland, Cal.—The Railroad Commission of California has rendered a decision authorizing the Oakland, Antioch & Eastern Railway to issue promissory notes of the total face value of $295,345. It is made a condition of the commission's order that these notes shall bear interest at not to exceed 7 per cent per annum.

Rochester Railway & Light Company, Rochester, N. Y.—The Rochester Railway & Light Company has been authorized to issue $250,000 of its 5 per cent fifty-year consolidated trust mortgage bonds for the purpose of refunding a like amount of the underlying bonds of the Brush Electric Light Company, maturing on Jan. 15, 1915. The new bonds are to be sold or exchanged at not less than 95. Should the holders of the underlying bonds not prove willing to exchange for the new bonds at not less than 95, the company has been authorized by the Public Service Commission of the Second District of New York to enter into agreement with such holders whereby an extension of the time for the

payment of the principal may be obtained for one year at an increase from 5 per cent to 6 per cent in interest during that time on the old bonds.

Springfield (Mass.) Street Railway.—The Springfield Street Railway has applied to the Massachusetts Public Service Commission for authority to issue $1,041,000 of additional stock at 110 to pay floating debt. This is part of an issue of $1,290,000 authorized by the stockholders. There is now $3,708,100 of stock outstanding.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.—E. W. Clark & Company, Philadelphia, Pa., are offering for subscription $1,118,000 of St. Joseph Railway, Light, Heat & Power Company 6 per cent sinking fund trust stock certificates due on May 30, 1917, and redeemable at par and accrued dividend on any dividend date. The certificates will be issued by the Guaranty Trust Company, New York, as trustee under an agreement with the Cities Service Company. This agreement provides for the deposit with the trustee of 31,948 shares out of a total of 35,000 shares of the common stock of the St. Joseph Railway, Light, Heat & Power Company. A sinking fund will operate monthly to retire certificates before maturity. The rate at which this fund will work will be $450,000 a year, giving the issue an average life of not more than fifteen months. If the certificates are not obtainable for purchase for the sinking fund at par and accrued dividend or better in the open market, they will be called by lot monthly. All certificates taken up in the sinking fund will be cancelled. The certificates are being offered at 97½ and accrued dividend, yielding more than 7 per cent to maturity and more than 8 per cent on their average life.

Toronto (Ont.) Railway.—William A. Read & Company, New York, N. Y., have sold $1,500,000 of 6 per cent gold bonds of the Toronto Railway, dated Dec. 1, 1914, and due half on Dec. 1, 1915, and half on Dec. 1, 1916, at 100¼ for the former and par for the latter. The purchase of these notes by the bankers was noted in the ELECTRIC RAILWAY JOURNAL of Dec. 5.

Washington Railway & Electric Company, Washington, D. C.—Notice has been served on the Washington Railway & Electric Company that because the purchase by the company of 740 shares of stock of the Washington & Rockville Railway was not authorized in writing by the Public Utilities Commission that body recognizes the transaction as void. The purchase was made from the Potomac Electric Power Company for a consideration said to have been $37,000.

West End Street Railway, Boston, Mass.—The Massachusetts Public Service Commission has received an application from the West End Street Railway for authority to sell at public auction the $650,000 of stock authorized by the stockholders on Nov. 24, as noted in the ELECTRIC RAILWAY JOURNAL of Nov. 28.

Wisconsin-Minnesota Light & Power Company, Eau Claire, Wis.—The Railroad Commission of Wisconsin has authorized the Wisconsin-Minnesota Light & Power Company, a subsidiary of the American Public Utilities Company, to issue preferred stock to the amount of $367,000 and common stock to the amount of $244,000. The company has authority to issue $300,000 in preferred and $200,000 in common stock for the purpose of acquiring the property of the Winona Gas, Light & Coke Company, Winona, Minn., the Red Wing, Gas, Light & Power Company, Red Wing, Minn., the Minnesota-Wisconsin Power Corporation, which furnished electric light to Wabasha and Lake City, Minn., and the Eau Claire Gas Light Company. Under this authorization, stock to the amount of $94,000 may be issued for improvements and extensions to the plants, and preferred stock to the amount of $17,000 may be issued to acquire all property including the accounts receivable of the Neillsville (Wis.) Electric Company.

Worcester (Mass.) Consolidated Street Railway.—The Worcester Consolidated Street Railway has applied to the Massachusetts Public Service Commission for authority to issue $1,880,000 of additional stock to pay floating debt. This is part of an issue of $2,350,000 authorized by the stockholders. The amount of stock already outstanding is $5,112,000.

DIVIDENDS DECLARED

Arkansas Valley Railway, Light & Power Company, Pueblo, Col., quarterly, 1¾ per cent, preferred.

Brazilian Traction, Light & Power Company, Toronto, Ont., quarterly, 1½ per cent, preferred.

California Railway & Power Company, San Francisco, Cal., quarterly, 1¾ per cent, prior preferred.

Cleveland (Ohio) Railway, quarterly, 1½ per cent.

Columbus (Ga.) Electric Company, 3 per cent, preferred.

Continental Passenger Railway, Philadelphia, Pa., $3.

Eastern Power & Light Corporation, New York, N. Y., quarterly, 1½ per cent, preferred.

Indianapolis (Ind.) Street Railway, 3 per cent.

Manila Electric Railroad & Light Corporation, Manila, P. I., quarterly, 1¾ per cent.

Union Traction Company, Philadelphia, Pa., $1.50.

United Light & Railways Company, Grand Rapids, Mich., quarterly, 1½ per cent, first preferred quarterly, three-fourths of 1 per cent, second preferred.

United Railways & Electric Company, Baltimore, Md., 2 per cent, preferred.

United Traction & Electric Company, Providence, R. I., quarterly, 1¼ per cent.

West End Street Railway, Boston, Mass., $2, preferred.

Traffic and Transportation

AUTO BUS COMPETITION IN SOUTHERN CALIFORNIA

Auto Bus Invades San Francisco—Los Angeles Railway, Losing $600 a Day, Has Withdrawn Twenty-One Cars

The "jitney" bus, as the nickel-a-passenger automobile is popularly referred to in southern California cities, has invaded San Francisco. On Dec. 1 six automobiles were put in regular service on Market Street, carrying passengers between the ferry and outlying points for 5-cent fares. As yet no special license has been placed upon these vehicles in San Francisco, but the fact that in that city they will be in competition with a municipal street railway may present the matter in a new light. While an increase in local passenger capacity during the exposition would be welcomed it is conceded that enfranchised street railways should not be deprived of their most profitable traffic by companies free from any obligation to serve in unprofitable districts and that automobiles should be subject to regulation, including a guarantee for damages in case of accident.

Long Beach, Cal., recently imposed a license fee of $25 a year on the "jitney" buses, compels the taking out of a $10,000 liability insurance for every car engaged in transporting passengers, and requires the buses to operate over designated routes and maintain reasonable schedules. On the day that this ordinance went into effect only forty-one out of 130 automobiles carrying passengers in competition with the street cars were continued in service. Prior to the passage of this ordinance in Long Beach the Pacific Electric Railway threatened to discontinue its East Ocean Avenue line altogether unless some regulation was placed upon the 5-cent automobile. Legislation is still pending on the matter in Los Angeles. According to the Los Angeles Railway Corporation its loss in revenue on account of the automobile competition amounts to $600 a day, and has caused the company to withdraw twenty-one cars on six lines and eighty-four motormen and conductors. Up to Dec. 1 the secretary of the Los Angeles police commission had issued a total of 1520 permits to chauffeurs to operate auto buses in competition with street cars, and that the rate of increase is rapid is shown by the record of over sixty additional permits issued on Dec. 2.

So serious has the auto bus matter become in Los Angeles that on Dec. 4 the directors of the local association of merchants and manufacturers addressed a letter in part as follows to the City Council:

"We believe that the time has arrived when your honorable body should take some action regulating the passenger traffic of the 5-cent automobile buses. If these buses can run through the city without proper regulation and protection to the lives of not only patrons but the public in general, we will soon be confronted with a number of accidents. In addition, with several hundred of these buses running up and down the main streets the traffic congestion is greatly increased, and the progress of other machines correspondingly retarded. To allow these machines unrestricted freedom is a menace to the entire community, and we believe that no good reason exists why they should not be placed under strict traffic regulations, and we therefore request that this matter receive the early attention of your honorable body."

NEW COMPANY PUBLICATION

The Hudson & Manhattan Railroad, which operates under the Hudson River between New York and New Jersey, has begun the publication of the *H. & M. Review*. The first issue, dated December, contains eight pages, 6 in. x 9 in. in size. In an article entitled "Object and Future of the *H. & M. Review*," Wilbur C. Fisk, president of the company, says in part:

"The need has been felt for months back for a means of intercommunication between all of us who are employed by the company and also between the departments to which we may be assigned. To accomplish this end, it has finally been decided to issue the *H. & M. Review*.

"The prime purpose to be achieved by the publication is the further promotion and cementation of the good fellowship already existing among the employees of the company. This can only be achieved by the hearty cooperation of all and by keeping the editor posted on all news items which are entitled to publication. The editor will always welcome contributions, but will not publish anything not prompted by the best of motives.

"It must not be forgotten that at times the company and your president may have a message which is meant for all of you, and the columns of the *Review* will be open to any officer of the company who has a message, either for the men of his own department, or which he believes will be beneficial to all. It is needless to say that events occurring during any one month will be faithfully reported in the paper.

"I earnestly request not only the officers but all employees of the company to lend the editor their assistance in his efforts to make the *Review* of real value."

The editor of the *H. & M. Review* is J. J. Scovern.

INTERURBAN SAFETY

The Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, of which E. F. Schneider is general manager, is continuing unabated its campaign of safety begun more than five years ago. The custom of the company has been to cover each year the entire system of 250 miles with talks to the 63,000 school children in the territory contiguous to the company's lines. Ben B. Casson of the company in a talk which he delivered recently to the grammar and primary grade pupils at the German Lutheran Parochial School at Elyria, Ohio, reviewed the activity of the company along these lines. In addressing the grammar grade pupils he said that in the year prior to the inauguration of the safety movement eleven children were injured and three killed, but that since then not a child had been injured or killed while going to or from school. He impressed the children with the necessity of exercising care not only as regards street cars but also as regards automobiles, motorcycles, wagons, bicycles and steam railroads. He emphasized the sad task which confronts the officers of the company in going into the homes of parents of children who had been injured or killed and witnessing the grief in the household. Mr. Casson also reviewed his own experiences during the four years that he operated a car over the Cleveland, Southwestern & Columbus Railway. The great problem before the American people to-day was the preservation of the lives of the people. He advised the school children to discuss safety among themselves and suggested similar discussions in the homes. The address to pupils of the primary grade was, of course, a modification of the one made to the grammar grade pupils. Heretofore the safety addresses to the school children have been made by officers of the company. Mr. Casson is a motorman, and his talks have presented a different viewpoint, and possibly for this reason have been especially valuable.

COMPLYING WITH THE NEW REVENUE PROVISION

A circular letter sent out several days before Dec. 1 to the regular shippers over the Louisville & Interurban Railroad, and a supply of stamps laid in by R. H. Wyatt, general freight and passenger agent of the company, enabled that company to start out under the new revenue tax on the first of the month without confusion. The circular letter reviewed briefly the nature and purposes of the revenue measure, explained what were the duties of the shippers, and then added that for the convenience of the patrons of the Louisville & Interurban Railroad stamps had been supplied to all conductors on freight trains, to agents of the company wherever stations were maintained and that the company would gladly obtain for shippers such supplies of stamps as they needed for use in shipments over its lines. As a consequence every shipper knew beforehand just what was expected of him, as, in addition, copies of the letters which were sent out were posted prominently at every shipping point. The company will continue, while the law is in effect, to have conductors and the various freight offices handle stamps for use of the shippers. Since postmasters are not paid for handling the stamps many of them are refusing to do so. The service which the company has installed in regard to stamps also enables the company to keep its records free from charge accounts of numerous shippers with small entries relating to the stamps.

Lifting Jacks in Pennsylvania.—The Lehigh Valley Transit Company, Allentown, Pa., has equipped all of its cars with lifting jacks conforming with the Pennsylvania statute effective on Dec. 1. The jacks are slung on special hang-

ers from the sides of the cars, and special instructions have been issued to the employees on the handling of the jacks in case of personal injury or derailment.

Increase in Fares in Eastern New Jersey.—The proposed increase in fares between Atlantic City and Pleasantville, N. J., referred to in the ELECTRIC RAILWAY JOURNAL of Dec. 5, page 1274, does not apply to the Atlantic City & Shore Railroad. The steam roads operating between the points mentioned plan, however, to put a higher rate of fare into effect on Dec. 15.

Serious Accident on New York Elevated.—In a rear-end collision between two northbound trains on the Ninth Avenue line of the Manhattan Elevated Railway in New York at 116th Street and Eighth Avenue at 6:30 p. m. on Dec. 9, two men were crushed and received burns from which they died, and more than a score of others were injured in the panic which ensued.

Vermont Fare Matter.—The Barre & Montpelier Traction & Power Company, Montpelier, Vt., has filed with the Public Service Commission of that State a proposed tariff increasing the fare over the line between the cities from 10 cents to 15 cents. The Supreme Court of the State recently held that the company was required to maintain a fare not to exceed 5 cents within the limits of each of the cities in which it operates.

Commutation Fare Order.—The Public Service Commission of Missouri on Dec. 7 issued an order to the Kansas City, Clay County & St. Joseph Railroad to begin on Jan. 1, 1915, issuing commutation tickets on definite rate schedules established by the commission, which figure out at about 1.1 cents per mile. Five days from the receipt of the order are allowed for an answer, which will carry until Dec. 14. A request for a rehearing is to be filed.

Car Advertising in Toronto.—Despite the objection of Works Commissioner Harris the Board of Control of Toronto, Ont., has decided to permit street car advertising in the cars on the city's own line. Last spring the commissioner reported against the proposal and it was dropped for the time being. It has been recommended that the contract be awarded to the Canadian Street Car Advertising Company.

Time-Table Prize.—The offer of a $25 prize for the best time-table to be submitted by one of its trainmen, which was published in the September number of the *United Railroads Magazine*, published by the United Railroads, San Francisco, Cal., aroused considerable interest and resulted in five time-tables being submitted by four contestants, one of whom submitted two tables. The prize was awarded to D. W. Sutlief, a conductor in the Twenty-eighth Street carhouse.

Far-Side Stops at Rock Island.—The City Council of Rock Island, Ill., insists that the Tri-City Railway discontinue the near-side stop and adopt the far-side stop. A plan to stop on the far side was suggested by John G. Huntoon, the general manager of the company, a year ago, but the people of Davenport did not favor the change and the matter was dropped. Now the cities of Rock Island and Moline are insisting on the far-side stop, irrespective of the attitude of the city of Davenport toward the proposal.

Company Relations in Galveston.—For many years the Galveston (Tex.) Electric Company has required a deposit of $30 from each of its trainmen as an assurance of good faith. A new policy, however, is now being put into effect. The deposits are being returned to the trainmen and 6 per cent interest is being paid each man for the time the money has been on deposit. The records for most of the deposits date back no further than 1900. Under the new plan the company has its trainmen under bond, the company itself paying the premium.

Market Transfers.—The Edmonton (Alberta) Radial Railway has adopted a special "market transfer," in order to promote business at the newly-opened civic market. Passengers going direct to the market, on market days, receive a "market transfer," which enables them to make the return trip on a single fare. J. H. Larmouth, superintendent of the railway, a municipal line, is reported to have expressed the opinion to the civic authorities that a portion of the cost of the transfer should be borne by the market committee of the City Council.

Transfer Changes in Savannah.—With a view to giving additional transfer privileges to its patrons, the Savannah (Ga.) Electric Company put into effect on Dec. 1 certain changes in its transfer system. Several important transfer points have been relocated and the system of issuing transfers as regards these points has been changed. The company asked the co-operation of its patrons in inaugurating the changes and announced that misunderstanding regarding the changes would be explained over the telephone or in person at the company's office.

Police in Safety Campaign.—The city of Montreal, Que., has decided to co-operate with the Montreal Tramways in the "safety first" campaign inaugurated by A. Gaboury, superintendent of the company. The chief of police is to work with Mr. Gaboury, and later a committee of civic officials is to be formed to study the entire question as it relates to Montreal. The chief of police has sent out thousands of circulars to owners of vehicles referring to the urgency of observing traffic regulations and making suggestions as to how to avoid accidents.

Height of Steps in New Hampshire.—The Public Service Commission of New Hampshire held a hearing in Concord on Dec. 1 to determine whether steps on the electric cars in the State are reasonably safe and low. Various estimates of the cost of changing the height of steps were made. They ranged from $30 to $150 a car, according to the rolling stock operated. All of the roads were represented except the Concord & Manchester Electric Branch of the Boston & Maine Railroad, which has already complied with an order of the commission in regard to steps.

Operating Changes in Vancouver.—Several of the city lines of the British Columbia Electric Railway in Vancouver, B. C., have been rerouted in order to provide greater economy of operation and still meet existing traffic conditions. The general plan affects the service on stub lines slightly. The company's owl service is also being operated in closer accordance with traffic requirements. The trainmen have made an arrangement among themselves providing for a certain lay-off each week in order to enable a larger force to be kept on than would otherwise be possible.

"Safety First" in St. Louis.—Bruce Cameron, superintendent of transportation of the United Railways, St. Louis, Mo., is quoted as follows in regard to the "safety first" campaign of the company: "I believe when the public has been impressed fully with the necessity for caution, we will find the number of persons injured in street car accidents far less than heretofore. There seems to be a general disposition to heed the warning of our signs. If wagon drivers will obey the traffic laws and pedestrians cross the streets only at street corners, instead of in the middle of the block, we will have few accidents."

Not Within Commission Jurisdiction.—Chairman McCall of the Public Service Commission for the First District of New York replied on Dec. 9 to Health Commissioner Goldwater of New York, who had written to the commissioner calling attention to alleged unsanitary conditions on the transit lines due to overcrowding. Mr. McCall pointed out that breathing, coughing and sneezing by persons in the cars were not matters subject to the jurisdiction of the Public Service Commission, and referred to the expenditure of $325,000,000 now being made for rapid transit lines intended to relieve the congestion of which Dr. Goldwater complained. There has been considerable other gentle persiflage in this connection recently.

Hunters Beware.—An appeal to hunters to be careful in handling firearms while on street cars has been made by the Detroit (Mich.) United Lines based upon a bulletin to conductors issued by the operating department. The bulletin follows: "Attention is called to the matter of firearms, particularly guns used for hunting purposes, carried by passengers. If at any time a passenger is examining a firearm, or handling it carelessly, or in such a way that it might imperil the lives of other passengers, caution him to desist and explain that this is a rule of the company for the protection of passengers. Also, so far as a conductor is able to do so, he must see that firearms carried by passengers are not loaded."

Passengers Carried in Greater New York.—The number of passengers using the transit systems of Greater New York for the year ending June 30, according to tables compiled by the Public Service Commission of the First District of New York, was 1,813,204,692, an increase over the previous twelve months of 43,328,184. They paid out in fares $89,361,262. The number of passengers carried by the Brooklyn Heights Railroad, the principal surface railway subsidiary of the Brooklyn Rapid Transit Company, fell off by 1,140,585, by the New York Railways by 1,742,267. The Second Avenue Railroad carried 858,189 fewer passengers than the year before, the Third Avenue 75,039, the Forty-second Street, Manhattanville & St. Nicholas Company lost 175,443, and the Dry Dock, East Broadway & Battery Company 1,297,743 passengers.

Chicago Drafts Electric Railway Freight Ordinance.—In an effort to further the recommendations of the Chicago Municipal Markets Commission relative to the advantage of permitting all the electric railways which enter Chicago to handle freight, an ordinance granting this privilege is being prepared. At a preliminary conference between a sub-committee of the Chicago City Council's local transportation committee, the officials of the surface and elevated lines, representatives of the city law department and the Chicago Municipal Markets' Commission, the preliminaries were arranged. According to the city legal department there was nothing to hinder the electric lines from carrying freight within the corporate limits. Upon being questioned regarding their attitude toward a proposition including the right to carry freight, the representatives of the surface and elevated lines expressed a willingness to co-operate in the matter.

Ten Months of Safety in Detroit.—W. C. Cann, chairman of the general safety board of the Detroit (Mich.) United Railway, reports that during the first ten months of this year more than 900 safety suggestions were submitted to the division and general safety board and that favorable action has been secured on 95 per cent of the suggestions. So far this year the number of cars in collision has decreased 47.7 per cent, derailments 7.7 per cent, running over crossings 30 per cent, and passengers hurt in boarding and alighting 32 per cent. The only reports showing any appreciable increase are those covering automobiles struck. These have increased 30.9 per cent. Mr. Cann expresses the opinion that the showing which the company had made in decreasing all accidents other than those in which automobiles are involved indicates that the burden of responsibility for the increase of automobile accidents is on the automobile driver and not on the men operating the street cars.

New Traffic Ordinance in Canton.—A new traffic ordinance was passed by the City Council of Canton, Ohio, on Nov. 9. It is provided that automobiles and horse-drawn vehicles shall cross the center of the intersecting street before turning into it rather than follow a diagonal course from one street into the other. No person under sixteen years of age shall be allowed to operate a motorcycle or automobile on the streets of the city. There are strict regulations with regard to automobiles being allowed to stand along the curb in the business district. A rate of speed exceeding 15 m.p.h. is to be taken as evidence of careless driving, and a rate of speed exceeding 20 m.p.h. is prohibited. Drivers of vehicles passing a street car stopping to discharge or to take on passengers, when said vehicle is going in a direction opposite to that from which the street car is moving, shall slow down and exercise due care so as not to endanger the safety of pedestrians. The driver of every vehicle approaching a street car stopping for the purpose of taking on or discharging passengers shall give some signal plainly visible or audible to such passengers, and shall keep such vehicle at least 6 ft. from the running board or lower step of such car. If it is not possible to preserve such distance from such running board or lower step, the driver or operator shall stop until the street car has again started. All vehicles upon a track in front of a street car shall turn out upon the near approach of the car. The penalty for violating the traffic ordinance is a fine not to exceed $100 and costs. In the section regulating the movement of pedestrians, it is provided that pedestrians shall have the right-of-way over drivers of vehicles at street crossings only.

Personal Mention

Sir George S. Gibb, chairman of the Metropolitan District Railway, London, has been appointed a civil member of the Army Council and will be charged with the supervision of army contracts.

Mr. J. M. Tomlinson, acting vice-president and general auditor of the New York, New Haven & Hartford Railroad since the retirement of Mr. H. M. Kochorsperger, vice-president, has been elected vice-president and comptroller of the company.

Mr. A. Mackrille, assistant general auditor, has been appointed general auditor of the New York, New Haven & Hartford Railroad with office at New Haven, and Mr. T. M. Prentice, assistant auditor, has been appointed auditor of the company with office at New Haven.

Mr. C. C. Collins has resigned as traffic manager of the Lehigh Valley Transit Company, Allentown, Pa., effective on Jan. 1, 1915. Before becoming connected with the Lehigh Valley Transit Company Mr. Collins was traffic manager of the Western Ohio Railroad, Lima, Ohio.

Lieutenant-Colonel G. S. Rennie, M.D., surgeon in chief of the Dominion Power & Transmission Company, Hamilton, Ont., and the Toronto, Hamilton & Buffalo Railway, will be in command of one of the field artillery batteries being mobilized in Toronto for overseas service.

Mr. Daniel L. Turner, deputy engineer of subway construction of the Public Service Commission of the First District of New York, has been appointed to serve on the advisory commission on city planning, which is to assist and co-operate with the committee on city plan of the Board of Estimate, New York City.

Mr. A. E. Beck, one of the permanent counsel of the British Columbia Electric Railway, Vancouver, B. C., and its claim agent, will leave the company's service at the end of the year to practice law on his own account in Vancouver. The company's legal and claims departments will be consolidated under the control of the other permanent counsel, Mr. V. Laursen.

Mr. C. H. Christensen has been appointed manager of the Missoula (Mont.) Street Railway, the Missoula Light & Water Company and the Clark Missoula Power Company, to succeed Mr. George R. Brown, deceased. Mr. Christensen has been connected with the Missoula Light & Power Company in various capacities for twenty years. During the last four years he held the position of superintendent of the Missoula Light & Water Company's Bitter-Root Valley System.

Mr. W. O. Demoss, who has been appointed master mechanic of the Wilmington & Philadelphia Traction Company, Wilmington, Del., and the Southern Pennsylvania Traction Company, was for ten years foreman of the West Baltimore Street and the Retreat Street carhouses of the United Railways & Electric Company, Baltimore, Md. On Feb. 27, 1911, he became maintenance foreman of the Delaware Avenue carhouse of the Wilmington & Philadelphia Traction Company and in March, 1912, was appointed general foreman of the Wilmington shops of the latter company.

Mr. John W. Graham, Twin Falls, Idaho, will fill the vacancy left on the Idaho Public Utilities Commission by the recent resignation of Judge D. W. Standrod. Mr. Graham has been practicing law in Idaho for the last four years. He is forty-one years of age and a native of Canada, but was educated at the University of Nebraska. He practiced his profession in Fremont, Dodge County, Neb., and was for four years prosecuting attorney of that county, and had altogether fifteen years' experience as a lawyer. The appointment which he has just accepted will hold until January, 1919.

Mr. H. R. LaMontagne has been appointed general agent of the express department of the Worcester (Mass.) Consolidated Street Railway to succeed Mr. F. E. Wood, whose appointment to the Cumberland County Power & Light Company, Portland, Maine, is referred to elsewhere in this column. Mr. LaMontagne entered the service of the passenger department of the Worcester Consolidated Street

Railway after graduation from a technical school. Later he became connected with the freight department, finally being made traveling auditor, from which position he was appointed to succeed Mr. Wood.

Mr. M. H. Bronsdon, chief engineer of the Rhode Island Company, Providence, R. I., from March, 1907, until August, 1912, has returned to that post, succeeding Mr. William Pestell, who recently resigned to accept a position with the B. F. Sturtevant Company of Boston, at Chicago. Mr. Bronsdon has been doing general engineering work in San Francisco since leaving Providence. Mr. Bronsdon was born in San Francisco and he had his first experience in engineering construction on a cable road in Los Angeles. In 1889 he became superintendent of the Providence Cable Tramway. He later was chief engineer at the Eddy Street power plant in Providence, having charge of the installation there. He later went to Duluth as designing and construction engineer of the Duluth-Superior Traction Company, and was afterward appointed engineer for the Old Colony Street Railway, Boston, Mass. His next engagement was with the United Railroads, San Francisco, where he remained until March, 1907, when he succeeded Mr. Fred N. Bushnell as chief engineer of the Rhode Island Company.

Mr. M. A. Tatum, who was appointed superintendent of the southern division of the Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, recently, began his career in electric railway work in the express and freight department of the Eastern Ohio Traction Company in 1905. In 1906 he resigned this position to enter the engineering department of the Roberts & Abbott Company, Cleveland. About a year later he accepted a position with the Washington, Baltimore & Annapolis Railroad as clerk to Mr. W. E. Slaughter, the superintendent. After the electrification of the road and the completion of the main line between Washington and Baltimore in 1908, Mr. Tatum was appointed clerk to Mr. Joseph O'Hara, superintendent of transportation. During 1909 he was employed in the carhouses and substations of the company, and in 1910 he was made inspector at Washington. During 1911 and 1912 he occupied the position of trainmaster and in 1913 he became general passenger and freight agent of the road. He resigned from the company in September to become connected with the Cleveland, Southwestern & Columbus Railway.

Mr. F. E. Wood has been appointed general freight agent of the Cumberland County Power & Light Company, Portland, Maine, operating the Portland Railroad and the Lewiston, Augusta & Waterville Street Railway. Mr. Wood entered the service of the Springfield (Mass.) Street Railway in 1909 and worked in the repair shop and the pit. Subsequently he entered the express department as general clerk and spare messenger. In February, 1910, on the opening of the express service on the Interstate Consolidated Street Railway operating through Attleboro and North Attleboro, Mass., to Providence, R. I., over the Rhode Island Company's line, Mr. Wood accepted the position of agent at Attleboro in charge of that division. This express service was later extended over the Milford, Attleboro & Woonsocket Street Railway, operating through Franklin and Milford, Mass. In March, 1912, he was transferred to Worcester, Mass. Express service was established on the Worcester Consolidated Street Railway in December, 1912, and in 1913 Mr. Wood was appointed general agent of the Worcester Consolidated Street Railway with headquarters at Worcester and jurisdiction over all the lines previously mentioned, together with the Springfield Street Railway. He resigned from the Worcester Consolidated Street Railway on Nov. 28, 1914, to become connected with the Cumberland County Power & Light Company. Before Mr. Wood left Worcester a banquet was tendered to him at the Hotel Bancroft, that city, by his fellow employees and he was presented with a watch fob by them as a token of their esteem.

OBITUARY

Morris G. Condon, president of H. B. Underwood & Company, Philadelphia, Pa., machinists and engineers, who was shot by an intruder in his room in the Hotel Adelphia in that city on Nov. 25, died from the effects of his wound.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Edmonton Northwestern Radial Railway, Edmonton, Alta.**—Application for a charter has been made by this company in Alberta to build an interurban electric railway from Edmonton northwest to the Pembina River. Messrs. Short, Woods, Bigger & Collison, 14 Howard Avenue, Edmonton, are said to be interested in the project.

***Albion, Charlotte & Northern Railway, Lansing, Mich.**—Chartered in Michigan to build a 53-mile electric railway. Capital stock, $100,000.

***Shelby (N. C.) Northern Railway.**—Chartered in North Carolina to build an electric or steam railway from Shelby to Casar, via Beams, Mills, Fallston, Belwood, Boggs and Warlicks. Capital stock, $400,000. Incorporators: S. S. Royster, Shelby, president, and L. M. Elam, Shelby, secretary and treasurer.

FRANCHISES

Calgary, Alta.—The Chestermere & Calgary Suburban Railway has received an extension of time on its franchise for the completion of its line in Calgary.

Vallejo, Cal.—A. D. Bowen, representing the Benicia Land & Terminal Company, will ask the Council for a franchise to build an electric railway in Vallejo. This is part of a plan to build an electric line to connect Benicia and Vallejo. [E. R. J., Oct. 24, '14.]

Tarpon Springs, Fla.—James H. Murphy, St. Petersburg, has asked the Council for a franchise in Tarpon Springs.

Macon, Ga.—The Macon Railway & Light Company has asked the Council for an extension of time on its franchise in which to remove its tracks from the south side of Tattnall Square Park to the center of College Street in Macon.

***Lewiston, Idaho.**—The State Highway Board has voted approval of a franchise to A. G. Nortz, Lewiston, to build an electric railway across interstate Lewiston-Clarkston bridge.

St. Peter, Minn.—The Electric Short Line Railroad has accepted the forty-nine-year franchise granted it by the Council in October for the use of so much of the levee as lies east of Front Street, between Chestnut Street and Park Row Street, and also to build a line along the entire length of Front Street to the north city limits of St. Peter.

Lockport, N. Y.—The Niagara River & Eastern Railroad had asked the Council for a franchise to use certain streets in the east and south of Lockport to build a line to connect the Buffalo, Lockport & Rochester Railway and the International Railway lines with a new line into Niagara Falls. [E. R. J., Oct. 17, '14.]

Youngstown, Ohio.—The Mahoning & Shenango Railway & Light Company has asked the Council for a franchise to extend its Mahoning Avenue line to Perkins Corners in Youngstown.

Cincinnati, Ohio.—The Street Railway Committee of the Cincinnati City Council has recommended the ordinance granting a twenty-five-year franchise to the Cincinnati, Newport & Covington Railway to be advanced to a second reading, following which a public hearing will be called to discuss its merits.

Cleveland, Ohio.—Mayor Baker of Cleveland has signed the amended franchise granted by the Council to the Cleveland & Youngstown Railroad to make certain necessary changes in its grade. [E. R. J., Oct. 5, '14.]

Findlay, Ohio.—The City Council of Findlay has before it ordinances giving the Toledo, Bowling Green & Southern Railway a twenty-five-year franchise on its streets and also a franchise for furnishing current for light and power purposes. They provide that the company shall pay to the city 2 per cent of the gross receipts from the business.

Guelph, Ont.—The Board of Railway Commissioners has authorized the Guelph Radial Railway to construct an inter-

change track with the Grand Trunk Railway on Suffolk Street, Guelph.

Medford, Ore.—S. Bullis, of the Southern Oregon Electric Railway Company, has asked the City Council and the Southern Pacific Railway Company for permission to cross the tracks of the Southern Pacific on Main Avenue. In case the Southern Pacific refuses to grant the request for crossing rights, the application will be presented to the State Railway Commission for final settlement. An extension of not less than 3500 ft. will be made as soon as the preliminary details are settled.

Philadelphia, Pa.—Peter E. Costello, Philadelphia, has received a franchise from the Council for a two-track elevated railway from Front Street and Arch Street to Rhawn Street, Holmesburg.

Montreal, Que.—The Montreal & Southern Counties Railway has received an extension of time on its franchise in which to complete its lines in Montreal.

Beaumont, Tex.—A petition was presented to the City Council asking that the Council take steps to induce the extension of the Beaumont Traction Company's line to the Magnolia Petroleum Company's refinery south of Beaumont.

Seattle, Wash.—The Puget Sound Traction, Light & Power Company in Seattle will not be allowed to change the terminus of its Yesler Way cable line from its present location, between First and Second Avenues, as it had petitioned, according to a decision rendered by the City Council franchise committee. The company argued that the operation of its cable cars over Second Avenue hindered the headway of its cars north and south on the arterial highway.

TRACK AND ROADWAY

Lacombe & Blindman Valley Electric Railway, Lacombe, Alta.—W. L. McKinnon & Company, Toronto, advertised recently inviting bids for $206,700 of this company's first mortgage bonds, maturing in 1943. The Alberta government has guaranteed the principal and interest of the bonds for $7,000 a mile, or $273,700 for 39.1 miles. They bear 5 per cent interest.

Argenta (Ark.) Railway.—Work on the extension from Washington Avenue and Hazel Street to Rock Island station, at Fourth Street and Beech Street in Argenta, has been begun.

Central California Traction Company, San Francisco, Cal.—Negotiations are pending by which portions of the city lines of this company will be abandoned and a universal transfer privilege established between this company's line and the lines of the Stockton Electric Railway.

San Francisco (Cal.) Municipal Railway.—Bids for another branch of this railway are being considered by the Works Board, which has received the offers to construct the California-Street municipal railway line and the Seventeenth-Street carhouse. The line will begin at Geary Street and Second Avenue and run over Second Avenue, Cornwall and California Streets to Thirty-third Avenue.

Marin County Electric Railway, San Francisco, Cal.—This company has received permission from the Railroad Commission of California to construct a line in Sausalito, Cal., on the condition that the present franchise shall be amended so as to give the municipality the right to purchase the system after five years. The company is granted authority to issue 185½ shares of capital stock at par, and it is provided that this stock shall be sold only to property owners and residents of Marin County. It is also provided that all moneys obtained from the sale of stock shall be deposited by the railway company in Marin County banks as trust funds, with the understanding that if a total sum of $18,550 is not deposited within six months, these moneys shall be repaid to subscribers. [E. R. J., Nov. 21, '14.]

Connecticut Company, New Haven, Conn.—Plans are being made by this company to extend its tracks along Railroad Avenue to the station in Westport.

***Havana, Cuba.**—Work has been begun on an electric line between Havana and Guanabacoa in Cuba.

Central Illinois Traction Company, Paris, Ill.—An extension between Charleston and Paris, 30 miles, will be constructed by this company during 1915.

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—This company will complete the construction of the Minnesota Street line, between Shelby Street and Churchman Avenue, for operation before Dec. 24. The special work at the corner of Shelby and Minnesota Streets will be completed sixty days fater the opening of the new year.

Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan.—This company has completed the survey and secured the right-of-way for the second section of the projected interurban railway between Kansas City and Topeka, Kan. The first section, from Kansas City to Bonner Springs, is now in operation and its business has considerably exceeded expectations. The second section is 21 miles from Bonner Springs to Lawrence. It probably will be in operation within a year. The third section, Lawrence to Topeka, will be built after the second section is in successful operation. Bids for the construction of the Bonner Springs-Lawrence section will probably be asked shortly. On the first section the company advertised for bids, but did with its own forces work for which it considered the bids unreasonable. The construction work which it is planned to start soon involves a bridge over the Kaw River at Lawrence. Carl G. Klemm, 1010 Commerce Building, is secretary of the company.

Kentucky Utilities Company, Somerset, Ky.—With this company disposing of $3,000,000 worth of bonds for needed improvements it is rumored that a part of the company's plans is to extend its line to Burnside, 7 miles south of Somerset, on the Cumberland River.

Winnipeg (Man.) Electric Railway.—Plans are being prepared for filing an application with the City Council for extensions in the northwest section of Winnipeg, in accordance with the City Engineer's directions.

Boston (Mass.) Elevated Railway.—This company is asked to consider plans to construct tracks on Pleasant Street, from the mouth of the subway to Washington Street in Boston.

Fitchburg & Leominster Street Railway, Fitchburg, Mass.—Surveys, which have been in progress for the extension of this railway to Townsend, have been suspended until spring. This line will ultimately be extended to Nashua, N. H.

Michigan Railway, Jackson, Mich.—This company has placed in operation its line between Kalamazoo and Monteith.

International Transit Company, Buffalo, N. Y.—The Board of Railway Commissioners has authorized the building of a bridge at Tagona, Sault Ste. Marie, Ont., to carry a highway and this company's tracks across the Algoma Central & Hudson Bay Railway. The cost of the bridge is to be borne by the electric railway company.

Cincinnati (Ohio) Traction Company.—A new crosstown line north of the present route on McMillan Street in Cincinnati is being considered by this company and may be built in the near future.

Ardmore & Western Interurban Railway, Ardmore, Okla.—As soon as negotiations are completed work will be begun by this company on the 100-mile line to connect Springer, Woodford, Poolville, Elmore City and Leon. Capital stock, authorized, $300,000. Bonds, authorized, $2,500,000. Officers: A. F. Costigan, Guaranty Bank Building, Ardmore, president; D. E. Allen, Ardmore, vice-president; A. L. Adath, Ardmore, secretary, and T. C. Bridgeman, treasurer. [E. R. J., May 30, '14.]

Forest Hill Electric Railway, Toronto, Ont.—The roadbed is now being prepared for this railway. Work has been begun at Bathurst Street, and the first stage from there to Dufferin Street will be proceeded with as rapidly as possible. The tracks will be laid on their entire route beginning near St. Clair Avenue. T. J. Glover is interested in this projected railway. [E. R. J., April 11, '14.]

Ottawa & St. Lawrence Electric Railway, Ottawa, Ont.—A contract has been awarded to Eastman, Kenny & Stearns, Russell, Ont., for grading about 6 miles of the projected line. About 2 miles of grading has been completed, and it is expected to have about 8 miles between Russell and Metcalfe completed and ready for the rails within the next three weeks. H. W. Pearson, Confederation Life Building, Toronto, Ont., secretary.

Toronto (Ont.) Civic Car Lines.—A by-law will be submitted to the ratepayers on Jan. 1, 1915, to provide for $455,000 for the extension of the civic car lines in Toronto.

Toronto, Ont.—City Solicitor Johnston advised the Board of Control on Nov. 27 it would be necessary to submit separate by-laws for each of the proposed new electric lines, consequently the board changed its recommendations. The Council will be asked to authorize the submission of a by-law for $105,000 for the proposed Lansdowne Avenue line, $317,000 for the North Toronto line, and $52,000 for the taking over of that portion of the Toronto & York Radial Railway Company's line within the city limits in the east end.

Electric Short Line Railroad, Minneapolis, Minn.—Plans are being considered by this company and the members of the Winthrop Commercial Club to build an electric railway through Winthrop and north as far as Winsted and south through Sleepy Eye to Jackson.

St. Louis, Mo.—The residents of South Lindenwood have submitted a petition to the Missouri Public Service Commission asking the United Railways for an extension of the Tower Grove line. The Tower Grove line terminus is 2½ miles away from the city limits in the Gratiot and Lindenwood section of the city.

Niobrara, Sioux City & Omaha Railway, Omaha, Neb.—Surveys have been completed by this company between Madison and Elgin. Right-of-way has been secured between Omaha and Norfolk via Madison. The Elgin line will be a branch proposition. Charles W. Baker, Omaha, is interested. [E. R. J., April 4, '14.]

Corry & Columbus Street Railway, Corry, Pa.—A 30-mile line from Corry, Pa., to Maysville, N. Y., via Columbus, Pa., Clymer and Sherman will be built by this company during 1915.

Slate Belt Electric Street Railway, Penn Argyl, Pa.—A 5-mile line between Wind Gap and Saylors Lake, Pa., will be constructed by this company during 1915.

***San Antonio, Tex.**—James L. Himrod, Thomas Moore, Austin, and others are making plans to build an electric railway to connect New Mexico, Lamesa, Robert Lee, San Angelo, Ballinger, San Antonio and other points with a port on the Gulf of Mexico.

Pittsburgh, Harmony, Butler & Newcastle Railway, Pittsburgh, Pa.—Within a few weeks this company will have completed its 6½ mile line between Evans City and Beaver Falls. In addition to passenger service the company announces that it will add trolley freight service over this line as well. The opening of this new line will give a direct electric railway line between Pittsburgh and Beaver Falls.

***Denison, Tex.**—Preliminary surveys are being made for a line betweeen Denison, Dexter and Locust. This is part of a plan to build an electric railway through Pottsboro, Locust, Gordonville, Dexter and Denison.

Houston, Laporte & Bay Shore Railway, Houston, Tex.—Preliminary arrangements are being made and work will be begun some time within the next six months on this line to connect Houston, Pasedana, Deepwater, Deer Park, San Jesenta City, Laporte, Seabrook, Webster, Friendswood and Pearland. The power station will be located at Houston and the repair shops at Pearland. The company will furnish power for lighting purposes. Capital stock, authorized, $2,000,000. Samuel F. George, Houston, president and general manager, and John H. Stoner, Houston, chief engineer.

Houston & Southern Railway, Houston, Tex.—Preliminary arrangements are being made to incorporate this company, which plans to begin work in the spring on its 55-mile electric railway to connect Houston, Pearland, Manville, Danbury, Belasco and Freeport. The company will furnish power for lighting purposes and will locate its power house in Houston and its repair shops at Pearland. It will also have amusement parks at Laporte and at Velasco. Samuel F. George, Dayton, Ohio, president, and John H. Stoner, Houston, chief engineer.

Glen Rose & Walnut Springs Railway, Walnut Springs, Tex.—Grading has been completed by this company for its 14-mile line to connect Glen Rose and Walnut Springs, via Seven Knobs. Officers: J. H. Farr, president; F S. Williams, vice-president; John Shields, treasurer, and F. B. Kirby, secretary, all of Glen Rose. [E. R. J., Sept. 12, '14.]

Rutland Railway, Light & Power Company, Rutland, Vt.—This company, a subsidiary of the General Gas & Electric Company, has begun construction under its plans for the conservation of the water supply at Chittenden Dam, near Rutland, Vt. The plans include the construction of two dams, a canal 3000 ft. long, and wood and steel penstocks. When completed, the reservoirs will furnish a large reserve supply of water for the new power station of the company at East Pittsford. Through this plan the water will be used twice for generation of power, once at the East Pittsford station, and once at the Mendon generating station.

Mercer Electric Railway, Athens, W. Va.—The tracks are being laid by this company on its line between Bluefield and Princeton. This line will connect Bluefield, Princeton and Athens. R. G. Meador, Athens, president. [E. R. J., Oct. 17, '14.]

SHOPS AND BUILDINGS

Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.—This company opened its new depot in Clinton, Ind., on Dec. 3.

Orleans-Kenner Electric Railway, New Orleans, La.—Plans have been prepared by this company to build sixteen shelter houses and way stations along its line between New Orleans and Kenner. The buildings will be on brick construction with tile roofs.

Moncton Tramways, Electricity & Gas Company, Moncton, N. B.—A temporary carhouse was erected to replace the building which was destroyed by fire recently. This building is 30 ft. x 80 ft., with accommodation for five cars, and is on the same site as the one burned. It is the intention of the company to build a steel and brick carhouse in the summer, on a new site which has not yet been acquired.

Brooklyn (N. Y.) Rapid Transit Company.—The Public Service Commission for the First District has approved the award by the New York Municipal Railway Corporation to the P. J. Carlin Construction Company, the lowest bidder, of a contract for the construction of six stations on the Liberty Avenue elevated railroad extension. The contract price is $232,000.

Brantford (Ont.) Municipal Railway.—This company is building a new passenger station and freight house at Paris. The cost is estimated to be $3,000.

Toronto (Ont.) Civic Car Lines.—The City Council has authorized Commissioner Harris to build a temporary carhouse near Dorval Road to house the cars of the new Bloor Street line in Toronto.

Milwaukee Northern Railway, Cedarburg, Wis.—Work will be begun at once by this company on a new terminal building on Fifth Street between Cedar Street and Wells Street in Milwaukee. The structure will be of brick, fireproof, one story high and will be divided into separate waiting rooms, a ticket office and baggage room. The cost is estimated to be about $40,000.

POWER HOUSES AND SUBSTATIONS

Bay State Street Railway, Boston, Mass.—This company has installed a new engine and generator at its Mason Street plant.

Ottawa (Ont.) Electric Ry.—This company's new auxiliary power plant has been put in operation. It cost $200,000 and has a generating capacity of 5000 hp. The equipment includes three Babcock & Wilcox boilers and a Westinghouse double-flow steam turbine.

West Penn Traction Company, Pittsburgh, Pa.—This company has just placed in operation a 19-000-kva, 6600-volt, three-phase, sixty-cycle, turbo generator, built by the Westinghouse Electric & Manufacturing Company.

Monongahela Valley Traction Company, Mairmont, W. Va.—This company is installing three 1500-kva, water-cooled, sixty-cycle, 22,000-volt high-tension Westinghouse transformers, and a complete electrically-equipped remote-control switchboard in its power house near Fairmont, W. Va.

Manufactures and Supplies

ROLLING STOCK

Sheboygan Railway & Electric Company, Sheboygan, Wis., expects to order two new steel cars for city service, double-end operation, pay-as-you-enter, double-truck, to seat forty passengers. The cars will be equipped with baby motors and 24-in. wheels.

Philadelphia & Reading Railroad, Philadelphia, Pa. is making an investigation into the advisability of establishing storage-battery car operation on branch lines of its Winslow Junction-Cape May division.

Empire United Railways, Syracuse, N. Y., has ordered twelve more cars from the St. Louis Car Company in addition to the twelve cars ordered last summer. These twelve cars are to be the same type as those on the previous order.

London & Port Stanley Railway, London, Ont., has ordered three electric locomotives and electrical equipment for five motor cars from the Canadian General Electric Company. The contracts approximate $135,000. The locomotives will be 1000 hp, capable of hauling a trainload of 1000 tons. The cars will have a four-motor electrical equipment of about 600 hp per car. The motor cars and trailers, of which there will be five each, will be of one pattern and steel construction throughout. Tenders on the car bodies were invited up to Dec. 2.

TRADE NOTES

Thomas A. Edison, Inc., West Orange, N. J., in a fire which started early in the evening of Dec. 9, suffered much damage to its property, calculated at something less than $1,000,000. Part of the phonograph works was destroyed by fire, but Mr. Edison's private laboratory, the Storage Battery Company and the Edison primary-battery department were not affected. The company emphasizes the fact that the business of both battery departments of the company will not be interfered with in any way by the fire and that it is prepared to continue business as usual.

Albert Lawrence Smith has been admitted as a partner in the firm of E. B. Smith & Company, public utility bankers, Philadelphia, Pa. Mr. Smith is a son of the senior member of the firm. He attended Harvard University and began his business career with the Franklin National Bank, Philadelphia. For several years he has been associated with the firm of which he is now a partner. He is a director of the Buffalo & Susquehanna Railroad and of the Easton (Pa.) Consolidated Electric Company.

Kerr Turbine Company, Wellsville, N. Y., builder of "Economy" steam turbines, has appointed A. E. Seelig as general sales manager, and John A. Hense as St. Louis representative. Mr. Seelig for several years held a similar position with the L. J. Wing Manufacturing Company, and more recently has managed the new machine tool department in the New York office of Schuchardt & Schutte. Mr. Hense was formerly with the National Malleable Castings Company, Chicago, and later with the Dravo-Doyle Company, Philadelphia.

Walter A. Zelnicker Company, St. Louis, Mo., has appointed Arthur E. Jackman as manager of its machinery department to succeed J. J. Hilpirt, resigned to become storekeeper of the Compania Mexicana de Petroleo "El Aguila," S. A., Tampico, Mexico. Mr. Jackman has had wide experience, gained as general manager of the Sea View Railroad and Narragansett Pier Electric Light & Power Company. He was several years in the railway and lighting department of the Westinghouse Electric & Manufacturing Company, and lately superintendent of the East St. Louis, Columbia & Waterloo Railway, which position he left to assume his present duties.

W. S. Miller has resigned as general superintendent of the St. Louis Car Company, after being connected with this company about fifteen years. Mr. Miller's first position with the company was superintendent of the brass foundry departments, two years after which he became general foreman of the blacksmith, machine and truck departments. After holding this position for three years he was appointed superintendent of machinery and tools. In 1907 Mr. Miller became works manager and later general superintendent, which position he has held up to the time of his resignation, Nov. 9, 1914. He was formerly a student of Washington University, New York.

Edison Storage Battery Company, Orange, N. J., has appointed Francis V. McGinness, formerly sales engineer, as assistant manager of the railway department, the position formerly held by William F. Bauer, who was recently made manager of the company's Chicago office. Mr. McGinness is a graduate of Columbia University's Schools of Applied Science, class of 1910, and before graduation had considerable practical experience with the New York & New Jersey Telephone Company. After a few months in the engineering department of the New York & Queens Electric Light & Power Company, Long Island City, he joined the sales force of the Edison Storage Battery Company. For the past two years he has been identified with the railway department.

National Corrugated Culvert Manufacturers' Association, Chicago, Ill., announces that the large number of manufacturers operating under the Watson corrugated culvert patent have just been informed by their attorney, Wallace R. Lane, Chicago, that the United States Court of Appeals for the Second Circuit, which has final jurisdiction, has just handed down a mandate reversing the lower court and holding this patent valid and infringed by another culvert which was recently installed. The court says, in part: "The patented culvert is cheap, strong, durable, easily transported, quickly laid down and easily repaired. We cannot believe that the man who gave such a structure to the world should be denied the title of an inventor." The manufacturers of corrugated culverts under this important patent make them out of Armco American ingot iron.

ADVERTISING LITERATURE

Fargo Manufacturing Company, Inc., Poughkeepsie, N. Y., has issued a bulletin describing its straight connector, cable lug, signal connection, ground point and ground meter, "L," "Y" and "T" and terminal connections.

NEW PUBLICATION

Bonds and Stocks—The Elements of Successful Investing. by Roger W. Babson. Babson Statistical Organization, Inc., Wellesley Hills, Mass. 422 pages and three charts. $2 net.

This is the second book of its kind intended for investors received this year for review by the ELECTRIC RAILWAY JOURNAL and written by an authority of national reputation. There are many excellent books planned primarily for the student of corporation finance, but there has been a dearth of books about the science of investing money. Mr. Babson has in his volume rendered a real service to the man unacquainted with security issues who has money to invest, and in addition he has furnished a volume very entertaining aside from its practicable value. Very hazy ideas are frequently held about securities by men otherwise well informed, and to such men the present volume should be more than welcome. It is all very well for the man unacquainted with finance who intends to invest to be sure of the reputation of the house through which he deals, but there is no excuse now that "Bonds and Stocks" has been issued for such a man not to understand the fundamentals of investing. The strong and weak points of stocks and bonds are pointed out with reasons why some classes of securities are attractive and why others are not attractive. Mr. Babson has divided his work into twenty-four chapters. The first four deal with introductory suggestions, the next fifteen with elements of successful investing and the five concluding chapters with supplementary suggestions. There is a chapter on electric railway securities as distinct from lighting, telephone and water power securities. A chapter on the investor's vocabulary contains an explanation of ten phrases, the meaning of which should be understood by every investor. These phrases are the technical ones used frequently by bankers in seeking subscriptions from the public, through the newspapers. Mr. Babson certainly is justified in saying in his conclusion that "if the reader has absorbed all that has gone before he should have in his mind a clear idea of the different kinds and groups of securities and the various questions and terms involved therewith."

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.

Consolidation of Street Railway Journal and Electric Railway Review

Vol. XLIV NEW YORK, SATURDAY, DECEMBER 19, 1914 No. 25

THE COMPANY'S SHARE IN SAFETY

To tell every employee the specific nature and exact cost of each safety installation is an unusual undertaking for a large property, but this is the policy that has been begun by the mechanical department of the Brooklyn Rapid Transit System. This policy is a logical step toward that employee's co-operation which has become a feature of the safety movement on smaller properties. The report of the B. R. T. mechanical department's safety committee, as quoted in the ELECTRIC RAILWAY JOURNAL of Dec. 12, declared that within three months the department had set aside more than $1,600 for such tangible items as machinery safeguards, hydraulic jacks and car-hoisting hooks. In addition, the men have been informed individually of other safety plans which are under way by the department. Further, they have been invited to suggest any additional betterments that they think feasible because of their specialized knowledge. On account of these conditions, the appeal to the men to do their share to avoid accident will meet with a heartier response than if the management had placed on them alone all the burden of watchfulness. As with other good causes, an ounce of sincere action is worth more in promoting safety than a pound of fine talk.

NEW JERSEY RATE DECISION

The decision of the highest court in New Jersey that an allowance must be made for the value of franchises in any public utility valuation for rate-making purposes accords with common sense. It seems difficult sometimes for the ordinary layman to understand the reason underlying this principle. He says: "The franchise originally cost the company nothing, and its only value has come from the growth of the community. The public should not have to pay increased rates because of this unearned increment." Just as fairly he might say that the men who took up land under the government homestead act thirty or forty years ago, developed the land and farmed it until it became valuable should receive no compensation for their property when it is taken for public purposes. The franchise, like the homestead, was not valuable until the occupant came and made it so. This possibility of a future increase in value was part of the consideration which induced the railway company to build its line, just as the grant of land under the homestead act induced the farmers to settle in the Far West, and it should be allowed just as definitely in one case as in the other. This point is clearly brought out in the decision of the Court of Errors and Appeals of New Jersey. The decision also cites cases where franchises are taxed in New Jersey and other cases where allowances have been made for franchises when water companies have been taken over for public use. Where this condition exists it is difficult to understand why a franchise should not also be considered as part of the property on which a company should be permitted to earn a return. We hope that the clear exposition of this entire subject by the New Jersey court will help to clarify public opinion on this important matter.

LETTERS TO THE EDITORS

One of the most important departments of a technical paper is that in which discussion among readers is carried on. Just as a technical meeting is most successful and interesting when the papers and reports produce discussion, so the use of a journal is most productive of the general viewpoint when some readers call the attention of others to important debatable or misunderstood topics through the communications column. When an engineer has a plan in mind for a movement which he would like to get started promptly he cannot do so, as a rule, through the appropriate national society because necessarily the machinery for this purpose is very elaborate and its operation is time-consuming. Through a "letter to the editor" of the technical journal reaching his field, however, he can quickly reach the eye of a large number of interested persons. Many ideas, not elaborate enough to warrant the preparation of extended articles, can be clothed appropriately in "communication" form. The author of such a communication is responsible for the accuracy of the assumptions which he makes and of the conclusions which he draws. While the editors endeavor to check statements of fact they cannot properly challenge assumptions and certainly not conclusions except in the editorial pages where they present their own opinions. The ELECTRIC RAILWAY JOURNAL is gratified by the interest shown in its correspondence section, as indicated by the increasing number of topics discussed therein, but still greater use should be made of this opportunity for interchange of the fruit of experience. Within the past few weeks letters have been printed on such diverse but relevant topics as operation of trains without train orders, the flagging rule, insert special-work failures, effect of wheel diameter on motors, indexing technical information, the truss-rod fallacy, economic limits of passenger haul, steel sheathing for car siding, advantages of the near-side stop, etc. Such letters ought to furnish an index to the vital problems of the hour. That such an index is desirable goes without saying, but the editors are dependent upon the readers to make it a success.

STANDARDIZING ELECTRIC RAILWAY FORMS

Different accounting problems and conditions for electric railways make an absolute uniformity of books and forms impossible and, even if this were not so, inadvisable. Yet this fact is no reason why individual books and forms commonly used by most railways or those used in interline accounting should not be made up with the goal of standardization ever in mind. Electric railways, and particularly electric railway accountants' associations, have already taken great strides toward this goal, but the result thus far has been confined to the attainment of that primary but not exclusively important feature, the standardization of copy or information desired and kept in accounting records.

As pointed out last week at the meeting of the Central Electric Railway Accountants' Association, however, other features of forms may be standardized, such as size, weight, color and quality of paper and style of ruling. These matters are more important than may be realized at first glance. Paper stock is made in standard sizes, and definite economies in printing cost can be secured if forms are cut to standard sizes so that waste will be avoided. The matter of weight is also important, for ledger papers, way bills, claim blanks, auditors' forms, car cards, etc., have to suffer varying degrees of usage, and not only should the weight be suited thereto but all the forms should be grouped by weight in order to effect the saving and greater purchase power secured by combination buying. Then, too, the proper choice of the quality in paper obviates the unending variation of manilas, bonds, fibers, etc., and also proves economical in press work and paper by making all printers bid on the same and best quality for each class of use. As to colors, the more in number and the more unusual in character the greater the first cost and the cost of matching. Lastly, except with extra large forms or small orders, standardized print rulings with a wax plate or standing form are preferable, making for a decrease in press cost and an expedition of deliveries.

Although all the above-named opportunities for standardization seem to have a more intimate connection with the printers' trade than with electric railway accounting, we believe that the securing of such ends is more properly the work of the accountants. In the first place, the latter already know the lettering to be used and its preferred arrangement, and it would be much easier for them to collect existing forms and standardize them along the suggested lines than for the printers to try to collect the forms, study their uses and induce the railways to use the ones decided upon. The success of such a standardization movement can only be secured when it is brought about by those most vitally interested in the tangible results, while the printers as manufacturers must be depended upon for their expert advice regarding the processes and materials used. In the second place, public accountants and systematizers have long since secured developments along these very lines. Every university school of commerce in teaching accounting theory and systems lays great stress upon a proper understanding by the accountant of the principles of printing that underly the make-up of forms, in order that the completed job may be secured with the greatest economy, fitness for peculiar usages, ease of replacement and adherence to standard practices.

In short, it seems to us that along this line electric railway accountants can make valuable and effective efforts to round out the excellent standardization work they have already accomplished. With the assistance of representative printers, they would surely lay a firm basis for the proper combination of standard accounting methods, decreased cost and easier inter-company accounting relations. In this connection, too, it would be well to remember the computing machines of various makes. The determination of the proper size and weight should be made with consideration for the way in which companies may desire to use the forms in such aids to efficiency and time saving. Finally, the yearly contract method of buying might be examined. With forms completely standardized, a railway could estimate the number of each class, contract for the immediate running of the whole and requisition sections from the printer during the year as needed. The advantage of competitive bidding would be retained, and economies would be secured in stores space, time in ordering and receiving goods, uniformity in supplies and fewer printers' accounts to handle.

HIGH-VOLTAGE INSULATOR PROBLEMS

The papers and discussion at last week's New York meeting of the American Institute of Electrical Engineers brought out clearly the facts that failure due to mechanical stresses is a large element in insulator depreciation; that the selection of the proper number of units in a suspension insulator is susceptible of mathematical analysis; that suspension insulators can be made partly puncture-proof by reducing the arc-over distance; that some kind of periodical test for insulators in situ is desirable, and that an altitude rating for insulators, high-tension bushings, etc., is a necessity.

This bill of particulars indicates some of the problems that are agitating the minds of electric transmission engineers. An insulator looks like such a simple construction, and the materials of which it is composed are, under ordinary conditions, so durable that a casual inspection would lead one to expect it to last for a long period unless punctured by an electric discharge or a hunter's bullet. Those on the inside tell us that insulator design is one of the most difficult arts, and this is substantiated in Mr. Austin's paper, abstracted elsewhere in this issue. Porcelain tends to absorb moisture and thus lose its electrical resistance; differences of temperature and chemical changes in the cement produce internal mechanical stresses; grooves on the porcelain surfaces and minute electrical discharges tend to start checking of the porcelain body, etc. When the condition of weather, the combined mechanical and electrical stresses to be resisted and the inaccessibility for inspection are considered it is remarkable that the depreciation of first-class insulators is as low as that of electrical machinery. That it is so was claimed at the Institute meeting, and the claim was not disputed.

A COMMON MISTAKE ABOUT TRANSFERS

A great many people are far too prone to judge the attitude of a street railway company toward the public by the number of transfers it issues. If a road makes a striking showing in the number of transfer passengers and thus obtains a low average rate of fare per passenger carried, it is looked on as rather beneficent in its attitude, while the system which issues a comparatively small number of transfers and shows a high earning per passenger carried is too often looked upon with suspicion and held up to entirely unjust criticism. As a matter of fact the proportion of passengers who ride on transfers has comparatively little significance unless one can ascertain that which no accounting system takes into reckoning, the real purpose of the transfer. A road may carry 5 per cent of its passengers on transfer slips and be almost needlessly generous to the public, or it may carry 30 per cent and confer no proportionate benefits.

Transfers are issued for two purposes, first, to give the public needed access to branch lines without payment of extra fare, and second, to avoid through routing of cars in a manner which may interfere with the best development of the traffic. In the former case the transfer may or may not mean an exceptionally long ride for a nickel. Often, too, actual physical transfer is made of which no definite record is kept, simply because such a plan is of more convenience to the riding public or perhaps to the road itself. We have in mind, for example, one small road in which there is near one end of the line a physical transfer of which no account is taken by reason of the particular circumstances in the case. The passengers get their full ride for a nickel, and the shift is made very promptly and easily, accommodating as it happens a large number of passengers. Now if transfer slips were issued in this particular instance the apparent fare per passenger of record would fall off and the road would seem to be liberal in transfers, whereas as a matter of fact it is saving the cost of the slips and making some other incidental savings without the slightest inconvenience to the public.

On the other hand, we can conceive of routes involving four or five transfers where the public would be better served by a larger number of through cars. Such a condition is apt to arise when changed conditions of business in a city alter the natural arteries of traffic. Under such circumstances, changes in routing should be made to accommodate the larger number of people, but a company, unaided by the municipality and a general public conception of facts, can rarely make these changes owing to the local opposition of merchants and others who are used to having certain popular lines of cars run past their doors.

When the uninformed layman tries to butt into a subject as technical in its details as is street railroading he will do well to drop that sublime confidence in statistics which characterizes the ignorant and find out the facts of the case before he makes any odious comparisons. In the cases cited, certainly, the facts are not shown on the face of the statistics. The truth as to whether the number of transfers given is adequate or not depends entirely on the way in which the transportation system really works out in practice and this can only be ascertained by intelligent physical study of the conditions. If people who write to the newspapers and complain to the commissions would "stop, look and listen" instead of rushing into print or litigation the world would be well rid of a good bit of unpleasant friction. Public utility companies have a reasonable claim to fair play which entitles them to careful investigation of the facts before critics jump at conclusions.

THE MERCURY RECTIFIER LOCOMOTIVE

The announcement that a mercury rectifier equipment with an output capacity of 1000 hp has made 20,000 miles and is in revenue service on a branch line of the New Haven Railroad deserves more than passing notice. It has been known for some months that the Westinghouse Company has been conducting experiments with the Cooper-Hewitt mercury vapor rectifier with a view to extending its use to traction work. The success of this type of rectifier in the storage-battery and arc lighting fields indicated what might be expected in traction work if a substantial container could be made which would withstand the shocks incident to locomotive operation, keeping the necessarily high vacuum and good electrical insulation. Glass bulbs are excellent for stationary work in moderate capacities, but they are obviously unsuited for heavy railway work. A steel shell is the ideal container from a mechanical standpoint, but its use involves difficult problems in the particulars mentioned above. That at least a measure of success has been attained in overcoming these difficulties is attested by the record.

The incentive to the development of the mercury rectifier is furnished by the desirability of securing the efficiency of power transmission of alternating current, the simplicity of a single-phase overhead system and the excellent operating characteristics of the d.c. series motor. If a simple single-phase rectifier or converter were available, and the present tests indicate that it soon may be, it will be possible to make a selection of a single-phase system which will best suit service conditions. There can then be used either the induction motor with the phase converter, as in the Norfolk & Western electrification, the compensated a.c. series motor, as in the New Haven system, or the new mercury vapor rectifier with standard d.c. motors. The competition between the d.c. and a.c. systems will then be keener and more interesting than ever, with a serious handicap to the latter removed.

Among the advantages which an a.c.-d.c. equipment may be expected to possess are high efficiency, good speed-regulating qualities, lightness, high power factor of input and independence of frequency. Continued tests will develop some compensating disadvantages as no one system can possess all virtues and no faults. The substantial fact, however, is that the equipment is operating satisfactorily, and it is to be expected that details of design and operation will be forthcoming shortly.

Electric Freight Service at Bangor

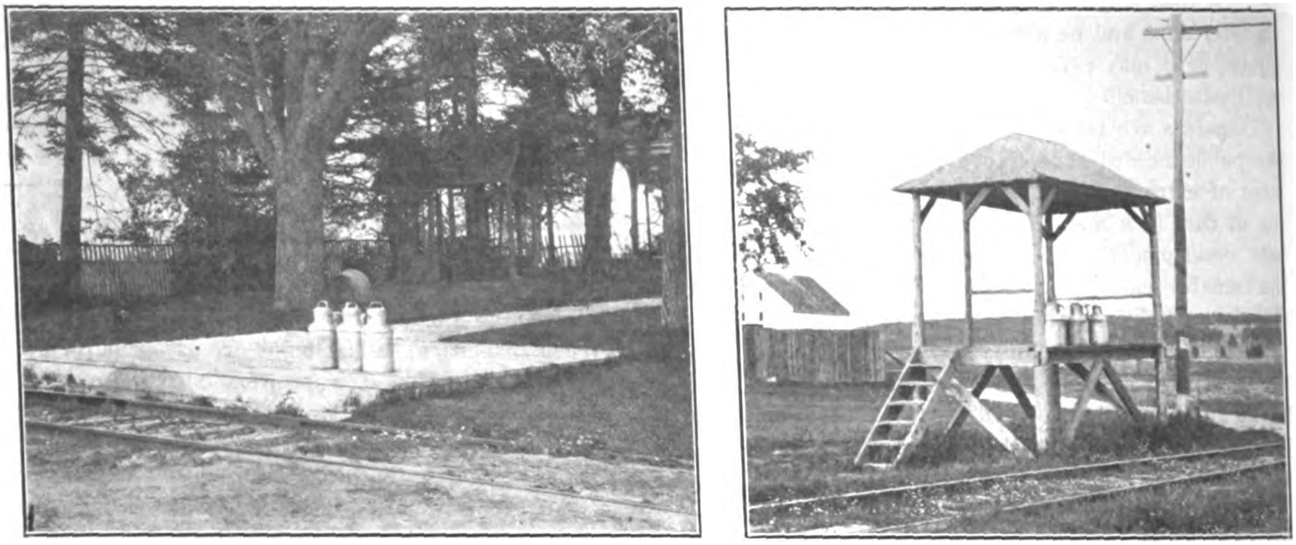
Development of Traffic on Thinly Populated Country Lines by Favorable Rates and Carefully Planned Service—Inauguration of Intensive Farming Under Company's Auspices

An interesting example of electric freight service developed from small beginnings to a profitable volume of traffic is afforded by the Charleston line of the Bangor (Maine) Railway & Electric Company. This branch of the system serves a purely agricultural district, the line being 25 miles long and having a tributary local population of about 2500. Under the executive direction of John R. Graham, president of the company, the revenue on this line has increased from gross earnings of $32,000 six years ago to a present income of $65,000, and the line now handles more than 50 per cent of the total electric freight business in the state. Co-operation with the farmers is the keynote of the company's policy, and the latest feature of the work is the establishment by the company of a model farm upon which the possibilities of intensive agriculture are being demonstrated for the benefit of the territory served by the line.

The line also serves the intermediate villages of Kenduskeag, 12 miles, and East Corinth, 18 miles from Bangor. Through passenger service is given in each direction on a two-hour headway, and hourly cars are operated between Bangor and Kenduskeag, in addition to the regular and extra freight service. Prior to the establishment of the present freight rates the line was losing about $25,000 per year. The present schedule was inaugurated by cutting the carload rate on potatoes 50 per cent. This reduction was extensively advertised in the local press and on posters in the cars. The present rate on potatoes and the shipments of potatoes during the past six years appear in Table I on the next page.

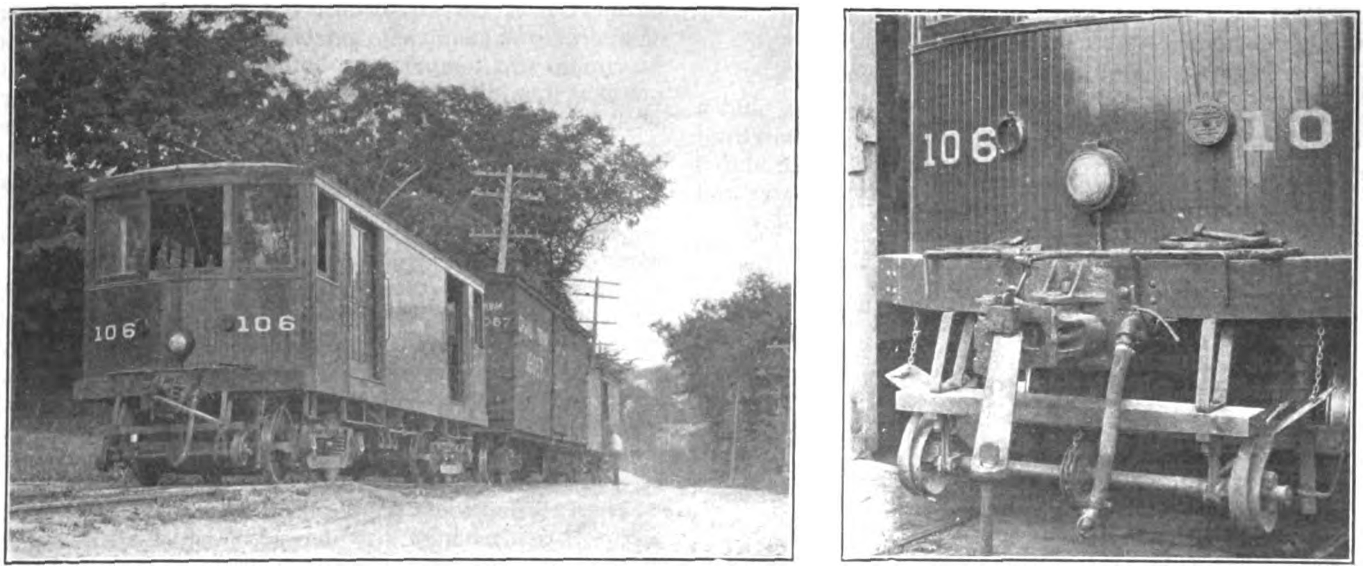
On other commodities the rates have been maintained substantially as at first, except that the rate on cordwood has been made especially favorable to the farmer. A few representative rates are given in Table II.

No house deliveries are made by the company. Shipments are frequently handled from platforms at the side of the track, as shown in two of the illustrations. These platforms are built of wood and in some cases are covered partially to protect the shipper and goods from the sun. A large amount of milk, cream and vegetables is shipped by the company daily into Bangor. On the regular return trip at 11:50 a. m. the company



BANGOR FREIGHT SERVICE—TYPICAL SHIPPING PLATFORMS

BANGOR FREIGHT SERVICE—POTATO FIELD AT COMPANY'S MODEL FARM. YIELD IS MUCH GREATER THAN ON OTHER FARMS IN VICINITY



BANGOR FREIGHT SERVICE—TYPICAL FREIGHT TRAIN, AND COUPLING AND AIR CONNECTION FOR FOREIGN CARS

handles farming implements, household supplies and miscellaneous freight. On week days a regular freight leaves Charleston at 6:30 a. m., East Corinth at 7 a. m., Kenduskeag at 8 a. m., arriving at Bangor at 9:30 at the company's freight depot, which is located on Front street, adjoining the wharf of the Eastern Steamship Corporation and having spur track connections with the Maine Central Railroad.

TABLE I—DATA ON RATES AND AMOUNTS OF POTATOES SHIPPED

	Carload Shipments to Bangor		
	Kenduskeag	East Corinth	Charleston
700 bushels	$11.89	$15.40	$19.60
800 bushels	13.59	17.60	22.40
Base rate per bushel for all carload lots, 500 bushels, minimum carload	1.7 cents	2.2 cents	2.8 cents

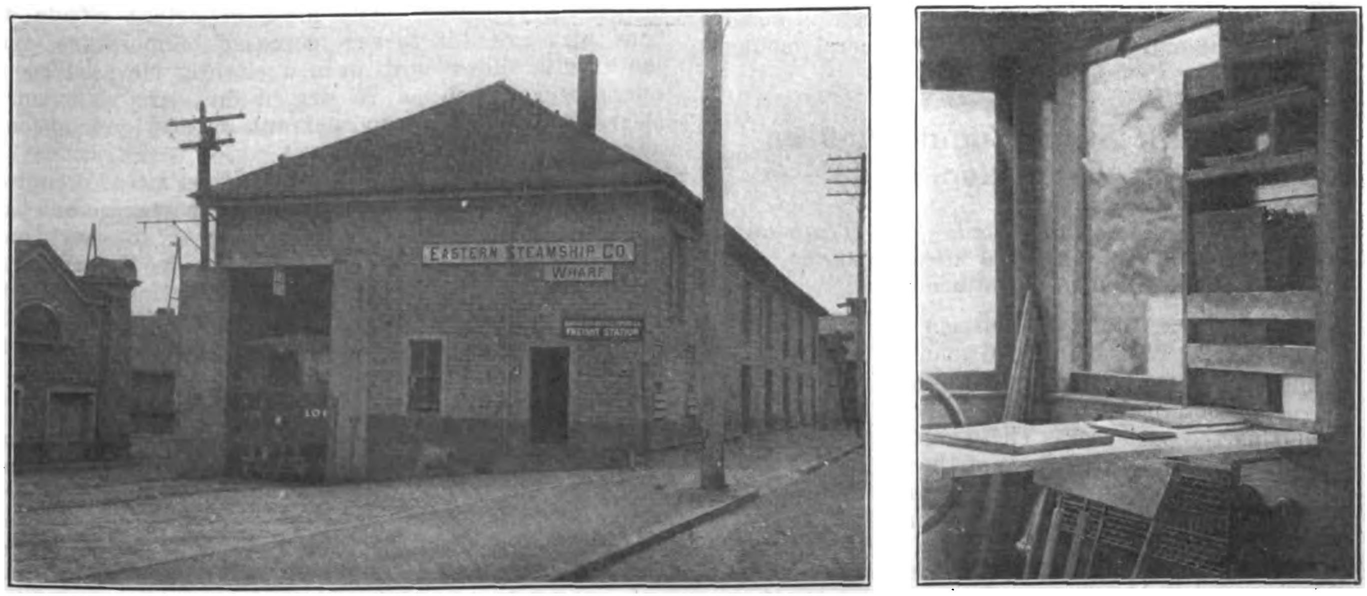
Season	Car Loads Potatoes
1907-1908	81
1908-1909	161
1909-1910	340
1910-1911	436
1911-1912	276
1912-1913	438
Total	1732

TABLE II—TYPICAL RATES CHARLESTON LINE

	Between Bangor and		
	Kenduskeag	East Corinth	Charleston
Pulpwood, per hundredweight	$0.0257	$0.0285	$0.0314
Cordwood, per cord	.75	.90	1.00
Fertilizer, per ton	1.00	1.30	1.60
Grain, per ton	1.00	1.30	1.60
Hay and straw, per ton	1.00	1.10	1.30
Groceries, less than 500 lb., per hundredweight	0.08	0.11	0.12
Berries, per small crate	0.15	0.20	0.25
Berries, per large crate	0.20	0.25	0.30
Horses, cattle, etc., less than carlot	2.75	3.30	3.85
Eggs, per case (56 doz.)	0.20	0.25	0.28

MODEL FARM

The model farm is 6 miles from Bangor and last season 40 acres were under cultivation, 30 acres being devoted to potatoes. The company finances the enterprise, which is operated by an expert agriculturist who is on the staff of the University of Maine. The average yield of potatoes in Maine is 200 bushels per acre, and the model farm is being run with the expectation of obtaining 400 bushels. One of the potato fields, which has been developed by the use of phosphates costing $35 per ton, is illustrated. Experiments are also being made with lime. The size of the plants and blossoms indicates the merits of intensive farming, when these are compared with others in the Bangor region farmed according to the old methods. In the summer the company holds farmers' meetings on the model farm, lestures and inspection of exhibits. In this way the farmers in the neighborhood have an opportunity to study at first hand the latest methods employed in scientific farming as well as to inspect the most modern



BANGOR FREIGHT SERVICE—FREIGHT STATION AT BANGOR AND FREIGHT RECORD DESK ON LOCOMOTIVE sanitary appliances and electrically operated labor saving devices.

FREIGHT EQUIPMENT AND POWER SUPPLY

The company owns ten box and ten flat cars, and a considerable part of its traffic consists in switching and hauling foreign freight cars to and from the Maine Central Railroad. Three combination express cars and electric locomotives are in service. Each locomotive is equipped with four G.E.-80 motors, K-28 control and straight air brakes. Each is capable of hauling four loaded box cars at a speed of 15 m.p.h. The latest equipment of this type, which was built by the Wason Manufacturing Company, Brightwood, Mass., is 34 ft. 6 in. long and 8 ft. wide inside, with side doors 5 ft. wide and 6 ft. 4 in. high. The car is equipped for double-end operation and weighs complete 24 tons. The door sills are of corrugated iron 6 in. wide. Nine 16-cp lamps furnish the interior illumination, and both luminous arc and incandescent headlights are installed. To facilitate handling foreign cars a coupler and intermediate air hose are provided. Two men handle the locomotive car and all trailers. A convenient home-made desk used on the car illustrated on page 1329. This is made of a box 4 in. deep, 18 in. wide and 30 in. high attached to the car siding and provided with a hinged cover with a leg at the outer end. The cover is at a height of 3 ft. 4 in. above the floor, and the box, which is of ½-in. stock, is divided into five compartments, the lower slats being provided with pencil grooves.

In March, 1914, the company handled 5022 tons of freight, its freight cars being operated 13,318 car miles. The motor cars made 4886 miles, and trailers 8432. The earnings of the freight department were $4,739, an increase of 17 per cent over March, 1913. Of this revenue, $1,002 came from way freight in less than carload lots, the balance being from handling cars in bulk. A substantial shifting service on the Hampden line of the company is included in the above revenue producers. The maximum grade on the Charleston line is 8 per cent, and the most difficult combination of grade and curve is in the city of Bangor, where the trains are operated around a 72-ft. radius curve on a 5 per cent incline.

Power for the operation of the Charleston line was formerly supplied by an inefficient steam plant at an expense of $18,000 per year. When the Graham interests took hold of the property the plant was shut down and later converted into a potato storage depot. The hydroelectric system of the Bangor company supplies power to the Charleston line at an almost insignificant cost, since the number of motor cars in service at any one time rarely exceeds six. Howard Brett is general freight agent and M. E. McCormick general manager of the company.

New York State Commission on Ventilation

Report of First Year's Experiments—High Temperatures Have Marked Physiological Effect—Vitiated Air of Little Influence

The New York State Commission on Ventilation, of which C. E. A. Winslow is chairman and G. T. Palmer is chief of investigating staff, has given out some of the results obtained in a series of experiments carried out during the past year. These were conducted in observation rooms at the College of the City of New York where the effect on human beings of air of various temperatures, humidities and chemical conditions was investigated in detail. The observations were made under circumstances not extreme in character, as in the case of most past investigations, but were designed to be comparable to conditions existing in occupied rooms, the maximum test temperature being 86 deg. Fahr. with 80 per cent humidity, and the minimum being 70 deg. Fahr. with humidities of 50 per cent and 60 per cent. Fans were used for agitating the air in some cases, but their influence appeared to be negligible on both the mental and physical condition of the subjects. There were no experiments with the use of agitating fans in a vitiated atmosphere.

Summed up, the results of the first year's work seem to have established that a very high temperature, such as 86 deg. Fahr. with 80 per cent relative humidity, produces slight but distinct elevation of body temperature, and an increase in heart rate. A moderately high room temperature, 75 per cent with 50 per cent relative humidity, has the same effect, although, of course, in less degree than the extreme temperature condition.

The extreme room temperature of 86 per cent with 80 per cent relative humidity showed no effect upon respiration, dead space in the lungs, acidosis of the blood, rate of heat production, or rate of digestion. Nor is the power to do either mental or physical work, when actually working in a concentrated fashion, diminished at all by a room temperature of 86 deg. with 80 per cent relative humidity.

On the other hand, the inclination to do physical work is certainly diminished and the inclination to do mental work is probably diminished by high room temperatures. So far as physical work is concerned the tests showed a decrease in actual work performed (when the subject was given his choice of working or idling) of 15 per cent under the 75-deg. temperature and of 37 per cent under the 86-deg. temperature as compared in each case with 68 deg.

Stagnant air at the same temperature as fresh air, even when it contains twenty or more parts of carbon dioxide and all the organic and other substances in the breathed air of occupied rooms, has no effect on any of the physiological responses nor on the power nor inclination to do physical or mental work nor on the sensations of comfort of the subjects breathing it. On the other hand, the appetite for food of subjects exposed to such stagnant air is slightly but distinctly reduced, perhaps as a result of a subconscious effect of odors.

These experiments seem to indicate that overheated rooms are not only uncomfortable but produce well-marked effects upon the heat regulating and circulatory systems of the body and materially reduce the work done by the occupants when they are free to work or not as they choose. The most important effects of "bad air" are due to the increased temperature, and the results shown with even a slightly elevated room temperature, such as 75 deg. Fahr., are sufficiently clear and important to warrant careful precautions against overheating.

The chemical changes in the breathed air of occupied rooms are of comparatively minor importance, but the substances present in such air appear to exert one definite measurable effect, a decrease in the appetite for food, and this constitutes an observation which, for the first time, offers scientific evidence in favor of fresh air as compared with stagnant air of the same temperature and humidity.

The work of making the existing double-track line from Tokio to Yokohama, Japan, into a four-track line has been practically finished. The old track will continue as a steam line, while the new track will be used for electric service. Electric cars will run from the new Tokio central station.

Valuation of Franchises

New Jersey Court of Errors and Appeals Holds that Value of Franchises Must Be Considered in Public Utility Rate-Making—Passaic 90-Cent Gas Ruling Reversed

An important decision was handed down last week by the Court of Errors and Appeals of New Jersey, in the case of Public Service Gas Company vs. Board of Public Utility Commissioners et al. A short statement of the decision was published on page 1311 of last week's issue. The syllabus of the decision, written by the court follows:

"When a public utility corporation is in the enjoyment of privileges to use streets and public places in this State for the purposes of its business, whether such privileges be conferred by the State alone or partly by the State and partly by the municipality and whether they be exclusive or subject to duplication such privileges constitute a special franchise, which is property, is subject to taxation and has normally a substantial value; and in making a valuation of the property of such corporation for the purpose of establishing a basis for the regulation of rates to be paid to it by the public for its product or service, it is erroneous to assign no value, or a merely nominal value, to such franchise when a substantial value is fairly reflected in the total market value of its securities."

In the decision, which was delivered by Judge Parker, the court concurs with the Public Utility Commission and the Supreme Court in holding that 8 per cent upon the true value of the company's property is a fair and lawful rate of income in determining the price to be charged consumers. The only real point of difference, therefore, hinged upon how this true value should be determined, and primarily upon whether a nominal or substantial value should be given to the special franchise. In discussing this point the court said, in part:

ALLOWANCE FOR FRANCHISE VALUE

"This brings us to the other main element of value, called by the commission the total value of all the intangible property of the company, and which the board estimated at 30 per cent of the valuation assigned by them to the structural plant. This, as the board expressly stated, included everything outside of the tangible property and associated plant assets, such as working capital. They expressly included preliminary outlay, such as engineering and legal expenses, canvassing, costs of incorporation, cost of securing franchises, financing, bankers' commission, deficit in operation during the earlier years, and inadequate early returns upon the investment; also 'the entire value of all franchises, primary or secondary, possessed or exercised by the company in the Passaic division.' Two or three other specific intangible elements were included that need no notice here. Nothing was allowed for good-will.

"In discussing the matter of franchises, the commission remarked that its finding as to the total amount of intangible property was 'tantamount to including the franchises of the company at a moderate rating, at a value comparable to the cost of obtaining these or similar franchise. It amounts, therefore, say the commissioners, 'to a practical denial of the company's contentions as to the value of its franchises.'

"The board stated that it is the public policy of the State not to allow the capitalization of franchises for an amount in excess of the actual cost involved in obtaining said franchises; evidently referring to paragraph F of Section 18 of the utilities act, P. L. 1911, page 381. We find difficulty in ascertaining from the report the method adopted by the commissioners for valuation of the franchises. In one place they announce that such value is included in the 30 per cent estimate of all the intangible property; in other places they say that there is no evidence before them to show that these franchises should be valued at any more than the cost of obtaining them; in their general summary of valuations the franchises are listed as an item and no value assigned thereto, and the next item consists of patent rights, which the commission expressly declares to have no value whatever; and yet the commission conceded that special franchises are property; that when tangible property is operated under franchise rights the instrument of public service is worth more than the material and labor involved in its construction; that taxation is imposed in respect of special charters as 'property' in this and other States; and that neither franchise nor any other property can be taken for public use without just compensation.

HAVE A SUBSTANTIAL WORTH

"These are extracts from the report in its exact language. In dealing with this question the Supreme Court seems to have gone a step further, for it held that 'logically no allowance should be made for the value of the special franchises in a case where it is not legally exclusive, and where the State still retains the right to fix rates.' 84 N. J. L. 482.

"We find ourselves unable to concur in this result. Without adopting in its entirety the rule laid down in our railroad tax cases, that the total valuation of the property and franchises should be gaged by the market value of the outstanding corporate securities plus floating debt, and that therefore the value of the franchises would be indicated by the difference between this total and the sum of the value of the physical plant, plus development cost; and conceding that in most of the cases of public utilities the privilege of utilizing the public domain is not exclusive, and is therefore subject to invasion by other similar utilities, and conceding also that charters and local franchises are often granted by the State or the municipality, without a cash or property consideration, the conviction still remains that such franchises have substantial value.

"We often hear of old charters being bought up for use by new enterprises. The very charter of the appellant seems to be one of this class. It seems a fallacy to say that if and because a municipality confers upon a gas company or a street railway company the privilege of using the public streets without any consideration in cash or property passing from the company, the rights thereby conferred should have no value for rate-making purposes; for this disregards at least the meritorious consideration that the promoters of the company have invested their money and given their time and taken their business risks in view of the making of this very concession, and the value of the enterprise on which the owners are entitled to draw an income should not be limited to the mere cash that they have put into it, but should include something for the risk and responsibility that they have taken in organizing and developing it.

"It is true, as the board remarked, that the utilities act forbids the capitalization of franchises. This prohibition, however, refers to the inclusion of a franchise valuation in the par value of capital stock, but does not affect its market value. Just as the value of a bank stock may be and often is legitimately enhanced by public confidence in the directors of a bank and the methods of its business management, Newark vs Tunis, 81 L. 45; 82 L. 461; so the market value of the securities of a public utility may be enhanced in part at least by the fact that it is operating under a municipal franchise costing little or nothing in cash outlay, subject, it may be, to duplication, but which the public has the right to suppose in a proper case will follow the general run of such franchises and be free from indiscriminate competition although not legally exclusive. Such a situation would be a legitimate element of market value and would be taxable, as reasonably and fairly enhancing the value of the property in the public mind. It would thus be capitalized, not by the utility itself but by the public as a business matter, and against such capitalization there is no prohibition, legislative or otherwise."

TAXATION EMPHASIZES WORTH

The court here presented a long list of citations to confirm this view. It then points out that the status of franchises as property is emphasized by the provisions made by the Legislature for taxing them and the deliverances of the courts in tax cases and says, in part:

"It should be unnecessary to remark that our reports would not contain this long line of decisions in earnestly litigated franchise tax cases, were it not a fact that franchises, general or local, State or municipal, have a substantial value of which the taxing authorities are prompt to take advantage, and which value in tax assessment controversies, the authorities estimate often in large figures. If other evidence of substantial value were needed, it may be found in the fact that as to municipal franchises, the municipality may impose within reason, and the utility must comply with, conditions involving considerable expense. J. C. & H. R. R. Co. vs. J. C. & B. R. R. Co., 21 Eq., 550.

"The respondents then must take and sustain this position: That although by numerous decisions of the Supreme Court, Court of Chancery, and of this court, it has been repeatedly declared that the privilege given to public utility corporations, either directly by the State, or partly by the State and partly by the municipality as a State agency, and whether exclusive or not, is a franchise, and as a franchise is property, to which the utility in a proper case may assert its special right as against an usurper, and as property is subject to taxation, at the will of the Legislature, upon a substantial valuation fixed by the taxing authorities; and though its bestowal may be and in most cases is conditioned upon a substantial, valuable consideration in money or contract obligation, yet when in the exercise of its rate regulating power the Legislature deputes an agency to determine a valuation as a basis for the rate, such agency may disregard the unquestionable value that is attached to the franchise for the purpose of yielding an income to the State or its subdivisions, and declare that such franchise has only a nominal value for the purpose of yielding an income to the public utility.

"We cannot agree to such a proposition. We are aware that some courts have held that a valuation for taxation is not necessarily identical with valuation for rate regulation. This may be so in a measure. Indeed, it is readily conceivable that if the franchise were exempt, as it was claimed to be under the act of 1903 (North Jersey Street Railway Company vs. Jersey City, supra) the rate valuation might exceed the tax valuation by the value of the franchise.

"But normally, when all the corporate property is subject to taxation and also valued for rate regulation, it would seem reasonable to say that the owner of the property is entitled to a fair income on property for which it is taxed. The fact that the State or the municipality, or both, have seen fit to confer a franchise in many cases as a gift (so-called) or for a consideration deemed inadequate in view of the advantages conferred, does not, as it seems to us, create any implication in the grant that the value of the franchise should be disregarded in fixing a reasonable rate.

FRANCHISES BASED ON A CONSIDERATION

"Recurring to the argument that these special or municipal franchises are given to the utility, or contributed by the public, and therefore should not be estimated in fixing a rate, we repeat that the minor premise is an unwarranted assumption of fact. A municipality desires street car or gas service. It can, if so authorized by the Legislature, build and operate its own plant and equipment. Perhaps the cost of installation is too great, so that there would be no sale for the bonds, or the citizens are unwilling to shoulder the interest charge; perhaps, also, the usual extravagance in operation due to public ownership is a deterrent. It is common knowledge that in this country a public utility is usually operated by the public at a loss or an inadequate return.

"The economic advantage of private ownership is generally recognized. In this situation, a company is organized and asks a franchise. The risk is all that of the organizers; nothing is risked by the municipality. If it fails, they lose their money. It must operate, however, so long as it does operate, at a reasonable rate, based on a theoretically economical plant and operating expense. It cannot charge the public more than the service is worth, just because otherwise it will not meet its operating expenses and fixed charges. It must pay its taxes, whether it earns them or not. In short, all such franchises are based on a consideration, viz., the risk and obligation undertaken by their grantees; and it will not do to say that the franchise is a public contribution exclusively.

"If the plant and franchise be taken over by the public, the franchise must be paid for like any other property. Monongahela Nav. Co. vs. U. S. 148, U. S. 312; Brunswick and Topsham Water Dist. vs. Maine Water Co., 99 Me. 371, 59 Atl. 537. In the latter case the Legislature expressly recognized that it should be paid for, but the court did not rest on that; on the contrary, it said that even in cases where by statute franchises were not to be included in the valuation, the court conceived that it must have been implied that the property was to be valued as rightfully where it was, and rightfully to be used; adding that the right to use and charge reasonable tolls were the franchises, at any rate the most important ones.

"If, as we think is the law, substantial allowance should be made for the franchise of a gas plant if taken for public use, and the value of such franchise paid in money to the owners thereof, we fail to see why, so long as the plant and franchise possessing that value for sale or condemnation are held and operated by the owners, the latter should not be entitled to a reasonable income on all elements of their property, including the franchise, in the absence of any charter reservation or contract to the contrary. As was said by the Supreme Court of Maine, in the Brunswick case, ubi supra, 'we apprehend that some difficulty in discussion has arisen from attempting to differentiate in logic what is inseparable in fact. The property taken is a single thing, to which belong certain characteristics which affect its value.'

"We do not wish to be understood as laying down the doctrine that the value of the franchise is to be measured necessarily by the total market value of outstanding capital stock and indebtedness, less physical valuation and development cost, because this would take no account of inflation of stock values; but if such market value added to indebtedness show an excess, such excess is at least evidential that where there are special franchises such franchises have some substantial value in excess of the mere outlays for legal, advertising and other legitimate expenses in obtaining them. This element was, apparently, expressly excluded both by the commission and by the Supreme Court. This exclusion, in our opinion, was error. We think there was evidence before the commission to indicate that from this standpoint the franchises had a substantial value which the commission refused to give to them, and as the 90-cent rate fixed by the commission was based on the theory of providing net income of 8 per cent of the total value of the property of the company, the finding of fact that such rate was just and reasonable was in direct violation of the fundamental theory on which the commission undertook to fix the rate, and is presumably not justified by it. On the appeal of the gas company, therefore, the judgment of the Supreme Court will be reversed and the order fixing the 90-cent rate will be set aside."

The opinion was delivered by Judge Parker. Five other judges concurred in it. Four judges voted to affirm the decision of the Supreme Court.

Rapid Handling of Auto Bodies on the Detroit United Railway

BY N. RUMNEY, TRAVELING FREIGHT AND EXPRESS AGENT DETROIT UNITED LINES

In Detroit, Mich., the movement of carload freight within the central district is entirely out of the question, and any business of this character must necessarily be confined to the outer districts. There are, however, a large number of factories located in the outlying sections engaged in the manufacture of various articles and part of the output of these factories is forwarded to customers in adjoining cities. Some of this material includes automobile parts, and the manufacturer is usually under contract to deliver a specified quantity of the material daily. This is difficult with the service afforded by the steam railroads in some cases, because of the delays en route and the unreliability of the service.

The accompanying illustration shows how automobile bodies are handled by the Detroit United Railway on flat cars equipped with stakes and railings. These bodies are shipped by automobile body companies of Detroit to one motor company at Flint, Mich., a distance of 70 miles, and to another motor car company at Pontiac, Mich., a distance of 25 miles. The bodies are 10 ft. 2 in. long and are set upon end, eighteen bodies being loaded upon a 34-ft. car. In transit the bodies are covered with a large canvas which, after the car is unloaded, is folded and placed in a side-hinged box provided for that purpose beneath the car.

During the busy automobile season it is a vital problem to secure material with sufficient regularity, for any interruption in the daily supply of any one of the numerous parts which enter into the make-up of the completed automobile may mean a serious setback, if not an actual money loss. So in this case the Detroit United Railway is relied upon to secure the prompt delivery of bodies, despite the fact that trucking is necessary at both the point of receipt and delivery, whereas the steam railroad could make complete delivery. These cars are loaded at Detroit during the day and are placed at the destination ready for unloading before 6:30 a. m. the following day.

The rate for transportation exceeds that charged by the steam railroads. The shippers, however, consider that this higher rate is more than offset by the advantage gained in having the goods on hand when required, thus enabling them to have the bodies well advanced in the process of painting and finishing before they would have been received in the ordinary course of steam railroad freight movement. To the shippers, another advantage lies in the fact that they are permitted to continue loading until a late hour in the afternoon or evening, thereby making it possible to ship the entire day's output at the close of the day's work. This increased efficiency enables the manufacturer to make contract deliveries even during the busiest part of the season.

Annual Meeting of C. E. R. A. Accountants

Report of Proceedings of This Meeting in Dayton, Ohio, on Dec. 11 and 12, with Abstracts of Committee Reports and Papers—Depreciation of Equipment and Cost Accounting Main Topics

The twenty-sixth annual meeting of the Central Electric Railway Accountants' Association was held on Dec. 11 and 12 in the Hotel Beckel, Dayton, Ohio. After a meeting of the executive committee the opening session was called to order on Friday afternoon at 2:30 o'clock by the president, L. T. Hixson, auditor Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind. The minutes of the mid-year meeting in Toledo were read and approved, and the delegates then accepted with thanks an invitation from John F. Ohmer, president Ohmer Fare Register Company, to join him at dinner at the Dayton Club. The address by President Hixson, abstracted elsewhere in this issue, followed. The executive committee reported with recommendations that F. S. Kelser, Mansfield Railway, Light & Power Company, Mansfield, Ohio; F. J. Haas, secretary Public Utilities Company, Evansville, Ind., and H. Armstrong, Steubenville & East Liverpool Railway & Light Company, East Liverpool, Ohio, be admitted to membership; that A. F. Elkins, auditor Columbus, Delaware & Marion Railway, Columbus, Ohio, be elected as honorary member, and that the printed list of membership of the association hereafter include only active members. These recommendations were all adopted.

REPORTS OF COMMITTEES ON ACCOUNTS

After the report of the treasurer, the reports of special committees were taken up. E. L. Kasemeier, auditor Ohio Electric Railway, Springfield, Ohio, chairman of the standing committee on freight accounts, presented two new paragraphs for addition under Section 4—way-bill corrections—as follows:

"When originating agent gives shipper prepaid bill of lading, but way-bills show shipment collect, agent at destination will deliver shipment without collection of charges, if consignee refuses to pay and turns over to destination agent the prepaid bill of lading. (Destination agent will ask originating agent to issue correction on billing.)

"When originating agent gives shipper collect bill of lading, but way-bills shipment prepaid, agent at destination should accept correction on billing, even though shipment has already been delivered as prepaid. (In event, however, he cannot make collection from consignee, he may so notify his auditor, who will take up with auditor of billing company for request of billing agent to make effort to collect from shipper. If collection cannot be made from shipper, destination road will be so advised.)"

Upon the discussion of this recommendation, however, the second paragraph was changed to relieve the destination road of liability as follows:

"When originating agent gives shipper collect bill of lading but way-bills shipment prepaid, agent at destination should endeavor to collect and if successful accept correction. If collection cannot be made, the correction should be denied."

The two paragraphs were then adopted by the delegates.

Mr. Kasemeier's committee further recommended that the association should print in pamphlet form the recommendations for handling interline freight accounts on paper cut to tariff size (8 in. x 10 in.), printing to be done on one side only and the copies to be disposed of at cost to railways by the secretary. This recommendation was also adopted. Mr. Kasemeier suggested that on account of the growing use of way-billing typewriters and the fact that some machines could accommodate way-bills only 8½ in. wide, it might be advisable for the association to recommend a form of interline way-bill of different size than at present so that such bills could be made out on small carriage machines. Upon motion by Walter Shroyer, auditor Union Traction Company of Indiana, Anderson, Ind., this matter was referred to the committee for further consideration. In regard to the matter of interchanging freight trailers, the committee recommended that the association adopt the recommendation of the Central Electric Railway Association as outlined in its bulletin 71, Brown Book 4, pages 10 to 14. This method provides for a report to be made by the junction agent to the auditor of the road owning the car with a copy of the report to the auditor of his own road, the report to show car initial and number, loaded or empty state, road to which delivered, exact hour and minute, and date. It was felt that such information would enable the owning road to make a proper bill against the using road. The recommendation was adopted.

In connection with his report, Mr. Kasemeier recalled that at the last meeting the committee was asked to prepare a resolution that "order notify" shipments be discontinued. The committee had not acted on this point, however, and a discussion was requested. Mr. Shroyer moved that before taking definite action the committee should write to different companies to find out how they handle such shipments and whether they object to receiving them, which was duly carried.

The report of the standing committee on passenger accounts was presented by Mr. Shroyer, chairman, who said that on account of a lack of questions submitted a report was unnecessary. He approved the combination of the standing committee on freight accounts and the standing committee on passenger accounts, and a motion to this effect by him was seconded by Mr. Kasemeier and carried.

QUERY BOX REPORT

The next order of business was the report of the query box committee, read by T. P. Kilfoyle, auditor Cleveland (Ohio) Railway, chairman. Four questions were submitted, the first of which had reference to what constitutes cash discount. To start the discussion Mr. Kilfoyle stated that anything above 3 per cent might be considered a trade discount. W. H. Forse, secretary and treasurer Union Traction Company of Indiana, Anderson, Ind., cited some examples of cash discounts running as high as 30 per cent, and Mr. Kasemeier stated that cash discount was discount received for prompt payment within ten, twenty or thirty days. Mr. Loftus said that in a recent case he refused to pass anything more than 2 per cent for ten days as a cash discount. Mr. Kilfoyle remarked that in Ohio cash discounts must be considered in the basis for the income tax. Large discounts should be considered as trade discounts, showing the possession of good purchasing qualities. According to President Hixson's definition, cash discount is a sum allowed for prompt payment, which amount is made up on a basis equal to the current charge for use of money.

In regard to the question whether it is proper to transfer any amount of sinking fund reserve to surplus after the bonds have been purchased and canceled, Mr. Kasemeier stated that if all the bonds have been retired any balance in the sinking fund reserve could be so transferred. President Hixson mentioned a $50,000 bond issue with $25,000 of the bonds retired from time to time through the sinking fund and the remaining $25,000 taken care of through a refunding issue. In this case the $25,000 of sinking fund reserve offsetting the sinking fund cash used to buy the bonds should not be retired without notation to surplus but should be ear-marked to show that the cash represented by this section of surplus had been spent. In this connection Mr. Forse stated in general that he was opposed to the splitting up of surplus into parts for dividends, sinking fund, depreciation, etc.

The next question dealt with the proper entry in making payment of bond interest when a portion of the company's bonds is held by the sinking fund trustee for the benefit of the company. President Hixson said that the new Interstate Commerce Commission classification provides that the account for interest on funded debt shall not include charges for interest on funded debt obligations issued or assumed by the company and owned by it, whether held in its treasury, special deposits, sinking or other reserve fund, or pledged as collateral. He also quoted from the accounts dealing with the appropriation of surplus to sinking fund and other reserves, sinking fund and sinking fund reserve, to show that interest on bonds held in sinking funds cannot be shown as a deduction from income. In such cases the debits would be to bond interest deductions for interest as bonds in the hands of the public only, and to sinking fund for interest on bonds which are held by the trustee and on which the trustee collects the coupons. The credit would be to cash for the interest on the full amount of the uncanceled bond issue. The next entry would be to debit surplus account 309—appropriation of surplus to sinking fund and other reserves—and credit sinking fund reserve for the amount of surplus representing the income accretion to the sinking fund during the period. Mr. Kilfoyle said that the Cleveland Railway has an interest fund of $500,000 created by ordinance, $300,000 of which is invested in the company's own stock. Each interest period the company pays directly to the interest fund 6 per cent.

The last question was as follows:—In reporting net income to the internal revenue collector, should the amount of discount on bonds purchased by the sinking fund trustee be included as income? Mr. Forse said that Interstate Commerce Commission account 306—profit and loss, miscellaneous credits—would show the proper provision to be made for such amounts.

At this point Mr. Forse called attention to the first ruling covering the reporting of deductions of bond interest in stating income. The first ruling provided for taking the entire capital stock and entire bonded indebtedness and dividing the total by two to secure a base for interest. The second ruling, however, was more favorable to most companies, inasmuch as they were allowed to take the entire bonded debt and half the capital stock as the base. Mr. Forse said that more than $800 had been returned to his company as a result of this second ruling and that it was worth following up by all companies.

President Hixson read a letter from H. J. Davies, secretary Cleveland (Ohio) Railway, to the effect that the Treasury Department in connection with the income tax on corporations had ruled that the gain or loss resulting from the sale of capital assets acquired before Jan. 1, 1909, was to be increased or decreased accordingly as there was gain or loss by the amount of depreciation charged off since Jan. 1, 1909, and not used to make good depreciation. This ruling as regards depreciation applied only to such tangible properties as were subject to wear and tear, exhaustion and obsolescence.

Committee to Confer with C. E. R. A.

The committee to confer with the Central Electric Railway Association reported through Mr. Kilfoyle, chairman, that the joint committee appointed to confer on the differences existing between the Central Electric Railway Association and the Central Electric Railway Accountants' Association had submitted a report to the executive committee of the former association at a meeting at Fort Wayne on Nov. 19, which was adopted. This report stated that a necessity was found for handling more properly the obligations incurred by the Accountants' Association, and it was recommended that an annual appropriation of $150 be made from the general fund, any unexpended balance to be returned to the general treasurer by the Accountants' Association and no obligation exceeding that amount to be incurred unless authorized in advance by the executive committee of the Central Electric Railway Association. Upon motion by Mr. Cavanaugh, this report was adopted by the Accountants' Association.

A telegram was received from C. S. Mitchell, comptroller Beaver Valley Traction Company, Pittsburgh, Pa., expressing his regret that he was unable to attend the meeting as scheduled. A representative of a Central printing house was given the privilege of the floor to state that his firm is trying to standardize railway accounting forms as to size, quality of paper, style of ruling, etc., the object being the attainment of a large reduction in printing cost. President Hixson appointed Messrs. Shroyer, Kilfoyle and Kasemeier as the nominating committee and the meeting was then adjourned.

SATURDAY'S SESSION

The first order of business on Saturday morning was the presentation of a paper on "Cost Accounting In a Manufacturing Plant" by G. D. Piper, director of works accounting Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa. This paper is abstracted elsewhere in this issue. In explaining the systems of wage payments used by his company Mr. Piper said that the company uses four different systems, namely, day work, piece work, premium and bonus. The premium or Halsey system is based on time. A definite time is fixed for the completion of a certain job by the average workman, to which is added a premium of from 30 to 60 per cent of the time. The workmen are paid for one-half of the time saved below the total on each job. The bonus plan is also based on time, but without the incentive of a premium being added to the base or net time. If the workman completes the work any time within the time limit, a flat bonus of 30 per cent on the day's wages is paid, but all jobs during the day must have been produced within the time limits. The base rates are set by a group of men independent of the foreman and under the direction of one of the staff. The bonus system is more generally used with jobs of short duration, while the premium plan is used in the main works in productive labor. Mr. Piper stated that the losses due to abnormal conditions are charged directly against income and are not used to inflate costs. Mr. Forse recommended that sets of forms furnished by Mr. Piper should be distributed among the absent members. A vote of thanks was rendered to Mr. Piper.

Discussion on Depreciation of Equipment

H. J. Davies was unable to be present for his address and the attention of the meeting was turned to a general discussion on the basis and the methods of accounting for depreciation on equipment. Mr. Forse opened the discussion by reading the Interstate Commerce Commission requirements on this point. He stated that the Boston & Maine Railroad within the last decade had charged off almost 4 per cent of the book value of its rolling stock, while the New York Central lines charged off 2 per cent per annum for freight car depreciation, and the New York, New Haven & Hartford Railroad only this year inaugurated a regular charge of 2 per cent. At the present time the Pennsylvania Railroad charges depreciation at the rate of 4 per cent of the original cost of locomotives and passenger cars and 3 per cent on freight cars. Other figures given were as follows:—European cars, 1.7 per cent per annum; British Columbia Electric Railway, 3.5 per cent; Stone & Webster testimony in Chicago Union Traction case, 5 per cent; testimony in Milwaukeee 3-cent fare case, 7½ per cent; average Scotch practice, 7½ per cent, and average English practice, 10 per cent. The above figures, according to Mr. Forse, show clearly the variation in practices and the estimated life of equipment, the latter ranging from ten to fifty-nine years. In his opinion accounting for depreciation must depend upon the policy of the individual company regarding upkeep and renewals. One company is providing for maintenance and renewals at a rate sufficient to pay for the rolling stock in nine years. Under such conditions it is inconceivable that some depreciation is not taken care of through such a process. Mr. Forse stated emphatically that if a car has passed one-half of its estimated life it is by no means proved that it has depreciated one-half. In the present Detroit valuation case the state engineers desired to write off depreciation on a 17-year-old car, but when the company tore the car down for inspection the posts, sills and general fittings were found to be in the best of condition.

Mr. Forse quoted from the editorial in the ELECTRIC RAILWAY JOURNAL of March 21, 1914, to show the conflict in commission rulings as regards the distinction between the treatment of maintenance and depreciation charges. He also noted conflicts in commission ruling where the question of valuation was involved, such as in the recent Manchester fare decision, the famous Kansas City Southern case and the recent Middlesex & Boston rate decision.

Mr. Forse said that the committee on standard classification of accounts recently received a letter asking whether the carriers had a right to figure depreciation on any other basis than the cost or purchase price—for instance, whether it could be calculated at a rate of 2½ cents per car-mile or 7 per cent of the gross earnings. The commission in answering this query said that depreciation may only be accrued as a percentage of the original cost. Mr. Forse objected to setting up each month an amount based on the book cost of the equipment, on account of conflicting tabulation experiences on the subject and on account of general lack of knowledge regarding it. He believed that companies should be permitted to charge off a lump sum based on experience, or a percentage of net earnings based on financial ability, or an amount per car-mile based on experience. Companies should be chary in setting up large amounts for depreciation on account of possible ultimate valuations, for the increased value of properties through terminals, rights of way, solidification of roadbed, as well as other intangible values, may not be allowed, and the valuation engineer will deduct depreciation already set up from the ascertained value of the property.

In Mr. Kasemeier's opinion the matter of depreciating equipment rests entirely with the company and depends on local conditions, class of cars and extent of maintenance. The practical way is to make a valuation of each road's equipment less the final scrap value, estimate its remaining life and thus secure a rate. Mr. Kasemeier believed that obsolescence is the most vital element in this question.

Mr. Campbell, representing the Illinois Traction System, said that a company should write off as much depreciation on equipment as seemed proper. The real question is whether it desires to spread this amount over a period of years or to be burdened with the whole amount when the equipment is scrapped. His company is trying to get an appraisal of the scrap value of the car bodies and electrical equipment to be deducted from the cost, the remainder to be spread over certain periods at the following rates: bodies and truck equipment, 4 per cent; electrical equipment, 5 per cent; freight equipment, 5 per cent; locomotive and bonding cars, 6 per cent. In cases where the company was unable to ascertain the purchase cost, the superintendent of motive equipment estimated the replacement cost. The company intends to figure depreciation on all the secured amounts down to July 1, the starting point. Each car is a separate unit in this accounting work. Mr. Kasemeier and Mr. Forse agreed that depreciation of equipment on electric railways was a more difficult question to handle than on steam railroads because of the difficulty of judging the value of electrical equipment as it is maintained, renewed or superseded from time to time.

Mr. Piper, in giving the experience of a manufacturing plant, said that fifteen years ago the Westinghouse board decided to discontinue charging to capital account expenditures made for additions to small tools, patterns, etc. Henceforth all went to operating expenses except the cost of special tools and patterns, which was treated as a development cost of special apparatus. Four years ago the plant was appraised and the difference between the book value and the appraised value was set up as a reserve. Since then additions to the reserve have been made by monthly charges to operating expenses, based on a flat percentage rate of the appraised value without respect to the different classes of equipment. A lower rate, however, is used for buildings. The results of this plan have more than proved the policy of the company to be conservative. The plan is not quite so accurate as it should be, but the board decided that the blanket rate was sufficient for all practical purposes. The plan provides for reappraisals at the end of each five-year period.

F. K. Young, auditor Scioto Valley Traction Company, Columbus, Ohio, said that no two lines could use the same rate for depreciation. He asked whether companies were compelled to show depreciation charges monthly or whether they were allowed at the end of the year to appropriate an amount for depreciation from surplus without any charge to the maintenance accounts. In support of this plan he said that this method would show the real and tangible operating expenses for each month and in addition satisfy stockholders and the public that depreciation charges for each fiscal period were being provided for, but the question was whether this method of accounting would satisfy the Interstate Commerce Commission. Mr. Forse replied that the commission requires monthly charges to be included in the operating expenses, but that a company may publish its own annual report in a form to do itself the most justice and secure proper credit for its depreciation accounting.

In connection with the situation in Cleveland, Mr. Kilfoyle explained that the street railway settlement there provided for a charge of 5 cents per car-mile for maintenance, renewals and depreciation. An average of this amount per year was set aside from earnings up to March 1, 1913, but the fund was insufficient to take care of maintenance and renewals, there being an overdraft of $324,000 without any provision for depreciation. A short time ago the company agreed with the city to charge out $6,000 per month. Since 1913 there has been another overdraft of $584,000 without any provision for depreciation. The 5 per cent rate per car-mile provides about $1,500,000 a year, or 20 per cent of the gross earnings. Mr. Kilfoyle cited these figures to show how impossible it is for engineers to estimate accurately what will be needed for maintenance, renewals and depreciation.

President Hixson stated that it was unwise to endeavor to distinguish between maintenance, depreciation and renewals on the books, and that these should all be grouped under one account, any amount remaining from the estimated sum after provision for maintenance and renewals to be considered as the charge to depreciation. Mr. Kilfoyle also thought that there should be one reserve to cover all these items.

NEW OFFICERS

At the conclusion of the discussion on depreciation of equipment, the nominating committee presented the names of the following nominees: President, H. B. Cavanaugh, auditor Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio; first vice-president, F. T. Loftus, auditor Indianapolis & Cincinnati Traction Company, Rushville, Ind.; second vice-president, J. B. Hooper, auditor freight accounts Detroit (Mich.) United Railway; secretary, A. L. Neereamer, secretary Central Electric Railway Association, Indianapolis, Ind. Upon motion the secretary was instructed to cast one ballot for the above nominees. The election of Mr. Neereamer as secretary effected a consolidation of the offices of treasurer and secretary. The following members were elected to the executive committee: J. N. Tabb, treasurer Parkersburg, Marieta & Interurban Railway, Parkersburg, W. Va.; T. P. Kilfoyle, auditor Cleveland (Ohio) Railway; Oren A. Small, auditor Benton Harbor-St. Joseph Railway & Light Company, Benton Harbor, Mich.; Edward Hayes, auditor receipts Illinois Traction System, Champaign, Ill., and F. K. Young, auditor Scioto Valley Traction Company, Columbus, Ohio.

The new president was escorted to the chair by Messrs. Kilfoyle and Young, after which speeches were heard from the newly-elected officers. President Cavanaugh then stated that at the last meeting in Cleveland it was voted to prepare a book of forms. On account of the Interstate Commerce Commission classification this had not been done, but he intended early in 1915 to ask for a new set of forms to be turned over to the new first vice-president. Mr. Kilfoyle moved that these forms be kept in the office of the secretary of the Central Electrical Railway Association and that the latter official should collect the forms. This motion was amended by Mr. Loftus to the effect that the secretary should be instructed to call upon a committee to be appointed by the president to help keep the book up to date. The motion was passed as amended and the meeting then adjourned.

PRESIDENT'S ADDRESS

BY L. T. HIXSON, AUDITOR TERRE HAUTE, INDIANAPOLIS & EASTERN TRACTION COMPANY, INDIANAPOLIS, IND.

In opening his address, President Hixson reviewed the advances that have been made in electric railway accounting during recent years but also mentioned several problems that still remain to be solved. In his opinion the part of the new Interstate Commerce Commission's instructions most difficult to comply with is that referring to depreciation. Another point was that while most companies use the official classification, very few secure the full benefit of the information which could be furnished from accounting departments, because of the great lack of proper departmental costs. Valuable lessons could be learned from manufacturing concerns regarding cost accounting, which term embraces timekeeping and storekeeping. Electric railway accountants might also well observe the methods employed by any large and progressive mercantile company with reference to accounts receivable.

President Hixson called attention to the facts that some state commissions have adopted a uniform classification of accounts for electric utilities and that the increasing number of combined railway and lighting properties make this form of accounting a most suitable subject of study for electric railway accountants. He observed also that some slight difficulty had been experienced in the past in regard to the failure of some companies to comply with rulings established by a majority vote of the association and pertaining to uniform practice in handling reports and settlements on interchanged business. He suggested that the executive committee of the Central Electric Railway Association should be requested to inforce the rulings made. Besides the above points, the following recommendations were made: the consolidation of the standing committee on passenger accounts and the standing committee on freight accounts into a standing committee on passenger and freight accounts, this step being advisable on account of many matters which come within the scope of both committees; a study of the balance sheet, with reference principally to a proper analysis to make this statement more intelligible; and the formation of a condensed system of departmental expenses, such system to be subsidiary and readily adapted to the present system of accounts.

COST ACCOUNTING IN A MANUFACTURING PLANT

BY G. D. PIPER, DIRECTOR OF WORKS ACCOUNTING WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, PITTSBURGH, PA.

In the main works of the Westinghouse Electric & Manufacturing Company the investment in working and trading assets is divided into three groups—i.e., (1) raw materials and supplies, (2) finished parts and completed apparatus, and (3) work in progress.

(1) Raw materials and supplies: The investment in this account represents the cost, f.o.b. works, of raw materials and supplies purchased and held in general stores pending withdrawals by the various works departments or shipment direct from the former to the customer.

(2) Finished parts and completed apparatus: The investment in this account represents the factory cost value of a portion of the parts made in the various works departments, delivered by the latter to general stores and held therein pending withdrawals by the works to be later assembled into complete salable units. It also represents the factory cost value of the completed apparatus made for specific customers, resting temporarily in this account awaiting shipment, and completed standard apparatus not yet sold, but a stock of which has been authorized by the commercial department.

(3) Work in progress: The investment in this account represents the factory cost value of parts and apparatus in course of manufacture preliminary to being delivered to general stores; the cost of working stocks of raw materials withdrawn from general stores on which no labor has yet been performed; the factory

cost value of working stocks of finished parts withdrawn from general stores for assembly into complete units, and the factory cost value of stocks of certain classes of finished parts which are always carried in this account. The latter are the heavier parts (frames, bedplates, shafts, etc.) to move which in and out of stores would entail unnecessary expense.

It is with the last named account that the following mostly deals. The total investment in this account is divided into forty odd sub accounts, this division having been made to conform very largely to the line-up of the supervision.

Handling Customer's Order

Upon receipt of a customer's order, a list of the apparatus sold is written on a form which is thereafter known as a "general order." This general order sheet is sent to the storekeeper, who, from his records of finished parts and completed apparatus, ascertains whether the apparatus is in stock, on order, or whether it will need be built specially for that specific customer. All items on the general order that are in stock or are coming through on an order for stock are marked "in stock" or "available." For items that must be specially made the storekeeper enters a manufacturing order, copies of which are distributed to the various works departments involved, and to the engineering department. The latter department proceeds to prepare a specification for each kind and size of apparatus for which manufacturing orders have been entered, detailing practically every item entering into the construction of the apparatus. A copy of the complete specification is sent to the works departments that will assemble the apparatus, and additional copies of such portions of specification as contain parts to be made in other departments and forwarded to the latter.

The first element of the total cost identified with the order is incurred in the engineering department in the preparation of the specification. This cost is secured through the medium of semi-monthly time reports turned in by this department, including drafting, tracing and clerical or specification divisions. This item of cost covers an amount for the overhead expenses of the department and becomes part of the "development cost," the total development cost including special tools, patterns, fixtures, etc., in addition to the engineering development.

Material Cost

Upon receipt of the specification in the works department steps are taken to provide the necessary material. If the raw materials and finished standard parts listed in the specification are not to be had from the working stocks carried by the department, and are not to be provided by a feeder department, the item or items lacking are ordered from the general stores by a requisition, which is made out in duplicate, the carbon copy accompanying the material to the section ordering same and the original being retained by the stores department for pricing and extending. After this latter operation is finished, the day's, or possibly several days', issues are summarized and the proper stores accounts credited and the work in progress account of the department drawing the material charged. The requirements are forwarded to the latter to be used in maintaining the price files in up-to-date condition, and, where required, as a basis for determining the material cost of the order. In case surplus material has been withdrawn on an order, the surplus is credited to the order by returning same to general stores on a credit memorandum, which is contra to the requisition.

It might be inferred that the material portion of the total cost is determined from these requisitions and credit memoranda. This is not the case, however, as the values appearing on these requisitions are used in arriving at the material cost of an order in comparatively few cases. The majority of the material costs are determined from tabulated lists of material commonly known as "bills of material." The bill of material is part of the information appearing on the face of each drawing, and is simply a tabulation of the description, quantity, dimension, etc., of the raw material necessary to produce one unit of each item appearing on the drawing.

Besides these two methods of building up the material cost, there is another source of material charges. Some parts will be delivered to the assembling department by the feeder departments at values which represent the factory cost of those parts. These charges flow into the assembling departments on interworks delivery reports, which show the quantity, description, weight or measurement, unit price and value. One of the three copies made out bears the factory cost for which the feeder department's work in progress account receives credit and the assembling department's work in progress account is correspondingly charged. The latter in building up the cost of the complete unit treat these interworks charges as "material," notwithstanding these values include both labor and overhead expense.

Another source of material charges, but one not frequently employed in connection with manufacturing orders for the reason that the specifications automatically provide for all work and material to be regularly supplied by other departments, is through the medium of foreman's requisitions. In some cases a department is unable, owing to an excess amount of work for its equipment, equipment disabled or for other reasons, to perform all the work assigned to it promptly enough to meet production requirements. When this condition obtains a requisition is issued by the foreman upon another department, requesting the latter to perform certain labor on material which will be furnished by the department issuing the requisition. It may be that the department on which the requisition is issued will be asked to supply the material as well as the labor. These transactions, commonly termed "requisition jobs," are treated in a similar manner to the interworks deliveries in the building up of the material cost in the assembling department.

FORM I—USED IN TABULATING AVERAGE COST OF PARTS RECEIVED FROM OTHER DEPARTMENTS

For convenience in tabulating the average cost each of parts received from other departments at various times and in varying quantities Form I, shown herewith, is used, it serving the double purpose of checking the prices at which the supplying department charges the using department and providing a price file for the latter. The card is 5 in. x 8 in., containing four similarly-ruled columns front and back. This form is also used to record the "average" cost of labor operations (frequently repeated) in the department in which they are performed.

Labor Cost

The Westinghouse Company has four different systems of wage payment—viz., day work, piece work, premium and bonus. The premium system of wage payment predominates, however, for the chief reason that furnishing of labor costs on individual orders, and it is this system is more generally used on productive work throughout the main works than are the other three.

The receipt of the specification in a section prompts the time clerk to open up a labor record. This is a loose-leaf sheet, 8¾ in. x 15 in., ruled on both sides with five labor columns. Each column is headed with the operator's name and number, base time, limit time, pieces, and rate spaces. Interior rulings are provided for check number, date, hours, pieces, total pieces and cost. This record performs the double function of preventing payment for more pieces than the order calls for and the furnishing of labor costs on individual orders, and it is used where the operations are numerous and extend over a considerable period of time. A similar form, or a 5 in. x 8 in. card, is used in sections where the operations are not so numerous and are shorter. This provides for practically the same information in the column headings as the other form, except that no provision is made for posting money values thereon. Its prime purpose is simply to safeguard the payroll.

FORM II—SINGLE TIME AND WORK REPORT ISSUED BY TIME CLERK TO WORKMAN

The information filled in on either of the forms is a combination of that secured from the specification and from premium limit records. The information secured from these two sources may not, in fact frequently does not, complete the labor record, as day work operations may be necessary which cannot be foreseen at the time the labor record is opened. To provide for such cases blank spaces are usually available when needed, or an additional labor record may be added. The labor record is then placed in the active file ready to have recorded thereon the time expended, etc., as reported during the progress of the work.

Departments using the first labor record employ single time and work reports, as illustrated by Form II. These are issued to the workman by the time clerk upon instructions from the foreman, and are retained by the workman until the number of pieces assigned to him has been completed. Upon completion the time and work report is approved by the foreman, assistant foreman or inspector and surrendered to the time clerk, when a new time and work report for the next job is issued. These reports are then rated, extended, posted to the labor record and forwarded to the payroll clerks.

Departments using the smaller labor record employ a similar form of time and work report, the top portion of which has a carbonized back to facilitate providing a carbon copy. This form of time and work report is kept intact until the values have been extended thereon. Then the original and carbon copy are separated, the former forwarded to the payroll clerk and the latter filed for cost purposes.

Overhead Expenses

A writer recently said that there never has been a perfectly satisfactory method devised for absorbing the overhead expenses, and that the aim of the cost accountant should be to adopt the "least unsatisfactory" method. In general the method we employ is the percentage-on-direct-labor plan. While this is not perfect, and is probably not so equitable as the machine hourly rate combined with a productive man hour rate, the company has hesitated to depart from it on account of the expense involved in the operation of these more theoretically correct methods.

The shop accounts approximate forty-five in number, each of which is known by a title, viz., Controller Department, Forge Department, Industrial Motor Departments (three in number), Locomotive Department, Punch Department, Transformer Department etc The overhead expenses for each department are ascertained monthly. While we do not fluctuate monthly the percentages added to direct labor in figuring costs, a comparison is made each month between the percentages used in costs with the percentage relations of the actual expenses to direct labor for that month. Obviously, if wide differences are noted between the percentages used and the actuals, investigations and explanations are demanded by the management.

FORM III—MONTHLY STATEMENT OF OVERHEAD EXPENSES BY DEPARTMENTS FOR EACH CLASS OF EXPENSE

A monthly statement of the overhead expenses for each department is prepared on record sheets similar to Form III, showing in detail just what amount was expended for each class of expense. This statement is divided into three groups—i. e., class "A," class "B" and class "C." Class "A" are the expenses which are controllable by the foreman of the section (a sub division of a department) and reported in their entirety by the departmental cost clerk. That is to say, nothing is added to this class of expense by the general accounting department. Class "B" are the expenses which are beyond the control of the foremen and general foreman of a department, but are considered to be largely, although not wholly, controllable by the superintendent of the department. While the bulk of this class of expense is reported by the department itself, some items are added to this group by the general accounting department, but none are added which are not considered as belonging to that class which the superintendent of the department controls wholly or in part. Class "C" are the expenses which are beyond the control of even the superintendent, and, as their titles indicate, are expenses added almost entirely by the general accounting department. After the additions to classes "B" and "C" are made by the general accounting department, copies of these statements are issued to the executives and other department heads, including the superintendents, who can, from a glance at the bottom of the class "C" portion of the expense statement, readily see how the actual percentages compare with the "fixed" or used percentages.

Numerous bases are used for distributing the various expenses added by the general accounting department on the class "B" and class "C" portions of these statements, those most commonly used being the relative number of employees, floor space, productive labor, etc. Such expense items as depreciation, power, storekeeping and shipping and charges for defectives are allocated to departments on more definite bases than the more or less arbitrary ones just referred to.

The company endeavors to control the major portion of the total factory expenses by a comparatively simple but effective method. After a review of the records for a considerable period, we established standard percentages of direct labor for the various classes of expenses which the superintendent can control, and within which he is expected to confine his expenditures for the month. At the beginning of each month the superintendent estimates the direct labor for his department or departments for the ensuing month, and by multiplying this estimated direct labor by the "standard" percentages he determines the amount he can spend during that month for each class of expense he controls. To enable him to keep in close touch with the condition of each expense account for which an allowance has been established two forms have been provided. One covers an individual account and shows the date of requisition, requisition estimates and allowances unspent. The other is a condensed summary of the whole analyzed as to accounts and days of the month.

In determining the percentages that are added to direct labor to absorb the overhead expenses, neither one general percentage or a few varying percentages are used. Rates have been established wherever an analysis and distribution of the "B" and "C" expenses to individual sections indicated that separate rates were justified. In fact, there are at present approximately one hundred sectional overhead percentages, some of which may be of the same value, ranging from 25 per cent to over 200 per cent. With this flexibility, combined with the advantage of segregated works departments, we are not so far away from the theoretically correct plan of machine hour rate supplemented by a productive man hour rate.

COMPOSITION OF COST

The combination of material cost and labor cost gives the prime cost of articles manufactured, which in turn becomes the factory cost on the addition of factory overhead. The further addition of commercial overhead gives the commercial cost, while the total cost is a combination of the commercial cost and the profit. The total cost may itself be increased by charges for boxes and containers, and development expenses and royalties, if they apply, are treated as a surcharge at this point, thus giving the selling price.

Reducing the Operating Ratio

In a recent issue of this paper S. H. Bennett, auditor Hagerstown & Frederick Railway, gave an account of some of the methods by which the company was hoping to bring down its operating ratio from 64 per cent to 50 per cent. Recent reports of the company show that its efforts toward economy are proving successful, as shown by the following table:

INCREASES IN OPERATING REVENUES, 1913 TO 1914

	Railway	Light and Power	Gas	Total
July	$422.82	$1,527.92	$139.10*	$1,811.64
August	180.37*	920.19	150.35*	589.47
September	1,697.82	927.34	234.84	2,860.00
October	1,125.01	1,247.86	49.27	2,422.14
Total	$3,065.28	$4,618.31	$10.34	$7,683.25

*Decrease.

INCREASES IN NET OPERATING INCOME, 1913 TO 1914

	Railway	Light and Power	Gas	Total
July	$1,044.95*	$1,756.49	$34.75*	$676.79
August	1,783.47	1,553.97	305.92	3,643.36
September	2,279.52	1,036.76	520.75	3,837.03
October	822.86	2,821.09	302.85	3,946.80
Total	$3,840.90	$7,163.31	$1,089.77	$12,093.98

*Decrease.

Decreases in operating ratio, 1913 to 1914, July, none; August, 8 per cent; September, 7.2 per cent.

The operating ratio for October, 1914, was 54.40 per cent as compared with 61.24 per cent for October, 1913. For the four months ending Oct. 31 the ratio was 56.07 per cent as compared with 61.70 per cent for the same period last year.

The company accounts for its reduction in expenses as follows:

In the power department some inexpensive changes in the forced draft system cut down fuel costs by one-third. At present the company is using with very satisfactory results small-vein coal costing from $1 to $1.10 per ton where formerly from $1.35 to $1.65 per ton was paid. The consumption of power by the cars has been reduced by training motormen regarding the importance of saving current. In car service the elimination of all layovers with but a slight increase in running time has resulted in a reduction of car mileage more than 6 per cent. It was accompanied by an actual increase in revenue due at least in some measure to a rigid adherence to published schedules.

In the way department a redistribution of the track force resulted in a labor saving of more than 10 per cent. Under the present arrangements foremen and their men live on the sections of track which they cover, while under previous conditions this was not done and a great deal of company time was spent in going to and from work.

In the passenger equipment no reductions in maintenance cost have been made, but in the freight equipment there has been considerable gain. During the months of July, August and September, owing to the increased volume of business thrown upon the road by its steam railroad connections, it was necessary to operate for twenty-four hours a day to avoid freight blockades. It was possible to do this because a blower outfit, controlled automatically and continuous in its action, had been placed on the largest locomotive, and armature and field troubles were thus greatly reduced while efficiency was increased. Formerly it was necessary to keep this locomotive in the shop for a much greater proportion of the time than at present.

In general, the cost has been brought down by organization, by abolishing useless departments and combining departments in some cases, by the elimination of duplication of work and by the lessening of useless "red tape."

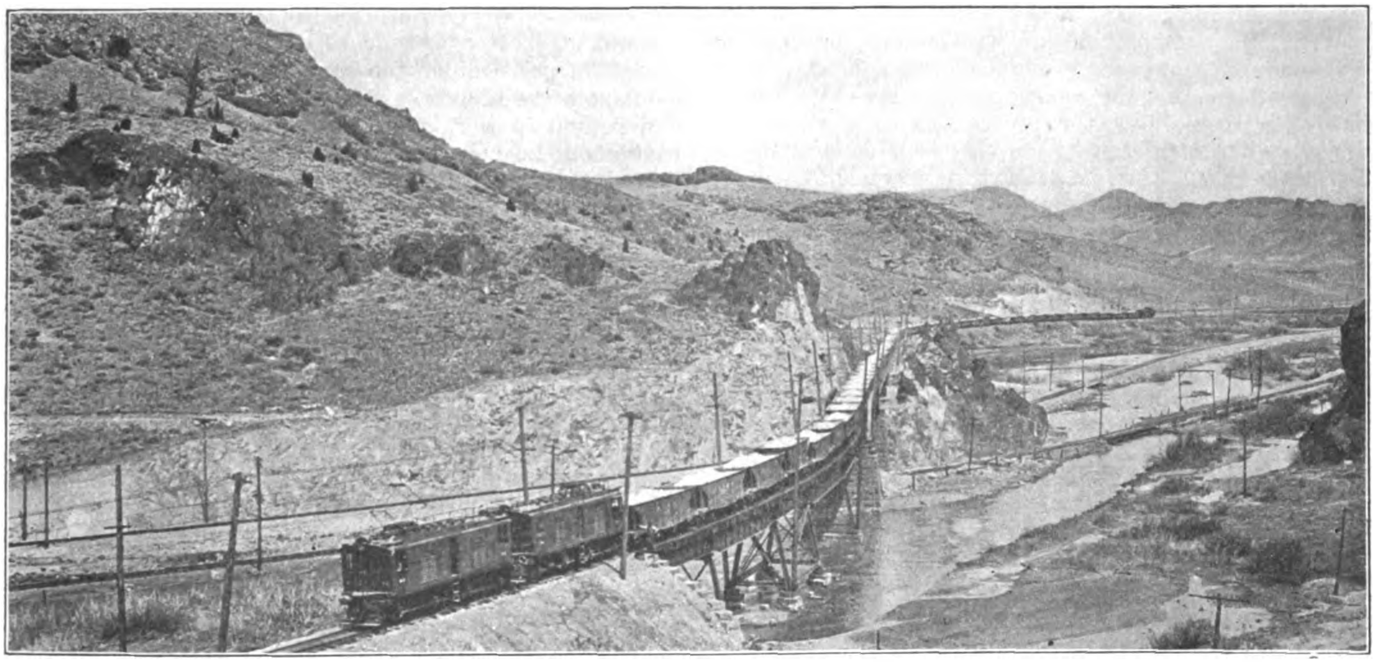
Operating Plans for the Electrified Division of the C., M. & St. P.

Provision for Continuous Power Supply—Twin-Conductor Trolley-Wire Suspended by Alternate Hangers from a Single Catenary—Operation of Pusher Locomotives on Down Grade

The operating plans for the electrified division of the Chicago, Milwaukee & St. Paul Railway possess special interest, for the reason that this is the first attempt to install and operate electric locomotives on tracks extending over several engine divisions. Under these conditions it is claimed that the full advantage of electrification can be secured. Previous terminal and tunnel installations of electric operation have been made necessary, more or less, by reason of local conditions; but the electrification of this steam road has been undertaken purely on economic grounds, with the expectation that superior operating results with electric locomotives will return an attractive percentage on the investment required.

As described in the full technical description of the electrification that was published exclusively in the ELECTRIC RAILWAY JOURNAL for Nov. 21, a contract has been let to the Montana Power Company for an adequate supply of energy over the 440 miles of main line considered for immediate electrification. This company has covered a great part of Montana and part of Idaho with a network of transmission lines, which are fed from several sources that provide a total developed and undeveloped capacity of 244,000 kw. The several power sites are inter-connected by transmission lines on steel towers and operating at 100,000 volts. Ample water storage capacity is provided in the Hebgen Reservoir, amounting to 300,000 acre-feet, and this is supplemented by auxiliary reservoir capacity at the several power sites, bringing the total up to 418,000 acre-feet. The Hebgen Reservoir is so located at the head waters of the Madison River that water drawn from it can supply in turn the several installations on the Madison and Missouri Rivers. Consequently the same storage capacity is used a number of times, affording an available storage capacity considerably greater than is indicated by the figures given. It would seem, therefore, in changing from coal to electricity as a source of motive power, that the railroad is amply protected in respect to the reliability and continuity of the power supply.

The initial contract calls for nine freight locomotives and three passenger locomotives, each weighing 260 tons, and taking current from a twin-conductor trolley, composed of two No. 0000 wires suspended side by side from the same catenary by independent hangers alternately connected to each trolley wire. This form of construction permits the collection of very heavy current by reason of the twin contact of the pantograph with the two trolley wires, and also insures sparkless collection under the extremes of either heavy current at low speed or more moderate current at very high speed. It is stated that the twin-conductor type of construction is equally adapted to the heavy grades calling for the collection of very heavy currents, and on the more level portions of the profile where maximum speeds of 60 m.p.h. will be reached with the passenger trains having a total weight of more than 1000 tons. The advantage of this type of construction is due partly to the greater surface for the collection of current, but largely to the very great flexibility of the alternately suspended trolley wires, a form of construction which eliminates any tendency to flash at the hangers either at low or high speed. Each locomotive, as stated in the above mentioned article, will be equipped with eight 430-hp General Electric motors. These will be twin-geared to the driving axles in the same manner as on the Butte, Anaconda & Pacific, the Detroit River Tunnel and the Baltimore & Ohio locomotives, a pinion being mounted on each end of the armature shaft. The motors are of the commutating-pole type and have openings for forced ventilation from a motor-driven blower located in the cab. The freight locomotives are designed to haul a 2500-ton trailing load on all gradients up to 1 per cent at a speed of approximately 16 m.p.h., and this same train load, unbroken, will be carried over the 1.66-per cent and 2-per cent ruling grades on the west and east slopes of the Rocky Mountain Divide with the help of a second similar freight locomotive acting as pusher. Track provision is being made at Donald, the summit of the grade, so that the pusher locomotive may run around and couple to the head end



C., M. & ST. P. ELECTRIFICATION—ONE TRAIN OF SIXTY-FIVE CARS IN TRANSIT ON ELECTRIFIED BUTTE, ANACONDA. & PACIFIC RAILWAY CONNECTING WITH THE MILWAUKEE SYSTEM of the train to permit electric braking on the down grade. In this case the entire train will be under compression and will be held back by the two locomotives at this head end, the entire electric braking of the two locomotives being under the control of the motorman in the operating cab of the leading locomotive.

It is considered that electric braking will prove very valuable in this mountain railroading, for, in addition to providing the greatest safety in operation, it returns a considerable amount of energy to the substations and transmission system, which can be utilized by other trains needing power. In this connection, the electric locomotives will have electric braking capacity sufficient to hold back the entire train on down grade, leaving the air-brake equipment with which they are also equipped to be used only in emergency and when stopping the train. There is provided, therefore, a duplicate braking system on down grades, which should result in the greatest safety of operation and the elimination of a considerable part of the customary break-downs, wheel and truck wear and overheating, thus reducing maintenance and improving track conditions.

With the completion of the remaining engine divisions, it is proposed to take advantage of the possibilities afforded by the construction of the electric locomotive by combining the present four steam engine divisions into two locomotive divisions of approximately 220 miles length, changing crews, however, at the present division points. As the electric locomotive needs inspection only after a run of approximately 2000 miles, requires no stops for taking on coal or water, or layover due to dumping ashes, cleaning boilers or petty roundhouse repairs, it is expected that the greater flexibility of the locomotive so provided will result in considerable change in the method of handling trains or limited by the restrictions of the steam engine.

Express Cars in City Service

Rush-Hour Service in Boston and Noon-Hour Service in Schenectady Are Described

As a means to the end of improving schedule speed on certain runs several companies have recently begun operating express cars sandwiched in between the regular local cars in city service. The Boston Elevated Railway about a year ago commenced this kind of operation in the rush hours on certain routes where the segregation of through from local traffic appeared desirable. At present the express cars are operated outward-bound in the afternoon rush hours from the rapid transit terminals at Dudley Street, Harvard Square and Sullivan Square. On the front and rear vestibules a 19-in. x 21-in. sign marked "Limited Stops" is hung as the car enters the terminal station of the rapid transit lines, acnouncement of the first stopping point being made by platform men, motormen and conductors. In the morning, inward-bound cars approaching junction points where inspectors are located may be run as expresses to the rapid transit terminal upon order of the inspector. In this case the limited-stop sign is taken from the inside of the vestibule and hung in position, the car number being taken by the inspector. Inward-bound limited-stop cars stop to discharge passengers between the point of departure and the rapid transit terminals, and outward-bound cars of this class stop to receive passengers between the terminal and the first scheduled stop after beginning the express run. Of seventy-five outward-bound cars that are run from Harvard Square in one afternoon rush hour, twenty-five are in limited-stop service. With this close headway it is impossible to provide gaps ahead of the express cars, but the distribution of the traffic and the comfort of the patrons are much improved.

The Schenectady Railway Company also has inaugurated a special express service during the noon hour from the General Electric plant to the suburbs. This started with one car which was first operated for and patronized principally by the heads of the various departments in this plant. Later, it became so popular that the custom gradually extended from the heads of departments to the general office help, and at present all are enabled to go to their homes for lunch if they so desire. The company is now operating express cars on every line to the suburbs. Many of these cars do not make any stops until reaching the outlying sections, and with one exception the cars are able to reach the terminals within ten minutes from the time they leave the main entrance to the General Electric Works. As the headway on all city lines around the noon hour is not closer than fifteen minutes and as the regular cars are made to wait at the intersections and junction points, all express cars can receive a clearance at this hour. Very little delay is experienced in the regular service on account of these express cars having the right of way. About 75 per cent of the cars make return trips, and employees are therefore able to eat their lunch at home and return to work within one hour. It is estimated that about 25 per cent of the employees have a lunch period of one hour and fifteen minutes, and they usually return on the regular cars.

Senate Hearings on Adamson Water Power Bill

The hearings on the so-called Adamson bill, which has already passed the House, were begun on Dec. 9 and have continued during the past week. Testimony has been presented by John A. Britton, vice-president Pacific Gas & Electric Company; W. A. Brackenridge, vice-president Southern California Edison Company; Franklin T. Griffith, president Portland (Ore.) Railway, Light & Power Company; George C. Ward, vice-president Pacific Light & Power Corporation, and others. The testimony indicated that state regulation in California had been in general satisfactory to the companies. The provision in the bill that not more than 50 per cent of the output of a plant should be sold to one customer was objected to on the ground that it will hamper development, as will also the limiting of the term to a short period, say less than fifty years. Incidentally the economy of modern steam plants was brought out, one speaker stating that his company had been able to produce from 285 to 290 kw-hr. per barrel of oil.

New Bulletin on Coal Analyses Issued

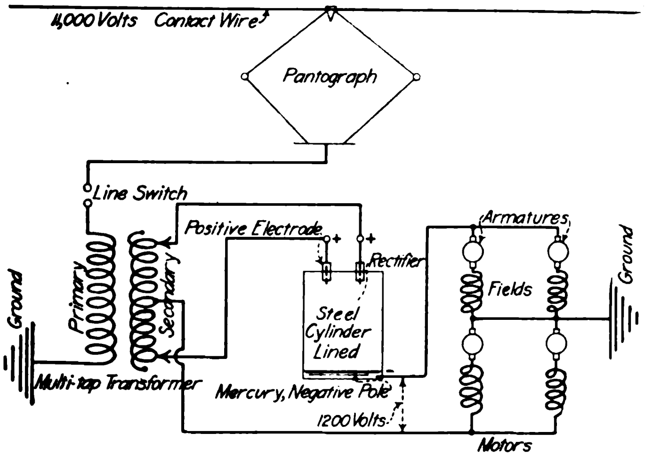
The United States bureau of mines recently issued a small edition of Bulletin 85, "Analyses of Mine and Car Samples of Coal Collected in the Fiscal Years 1911 to 1913," by Arno C. Fieldner, Howard I. Smith, Albert H. Fay and Samuel Sanford. The present bulletin presents analyses and descriptions of samples of coal collected from many mines throughout the entire country. In order that the material in this bulletin may be made to supplement that presented in Bulletin 22, "Analysis of Coals in the United States," the same plan of geographical classification has been followed, the analyses and descriptions of the samples being grouped in alphabetical order according to the state, county and town near which the mines or prospects sampled are situated. Bulletin 22 was said to be the most comprehensive publication ever issued on the coals of the United States, and the new bulletin is an extension of that work.

Mercury Vapor Rectifier Locomotive an Accomplished Fact

Trial Equipment Has Covered 20,000 Miles and Is in Revenue Service on New Haven Branch Line

The Westinghouse Electric & Manufacturing Company has had in service for some months a motor car provided with a Westinghouse-Cooper-Hewitt mercury arc rectifier locomotive equipment. This consists essentially of a transformer for lowering the a.c. line voltage from 11,000 to about 1200, with secondary taps for use in varying the voltage; two single-phase rectifiers, one for service and one for reserve; four d.c. motors of 1000-hp combined capacity, and the necessary control apparatus, rectifier exciter, etc.

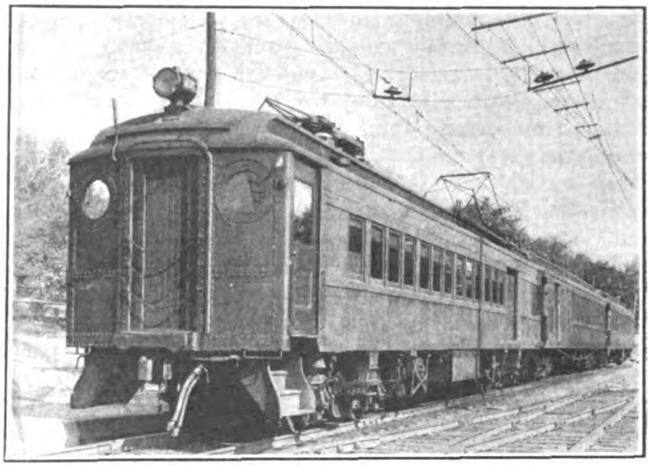
This demonstration was for the purpose of developing the rectifier locomotive equipment for the Pennsylvania Railroad, and it is installed on a combination baggage and passenger car furnished by that railroad. The reason for installing the equipment on a car in this instance was to secure in the readiest manner possible railroad operation with an equipment of substantial size. This car was first tried out on the Westinghouse Company's test track at Pittsburgh. As the length of this track and the power available were not sufficient for an ample test under service conditions the equipment was later transferred to the electrified zone of the New Haven Railroad and is now running on the New Canaan branch of that company. After preliminary trials it was put into revenue service, hauling trains, and to date has been operated more than 20,000 miles. Its present schedule calls for a daily mileage of 240. These tests were designed to demonstrate the durability of the equipment under general service conditions, such as sustained high voltage, voltage fluctuations, as well as mechanical shocks and vibrations.



MERCURY RECTIFIER LOCOMOTIVE EQUIPMENT—SIMPLIFIED ELECTRIC CIRCUIT DIAGRAM

The fundamental parts of the equipment and the circuit connections are shown in the accompanying diagram. Current is drawn from the 11,000-volt overhead contact wire through the standard pantograph of the New Haven Railroad. It flows through a line switch and the primary winding of a lowering transformer to the rail return. The transformer secondary is provided with a center tap and with a number of others equally spaced two by two from the center on both sides to permit the varying of the a.c. voltage from zero to the maximum. The center tap connects with the terminal of a group of four motors connected permanently in series-parallel. These motors are standard Westinghouse No. 308, wound for 600 volts. The group is grounded at the center to limit the d.c. voltage between any point in the equipment and ground to 600. The outside secondary transformer terminals connect to the two positive electrodes at the top of the rectifier. The remaining connection is from the mercury or negative terminal of the rectifier to the other terminal of the motor group.

The rectifier consists of a light steel cylinder container approximately of 20-in. diameter and 36-in. height. The electrodes enter at the top of the container through airtight insulating bushings, projecting a short distance into the cylinder. The arc is started by means of a small motor-generator exciter. No external reactance is needed on the d.c. side, as the motors furnish ample reactance for the purpose of steadying the current. That they do so is indicated by the fact that they operate as well on the rectified current as on that supplied from a rotating machine. The voltage drop in the rectifier is about 25 volts; practically regardless of the magnitude of the current, so that at say 750 d.c. amp, which is about full load for the motors, the power loss is 18¾ kw, and the efficiency, at 1200 volts, is very high.



MERCURY RECTIFIER LOCOMOTIVE EQUIPMENT—MOTOR CAR HAULING TWO COACHES

Details of the cooling system, electrodes, exciter connections, etc., are not yet available, but it is understood that the important problems in these items, as well as the larger ones, have been successfully met on this equipment.

The rectifier weighs but a few hundred pounds, and the motor car complete weighs 72 tons. The rectifier equipment is mounted in the baggage compartment and occupies, with the switch groups and transformer, not more than one-half the floor area. The accompanying half-tone shows the rectifier train in service on the New Canaan branch.

London Motor Omnibuses at the Front

A number of the motor omnibuses belonging to the London General Onmibus Company are serving as armed road cruisers in the British battle line in France. They are driven in a number of cases by men from the omnibus company which, with the other transportation companies in England, has sent many men to the front. The associated transportation lines in London which are under the direction of Sir Albert Stanley publish the news in regard to employees at the war as well as the progress of the relief fund of the company in a small paper, published every two weeks. The last few issues of this paper received in this country contain letters from men who have enlisted in the army and navy and also chronicle the status of the relief fund, which, up to a recent date, amounted to £11,319.

COMMUNICATIONS

Effects of Variance in Car-Wheel Diameters on Motors

ST. LOUIS, MO., Dec. 5, 1914.

To the Editors:

The communications dealing with the effects of variance in car-wheel diameters on motors that have appeared in your issues of Oct. 3, Oct. 31 and Nov. 28 reveal not only uncertainty concerning the magnitude of the effects attributable to differences in wheel diameter but also a belief that the solution of the problem involves considerable complication. As a matter of fact the problem is relatively simple, and is susceptible of complete solution without the use of mathematics and with no more data than are to be found in the curves of motor performance furnished by the manufacturers. It is not unlikely that the problem has been solved by others, especially by the designers of railway motors, but as the writer has been unable to find any publication bearing upon the question, the following analysis is submitted for the use of those who are interested in the matter.

The torque and speed curves in the accompanying diagram are taken from a bulletin of the General Electric Company, and in the original form showed tractive effort and speed of car as functions of current input for a motor having a gear ratio of 25:73 and with driving wheels of 33-in. diameter. For the purpose of this discussion speed in miles per hour has been converted into motor revolutions per minute, and tractive effort into net motor torque in pound-feet. The change from speed in miles per hour to speed in revolutions per minute was made by using the simple relation

$$\frac{\pi \times \text{wheel diameter in inches} \times \text{r.p.m.} \times 60 \times \text{gear ratio}}{12 \times 5280} = \text{miles per hour,}$$

or, since wheel diameter equals 33 in. and gear ratio is 25:73, it follows that

$$\text{r.p.m.} = 29.76 \times \text{miles per hour.}$$

Similarly,

$$\frac{\text{Tractive effort} \times \text{wheel radius in inches} \times \text{gear ratio}}{12} = \text{net motor torque in pound-feet.}$$

or,

$$\text{net motor torque} = 0.471 \times \text{tractive effort.}$$

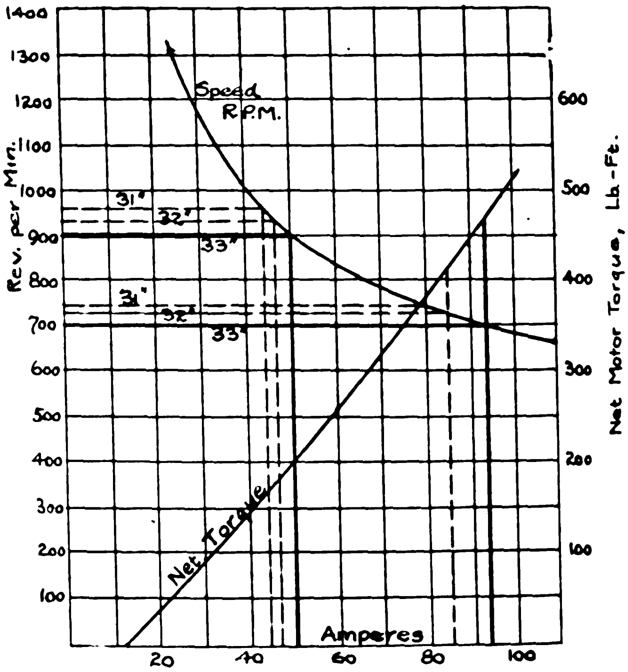
The consideration that determines the division of the load between two identical motors having equal gear ratios but driving wheels of different diameters is that the peripheral velocities of both sets of driving wheels must be the same, for otherwise there would be slipping of the wheels. It follows from this fact that the actual speeds of the two motors (expressed in revolutions per minute) will be to each other in the inverse ratio of their respective wheel diameters. Thus, if one motor of a pair has 33-in. wheels and the other 32-in. wheels, the latter will run faster than the former in the ratio of 33 to 32.

For example, let *A* be a motor with the characteristics shown, and let it be provided with 33-in. wheels; and let *B* be an exactly similar motor, with the same gear ratio, but with 32-in. wheels. If motor *A* runs at 900 r.p.m., corresponding to a car speed of 30.3 miles per hour, motor *B* will run at a speed of 900 × 33/32 = 929 r.p.m. Reference to the curves shows that under these conditions motor *A* will take 50 amp and will develop a torque of 200 lb.-ft., while motor *B* will take 47 amp and will develop a torque of 180 lb.-ft. The tractive effort communicated through the 33-in. wheels will be 425 lb. and that through the 32-in. wheels will be 394 lb.

Again, if the motor *A* runs at 700 r.p.m., equivalent to a car speed of 23.5 miles per hour, its current input will be 93 amp and the tractive effort 1000 lb.; at the same time motor *B* will run at 700 × 33/32 = 722 r.p.m., and will take only 85 amp and develop a torque of 410 lb.-ft. and a tractive effort of 899 lb.

In the figure lines have been drawn to indicate the method of determining the effect of a 2-in. difference between the wheel diameters, the diameter of the wheels of motor *A* being assumed, as before, to be 33 in., while those of motor *B* are taken as 31 in. Under these conditions a speed of 900 r.p.m. in the case of motor *A* corresponds to a current of 50 amp through *A* and of 44 amp through *B;* the corresponding torques are 200 and 170 lb.-ft., and the tractive efforts are 425 and 372 lb., respectively. When motor *A* runs at 700 r.p.m., the currents through *A* and *B* are, respectively, 93 and 80 amp, the torques are 470 and 380 lb.-ft., and the tractive efforts 1000 and 832 lb.

In the case where the wheel diameters were assumed to be 33 in. and 32 in., respectively, the currents at an assumed speed of 900 r.p.m. for motor *A* were in the ratio 50:47. The copper losses in the two motors will then bear to each other the ratio $(50/47)^2$, or, in other words, the copper loss in *A* will be 13 per cent greater than it is in *B;* at the same time the core loss of *A*, due to the 6 per cent greater excitation, will be about 2 per cent greater than in *B*, so that *A* is called upon to radiate about 15 per cent more heat than is developed in *B*, while its speed of rotation is about 3 per cent less than that of *B*. At a car speed of 23.5 miles per hour the copper loss of motor *A* is 30.5 per cent greater than that of motor *B*, and the core loss will be about 9 per cent greater. These differences become more and more pronounced with increasing differences between wheel diameters; thus, with diameters of 33 in. and 31 in., and at a car speed of 23.5 m.p.h., the copper loss of motor *A* is 35 per cent greater than that of motor *B*, and the core loss about 10 per cent greater.



EFFECTS OF VARIANCE IN CAR-WHEEL DIAMETER

It will be evident from the diagram that a difference of wheel diameter of only $\frac{1}{4}$ in. will not have much influence unless the speed curve bends around very sharply toward the horizontal, as in motors with highly-saturated magnetic circuits. In general, however, the conclusions deducible from this analysis may be applied to any standard railway motor, since the performance curves of practically all motors have quite similar shapes. It will be understood, of course, that the numerical values used are merely illustrative of one particular equipment.

A. S. LANGSDORF,
Dean of the College of Engineering.

Substation Spacing in A.C. and D.C. Systems

THE NEW YORK, NEW HAVEN & HARTFORD RAILROAD COMPANY

NEW HAVEN, CONN., Dec. 15, 1914.

To the Editors:

In your Dec. 5 issue I note with interest an abstract of a paper read by H. F. Parshall, entitled "Economics of Electric Railway Distribution." Mr. Parshall shows clearly the large economic gain which follows by increasing from 600 volts to 1200 volts, and the still further gain when the potential is raised to 2400 volts. He also points out that beyond 2400 volts with direct current no further gain is possible because of the increased cost of rolling stock. Passing on, however, to the use of alternating current, he shows that much higher voltages may economically be utilized. This is indeed a beam of welcome light from one who has been regarded as a d.c. partisan. For a number of years there have been those who have attempted to minimize the large economic advantages which a high voltage a.c. system made possible. I cannot, therefore, but be pleased to have had Mr. Parshall announce his later convictions as to the possibilities of the a.c. system.

There are, however, other statements in Mr. Parshall's article to which I cannot so fully subscribe. He states "the energy losses in distribution conductors of a given section vary with the cube of the distance between substations." While this is true, its statement in this manner obscures a more important truth, namely, that a change in the substation spacing, while varying the energy losses between individual substations as the cube of the distance, varies the energy losses in the total system as the square of the distance between substations. Why use this new flower, the "cube rose" in our mathematical garden, which applies only to part of the problem, when the good old "square" serves the whole?

It is unfortunate that Mr. Parshall should lay such stress upon the influence of the density factor in deciding the substation spacing for, after all, this factor has nothing to do with the economic result. If in any given situation the correct substation spacing has been determined, then for, say, twice the density of traffic the same number of substations may again be the most commercially efficient solution. With a given train density the correct spacing can be found by separately plotting as abscissas the yearly operating and fixed charges for both line and substation, with the number of substation intervals as ordinates. Two intersecting curves would be formed and obviously the most commercially efficient result is shown at that point where the sum of the line and substation yearly charges is a minimum. If a proper balance has thus been struck between substation and line charges, then the increased traffic would necessitate both increased line and substation capacity and charges, but not necessarily the shortening of the distance between substations.

There is a further point. I note that Mr. Parshall shows the correct substation spacing for 2400 volts, under certain conditions to be 16 miles, and that for the single-phase system at 5000 volts, the spacing is again only 16 miles. This is a very surprising conclusion to reach, since apparently it implies a power factor for the single-phase system of from only 40 per cent to 45 per cent, or little more than half of that which would obtain in actual practice. However, lacking details of the exact conditions upon which Mr. Parshall has figured, it is difficult to do more than say that so far as I know no conditions have ever obtained in practice which would justify such a conclusion. Such experience as I have had, and what I can gather of the conditions with which Mr. Parshall is dealing, would lead me to suppose that the single-phase substation spacing for this voltage would be in the neighborhood of 21 miles, instead of the 16 miles given by Mr. Parshall, and that an increase to 15,000 volts would increase the substation spacing to 43 miles, or more than two and one-half times that for 2400 volts.

Advancing the thought still further, I would point out that the cost of one of these a.c. substations is on the order of one-sixth that of a d.c. substation, and further that it requires practically no attendance; so that on Mr. Parshall's own showing, a 15,000-volt a.c. substation at one-sixth of the cost will replace more than two and a half 2400-volt d.c. substations. The comparative economic net efficiency of a.c. and d.c. substations is therefore on the order of at least 15 to 1, even leaving out of consideration the difference in the yearly operating charges.

WILLIAM S. MURRAY,
Consulting Engineer.

The Code of Principles and Publicity

THE AMERICAN RAILWAYS COMPANY

PHILADELPHIA, PA., Dec. 16, 1914.

To the Editors:

I have your recent letter asking that I write you something with reference to the Code of Principles. The code is so elementary and at the same time so fundamentally sound, that the principles become almost axiomatic. It is, therefore, rather difficult to enlarge upon them without seeming to be arguing in favor of that which is obvious. At the same time, you will find in the industry someone who will, in the strictest confidence possibly, dissent from these principles in some particular; and if the inquiry were pushed far enough, you would doubtless find a sufficient number of individuals among whom someone would dissent from practically every article of the code.

Either by design or through a happy coincidence, the Code of Principles contains ten articles, and they might be likened to the ten commandments of the business. It is just as important that the electric railway operator should get these ten articles thoroughly engraved upon his understanding and that he should guide his conduct thereby as it is that the individual should be guided by the decalogue.

To my mind at this time, probably, the most important of these principles is the tenth, and it is the one from which, I fancy, there will be the most general dissent. Publicity is not as generally understood as it should be, and a number of companies have had unfortunate experiences with so-called publicity. An electric railway has as much right to expect results from publicity designed and put out by an amateur as a great department store might expect to get results from the same kind of advertising. The merchant has a message to deliver to the public, and he has found by experience that it is economy to employ competent persons to prepare that message and place it before the public, and he therefore employs a skilled advertising man. A public utility, which has a message to deliver to the public, sometimes employs a skilled man who can deliver the message with a punch and sometimes entrusts it to someone already in the office. In the latter case the message usually lacks the punch because the railroad man is a railroad man; he knows the facts and he presents his message to the public in a manner which the public doesn't understand, or he fails to emphasize a salient point, or he overburdens it with detail.

Several years ago I had a message that I wanted to get from our company to the public, and I took occasion to embody it in an address I made before our employees' beneficial association. It was duly published in the daily papers of the city, and I don't think it made even a scratch, much less a dent. A short time after that we employed a publicity agent in another city, and in getting together material for him to work with he was shown a newspaper report of this address. He remarked that it was full of excellent material, but that I had used up in one publication enough material to last a campaign of from six to eight weeks. He then proceeded, in the other city, to take identical material relative to that property and conduct such a campaign, and the campaign was successful. This merely by way of illustration and to enforce the point which seems to me should be my contribution to this discussion, that publicity is the important thing at this time, because the events of last November show that the public mind is wavering and is in a receptive condition. The time is therefore opportune to get before the public our side of the story, but it must be done by men who know how to do it and who can put the necessary punch in their statements.

C. L. S. TINGLEY,
Second Vice-President.

Importance of the Public Library to Railway Men

FREE PUBLIC LIBRARY
NEW HAVEN, CONN., Dec. 3, 1914.

To the Editors:

It seems to me that the editorial which appeared in the issue of the ELECTRIC RAILWAY JOURNAL for Nov. 28, 1914, page 1188, entitled "Electric Railways and Public Libraries," should tend to bring about a closer spirit of co-operation between these two fields. As the editorial states, the present-day librarian is rapidly breaking away from the attitude of the man of the past who, like a former librarian of Harvard College, sighed a sigh of great relief because he had all of his books in the sanctuary. It is not so much that our work here is an activity peculiar to New Haven, but rather that it is a direct reflection of the signs of the times. That our activities are taken up with the electric railway industry is due, no doubt, to the fact that the librarian has given me free use of my power as head of the department and, like electricity, I moved in the line of least resistance. Being more or less familiar with the electric railway industry I felt better qualified to cooperate with the men in this line than with those in lines less familiar.

That the ELECTRIC RAILWAY JOURNAL has so kindly offered to act as a clearing house for discussion of the relations of the public library to the electric railway industry will, I am sure, be greatly appreciated by librarians at large as well as by the members of the industry in which the paper is such a valuable organ.

In my mind the public library of a given size can play a most important part in the conducting of a transportation company inasmuch as it is the storehouse for printed material, whether in book, pamphlet, periodical, transaction, clipping, photograph or even manuscript and excerpt form. These all pass through the librarian's hands and they represent much valuable material. If railway men realized this fact the material could easily be made very useful.

I trust that we, the public libraries, will not fail to realize our splendid opportunity to help such a large and most important industry as electric railroading.

KENNETH C. WALKER,
Head of the Department of Technology.

"Poisoning the Wells"

DREXEL INSTITUTE
PHILADELPHIA, PA., Dec. 15, 1914.

To the Editors:

The editorial "Poisoning the Wells" in the ELECTRIC RAILWAY JOURNAL of Dec. 5 is well put. It is so common for newspaper people at least to read greed and selfishness into anything originating with public service companies that it is probably wise to take the space which is devoted to this editorial for its particular purposes. One fault I find with it is that it calls attention to an article in *The New Republic*, which probably few people have seen or read.

So many college men go into the employ of government, municipalities and public service companies, while so few get any training worth while in practical economics, that no overestimate is likely to be made of an inter-relation planned to put into the hands of faculty and students information on public service relations which the public service companies have at their command, but which has been difficult to reach heretofore. Their willingness to co-operate is, of course, one of the signs of the times and shows an enlightened cooperative spirit which is certainly to be admired.

The need of more and better training in practical economics for technical students is slowly beginning to be recognized. May nothing arise to interfere in the least with the formation of closer bonds between educators and men of wide experience in public service relations.

I sometimes wonder at the patience which such men exhibit, since their motives are so constantly misinterpreted and their purposes maligned. I suppose there must be some rascals connected with public service enterprises, but I have not personally met any of them. I must, therefore, believe in the sincerity and honesty of purpose of those who manage these great enterprises, and particularly believe in the committee of the American Electric Railway Association which drew up the "Code of Principles."

ARTHUR J. ROWLAND,
Dean.

Cost of Hand-Throw Signals

NACHOD SIGNAL COMPANY, INC.
NEW YORK, Dec. 14, 1914.

To the Editors:

In your issue of Dec. 12, in the proceedings of the Pennsylvania Street Railway Association, we note that one of the speakers is reported to have said "in times of rigid economy, the old hand-throw signal of five lights in series would be the most advisable system."

It may not be generally known what the apparently small amount of time lost at each turn-out due to the use of hand signals amounts to in a year. For example: Consider one turn-out on a single-track line having a twenty-minute average headway during the twenty-four hours, then cars would meet there every ten minutes, or 144 times a day. If we assume only fifteen seconds lost due to the operation of throwing hand signals, which seems to be a very conservative estimate, this amounts in a day to thirty-six minutes, or six-tenths of an hour. If the wages of the car crew are 25 cents per hour, then the time lost for the four men costs 60 cents per day, or $219 per year of 365 days.

Since automatics to replace the hand signals cost not much over $400 per block installed and have a low maintenance charge, it is easy to see that the automatic signals would save their cost in about two years. Furthermore, the saving effected by the automatics has been figured on the wages of car crews alone, which is of course only one of the items involved.

CARL P. NACHOD,
President and Chief Engineer.

Maximum Motor Input

TRANSIT DEVELOPMENT COMPANY
BROOKLYN, N. Y., Dec. 8, 1914.

To the Editors:

Referring to the communication from William A. Del Mar, printed in the issue of the ELECTRIC RAILWAY JOURNAL for Dec. 5, page 1254, relative to the maximum input in railway motors, discussed by the railway section of the standards committee of the A. I. E. E., it is my opinion that the maximum input of a railway motor should be such that it will be capable of carrying a load of twice the nominal rating for one minute at the rated voltage, without flashover or injurious sparking at the brushes. I do not believe it necessary that this period be as long as five minutes for the average and possibly more than average conditions in this country.

I believe, further, that since the tapped-field motor is coming into quite general service and is applicable to a very large percentage of railroads throughout the country, the definite rating should be specified for such type of motor, in which case I am of the opinion that to properly protect the motor from injury, it should have the rating mentioned above for use when operating on full field, and it should withstand a swing for ten seconds of three times its nominal current rating at the rated voltage without flashover or mechanical injury or injurious sparking at the brushes.

WILLIAM G. GOVE, Superintendent of Equipment.

NEW YORK, Dec. 15, 1914.

To the Editors:

The subject of motor overloads referred to in the communication from William A. Del Mar, printed in your issue of Dec. 5, seems to me to take up a matter which very few persons are really qualified and competent to pronounce upon. I would expect that circumstances would alter cases to a considerable extent. As Mr. Del Mar correctly points out, the manufacturers and the users of railway motors have different points of view in regard to overload capacity. There is something to be said on each side. Under these circumstances I think that it would be difficult, if not impossible, to settle the matter definitely until there are more results of experiments and tests available. Until this time a provisional compromise on the matter is all that can be expected.

C. O. MAILLOUX,
Consulting Engineer.

ALLIS-CHALMERS MANUFACTURING COMPANY
MILWAUKEE, WIS., Dec. 15, 1914.

To the Editors:

Referring to Mr. Del Mar's communication on "Motor Overloads," I would say that the proposed section of the Institute rules referring to railway motors as it stood in the preliminary edition would work against the interests of the manufacturers who have a stock of non-interpole motors on hand.

It would be unreasonable, as a commercial proposition, to expect a non-interpole motor to withstand the tests specified. There are many classes of service where the use of the interpole motors is not required or justified.

It would seem to the writer that the proposed section should be split up under two headings, namely, interpole railway motors and non-interpole railway motors. The railway company's specifications should state the requirements which will determine whether interpole motors are necessary or not.

H. W. CHENEY,
Engineer Electrical Department.

[NOTE.—The section referred to in these three letters is No. 418 in the A. I. E. E. standardization rules. As it appeared in the preliminary draft approved tentatively by the board of directors on July 10, 1914, it read as follows:

"418. *Maximum Input.* Railway motors shall be capable of carrying twice the current corresponding to their normal rating for a period of five minutes, without flash-over or mechanical injury. They shall also be capable of carrying a load of three times their nominal rating for one minute under the same conditions. These overloads shall be applied when the motor is at the temperature which it would acquire when operating at its continuous rating."

As revised by the standards committee and as it will appear in the regular edition of the rules now in press this section reads: "The subject of overloads for railway motors is under investigation."

As the preliminary form of the rule has been already published in at least one important book it is well to direct attention to this significant emendation.—EDS.]

Functions of the Company Section

WASHINGTON RAILWAY & ELECTRIC COMPANY
WASHINGTON, D. C., Dec. 12, 1914.

To the Editors:

By way of comment on your editorial of Nov. 28, entitled "Functions of the A. E. R. A. Company Section," I send the following:

AN ASSOCIATION ACROSTIC

The functions of a company section may be expressed in a few words as follows:

They stimulate and promote:

A.mbition
E.ducation
R.eliance
A.dvancement

Co-operation
Opinions
Mentality
Publicity
Ability
Notoriety
Your ideas

Sociability
Entertainment
Congeniality
Thought
Interest
Originality
New conceptions

Many
Opportunities of great
Value, which with
Enthusiastic support
Means much to
Electric railway companies
Now and in
The future

This little acrostic seems to me to contain references to most of the benefits which accrue to us as members of a company section.

GEORGE G. WHITNEY,
President Company Section.

The Jones System of Control

PITTSBURGH RAILWAYS COMPANY,
PITTSBURGH, PA., Dec. 10, 1914.

To the Editors:

I notice in your issue of Dec. 5 an article by C. W. Squier explaining the control used in Pittsburgh. You may be interested to learn that in a recent patent (issued Sept. 1, 1914) further improvements have been made in the control, and under the new system there are never fewer than three motors in use. We still have one of the original equipments in use with the connections as they seem to be explained in Mr. Squier's article, but we early found that we could increase the acceleration of the car on bad track and on grades by a slightly different arrangement of connections beyond the series-parallel position. Fifty-five cars are now in operation here equipped with these controllers built in our own shops, and 100 additional equipments, on which delivery is now beginning, are being manufactured for us. This control is applicable to other than the baby motors, as we have used it with four standard 50-hp motors.

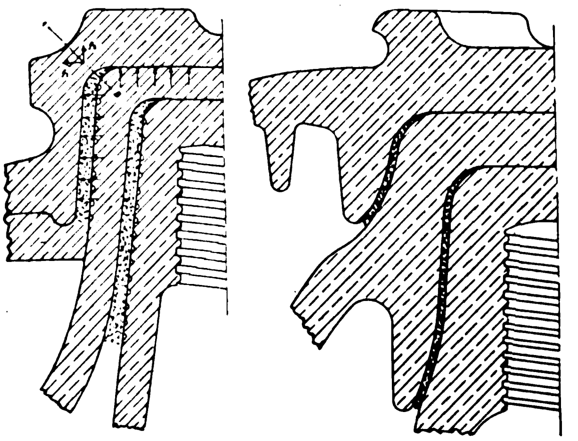
The new control, together with small motors and 24-in. wheels, saves 20 per cent to 30 per cent in power consumption, depending upon the type of city equipment with which it is compared.

The motors and trucks weigh 4½ tons to 5 tons less than the usual trucks and quadruple equipment of four 50-hp motors in use in many cities. The saving due to the controller is 10 per cent in energy for typical city service, and where there is much wagon traffic the slow speed with all motors in series is of great benefit.

P. N. JONES, General Manager.

High-Tension Power Transmission Problems Discussed at December A. I. E. E. Meeting

At the regular monthly meeting of the American Institute of Electrical Engineers, held in New York on Dec. 11, papers were presented by A. O. Austin, chief engineer Ohio Insulator Company, on "Insulator Depreciation and Effect on Operation," and F. W. Peek, Jr., consulting engineer General Electric Company, on "Effect of Altitude on the Spark-Over Voltages of Bushings, Leads and Insulators." Mr. Austin stated that some lines operate for years without insulator troubles only to run into serious and increasing trouble. This is usually attributed to fatigue in the insulator, but it may be due to one or more of a number of causes. Examination of fractured pin insulators show that there must have been strong radial forces which split the outer parts, or sheared the heads of the cylinders from the side walls. These results appear to be due to high stress rather than to long-continued low stress, and they are probably due to uneven expansion from varying temperature, and to expansion of the cement. Porcelain is a poor conductor of heat so that, when suddenly cooled, say by rain, severe stresses may be set up, possibly producing cracks.



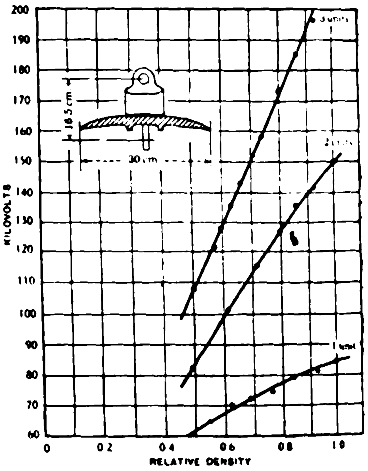
HIGH-TENSION PROBLEMS—FIG. 1—PIN-TYPE INSULATOR OF OLDER FORM—FIG. 2—NEWER FORM, PRACTICALLY LIGHTNING PROOF

In Mr. Austin's opinion temperature differences do not account for all insulator failure, for insulators sometimes fail in storerooms and other protected places. Troubles usually develop at railway crossings first where it appears that sulphur fumes in the smoke attack the cement and produce crystalline growth, presumably of calcium sulphate, with consequent expansion. Microscopic examination sometimes shows such crystals. Little attention has been given to this complicated subject as the operating conditions are difficult to reproduce experimentally.

In illustrating the general principles of insulator design, Mr. Austin used the diagrams shown in Figs. 1 and 2. Fig. 1 represents a cross-section of part of a pin-type insulator with which trouble was experienced from cracking, particularly along the line *AB*. The directions of the forces are shown by the arrows, the resultants being represented by f_1 and f_2. Fig. 2 shows a section of a later type of insulator in which the stresses, due to uneven heating or cement expansion, are less, while the strength of the parts resisting them is greater. Refinements in the cement or the use of an elastic varnish or wax on the ends of the shells, while desirable in the older type are unnecessary in the newer one. A new process of sanding the porcelain surfaces in contact with the cement is also used to avoid the use of grooves.

Mr. Austin also took up the general subject of insulator depreciation, calling attention to the fact that with modern insulators there is little to be feared from static punctures in comparison with other dangers. Trouble comes not from the depreciation of the insulator as a whole, but from the matching up of defective parts in a single insulator or string. He gave a mathematical demonstration based on the theory of probability showing the relation of the rate of depreciation and the probability of the occurrence of bad strings of insulators under different conditions.

Mr. Peek's paper contained a wealth of experimental data, secured by testing various high-tension insulating devices under varying atmospheric pressure, presented in tabular and graphical form. Fig. 3 is typical of the illustrations. It is impossible to present a digest of these data in a few words.



HIGH-TENSION PROBLEMS—FIG. 3—ARC-OVER VOLTAGES AT VARIOUS DENSITIES

In the discussion which followed the presentation of the papers, Dr. Steinmetz urged the development of a systematic method of testing insulators on the line with or without removing the voltage. Mr. Peek suggested a more accurate use of the expression "high frequency" which is now applied to alternating quantities, wave trains and impulses of short duration. He hinted at some interesting data soon to be available on the effects of high-potential impulses of extremely short duration, say one millionth of a second, upon insulators. Mr. Peek also explained why more insulator failures occur on low-tension than on high-tension lines, this being due to the lower arc-over voltage of the former which are subjected to the same lightning voltages. He also advocated more rigid inspection of insulators and the rejection of all when more than 2 per cent fail under test.

American Association News

List of Committee Chairmen Announced—Several Committee Meetings Were Held Last Week, Including Those of Two Important Joint National Committees—A. E. R. A. Arrangements for the Mid-Year Meeting

CHAIRMEN OF COMMITTEES, 1914-1915

Following are the lists of chairmen of the several associations. Lists of the members of the committees will follow as soon as they are complete. It is expected that preliminary reports of all committees will be completed in time for presentation to the executive committee at the American Association meeting at Washington on Jan. 29, 1915.

AMERICAN ASSOCIATION

Subjects—C. L. Henry, president Indianapolis & Cincinnati Traction Company, Indianapolis, Ind.; insurance—H. J. Davies, secretary Cleveland Railway, Cleveland, O.; education—H. H. Norris, associate editor ELECTRIC RAILWAY JOURNAL, New York, N. Y.; federal relations—Arthur W. Brady, president Union Traction Company of Indiana, Anderson, Ind.; taxation—T. W. Wilson, vice-president and general manager Wilmington & Philadelphia Traction Company, Wilmington, Del.; compensation for carrying United States mail—Captain A. R. Piper, general freight agent Brooklyn Rapid Transit Company, Brooklyn, N. Y.; public relations—Thomas N. McCarter, president Public Service Railway, Newark, N. J.; to consider relations with state and sectional associations—R. P. Stevens, president Mahoning & Shenango Railway & Light Company, Youngstown, O.; *Aera* advisory—H. C. Donecker, assistant general manager Public Service Railway, Newark, N. J.; company membership—James E. Gibson, general superintendent Metropolitan Street Railway, Kansas City, Mo.; company sections and individual membership—Martin Schreiber, engineer maintenance of way Public Service Railway, Newark, N. J.

Electrolysis—Calvert Townley, chairman board of directors Lackawanna & Wyoming Valley Rapid Transit Company, New York, N. Y.; ways and means—J. H. Pardee, president J. G. White Management Corporation, New York, N. Y.; 1915 convention—J. D. Mortimer, president Milwaukee Electric Railway & Light Company, New York, N. Y.; award of bronze medal for best paper presented before a company section—Oscar T. Crosby, Warrenton, Va.; relations with manufacturers' association—C. L. Henry, president Indianapolis & Cincinnati Traction Company, Indianapolis, Ind.; special committee on membership—L. S. Storrs, president Connecticut Company, New Haven, Conn.; to confer with other organizations regarding meeting dates—H. C. Clark, editor *Aera*, New York, N. Y.; to represent the association at the American Good Roads congress—E. C. Faber, second vice-president and general manager Aurora, Elgin & Chicago Railroad, Wheaton, Ill.; arrangements for mid-year conference and dinner—C. L. Henry, president Indianapolis & Cincinnati Traction Company, Indianapolis, Ind.; valuation—L. S. Storrs, president Connecticut Company, New Haven, Conn.; standards for car loading—S. W. Huff, vice-president Brooklyn Rapid Transit Company, Brooklyn, N. Y.; Anthony N. Brady medal—Arthur W. Brady, president Union Traction Company of Indiana, Anderson, Ind., and 1915 transportation committee—J. H. Pardee, president J. G. White Management Corporation, New York, N. Y., master of transportation.

TRANSPORTATION AND TRAFFIC ASSOCIATION

Rules—W. H. Collins, general manager Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y.; passenger traffic—P. P. Crafts, general manager Mobile Light & Railroad Company; express and freight traffic—F. D. Norviel, general passenger and freight agent Union Traction Company of Indiana, Anderson, Ind.; fares and transfers—J. E. Duffy, general superintendent New York State Railways, Syracuse, N. Y.; training of transportation employees—Cyrus Ching, chief instructor Boston Elevated Railway, Boston, Mass.; transportation-accounting—Joseph K. Choate, vice-president J. G. White Management Corporation, New York, N. Y. (co-chairman); block signals—J. W. Brown, assistant general superintendent Public Service Railway, Newark, N. J. (co-chairman); standards—L. H. Palmer, Harrison Williams, New York, N. Y.; to develop uniform definitions—H. C. Donecker, assistant general manager Public Service Railway, Newark, N. J.; construction of schedules and time-tables—Alexander Jackson, superintendent schedules and time-tables Public Service Railway, Newark, N. J., and transportation-engineering—P. N. Jones, general manager Pittsburgh Railways, Pittsburgh, Pa. (co-chairman).

ENGINEERING ASSOCIATION

Power generation—J. W. Welsh, electrical engineer Pittsburgh Railways, Pittsburgh, Pa.; buildings and structures—C. F. Bedwell, assistant engineer Public Service Railway, Newark, N. J.; equipment—W. G. Gove, superintendent of equipment Brooklyn Rapid Transit Company, Brooklyn, N. Y.; heavy electric traction—E. R. Hill, consulting engineer Pennsylvania Railroad, New York, N. Y.; power distribution—A. S. Richey, Worcester Polytechnic Institute, Worcester, Mass.; electrolysis—A. S. Richey, Worcester Polytechnic Institute, Worcester, Mass.; transportation-engineering—R. N. Hemming, superintendent of motive power Union Traction Company of Indiana, Anderson, Ind. (co-chairman); engineering-accounting—Charles Rufus Harte, construction engineer Connecticut Company, New Haven, Conn. (co-chairman); life of railway physical property—Martin Schreiber, engineer maintenance of way Public Service Railway Company, Newark, N. J. (co-chairman); way matters—C. S. Kimball, engineer maintenance of way Washington Railway & Electric Company, Washington, D. C., and block signals—J. M. Waldron, signal engineer Interborough Rapid Transit Company, New York, N. Y. (co-chairman).

ACCOUNTANT'S ASSOCIATION

Express and freight accounting—E. L. Kasemeier, auditor Ohio Electric Railway, Springfield, O.; passenger accounting—L. T. Hixson, auditor Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., and to represent association at convention of railroad commissioners—W. F. Ham, vice-president and comptroller Washington Railway & Electric Company, Washington, D. C.

JOINT COMMITTEE ON ELECTROLYSIS

The sub-committee on publication of the national committee met for the first time at 29 West Thirty-ninth Street, New York, on Dec. 16 under the chairmanship of E. B. Katté, chief engineer electric traction New York Central Railroad. The committee met to consider the reports submitted by the other sub-committees which had been referred to it by the full committee at its last meeting. The present meeting was devoted to organization and a preliminary examination of the data submitted. Members of the main committee have until Jan. 1 to submit comments on the sub-committee reports. After considering these the publication committee will submit the complete report to the full committee for final approval.

ARRANGEMENTS FOR MID-YEAR MEETING

Arrangements for the mid-year meeting of the American Electric Railway Association, to be held in Washington, D. C., on Jan. 29, 1915, are being perfected. A meeting was held at the New Willard, Washington, on Dec. 13, and was attended by C. Loomis Allen, C. L. Henry, C. C. Peirce, E. B. Burritt and H. G. McConnaughy of the committee of arrangements, and S. L. Colby of the Manufacturers' Association and J. N. Shannahan of the Transportation & Traffic Association. It was decided to hold the day sessions of the association as well as the banquet in the evening at the New Willard Hotel. The committee hopes in the afternoon of Jan. 29 to arrange for a reception of the delegates by President Wilson at the White House. If they are successful in this there will be but one business session beginning at 10 o'clock and lasting until the business of the association is finished.

All of the speakers for this session have not yet been selected, but they will include Col. T. S. Williams, president Brooklyn Rapid Transit Company, who will speak on the "Code of Principles," and N. C. Kingsbury, vice-president American Telephone & Telegraph Company, New York, who will discuss some features of publicity.

The committee anticipates a large attendance at this meeting and is making arrangements for special transportation so as to add to the convenience of those planning to be present. Probably special trains will be run from New York to Washington and return over both the Pennsylvania and Jersey Central-Reading routes. Actual leaving times will be announced later, but the trains will be planned to leave New York on the night of Jan. 28 and returning will leave Washington on Jan. 29 after the banquet. The committee hopes also to arrange for special cars from other cities like Chicago, St. Louis, Pittsburgh and Atlanta.

NATIONAL JOINT COMMITTEE ON OVERHEAD AND UNDERGROUND CONSTRUCTION

This committee held its first full meeting in New York on Dec. 16 with Farley Osgood, assistant general manager Public Service Electric Company, in the chair. R. D. Coombs, consulting engineer, New York, representing the A. R. E. A., is secretary. The American Association was represented by W. J. Harvie, of Allen & Peck, Inc.., while G. W. Palmer, Jr., Bay State Railway, and C. L. Cadle, New York State Railways, represented the Engineering Association. The meeting was addressed by J. J. Carty, chief engineer American Telephone & Telegraph Company, and E. B. Rosa, chief physicist United States bureau of standards, on co-operation between the telephone and other interests and on the work of the bureau respectively. The discussion brought out these facts, among others: That the purpose of the committee is to furnish a clearing house for information; that it will endeavor to prevent by its influence the independent action of one interest which might interfere with the rights of another; that the specifications for overhead crossings prepared by the predecessor of the present committee are being increasingly adopted by public service commissions; that it is not desirable that these specifications be incorporated into state laws, as they are always subject to revision, but that it is preferable that commissions base orders upon them "as revised." There are thirteen interests now represented in the committee of twenty-one members. Alternates to a number somewhat less than this will also be appointed.

COMMITTEE ON TRAINING TRANSPORTATION EMPLOYEES

This committee of the T. & T. Association met in New York on Dec. 17. Those present were Cyrus Ching, chief instructor Boston Elevated Railway, chairman; E. E. Strong, superintendent of transportation New York State Railways, and W. J. Harvie, Allen & Peck, Inc. The assignments made by the executive committee were considered and the chairman undertook to frame a set of questions which can be sent out to the membership to secure the necessary data for filling the assignments.

ANNUAL SMOKER OF COMPANY SECTION NO. 2

The annual social gathering of the Public Service Railway Company Section was held on Dec. 17 in Newark, N. J., with a large attendance. The secretary announced that the registration at the November meeting was 418 names, indicating the record attendance in the history of the section. The evening was spent in singing, smoking and listening to a vaudeville program furnished by professional entertainers. It closed with a turkey supper served in the company employees' dining room. President Maguire urged the inauguration of an "each-get-one-more" membership campaign.

The association was represented at the Good Roads Congress in Chicago this week by E. C. Faber, chairman of a committee appointed for the purpose, C. N. Wilcoxon and C. D. Emmons.

Committee on Uniform Crossing Agreements

This committee which had been appointed, at the request of the Pennsylvania Public Service Commission, to represent the Pennsylvania Street Railway Association on a joint committee on wire crossings, reported at the recent convention of the association that it had met with the joint committee in Harrisburg, Pa., on Nov. 16. It was then decided to draw up specifications for recommendation to the commission to supersede the present order covering this subject and a sub-committee was appointed for the purpose. Beginning Dec. 1 the sub-committee has followed the plan of holding weekly meetings in Philadelphia on Tuesdays pending the completion of its report. The Railway Association is represented on the sub-committee by G. E. Wendell, Vallamont Traction Company; Pittsburgh & Allegheny Valley Traction Company, and R. P. Stevens, Mahoning & Shenango Valley Railway & Light Company. The last-named is also chairman of the Railway Association committee.

United States Civil Service Examination

The United States Civil Service Commission has announced open competitive examinations for the following positions: Junior railway mechanical engineer, grades I and II; junior railway signal engineer, grades I and II; junior railway electrical engineer, grades I and II; junior railway civil engineer, grades I and II. The salaries, in each instance, are: Grade I, $1,200 to $1,680; grade II, $720 to $1,080. Persons desirous of taking either of these examinations should apply at once for Form 2039, stating the title of the examination for which the form is desired, to the United States Civil Service Commission, Washington, D. C. The examinations will be held on Jan. 20.

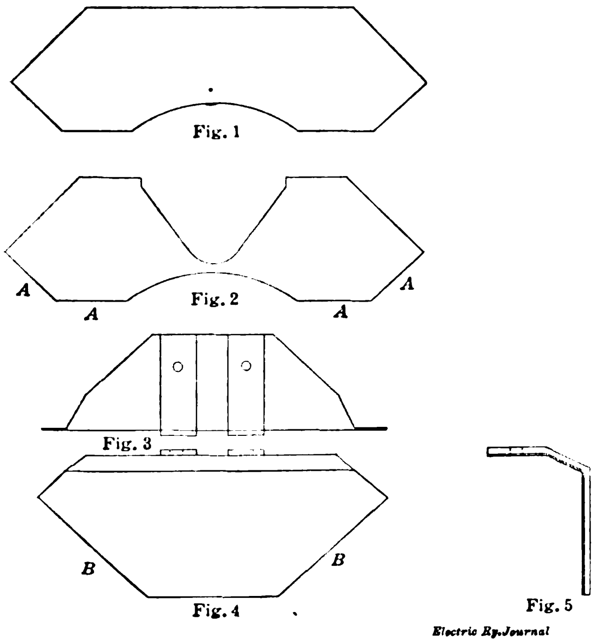
Handy Templets for Assembling Brush-Holder Yokes for GE-57 Motors

BY J. N. GRAHAM, MASTER MECHANIC ROCKFORD (ILL.) & INTERURBAN RAILWAY

In assembling the parts of brush-holder yokes for some of the older types of railway motors it is sometimes difficult to get the positions of the castings on the body of the yoke absolutely correct. The accompanying illustration shows a set of templets which, if properly made and properly used, greatly simplify the making of these yokes. As the castings seldom are damaged in any way, they can be removed from blocks that are charred or otherwise damaged and again used on new blocks.

All templets are made of 1/16-in. blue annealed steel. Fig. 1 shows a plate cut out of the steel and used as a pattern for marking out the blocks of well-seasoned hard maple which form the body of the yoke. After the blocks are cut to the proper size and shape they must be soaked for at least twenty-four hours in hot paraffine. Fig. 2 is a templet for setting the casting which holds the yoke to the motor frame, the edges *AAAA* of which are turned over for about 1 in. at right angles to the templet. The lip so formed acts as a guide to hold the templet in the proper position on the yoke while the holes are being marked for the rivets which hold the casting to the block. The space cut out at the top of the templet must fit the casting. This casting is then riveted to the block.



DETAILS OF TEMPLETS FOR GE-57 BRUSH-HOLDER YOKES

Figs. 3, 4 and 5 show three views of the templet used in placing the castings which hold the brush-holders on the block. This templet is bolted to the yoke at the point where the yoke is to be bolted to the motor frame through the holes shown in the cut. This plan allows the rest of the templet to lie against the face of the yoke, the lines *BB* being the inside edges of the castings which hold the brush-holders. This templet should be left on the yoke while the castings which hold the brush-holders are being riveted to the yoke. To assure the proper position of all castings, the templet should not be crowded out of place. This templet is reinforced with two pieces of ¼-in. x 1½-in. iron which are bent to fit over the outside of the templet and are riveted to the templet with conutersunk rivets to get a smooth surface.

The best way to make a set of these templets is to fit them to a new yoke that is absolutely correct. The different types of motors will require different sets of templets, as there is a difference in the size of the yokes. The ones shown in the illustration are used for GE-57 motors.

Economical Use of Wood and Preservation of Timber

BY E. W. BRIGHT, TIE AND TIMBER AGENT BOSTON ELEVATED RAILWAY

It is astonishing to see the saving that the consumer can make by the proper selection of the kind and quality of the wood for a particular class of service. First of all, it has been my experience in regard to specifications for lumber that very good results can be obtained by using the grading rules issued by the various lumber associations, and by careful study one can invariably find some grade that will meet with his requirements.

The buyer must bear in mind that if he specifies certain widths or lengths that are not given in standard grading rules the material is going to cost more money. However, I know that conditions come up where it is advisable to order special widths or lengths. When material is ordered in this way it is a good plan to have it piled separately and marked "Special," for men at work around the mill will invariably go to a pile of lumber and pick out the best they can find regardless of how and where they are going to use material.

As to care of lumber, the material should be well seasoned as far as possible before it is used because it is a commonly accepted fact that dry timber will not decay nearly so fast as wet timber. It is therefore essential that all lumber should be piled properly and air spaced. This applies to lumber piled indoors as well as in the open. Where lumber or ties are piled in the open, bed blocks should be used to keep the material from the ground, and a slanting roof should be made over each pile to protect the material from the sun, rain and snow. Hardwoods and flooring should always be piled under cover, and all sheds housing lumber should be absolutely watertight, for to store material in a leaky building is far worse than to pile it out in the open.

Wood Preservation—Methods and Quantities

The preservative treatment of timber is widespread, and each year sees it applied more extensively. I will not go into the different processes used in the treating of timber, but will give some idea of the Bethell process which, no doubt, is used more in the United States than any other process.

Under the Bethell process timber to be treated is placed on iron trucks or "cylinder buggies" and run into huge horizontal cylinders. These cylinders are capable of withstanding high pressure, and their doors are so arranged that they can be closed and hermetically sealed after the timber is drawn in. After the doors are closed live steam is admitted into the cylinders, and a pressure of about 25 lb. per square inch is maintained for several hours. After the vacuum period the preservative is run into the cylinder at a temperature of about 170 deg. Fahr., and the pressure pumps are started and are continued until the desired amount of preservative is forced into the wood. The surplus preservative is then blown back into the storage tanks, the timber is allowed to drip for a few minutes, the cylinder doors are then opened and the timber is withdrawn.

Many antiseptics are used in the United States, particularly zinc chlorid, corrosive sublimate (bichorid of mercury), and copper sulphate, but creosote (dead oil of coal tar) is used more than any other antiseptic. I think the best specification for creosote oil is that which was adopted by the American Railway Engineering Association at its thirteenth annual convention, held in Chicago in March, 1912.

In the treatment of lumber the pounds of oil to be used per cubic foot should be based in a measure on the quality of the timber to be treated and on where the material is to be used. In other words, we know that lumber with a great deal of sap will take more penetration that that which contains more heart. It is the writer's opinion that where one specifies a 10 lb. treatment for a 6 in. x 8 in. x 8 ft. hard pine sawn tie of standard quality, an 8 lb. treatment is sufficient for a tie that grades "merchantable" or "prime."

I have always maintained that the consumers of treated material have been specifying more pounds of oil to the cubic foot than is really required in the treatment of lumber. I understand that in experiments which have been made at the Forest Products Laboratory it was found that the amount of creosote usually injected into wood is from 20 per cent to 50 per cent greater than the amount actually required to prevent attack. As to the strength of treated timber, it is my opinion that creosoting does not directly weaken wood. I would refer the reader to Circular 39 issued by the Forest Service, which covers fully experiments on the strength of treated timber.

Timber to be treated should be thoroughly air seasoned. If, however, there is not time for this, the inspector in charge should decide with the superintendent of the creosoting plant the length of time the material is to be steamed. Care should be taken to remove all inner and outer bark from the material before treatment, as creosote oil will not penetrate through the inner bark.

The inspector should keep lumber of similar sizes and quality together as far as possible where the quantity of the oil to be used is the same. He should also see that the creosoting plant is in good operating condition. Leaky valves and pumps should not be permitted, and all gage scales should be accurate, with the pulleys and floats running free.

It is the duty of the inspector to take readings during the creosoting process, and occasionally he should take samples of oil from the cylinders to see if the oil comes up to the specification. After the vacuum period he should see that all valves to sap drums, drainage tanks, etc., whereby oil may escape from the cylinder about to be filled with oil, are closed.

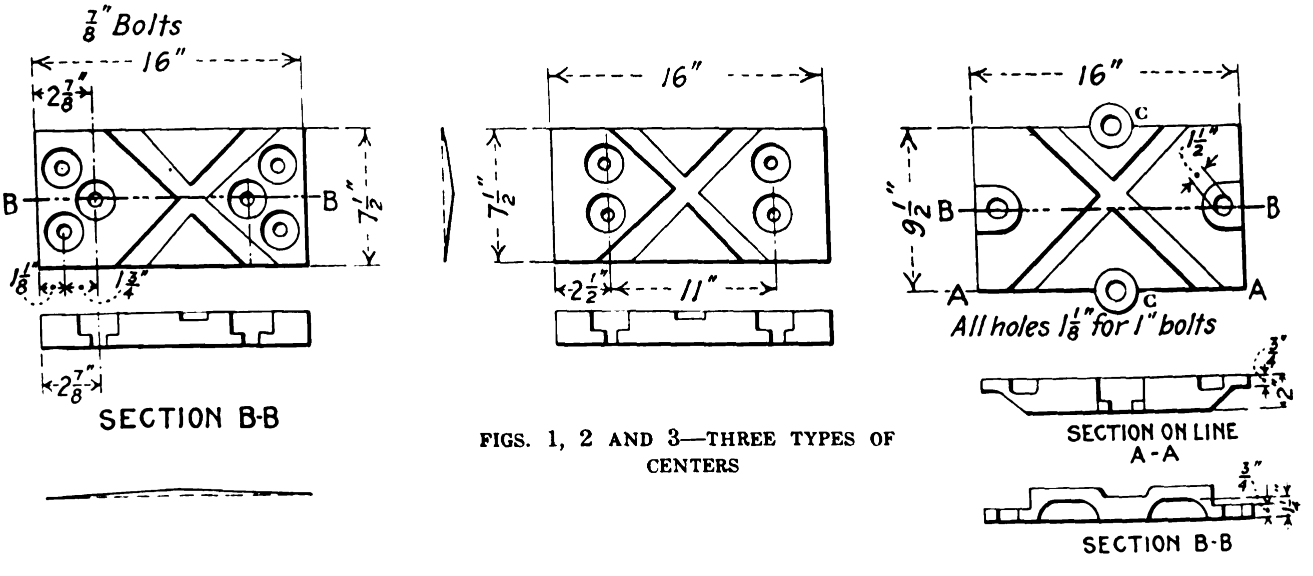
Treated lumber or ties that have been on hand for some time should be used in preference to that which has just been treated, as treated material improves in strength by air seasoning.

The All-Babbitted Center

BY R. P. WILLIAMS, INSPECTOR OF SPECIAL WORK BROOKLYN RAPID TRANSIT SYSTEM

As the writer's statement in his article of Sept. 19 that the all-babbitted center, properly installed, would hold just as well as the partially-machined or the machined insert has been questioned by a correspondent, it may be worth while to present some further discussion based on fifteen years' experience with the babbitted construction.

The writer believes that if the real reasons for the loosening up of centers had been thoroughly canvassed and eliminated, the machined types would never have come into existence. To illustrate, let us take three types of centers as follows: The center in Fig. 1 is held by six 7/8-in. bolts, and note the leverage. The two outer bolts are 1 1/8 in. from the edge; the middle bolts are each 2 7/8 in. from the edge. When this center is made of manganese and cold rolling takes place all of the strain is put on the center bolts, which invariably show the first signs of loosening. As one of these centers was found loose and broken, a new center of sixty-point carbon open-hearth hammered steel was substituted. It is three years since this installation was



FIGS. 1, 2 AND 3—THREE TYPES OF CENTERS

made, yet the center is still perfectly tight. Many similar renewals have been made and none have loosened up. The center in Fig. 2 is held by four 1-in. bolts. We have 192 of these centers in 90-deg. crossings, only twelve of which have become loose. Note the position of the bolts, 2½ in. from the edge; yet in removing centers of this type on account of breakage, they have shown as much as ⅝-in. camber. This type is all manganese. Clearly there are two causes here which would not be removed by machining the bed, namely, the quality of the metal and the improper placing of the bolts.

These comparisons could be carried on with all of the keyed types, showing the same results. We have made renewals of the vertical and horizontal keyed types, using open hearth hammered steel in replacements, employing in every case the original method of holding. Although these experiments have been carried through four and one-half years and under every degree of traffic, we have yet to find the first loosened center.

As to the last center, Fig. 3, one would think from the almost even distribution of the holding-down pressure that the bolts would not loosen, but the reverse is the fact. Although held down by four 1-in. bolts, out of three crossings (forty-eight centers) not one has remained tight. The cause is plain: To reduce the amount of manganese metal the bearing area of the center has been corrugated, permitting peening action to such an extent that the light lugs at *CC* bend under the raising action. The center begins to pump and then nothing is left to do to save the crossing but to renew the centers and await the next loosening, for a center once loosened on account of peening can never be made permanently tight.

The writer is familiar with the construction of the partly machined and completely machined types, although he has had no experience in their up-keep. He has no doubt that a greater number will remain tight than in the case of the all-babbitted center, for the reason that more care has been given to the bolting. He does not believe, however, that renewals can be made permanent unless the work is followed very closely, for if the bearing surface is allowed to become worn, nothing is left to do but to make a complete renewal.

Equipment Defects—Control Apparatus and Connections—VI

BY C. W. SQUIER, E.E.

Increased Size of Motors for Rheostatic Braking.—The question is often asked as to how much it is necessary to increase the size of the motors when they are used for rheostatic braking in addition to propelling the car. Of course, this will vary with the service, but to illustrate how rheostatic braking may affect the size of the motors from a heating standpoint I have shown in Fig. 15 a speed-time curve and a curve plotted from the squares of the instantaneous values of current per motor for a car loaded weighing 14.75 tons, making a schedule speed of 9 m.p.h. with ten stops of eight seconds each per mile. The initial acceleration is taken as 1.6 m.p.h.p.s. and the average rate of braking as 1.5 m.p.h.p.s. The amount of heating of the motors in service is determined by the square root of the mean square motor current and the average voltage on the motors. The value of this average or mean square current is determined from this curve by dividing the area under the curve in (amperes per motor)^2 — seconds by the time of the run, including the stop in seconds, and taking the square root of this value. In this case it is found that a mean square current of 42.4 amp per motor is required to propel the car, and as the motors are also used for producing the stop by rheostatic braking, this average current will be increased to 54.4 amp per motor, or an increase of 28.3 per cent in the value of the heating current.

In deciding on a motor to do the work as outlined hereinbefore it is found on referring to the rating for several sizes of standard motors that a 55-hp motor has a continuous rating of 46 amp. This motor would be large enough for this service provided rheostatic braking was not used, but with rheostatic braking we should have to choose a 75-hp motor which has a continuous rating of 55 amp. It is thus seen that in this particular case the motors have to be 36 per cent larger when used with rheostatic braking than if they were used only to propel the car.

High Voltages and Skidding of Wheels.—Motors used for braking are also subjected to greater voltage peaks than would otherwise be the case. In some tests peaks as high as 2000 volts were recorded while using the motors to furnish power for electric brakes. Also with the car traveling at a high rate of speed, the motorman when required to make an emergency stop will be quite likely to throw this controller handle right around to the last braking notch, with the object of stopping the car as rapidly as possible. This results in a very high current in the braking circuit and in the development of an enormous retarding torque by the motor armatures so that the wheels are often badly skidded. To prevent these troubles the British Westinghouse Electric & Manufacturing Company has developed a device for automatically shunting the field current of the motors when certain predetermined limits are reached, and by this means the voltage generated by the motors is kept down to approximately that for which the machines are wound. This improvement effectually prevents the skidding which is produced in service when the motors act as generators.

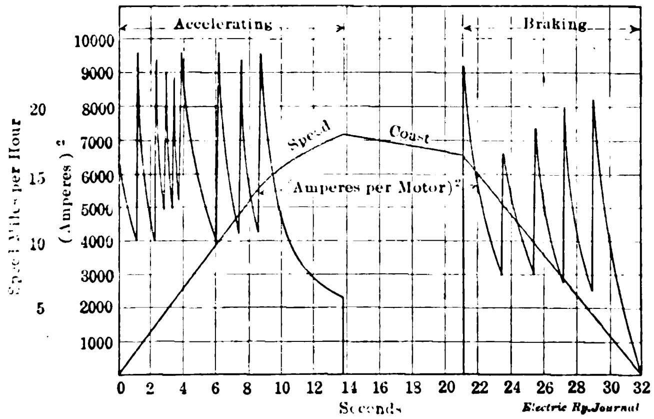


FIG. 15—SPEED-TIME AND POWER CURVES FOR A CAR USING RHEOSTATIC BRAKING

Fig. 16 shows the connections for electric braking with this voltage regulator incorporated. Two solenoid switches *A* and *B* are connected in the braking circuit in series with the magnetic brake coils, and these switches close when the current in the brake circuit exceeds certain predetermined values. The windings of these solenoids are different so that switch *A* will close with less current through the circuit than is required to operate *B*. When these switches close they connect the resistances R_1 and R_2 in parallel with the fields of the motors. R_1 usually consists of about 0.4 ohm and R_2 of 0.2 ohm, but generally enough grids are provided to adjust the resistance to meet the service requirements. The switches themselves can also be adjusted to close at any required current merely by screwing or unscrewing a movable portion of the solenoid core, thereby altering the air gap for the magnetic circuit of the solenoid switches. This device is satisfactorily used on the Glasgow Corporation Tramways and the London County Council Tramways in connection with their electric brakes.

The amount of regulating resistance required when the motors are used for electric braking is appreciably more than is required for ordinary operation. Eight to 9 ohms are commonly used for equipments with electric brakes, while without electric brakes 4 to 5 ohms would be sufficient to give a good resistance stepping.

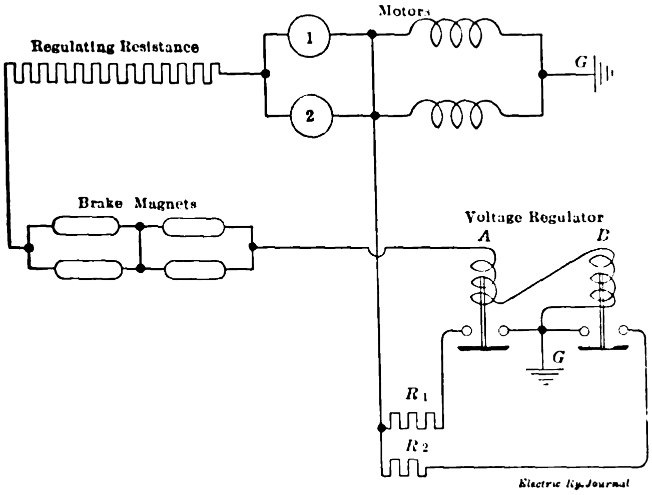

FIG. 16—CONNECTIONS FOR ELECTRIC BRAKING WITH VOLTAGE REGULATION

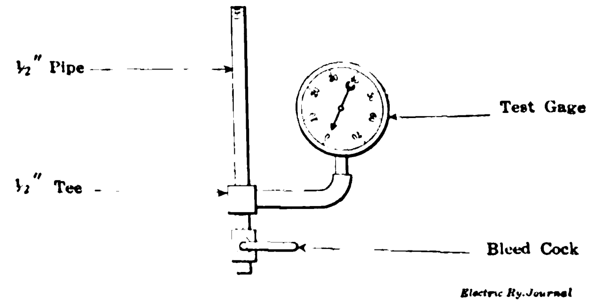
The General Electric Company's Type B controllers are specially arranged to care for electric braking. The power circuit connections of these controllers are the same as for that company's Type K controllers.

Device for Testing Air Gage and Governor

BY R. H. PARSONS, ELECTRICAL FOREMAN

A simple outfit consisting of a small test gage, bleed cock and a little pipe will be found to be of great value in testing the air gages and governor of a car. The ½-in pipe shown in the accompanying sketch is made to screw into the drain cock of the main air reservoir. After the attachment is made the drain cock can be opened and the air pressure will be indicated on the test gage.

A man who uses this device can check up the reading of the test gage with the platform gages without removing the latter, unless they are found to be incorrect. With the same means he can, from his testing station, bleed his main reservoir to check up the cutting-in and cutting-out points of the governor. Many cars are equipped with the governor beneath the car. In that case one man has the whole situation before him and can check and set his governor easily and accurately. The gage used should be of a high grade and should be tested at least once a week to insure accuracy.



DEVICE FOR TESTING AIR GAGES AND GOVERNORS

Standard Aspects for Contact Signals

BY H. R. STADELMAN

No doubt all those who attended the Atlantic City Convention noticed the many exhibits showing American Electric Railway Association's standard signal aspect, and since the Street Railway Signal Company was the first manufacturer to use this aspect, the writer wishes to explain some of the reasons that led to its adoption by that company, aside from the important fact that it had been designed and recommended by the block-signal committee of the association.

Red, the indication for "stop" or "block occupied," is the most conspicuous of all colors and attracts the eye more quickly than any other. It is not dazzling, nor does it dim the sight by over-brilliancy. Because it stands out boldly against all surrounding colors, no matter what the atmospheric conditions may be, it is the safest color to use as a danger signal.

The use of yellow in combination with red for a permissive indication, or "proceed with caution," is generally recommended by signal experts and color scientists owing to the prevalence of color blindness with regard to red, so that yellow in combination with red becomes a positive, distinctive, unmistakable indication.

Green has become generally known as a clear indication. There are several reasons for this, primarily because it marks a positive difference between the signal light and existing neighboring lights, the latter being white in nearly all cases. Then, too, green is nature's own color, and is therefore a safe color for the eye to rest upon for a long time.

In railroad rules a dark signal is considered to be a danger signal, and a motorman coming up to a signal that displays no indication should bring his car to a stop and be governed by his operating rules. If the indication is green as the motorman approaches the signal, and it changes to red alone as he passes into the block, the contrast will be so great that he cannot help realizing that he should stop. If the indication changes to red with a staggered yellow, the indication is obviously proceed. For following movements in which the yellow changes to the opposite side of the red when the car enters the block, the red acts as a finder or marker, and the motorman has a positive indication that he has operated his signals.

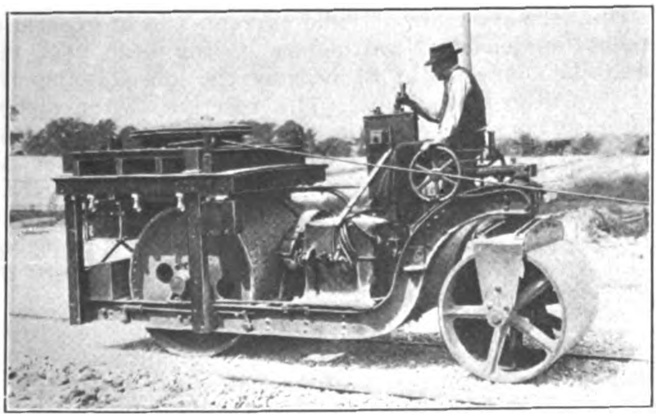
With all-light signals it is true that, if a light burns out, there is no provision for an indication, but the lamps in the all-light signal may be installed, either two in multiple, or on a reserve relay, so that the probability of both being out at the same time is very remote. The writer wishes to take exception here to any claims that an electric lamp behind a lens is an inefficient indication. In the first place, a 110-volt, 35-watt lamp behind a 6⅜-in. green lens with efficient sunshades can be readily seen under most adverse conditions at a distance of 1200 ft., and when it is behind a red lens it can be seen 1500 ft. away. In fact, ranges of visibility of 1800 ft. and 2000 ft. respectively have been publicly advertised. In the second place, in actual tests on the Pennsylvania Railroad light indications could be seen when the semaphores were invisible owing to the distance, and because of this test this road is equipping its new electric division with all-light signals. With efficient sunshades no phantom indications or lights occur.

It is true that a semaphore stands out from its mast clearly, but, in spite of this, steam railroads have found it necessary to shape the blades differently for different functions, a dovetail for caution, and a square or half round for stop, and some railroads do not even change the color of the blades at all, letting only the shape of the ends signify their meaning. When the writer was a repairman at a prominent tower on the Pennsylvania Railroad he had instructions to keep his signal lamps burning all the time because on a dark day the blades were not discernible. In consequence, the same indication for both day and night seems to be a thoroughly practical economy.

Electrically-Driven Road Roller at St. Louis

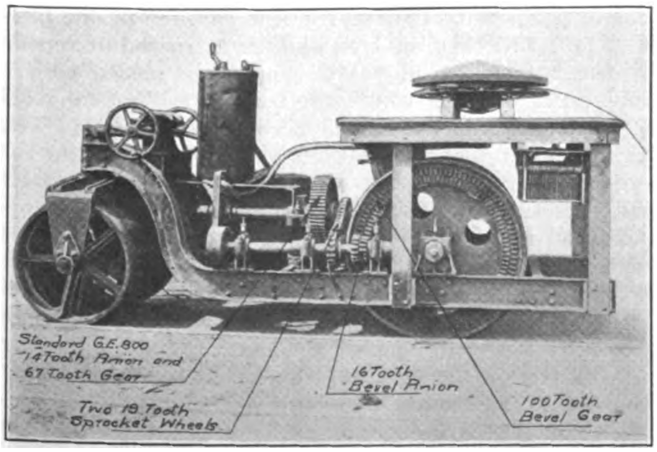
Through the courtesy of Richard McCulloch, vice-president and general manager, the following particulars are available on an electrically driven road roller which the United Railways of St. Louis has been using during the season of 1914.

A five-ton roller without steam engine, boiler or water tank was purchased from the Iroquois Engineering Works. This roller was equipped with a GE-800 railway motor geared down as indicated in one of the illustrations. The reduction in gearing is such that when the motor is running at its maximum speed the roller makes about 4 m.p.h. Current is conveyed to the motor through a duplex wire, one going to the trolley and the other to a contact on the rail. This duplex wire is kept taut by means of an automatic reel mounted on top of the roller. The roller is electrically illuminated besides being equipped with the usual oil signal lamps.



ELECTRICALLY-DRIVEN ROLLER RUNNING OVER MACADAM

The machine is used principally for rolling granite, brick or creosoted wooden block paving. It has also been used for rolling trenches in advance of track laying, although a heavier roller would be more satisfactory for this purpose. When rolling paving it requires, for its operation, a maximum of about 15 hp. It is simple to operate, an ordinary laborer being instructed in its operation within a few days. The electrically-driven roller has the following advantages over the steam-driven roller: No skilled mechanic is required for its operation; it is ready to run at a moment's notice; it requires no supplies, such as coal and water; it will not freeze up in the winter and it makes no dense smoke or noise on the street.



REDUCTION GEARING OF ROLLER EXPOSED

Auxiliary Contact Wire of Steel — Long-Life Pantograph Shoe

Excessive wear in the No. 0000 copper trolley wire installed on the 6600-volt, single-phase lines of the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind., made it necessary to install a No. 0000 steel auxiliary contact wire during the past summer. This wire was suspended 1¾ in. below the copper wire on 2-in. duplex clips. The old copper trolley wire had been in service more than seven years and would soon have required replacement. At the present time approximately 103 miles of steel wire is in service. It is used exclusively where the trolley wire is supported on mast-arm construction, but it is planned to test this construction also on span-wire suspension.

Following this change from copper to steel trolley wire, it was found that the greater rate of wear had been transferred from the wire to the No. 12-gage galvanized iron sliding pantograph shoes. In fact, it was possible to obtain only 2500 miles from each shoe before renewal was necessary. In seeking a remedy for this difficulty two pieces of half-oval mild steel, ⅜ in. x 1½ in. in section, were substituted for the 12-gage galvanized iron. This change has raised the useful life of the shoe to 9000 miles.

The two sections of half-oval steel 36 in. long are fastened with four rivets to the pantograph shoe frame which is made of ¾-in. x ¾-in. angles. In order to permit the steel contact wire to shift from these contact shoes to the frame and back again without catching, the ends of the half-oval pieces are given a long taper at each end. The average cost of the new shoes is approximately 15 cents for material and 30 cents for labor.

Electric Railways of Japan in 1912

The Japanese Ministry of Finance has issued the following data on the electric railways of Japan for the calendar year 1912:

The country possessed forty-four privately-owned installations totaling 432 miles of route, or 692 miles of single track, the construction cost of which was $44,295,000. About 133 miles of track were under construction, and in addition, thirty corporations with a combined capitalization of $14,255,000 had not yet begun operation. The municipally-owned systems, which are at Osaka, Tokyo and Kyoto, have built 116 miles of route or 209 miles of single track for $124,764,750, with another 66 miles of route under way. The operating statistics of the privately and publicly owned lines are presented in the accompanying table.

TABLE SHOWING STATISTICS OF ELECTRIC RAILWAYS IN JAPAN FOR 1912

	Privately Owned Lines	Municipal Lines of— Osaka	Tokyo	Kyoto	Tota
Systems	44	1	1	1	47
Route mileage	442	23	72	21	558
Single track mileage	635	45	143	21	844
Capitalization, yen*	89,180,000	26,079,359	82,796,100	10,379,212	208,434,671
Cars	1,392	413	1,211	119	3,135
Passengers	124,512,924	97,491,378	225,395,343	11,389,077	458,788,722
Passenger earnings, yen*	10,558,772	3,454,677	8,709,922	388,030	23,111,401
Other earnings, yen*	1,143,346	18,472	663,223	991	1,826,032
Operating expenses, yen*	5,573,621	1,779,003	3,856,624	280,549	11,489,797
Other expenses, yen*	1,189,813	18,890	55,997	3,497	1,268,197
Surplus, yen*	4,938,684	1,675,256	5,460,524	104,975	12,179,439

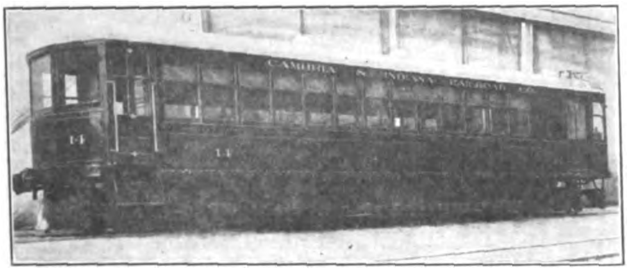
*A yen is worth approximately 50 cents.

Large Storage Battery Car for Cambria & Indiana Railway

A new 50-ft. storage-battery car, which marks an advance in meeting more effectively the requirements of service on light service branch lines of steam railroads, was put in operation on Dec. 9 on the 12-mile Colver Heights-Rexis line of the Cambria & Indiana Railroad, Colver, Pa.

By means of steam locomotives this railroad handles a large coal business. The lightness of passenger traffic on the line, however, has favored storage-battery propulsion, and for some time a battery car has been operated over the Colver Heights-Rexis section, making three round trips a day, with five intermediate stops per trip. With the acquisition of the new equipment the railroad may extend electric service to the remainder of the road, as well as to a proposed 4-mile extension for which a third car would be used.

The car is equipped to meet the peculiar feature of operation found on the 2¼ miles between Colver Heights and Colver, where a constant 5 per cent grade exists. The batteries are powerful enough in themselves to propel the new car up the grade, but as this would greatly reduce the possible mileage on one charge, 600-volt energy is taken on this section from an overhead wire. To delay corrosion from the exhaust gases of steam locomotives the trolley wire is offset. The trolley board, of course, is also offset.



CAMBRIA & INDIANA CAR—VIEW SHOWING POWERFUL STORAGE-BATTERY EQUIPMENT

The new Cambria & Indiana car has a much greater operating capacity than its predecessor, which was described in the Electric Railway Journal of Oct. 4, 1913. The length of the new car is 50 ft. or 15 ft. more than the old car, while its total weight, including trucks and battery equipment, is about 29.5 tons, as against 18 tons, the average loaded weight of the older car. The difference in weight is due mainly to the increased length of the car and its greater number of cells. The electrical equipment of the new car consists of 240 Edison A-12 cells for power and ten A-12 cells for lighting purposes, supplied by the Railway Storage Battery Car Company, and four Westinghouse 25-hp motors and control. The battery equipment weighs 14,000 lb. The batteries have a range of 130 miles on level track on a normal seven and one-half-hour charge, twice the distance possible under the same conditions with the older car. The maximum speed of the new car is 35 m.p.h.

The car body is mounted on Brill 69-E double-truck equipments with M.C.B. 33-in. wheels. These trucks are furnished with S.K.F. self-aligning ball-bearings. The car body, which was built by The J. G. Brill Company, is of steel up to the belt rail and has steel posts. It has a 32-ft. passenger compartment, a baggage compartment, space for smokers, partitioned section for the motorman and a toilet compartment. The total seating capacity is fifty-two. The car is heated by the Peter Smith forced hot-air system.

Reactive Factor Meters

Although instructed to keep the power factor of the circuits over which they have control as near unity as possible, switchboard attendants often maintain a power factor of 1 per cent or 2 per cent less than unity as being good and do not try to improve it. But computation and tests show that at 98½ per cent power factor the armature copper loss in the leading tap coils of a rotary is almost half again as much as at 100 per cent power factor. Under heavy load this is often enough to cause trouble in the tap coils. Also, the average heating in all the armature coils is about a quarter again as much at 98½ per cent power factor as at 100 per cent. The capacity of the rotary is therefore decreased considerably.

REACTIVE FACTOR METER

The measurements of "idle currents" is in general a recent development, wattmeters having been used recently so connected as to measure the idle volt-ampere, or "wattless component." The reactive factor meter, however, corresponds in its action to the power factor meter and bears the same relation to the latter that the "wattless component meter" bears to the "wattmeter." This meter indicates the sine of the angle of lag or lead instead of the cosine, as in the power factor meter. Unity power factor is, therefore, indicated as zero reactive factor.

If instead of the power factor meter there is on the circuit a reactive factor meter, a condition of 98½ per cent power factor is indicated as 17½ per cent reactive factor. The attendant consequently will be more on the alert and will be more likely to improve it. Power factor and reactive factor are equal at the value 70.7 per cent. At higher power factor, the load conditions are more conspicuously indicated on the reactive factor scale. At lower power factors the reverse is true. Reactive factor meters are therefore recommended for use only on circuits operating normally at power factors close to unity and which never fall below 70 per cent.

The Westinghouse Electric & Manufacturing Company's reactive factor meter, which has been recently introduced, operates on the rotating field principle like its power factor meters. A rotating field is produced in angularly placed coils connected in shunt with the metered circuits, one for each phase of the system in the case of polyphase meters. In their field is provided a movable iron vane or armature, magnetized by a stationary coil the current of which is proportional and in phase with that of the line current in one phase of the circuit. As the iron vane is attracted or repelled by the rotating field of the angularly placed coils, it takes up a position where the zero of the rotating field occurs at the same instant as zero of its own field. Thus its position indicates the phase angle between the voltage and current of the circuit. The reactive factor meter is then calibrated to read the sine of the angle indicated while the power factor meter is calibrated to read the cosine.

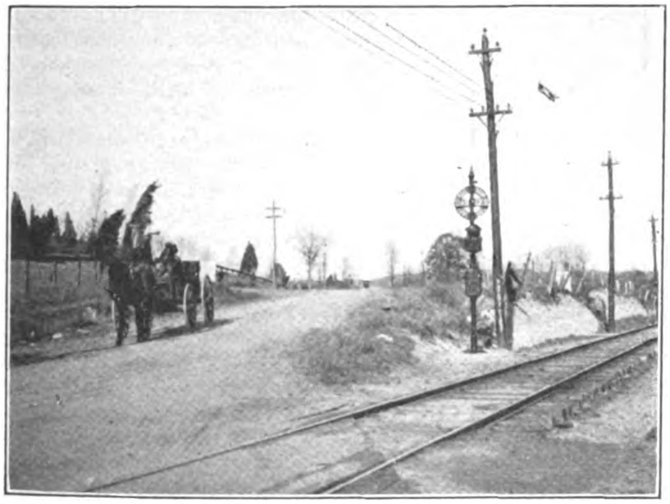
In the three-phase meter the rotating field is produced by three coils spaced 60 deg. apart; in the two-phase meter by two coils spaced 90 deg.; in the single-phase meter the rotating field is produced by means of a split-phase winding connected to the voltage circuit.

The meters are inclosed in round dust-proof cases, the type SI being 7 in. and the type TI being 9 in. in diameter. The entire pointer is visible so that readings are easily made from a distance. No springs are used to control the movement or carry current, nor are there any moving coils, the construction thus being extremely simple. The meters are not influenced by external fields.

Highway-Crossing Protection by Trolley Contact Control

As instances of grade-crossing protection with control exactly adapted to the operating conditions some installations of Nachod highway-crossing signals on the Washington-Virginia Railway are interesting. In one case, on double track, the headway is thirty minutes during the day and fifteen minutes in the evenings. Trains are run in sections, as many as four or five cars following each other closely. The highway crosses at right angles and at a considerable grade, but the view is obscured by trees, brush and high banks on three of the corners.

The apparatus installed at this crossing consists of an iron pole with the sign, bell and relay attached, and the control box a part of the pole. The starting contactors, operated by the trolley wheels, are placed about eight poles from the highway in each direction on the corresponding track, and stopping contactors are located at the highway, there being four contactors in all. Flashing pilot lights are located three poles ahead of each starting contactor to indicate to the motorman that the bell is in operation. The control circuit, bell and lights are all tapped from the trolley wire, and no other source of power is used. The speed reaches a maximum of about 30 m.p.h. under the contactors, the bell ringing from twenty seconds to twenty-five seconds before the car reaches the crossing. The warning indication is given by a 12-in. bell, and a transparency also flashes the word "Danger," a connection from one of the series of lights in this transparency being run each way to the pilot light. Consequently, when the car passes the starting contactor the action of the bell is made apparent to the motorman by the flashing of the pilot light. This use of a flashing light as a "return indication" of the actual ringing of the bell has been favorably received by the railways, as it overcomes the objectionable condition of requiring the motorman to proceed upon only the assumption that the bell is ringing.



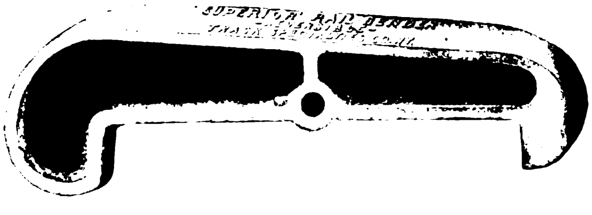
HIGHWAY CROSSING PROTECTION—CROSSING SIGNAL WITH ANSWER-BACK PILOT LIGHT ON WASHINGTON-VIRGINIA RAILWAY

The transparency contains six 23-watt 110-volt Mazda lamps shunted by resistances, so that a failure of one lamp does not open the circuit of the remainder. The flashing of the lights is produced by a contact maker on the armature of the bell clapper. Because cars follow each other so closely over the crossing, a car-counting control was provided, so that the bell would not be cut out at the crossing until all the cars that have passed the starting contactor have also passed the crossing.

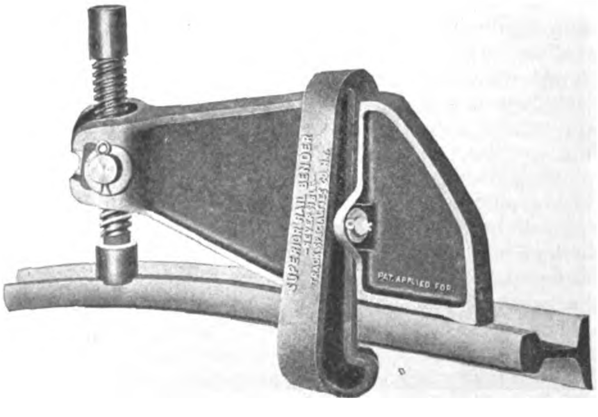
In another installation for a single-track crossing of a main highway where funerals and tourists' sightseeing cars pass frequently, cars follow each other closely at certain times of the day, passing every fifteen minutes. The starting contactors in this installation are about nine spans away from the highway, three contactors being used. The control in this case is both car-counting and directional, and the frequency of cars at this point involves the ringing of the bell for about one hour in the twenty-four. The bell and relay unit with bracket is mounted on an existing pole, and a separate danger transparency is hung by a bracket on the same pole. This transparency is novel as it consists of a sheet-iron sign with letters 12 in. high which are composed of small lens-like glasses with many facets, the letters showing white on a black background. The subdivision of the glass into a multiplicity of small units is a protection against malicious breakage and, like the military mast on a warship, would require many blows to demolish it.

Portable Rail Bender

A cast-steel rail bender which weighs but 150 lb. has lately been devised by the Track Specialties Company, New York. As shown in the accompanying illustrations, the principal feature is the reversible hook and swivel collar through which the screw passes. This swivel collar maintains the screw perpendicular to the rail at all times. Merely by reversing the yoke the same bender may be used either as a right-hand or left-hand tool, a feature which is of particular service at the heels of frogs or at switches. The bender is sold under the trade name of "Superior."



REVERSIBLE SWIVEL COLLAR



COMPLETE RAIL BENDER IN SERVICE

The Philippine Board of Public Utilities Commissioners has decided that it has no jurisdiction over the so-called public utilities owned by a province or a municipality.

News of Electric Railways

I. C. C. REPORT

Recommendations of Commission and Parts of Report of General Interest to Electric Railways Reproduced

The twenty-eighth annual report of the Interstate Commerce Commission to Congress, dated Dec. 1, 1914, contains these recommendations:

That, for the purpose of uniformity and to prevent injustice, there should be provided by law one period—in our opinion three years—for the beginning of all actions relating to transportation charges subject to the act.

That there should be appropriate and adequate legislation upon the subject of control over railway capitalization.

That there should be legislation to make explicit and certain the authority of the commission to examine all correspondence, files, indexes, and other papers and documents retained by carriers subject to the act.

That the penalty for violations of the hours-of-service act be changed to a fixed and definite sum, or that a minimum penalty of $100 be established instead of the penalty of "not to exceed $500," as now provided.

That the use of steel cars in passenger-train service should be required, and that the use in passenger trains of wooden cars between or in front of steel cars should be prohibited.

The total expenditures of the commission for the year ended June 30, 1914, were $2,209,627.

Referring to the division of carriers' accounts the commission says in part:

"At the date of the last report a general revision of the accounting classifications for steam railways, electric railways, and express companies was in progress. This work has been completed and the revised classifications were made effective July 1, 1914.

"This general revision has been in the direction of development rather than change in principle. Additional accounts have been provided, instructions have been amplified, item lists extended, and the terminology simplified and made more descriptive. The grouping of accounts has also been so changed as better to show their relations. In the classifications of operating expenses for steam railways, electric railways, and express companies accounts have been provided for depreciation upon several classes of fixed property as well as equipment. The carriers are required to report to the commission the bases used by them in calculating depreciation. The revenues and expenses of certain auxiliary, or 'outside' operations of steam railways, heretofore shown separately in income account, are now combined with those of the main operations to which they are incidental, although they are still chargeable to separate primary accounts. The increasing use of electricity as an auxiliary in the operation of steam railways has been recognized by the addition of several new accounts.

"The system of accounts for electric railways has been completed by the addition of classifications of income, profit and loss, and balance-sheet accounts, and that of express companies by the addition of income and profit and loss accounts. The bulletin of accounting decisions under the former classifications for steam railways will be revised to conform to the new classifications and will be issued with additional cases. A similar revision of decisions under the electric railway classifications is in preparation.

"While much progress has been made during recent years in the practice of accounting by carriers, it is necessary to bear in mind that much remains to be done. A correct statement of assets and liabilities is not reached through recording merely the receipts and payments of money. So far as possible, account should be taken of the changes in values as they progress. Depreciation is not yet receiving adequate treatment by carriers. Repair expenses, which should be current, do not always appear in the period in which they accrue.

"An important administrative change in this division has been made since our last report. When organized, and for two years thereafter, the entire force of the division had its headquarters at Washington. On July 1, 1910, a branch office was opened at Chicago. During the past year additional branch offices have been established at New York, Philadelphia, Pittsburgh, St. Paul, St. Louis and San Francisco. Another will be opened at New Orleans. A force of resident examiners is attached to each branch office. An advantage expected to accrue from this change is increased efficiency through better acquaintance with local conditions at important railroad centers and in their vicinity."

In referring to judicial interpretation of the safety appliance act the commission says:

"In Spokane & Inland Empire Railroad v. United States, 210 Feb., 243, the Circuit Court of Appeals for the Ninth Circuit, affirming the judgment of the District Court for the Eastern District of Washington, held that the words 'used on street railways' as employed in the act of 1893, exempting such cars from the operation of the statute, do not include cars of an interurban line engaged in interstate commerce, even though they may be run for a short distance over the street railway tracks in order to reach a terminal in the center of a city."

Sixty-three train accidents were investigated by the Interstate Commerce Commission during the year ended June 30, 1914, forty being collisions and twenty-three derailments. The collisions were responsible for 108 deaths and 1162 injuries and the derailments caused 61 deaths and 972 injuries. The report says:

"Collisions caused by improper flagging continue to be a prominent feature of these investigations. Eight of the forty collisions investigated were due to this cause. In these eight collisions forty-five persons were killed and 286 injured. Attention has been called to the indefiniteness of the flagging rule in force on many roads, and to the practice of employing inexperienced men as flagmen." In one collision, due to improper flagging, which caused fourteen deaths and 294 injuries, the flagman at fault had been employed only twenty-four days and was entirely without previous railroad experience.

The record of accidents investigated shows a considerable decrease in the number of collisions due to the failure of enginemen to obey the indications of block signals. There were but two collisions of this nature during the past year, as against seven the previous year. The enginemen at fault were trusted employees of long experience and no adequate explanation can be given for these lapses from duty by trusted and competent men, who in many cases suffer death as a consequence of their error. It is to be hoped that the investigations authorized by the Congress may lead to the development and use of some system of automatic train control to be used in connection with existing signal systems which will eliminate this class of accidents.

The report adds: "The inherent weakness of the train-order system continues to manifest itself as a prominent feature of the accident record." Seven collisions were caused by trains encroaching upon the time of superior class trains and six were caused by the failure of trainmen to obey orders. On most roads where the train-order system is used the rules require that an order establishing a meeting point for opposing trains shall be sent simultaneously to all the trains involved, and also, whenever practicable, to the operator at the designated meeting point, thus providing a check against the possibility of trainmen forgetting or misunderstanding the order. This check, provided by the so-called "middle order," is an important element of safety in the movement of trains on single-track lines, but on some roads the rule which requires it to be used is not observed. Two of the collisions herein discussed, in which five persons were killed and three injured, could have been prevented by an observance of the rule, and in both cases the placing of a middle order was practicable.

In the report attention is again directed to the need of legislation requiring the standardization of operating rules. The efforts of the American Railway Association to standardize operating rules, while commendable, have not been wholly effective, for the reason that the association has no power to compel individual roads to observe its recommendations. The situation is similar to that which led to the passage of federal legislation enforcing uniformity in the application of safety appliances to cars and engines.

In previous annual reports the commission has called attention to bad conditions of track and roadway. No material improvement in such conditions is noticeable. Six of the twenty-three derailments investigated were either directly caused or greatly contributed to by bad track, and were responsible for 54 per cent of the deaths and more than 50 per cent of the injuries due to derailments from all causes. In at least three of these derailments, occurring in widely separated sections of the country, the track conditions were absolutely unsafe for the operation of trains at speed. Investigations of accidents caused by broken rails and fractured car wheels have confirmed the need for further investigation to determine with accuracy the stresses to which rails, car wheels and track structures are subjected under existing conditions of service, and to establish safe working limits for their use. The commission also renews the recommendation contained in its last annual report respecting legislation requiring the use of steel cars.

In connection with the authorization to investigate the use and necessity of block signal systems, appliances for the automatic control of railway trains and any devices intended to promote the safety of railway operation, an engineer-physicist and a signal engineer have been employed, and other employees of the commission have been also assigned to this work. Information has been received regarding experiments with train-control devices on several railroads, and in some instances official tests have been made. The total length of railroad line operated under the block system on Jan. 1, 1914, was 86,736.9 miles. The increase during the year 1913 was 2787.1 miles In previous reports the commission has recommended that railroads be required to adopt the block system.

The report shows the extent to which inspection of locomotive boilers has been carried out. In 1912, 74,234 boilers were inspected; in 1913 the number was increased to 90,346, and in 1914 it reached 92,716. During 1914 also 2141 defects to locomotives for which existing laws do not provide a remedy, 1155 of which were defective wheels, were reported by inspectors and brought to the attention of the railroad officials, with request that proper repairs be made.

In connection with the work of appraising the railroads of the country the report stated that the eight parties now at work in each district cover an aggregate of from 1500 to 1700 miles per month. It is believed that these same parties, by reason of increase in efficiency with experience, will soon be able to cover an appreciably increased mileage. It seems advisable not to increase the present force until methods of computing and assembling have been so far perfected that the result of these surveys can be placed upon the assembly sheets as fast as they are made. The preparation of inventories of telegraph and telephone lines has also been begun.

The commission says that beginning Jan. 1 next the most economical conduct of the work of valuation will probably require the increase of the field parties to from sixteen to twenty in each district. The opinion is expressed that the present general organization should be able to suppor twenty field parties, the cost decreasing in proportion as surveying parties can be multiplied without increase in overhead expenses.

KANSAS ARBITRATION

Board Decides Against Men, Except as Regards Sliding Scale—Award Lower than Company Offer

The board of arbitration selected to adjust the wage scale on the Joplin & Pittsburg Railway, Pittsburg, Kan., made its report on Dec. 5, to the effect that only the wages of platform men are to be readjusted. Following the settlement of the strike on the road on Sept. 24, after eighty days of idleness, an agreement was signed by the representatives of the local union and by officers of the company covering all points of difference except the wage scale. This matter was by agreement submitted to arbitration, the arbitration decision to be final and to be embodied in the contract. James A. Cable was selected by the local Amalgamated Association men and John M. Kinkel by the company as arbitrators. Both are members of the Public Utilities Commission of Kansas. They requested Frank A. Wightman of the Public Service Commission of Missouri to act with them, the conditions of the previous agreement that the board must be constituted of members of these two state commissions being thereby complied with. The board heard testimony on Dec. 3 at Pittsburg. One paragraph says:

"The board of arbitration unanimously finds that sufficient facts were not presented to justify or warrant at this time a change in the wage scale, except that the so-called 'merit system' or 'sliding scale' seems desirable, and should wherever possible be instituted, for the reason that it has a tendency to promote efficiency of service on the part of the employees."

The finding follows:

"It is the unanimous judgment of this board of arbitration that the wage scale now in force and effect on the Joplin & Pittsburg Railway be continued with the further provision that motormen and conductors (commonly known as 'platform men') should, after five years of continuous service, be paid at the rate of 27 cents an hour."

Before the strike the company offered the men 26 cents an hour for the first year and 27 cents thereafter. The men at first demanded 40 cents, but reduced the demand to 33⅓ cents. Since the resumption of traffic, the rate paid has been 25 cents an hour, with the provision that a platform man after one year of service is to receive 26 cents. The award adds 1 cent an hour after five years' service. Thus the award is considerably under the offer made by the company before the strike, the offered figure of 27 cents after the first year, made by the company, not being reached under the arbitration decision until after five years, and the offered figure of 26 cents an hour made by the company for the first year coming under the award with the second year.

The other sections of the wage schedule, which remains unchanged, are as follows: Blacksmiths, 33 cents an hour; machinists, 35 cents; carpenters, first class, 33 cents; carpenters, second class, 28 cents; painters, 33 cents; painter's helpers, 20 cents; pitmen, 27 cents; pitmen's helpers, 20 cents; armature winders, 35 cents; car cleaners, 20 cents; head-light, tail-light and telephone men, 25 cents.

MASSACHUSETTS STREET RAILWAY ASSOCIATION

Account of December Meeting and of Presentation to Secretary Clark

At the regular monthly meeting of the Massachusetts Street Railway Association at Boston on Dec. 16 P. F. Sullivan, president of the Bay State Street Railway, said that in his opinion the recent Middlesex & Boston rate decision marked a turning point in electric railway history and opened the way toward better days for the industry. The pronouncement of the board allowing 20 per cent of gross income as a tentative figure covering maintenance and depreciation was of great interest. If such an allowance had been made by the Massachusetts street railways last year there would have been required $600,000 in excess of the amount paid out in maintenance alone. The companies actually paid 17.5 per cent, although 25 per cent is the actual requirement in many cases. Great difference existed among companies, and to reproduce the property in twenty years would require in one case a 15 per cent and in another a 40 per cent maintenance and depreciation allowance. The importance of studying each case upon its merits was emphasized by Mr. Sullivan in closing his formal remarks, after which he turned unexpectedly to Secretary Charles S. Clark and on behalf of the association presented him with a handsome gold watch appropriately encased in a Christmas stocking as a mark of appreciation. Before the secretary could respond a second gift was brought forth in the form of a hand-illustrated book depicting in verse and sketches various episodes in the career of the astonished guest of honor, and one after the other past-presidents, E. C. Foster. John R. Graham, Francis H. Dewey, E. P. Shaw and Robert S. Goff, spoke of the able and loyal service rendered by Secretary Clark. On behalf of Stone & Webster, Edward F. Flynn, Boston, offered congratulations and good wishes, and after the guest of honor made a characteristic response the meeting adjourned.

CLEVELAND NEAR-SIDE ORDINANCE DEFEATED

The Meyers ordinance, requiring cars to stop on the near side of the street, was defeated in the City Council at Cleveland, Ohio, on Dec. 14. At the same meeting Councilman Dittman submitted an ordinance providing that all cars leaving the Public Square shall be operated as pay-as-you-leave cars and all cars going toward the Square shall be operated as pay-as-you-enter cars. This will make the system uniform on all lines reaching the Square. Heretofore changes have been made frequently and much confusion resulted.

The Warner Road extension of the Cleveland Railway tracks from the intersection of Miles Avenue and Broadway to Bancroft Avenue was put in operation on Dec. 15. The through 105th Street cars will now use this track instead of making a loop that has not been satisfactory in the past. The Harvard-Denison line, which terminated at Broadway, will soon be completed on Harvard Avenue to East Ninety-third Street.

Legislation is pending in Council providing for the purchase of the North Randall line by the Cleveland Railway. This is the line that reaches the race tracks.

It is possible that plans for building tracks on Euclid Avenue between East Twenty-second and East Fortieth Streets, known as "Millionaires' Row," may meet with opposition from members of Council who feel that this additional expense should not be incurred just now. Because of the opposition of wealthy residents along that section of the street the company was never able to secure the right-of-way for tracks and was forced to run on Prospect Avenue for that distance, but the shift in the residence section has made it possible, both company and city officials believe, to secure consents of property owners at this time.

Judge Leighley of the Common Pleas Court has set aside the verdict of the jury which recently found George De Graff guilty of obtaining $500 from the Cleveland Railway on false pretenses and allowed the man to plead guilty to a minor offense. The cases against Dr. C. D. Treister and Dr. Sidney J. Havre, who were indicted with him, have been dismissed.

SUBWAY ORDINANCE PASSED IN CLEVELAND

The City Council of Cleveland, Ohio, passed the amended ordinance of the Cleveland Rapid Transit Railway on Dec. 14. W. R. Hopkins, president of the company, stated that the Ohio Public Utilities Commission will be asked to authorize an issue of bonds to the amount of $12,000,000 or $15,000,000, from the proceeds of which the first two lines of the proposed subway system will be built. The amended ordinance gives the company twelve months within which to begin the construction work and the first line must be completed within thirty months. It allows the use of larger tubes than were contemplated originally and increases from $350,000 to $550,000 per mile of single track the fixed amount the city shall pay in case municipal ownership of the line is decided upon.

LOS ANGELES FRANCHISES

Eleven Grants Expire in Los Angeles at Different Periods in Next Four Years

The Board of Public Utilities of Los Angeles has recently made an investigation of the franchises held by the local street railway companies and reports that between the present time and Jan. 1, 1919, eleven street railway franchises, covering approximately 9.45 miles of track within the city limits, will expire. The franchises held by the Los Angeles Railway Corporation and their dates of expiration are as follows: Temple Street, from Spring to Hoover, 2.94 miles, July 7, 1915; Maple Avenue, from Seventh to Thirty-second, 1.95 miles, Jan. 28, 1916; Pico Street, from Flower to Hoover, 1 mile, Jan. 28, 1916; Ninth Street, from Lake to Grandview, 7 miles, Nov. 27, 1916; Macy Street, from Mission to Brooklyn, 0.17 mile, April 14, 1917; Fifth Street, from Maple to San Pedro, 0.17 mile, Aug. 27, 1917; Mateo Street, from Palmetto to Eighth, 0.73 mile, Sept. 29, 1918; Santa Fé Avenue, from Ninth to south charter boundary, 0.72 mile, Sept. 29, 1918. Total, 7.75 miles.

The expiring franchises of the Pacific Electric Railway are Sunset Boulevard, from Echo Park to Maltman, 1.59 miles, Dec. 1, 1916; Echo Park Avenue, from Sunset to 600 ft. north of Sunset, 0.11 mile, April 15, 1917; Pasadena Short Line crossing at Macy, Echandia and Lord Streets, Dec. 13, 1918, making a total of 1.70 miles.

The fact that the Temple Street franchise of the Los Angeles Railway Company, from Spring Street to Hoover Street, will expire almost within six months, has given rise to the suggestion that if the city plans to take this line over for municipal ownership the Council should at once define its position in the matter.

"S. O. S." MUNICIPAL OWNERSHIP SIGNAL

After relating briefly the experiences of the Canadian cities of Edmonton and Calgary with municipally-owned electric railways the Seattle *Times* said in an editorial in its issue of Dec. 9:

"By contrast Seattle is in splendid condition, although while Seattle's population has grown fourfold, its debts, on account of municipal ownership and other follies, have increased twelvefold.

"If the municipal ownership theorists in the City Council could have had their way and plunged this city clear in 'to the neck' as is the case at Edmonton, the situation here would be indescribably bad.

"Seattle's bonded debt to-day is $15,420,000; but if the Edmonton per capita rate prevailed here, the total now would be the stupendous figure of $98,784,000—or nearly six times the present total. If Seattle carried Edmonton's per capita municipal railway debt, the obligation on that count alone would be $12,222,000.

"The Canadian towns have sunk into the depths of despair by reason of their ruinous experience.

"Seattle is waking up just in time to save the taxpayers from similar disaster.

"It is proper, therefore, to 'shake down' the municipally-owned car lines, to ferret out the false and fictitious 'dividends' proclaimed regularly by the city lighting plant, and to take warning generally that the fad for control and operation of public utilities is a thing that can be pushed too far.

"In a word, Seattle can catch this fallacy in time to spare the necessity of the 'S. O. S.' for the municipal 'ship of state.'"

SAFETY EXPOSITION IN NEW YORK

The second exposition of safety and sanitation was held at the Grand Central Palace, New York, during the week ended Dec. 19, under the auspices of the American Museum of Safety. The New York Central Railroad occupied a large amount of space with a model of the Empire State Express running at top speed and with slides of its road equipment, methods of operation, and charts showing what that road has accomplished by its campaign of safety in preventing accidents. The Southern Pacific Company and the Union Pacific Railroad had exhibits displaying sections of actual roadbed and block signal equipment operated automatically by electricity. Figures were displayed to show how accidents have been all but eliminated. Accident prevention was the keynote of the exhibit of the Brooklyn Rapid Transit Company, which showed stereopticon and other pictures. Models of the new side-door type of subway cars and stepless cars were shown. Alongside of this exhibit was one by the Brooklyn Institute for Safety. A jury of awards will select the best and most important new devices shown by each industry and will award prizes.

ANNUAL REPORT OF CONNECTICUT COMMISSION

The third annual report of the Public Utilities Commission of Connecticut was submitted to the Governor on Dec. 16. The commission declares that the continued frank and friendly cooperation of all public service companies and the prompt acceptance of suggestions made by the commission, as well as the compliance with orders for the betterment of service or safety of operation, is resulting in an increased efficiency that is highly gratifying to the commission. Attention is again called to the recommendations made in the report for 1912 that there should be enacted "a law which will effectively prohibit the merger or consolidation of public service companies without first obtaining the approval of the public utilities commission."

There are 190 public service companies under the jurisdiction of the commission, twenty-nine electric, two express, thirteen gas, seventeen gas and electric, eight railroad, twenty-two electric railway, three telegraph, ten telephone and eighty-six water companies. Forty-eight petitions of approval of proposed construction or reconstruction of tracks by electric railways have been approved in whole or in part. One hundred and fourteen informal complaints were received, all of which were investigated, and in most cases the conditions complained of were corrected. The details of the report in so far as they relate to the electric railways will be published in the ELECTRIC RAILWAY JOURNAL of Dec. 26.

Annual Report of Transit Commissioner of Philadelphia.—The annual report of A. Merritt Taylor, director of the department of city transit of Philadelphia, Pa., for the current year has just been published. It gives a brief sketch of the organization of the department and outlines the recommendations of the commissioner as to the proposed rapid transit system, previously described in these columns.

New York's Subway Labor Problem.—Owing to the situation caused by the pending litigation involving the constitutionality of the alien labor clause of the State labor law and the recent decision of Judge Newburger, upholding the law, the Public Service Commission for the First District of New York deferred the opening of bids for the construction of Section No. 4 of Routes Nos. 4 and 36, set for Dec. 11, until Dec. 29. Section No. 4 covers that portion of the Broadway subway lying in Seventh Avenue between Fifty-first and Fifty-ninth Streets. The commission began advertising for bids for its construction about three weeks ago.

The Proposed Cleveland, Canton & Akron Terminal Railway.—In order to work out plans for the freight subway under East Fifty-fifth Street, Cleveland, as proposed by O. C. Barber, the Cleveland, Canton & Akron Terminal Railway has been incorporated with a capital stock of $10,000 by W. W. White, Thomas H. Garry, James McSweeney, W. M. Connelly and W. B. Snavely. The present capital is only nominal. The company will first endeavor to secure a franchise, after which the Public Utilities Commission will be asked to allow the issue of securities to construct the road and large coal and ore docks on the lake front.

Chicago Elevated Organizes Club.—About one hundred of the officers and supervisory force of the Chicago (Ill.) Elevated Railways have formed an organization to be known as the Elevated Club. The following officers have been elected: President, H. A. Johnson, master mechanic; vice-president, T. D. Milne, trainmaster; secretary and treasurer, E. L. Smith, power supervisor. The club will hold regular meetings once each month. At these meetings addresses will be made by one of its members or by outside speakers. Following the organization of the club, Peter Junkersfeld, assistant to the vice-president of the Commonwealth Edison Company, Chicago, delivered an illustrated address on power development in and about Chicago.

Subway Suggestion in St. Louis.—Richard McCulloch, vice-president and general manager of the United Railways, St. Louis, Mo., commenting on the initial plans for a subway, considered by the Kiel administration, was quoted recently as follows: "A subway for St. Louis is a big project. A municipal corporation or a private corporation cannot afford to put money into a subway unless it believes from the reports of competent engineers that the probable earnings and service will justify the cost. The United Railways has not employed engineers so far to investigate the feasibility of a subway from this standpoint. City officials have not consulted us on the subject, but we are ready and willing to give city officials any information or assistance we can whenever they decide to take up the question."

Prospects for Increased Power for the I. C. C.—Senator Newlands, of the interstate commerce committee of the Senate, said after a visit to the White House, on Dec. 11, that the Rayburn bill, regulating stock and bond issues of railroads engaged in interstate commerce, had not been abandoned. Senator Newlands said the President was inclined to believe that the Interstate Commerce Commission is overburdened with work at the present time, and that it would be better to let the stock and bonds issue bill go over until next session when a comprehensive measure, increasing the size of the commission and perfecting the machinery of that body so as to handle the additional work, could be presented. Such a bill would probably provide for dividing the work of the commission so as to be handled by three sections, one taking railroad rates, another physical valuation of railroads and the third the issue of securities.

Seattle Reconstruction Costs.—The first of the reports from the heads of city departments regarding the cost of reconstruction of the Seattle, Renton & Southern Railway as a city line have been made to Mayor H. C. Gill of Seattle, Wash. According to M. H. Tiedeman, assistant city engineer, it will cost between $363,000 and $762,000, depending upon the character of the work, to reconstruct the roadbed, install a double track from Dearborn Street to Fifty-seventh Avenue South and put in the necessary street improvements. This estimate does not include the cost of cars. J. D. Ross, superintendent of lighting of the city, estimates that it will cost an additional $150,000 to provide equipment necessary to furnish power to the line from the city plant. New substations will be necessary in Columbia City and an addition will have to be built to the central distributing plant in Seattle. The sale of the property to the city is now pending.

Chicago Merger and Subway Proposals.—Several propositions before the local transportation committee of the Chicago City Council upon which hinge the character of a proposed passenger subway are again up for disposition. These include consolidating the surface and the elevated lines with a subway in the downtown district to furnish both lines additional track capacity. Negotiations with this in mind were taken up in 1912, but failed because of a $30,000,000 difference in the real estate values as estimated by the railway company and by the city's harbor and subway commission. Recently a sub-committee of the local transportation committee has been appointed to give further consideration to this difference in real estate values. The work of this committee consisted of bringing the real estate values up to date and making such revisions as it deems necessary. The committee, assisted by Montague Ferry, commissioner of public service, reported its findings to the local transportation committee on Dec. 17, 1914.

Kentucky Compensation Law Unconstitutional. — The Court of Appeals of Kentucky, in a majority opinion handed down on Dec. 11, held unconstitutional the workmen's compensation act passed by the last Legislature. The decision turned on the contention that while employees might voluntarily waive their rights to recover damages under the constitution, the provisions of the law were such that they would automatically be drawn into such contract and that thus the law was such that "the compensation of the injured man is limited to the amount specified in the schedule of the act." The majority of the court expressed the opinion that the Legislature could pass an enforcible act, but the dissenting opinion, signed by three judges, held that the decision was such as to make it impossible for the Legislature to enact an effective compensation law under the present constitution. The law was to have become effective as to its compensatory provisions on Jan. 1, 1915.

Proposed Auto-Bus Routes in New York.—Harry P. Nichols, head of the franchise bureau of the Board of Estimate and Apportionment of New York, N. Y., has worked out a plan of routes in connection with the applications for auto-bus rights before the city and a public hearing was set for Dec. 18 in the City Hall. Applications for franchises have been made by the present Fifth Avenue Coach Company, the New York Motor Bus Company, the Manhattan Motor Bus Company, and the People's Five-Cent Bus Corporation. The Nichols plan has not followed the suggestions made by any one of these concerns, but rather has been worked out to provide a system of routes which would be particularly useful in this city, taking into account the existing lines of the Fifth Avenue Coach Company and providing for operation to fill in the gaps left by the subway, elevated and surface railway systems already in operation. According to Mr. Nichols' plan none of the motor buses would run south of Fourteenth Street. From that thoroughfare two trunk lines are planned, one to serve the east side and one the west side of the city.

New Haven Conspiracy Cases Argued.—Argument was heard on Dec. 11 before Judge Grubb in the Criminal Branch of the United States District Court at New York in the conspiracy case in which twenty-one directors of the New York, New Haven & Hartford Railroad were indicted. The cases of John L. Billard, James S. Elton and William Skinner came up, they having put in pleas in bar. Counsel for Mr. Billard, in the first place, however, moved to withdraw that plea, and to have a plea in abatement entered instead, the effect of which would be, if successful, to bring the proceeding to an end, because of mistakes made by the government. Judge Grubb denied the motion. Counsel for the other defendants maintained that they were immune from prosecution because of their testimony before the Interstate Commerce Commission. Counsel for the government argued that the purpose of the law, which provides that testimony given by a defendant cannot be used against him, applies only to that particular proceeding; or, at any rate, only to a proceeding in which no case could be made out without the testimony of such defendant, which, it was claimed, would not apply in the present instance.

Valuation of St. Louis Properties Suggested.—The Civic League of St. Louis, Mo., has suggested to the Missouri Public Service Commission that a physical valuation of the property of the United Railways be made to afford a basis upon which to settle the question of downtown loops and service improvements. A letter to the commission from the league says in part: "Your engineer has accepted a certain arbitrary standard as adequate service, namely, an average of all seats filled and a certain number standing. The quality and price of service from a public utility should depend, we believe, not upon any arbitrary standard, but upon the public's getting everything over and above a reasonable return on the company's investment or fair value of the property devoted to the service of the public. Granting that there should be a return on the capital such as will form a proper reward for its use, all above that amount earned by the company should be put either into improved service or into a reduction in fares. This, of course, at once raises the question of valuation, and no satisfactory solution can be had without a valuation. The valuation of the United Railways should not be a difficult matter. In fact, through our local public service commission a valuation of physical property has been made which was agreed to by the company within 6 per cent. We submit that it would be easy to verify that valuation and determine what amount has been put into the property since. With the physical valuation determined, the question of intangible values only remains."

PROGRAMS OF ASSOCIATION MEETINGS

Wisconsin Electrical Association

The annual meeting of the Wisconsin Electrical Association will be held at Milwaukee, Wis., on Jan. 20, 21 and 22. The session on Jan. 20 will be devoted to gas subjects, that on Jan. 21 to joint subjects and that on Jan. 22 to subjects pertaining to electric railways and electric utilities. The banquet will be held at the Hotel Pfister, Milwaukee, on the evening of Jan. 21.

International Engineering Congress, 1915

Some confusion seems to have arisen regarding the international electrical congress, which is was proposed to hold in San Francisco in September, 1915, and the International Engineering Congress, which is to be held during the same month. Owing to the situation abroad, and the impossibility of convening the International Electrotechnical Commission, under whose authorization the electrical congress was to have been held, it has been decided by the governing body of the American Institute of Electrical Engineers to postpone the holding of the electrical congress indefinitely. This does not affect the International Engineering Congress, in connection with which marked progress is being made. Full information concerning the congress may be obtained by inquiry at the headquarters of the congress, Foxcroft Building, San Francisco, Cal.

Financial and Corporate

RESUMPTION OF STOCK TRADING

The chief item of interest during the past week has been the results of the opening of the New York Stock Exchange on Dec. 12. The opening was hedged with caution, but there were no evidences of an avalanche of foreign liquidation. Rather does there exist, as a result of long economy, a substantial and confident investment demand. The advance of Brooklyn Rapid Transit stock on the opening day one-quarter over the last committee sale and 7¼ over the July 30 price indicates the general behavior of price quotations.

On the curb American Light & Traction is selling above the closing price of July 30, and the elimination of weak accounts during the last three months is expected to create a steady increase. The common and preferred stocks of the Cities Service Company advanced sharply on rumors of dividend resumption, but the common has fallen back to around 50. The resumption of dividends seems to be dependent upon a market for absorbing new securities. The company reports a small increase in gross operating revenue for November, but a decrease in net income and surplus as compared to the same month of last year. Virginia Railway & Power Company reports slightly decreased gross but improved net earnings.

Some hesitancy among the investors in taking up railroad and industrial issues is still apparent, the railroad issues in particular being passed by the more conservative buyers. That this condition will remain until the railroads get some relief from their present financial troubles is the opinion of the majority of the bond dealers. Investment bankers, however, expect that after the first of the year there will be a general resumption of business to normal.

CORPORATION TAXES

The report of the commissioner of internal revenue shows that 316,909 corporations made reports under the income tax law for 1913. These represented a total capitalization of $101,207,534,281, divided into capital stock of $64.071,319,185 and bonded and other indebtedness of $37,136.215,096, an increase of $2,333,091,459 over 1912 in capital stock and $2,386,698,743 in indebtedness. Their total income was $4,339,550,008, an increase of $507,399,597 over 1912. Of the 316,909 corporations reporting 128,043 made declarations that they had earned no net income in the year.

In Class "B," public service corporations, such as railroads, steamboat, ferryboat and stage line companies; pipe line, gas and electric light companies; transportation and storage companies; telegraph and telephone companies, 26,358 companies made reports, showing capital stock of $22,120,255,489 and bonded and other indebtedness of $20,198,907,819, on which net income was $1,003,185,721, although 11,928 companies reported no income. The percentage earned on capital stock was 4.55 per cent, and the percentage of indebtedness to capital stock was 91.31 per cent.

Returns filed during the year increased 3.79 per cent over previous year, while increase of taxable returns was 209.02 per cent, due almost entirely to removal of the $5,000 specific exemption. For years 1909 to 1912, inclusive, there was collected as special excise tax on corporations $118,060,868. During the fiscal year 1914 there was collected as special excise tax $10,671,077, or a grand total of $128,731,945 special excise tax collected for 1909 to 1912, inclusive. as well as for January and February, 1913. Special excise and income tax collected during the fiscal year ended June 30, 1914, was $43,127,739, against an aggregate assessment during that period of $45,614,369.

The following table shows the details of the various classes, Class "A" representing financial and commercial corporations; Class "C" industrial and manufacturing plants; Class "D" mercantile dealers, and Class "E" architects, contractors, theaters and all others.

	Net income
Class A	$438,746,584
Class B	1,003,185,721
Class C	2,026,883,951
Class D	473,201,741
Class E	397,532,000
Total	$4,339,550,008

ANNUAL REPORT

Aurora, Elgin & Chicago Railroad

The statement of income, profit and loss of the Aurora, Elgin & Chicago Railroad, Wheaton, Ill., for the year ended June 30, 1914, follows:

Gross earnings and other income:	
Revenue from transportation	$1,726,724
Revenue from operations other than transportation	368,259
Interest	870
Miscellaneous	330
Total	$2,096,183
Operating expenses and taxes:	
Maintenance of way and structures	$202,806
Maintenance of equipment	158,190
Traffic	9,604
Conducting transportation	655,454
Other operations	33,966
General and miscellaneous	307,522
Total	$1,366,942
Less undistributed operating credits	24,091
Remainder	$1,342,851
Taxes	53,940
Total operating expenses and taxes	$1,396,791
Gross income	$699,392
Deductions from income	418,759
Net income	$280,633
Profit and loss surplus at beginning of year	557,394
Profit and loss—gross surplus	$838,027
Profit and loss charges:	
Dividends	$279,000
Other	1,308
Total	$280,308
Profit and loss—surplus at end of year	$557,719

The revenue from transportation during the year was $1,726,724, as compared to $1,674,768 for the year ended June 30, 1913, an increase of $51,956, or 3.1 per cent. The total gross earnings increased $81,340, or 4.03 per cent. The total operating expenses and taxes increased from $1,238,642 to $1,396,791, an amount of $148,149, or 11.9 per cent. This increase was largely made up by the following increases in the several operating groups: Maintenance of way and structures, $48,417, or 31.3 per cent; maintenance of equipment, $29,918, or 23.3 per cent; conducting transportation, $55,061, or 9.1 per cent; general and miscellaneous, $15,585, or 5.3 per cent, and taxes, $9,973, or 22.7 per cent. Expenses for other operations decreased approximately 3 per cent, and traffic expenses showed a slight decrease.

Gross income for the period decreased $76,809, or 9.7 per cent, while the net income on account of increased deductions decreased $100,345, or 26.3 per cent. Owing to the fact, however, that the profit and loss surplus at the beginning of the previous year was nearly $100,000 larger than at the beginning of the present year, the surplus at the end of the present year has been slightly more than fully maintained up to the June 30, 1913, standard.

The report mentions the various unusual items of maintenance during the year, and states that the lines and property of the company are in excellent condition. Ten new cars were put in service during the year. Owing to the dissolution of the United States Express Company, the revenue from this source was lost, but the company is undertaking through the Arrow Transfer Company to build up a local freight and express business between Chicago and various towns along the line. The company now has in its treasury $1,119,000 of first and refunding bonds certified against construction heretofore made, which will be sold to liquidate present notes and accounts payable and leave a substantial cash balance when market conditions again become normal.

Bartlesville (Okla.) Interurban Railway.—Henry L. Doherty & Company and Frederick J. Curnick, New York, N. Y., are offering for subscription, at 95 and interest, the final block of $32,500 of a total of $250,000 of first mortgage 6 per cent gold bonds of the Bartlesville Interurban Railway, dated 1910 and due July 1, 1934, but redeemable on any interest date at 102 and interest. The mortgage under which the bonds are secured is now closed. The interest on the bonds is payable January and July at the office of the Equitable Trust Company, New York, N. Y. The bonds are in the denomination of $500. The Citizen's Bank & Trust Company, Bartlesville, is trustee in the mortgage.

Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala.—The independent committee of bondholders of the Birmingham, Ensley & Bessemer Railroad has decided to hold open its deposits for the present and invites the holders of the first mortgage 5 per cent bonds to deposit their securities with the American Trust Company, Boston, Mass., depository, or with the Columbia Trust Company, New York, N. Y., as agent. The committee says that the financial and physical investigation conducted in its interest makes it possible for the committee to intervene in any foreclosure suit and to guarantee its bondholders against any prejudice to their interest which may arise from a private sale.

Cities Service Company, New York, N. Y.—Henry L. Doherty, president of the Cities Service Company, has concluded a circular to the stockholders of the company as follows: "We are still of the opinion that when the present disturbance is at an end and conditions have become normal, public utility securities will be held in relatively higher esteem than ever before, and especially those representing a wide diversity, such as is found in the Cities Service Company. No immediate change is contemplated in policy of deferring dividends, although the matter is under constant consideration."

Fairmount Park Transportation Company, Philadelphia, Pa.—C. J. Jones has been elected a director of the Fairmount Park Transportation Company to succeed Robert Wetherill, Chester, Pa., resigned.

Interborough-Metropolitan Company, New York, N. Y.—The application of the Interborough-Metropolitan Company to the Stock Exchange is to list $28,784,100 of 5 per cent cumulative preferred stock instead of $17,942,000 as announced in the ELECTRIC RAILWAY JOURNAL of Dec. 12, page 1316. This is not in any manner an increase of capital stock, but simply a reconversion of preferred stock voting trust certificates into preferred stock. To date $17,942,000 of the voting trust certificates have been reconverted into preferred stock, leaving $10,842,000 still to be reconverted from time to time. Of the $45,740,000 total preferred stock of Interborough-Metropolitan Company only $28,784,100 was originally placed in the voting trust. The difference of $16,955,900, in stock, was listed long ago. The common stock is all in voting trust certificates, which are listed, but the stock itself is not.

International Traction Company, Buffalo, N. Y.—Ten second mortgage sinking fund gold bonds of the Buffalo & Niagara Falls Electric Railway, dated July 1, 1896, have been called for payment on Jan. 1, 1915, at 105 and interest at the office of the Bankers' Trust Company, New York, N. Y.

Jacksonville Railway & Light Company, Jacksonville, Ill.—The Jacksonville Railway & Light Company has called for payment at 103 and interest on Jan. 1, 1915, at the office of the Merchants' Loan & Trust Company, Chicago, Ill., two first mortgage bonds of $1,000 each and six of $500 each issued by the Jacksonville Gas, Light & Coke Company.

Memphis (Tenn.) Street Railway.—The Memphis Street Railway has declared a dividend of 2½ per cent on the $2,500,000 of common stock, payable on Dec. 31 to holders of record of Dec. 22. The American Cities Company owns 86 per cent of the common stock of the Memphis Street Railway and 88 per cent of the preferred stock. On June 30, 1914, one-half of 1 per cent was paid and in December and March, 1913, and June, 1912, 1 per cent each. The payment in June, 1912, was the first made.

National Properties Company, New York, N. Y.—The National Properties Company, through its ownership of the Wilmington & Philadelphia Traction Company and the Wilmington Light & Power Company, has secured control of the E. I. duPont de Nemours Powder Company's electric transmission lines, distributing system and light and power business, extending through the Valley of the Brandywine from Wilmington to Winterthur.

New Orleans Railway & Light Company, New Orleans, La.—The New Orleans Railway & Light Company has declared a dividend of 1 per cent on the $20,000,000 of common stock of the company, payable on Dec. 31 to holders of record of Dec. 19. In June, April and January, 1914, one-half of 1 per cent was paid on the stock, while 1 per cent was paid in June and one-half of 1 per cent in January, 1913. An initial payment of 1 per cent was made on July 1, 1912.

Oakland, Antioch & Eastern Railway, Oakland, Cal.—The Railroad Commission of California has authorized the Oakland, Antioch & Eastern Railway to issue promissory notes of the total face value of $295,345. It is made a condition of the commission's order that these notes shall bear interest at not to exceed 7 per cent per annum. A group of bondholders of the company called a general meeting of bondholders in San Francisco on Dec. 11 and elected W. M. Alexander temporary chairman, giving him power to appoint a committee of four to consider the financial report of the expert accountants which is now in course of preparation, and advise the security holders of their views concerning the new financing.

Portsmouth Street Railroad & Light Company, Portsmouth, Ohio.—The unsold portion of a total authorized issue of $500,000 of new first mortgage 6 per cent bonds of the Portsmouth Street Railroad & Light Company is being offered for a subscription at par and interest by John Nickerson, Jr., New York, N. Y., and St. Louis, Mo. The bonds are dated July 1, 1914, and are due serially, $25,000 each July 1, from 1918 to 1934, both inclusive, and $75,000 on July 1, 1935. They are in the denomination of $1,000 and $500 and are callable at 102½ on any interest date. Interest is payable in January and July at the office of the Guaranty Trust Company, New York, N. Y., trustee. The bonds are being issued to provide funds to extend the railway lines of the company from Portsmouth, Ohio, to Ironton, Ohio, 22 miles, build a new carhouse, make other improvements and reimburse the treasury for the redemption of the $50,000 of first mortgage 5 per cent bonds of 1906 called for payment on Jan. 1, 1915, at 102. The extension to the railway lines will be built by the Ohio Valley Traction Company, a subsidiary, all of the securities of which will be pledged as part security for the new bond issue. The line between Portsmouth and Ironton will be operated by the Portsmouth Street Railroad & Light Company under the lease from the Ohio Valley Traction Company, which continues for twenty years after the maturity of the bonds.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The San Francisco-Oakland Terminal Railways has asked the Railroad Commission for an extension of time to June 30, 1915, in which to dispose of $239,370 of promissory notes. These notes are part of an issue amounting to $650,000, which was ratified by the commission on June 23, 1914. Up to Oct. 1, 1914, when the authority granted by the commission expired, the company had succeeded in disposing of only $420,630 of the notes. In addition to an extension of time on the $239,370 of notes remaining unsold, the company desires authority for a further issue of notes secured by the pledge of $370,000 of its general lien mortgage bonds, upon the condition that the face value of the notes issued shall at no time be greater than 66 2/3 per cent of the face value of the bonds pledged as collateral. From the proceeds of the sale of these new notes the company proposes to reimburse itself for $148,922 expended from income for capital purposes; purchase new cars to the value of $75,000; and expend $22,744 for the construction of an interlocking plant at Stanford Avenue and Lowell Street, Oakland. Between Jan. 1 and Jan. 15, 1915, the company states that it will be required to meet interest payments on its bonded indebtedness amounting to $372,830.

Shore Line Electric Railway, Norwich, Conn.—The board of directors of the Shore Line Electric Railway has been reduced from fifteen to nine. The following directors have been elected: C. W. Sheafe, Jr., W. S. Rathbun, W. L. Barnett, F. E. Hall, A. E. Clark, A. S. May, W. C. Skidmore, E. G. Buckland and J. M. Tomlinson.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.—E. W. Clark & Company, Philadelphia, Pa., with whom there was deposited substantially all of the $3,500,000 of common stock of St. Joseph Railway, Light, Heat & Power Company, sold to Henry L. Doherty & Company, New York, N. Y., for the Cities Service Company at $60 a share, notified depositing stockholders that the balance of $35 a share on the stock would be paid, with accrued interest, on and after Dec. 10. Funds for the payment of this stock were secured by the sale of $1,118,000 of St. Joseph Railway, Light, Heat & Power Company trust certificates secured by all the deposited common stock of the St. Joseph company. Trust certificates will be retired monthly through a sinking fund provided by the Cities Service Company, the final certificate being retired June 1, 1917.

DIVIDENDS DECLARED

American Cities Company, New Orleans, La., 3 per cent preferred.

Boston & Worcester Electric Companies, Boston, Mass., $1 preferred.

Duluth-Superior Traction Company, Duluth, Minn., quarterly, 1 per cent, preferred; quarterly, 1 per cent, common.

Elmira Water, Light & Railroad Company, Elmira, N. Y., 1¾ per cent, first preferred.

Illinois Traction System, Peoria, Ill., quarterly, 1½ per cent, preferred.

Memphis (Tenn.) Street Railway, quarterly, 1¼ per cent preferred; 2½ per cent, common.

New Orleans Railway & Light Company, New Orleans, La., quarterly, 1¼ per cent, preferred; 1 per cent, common.

Twin City Rapid Transit Company, Minneapolis, Minn., quarterly, 1¾ per cent, preferred; quarterly, 1½ per cent, common.

Washington, Baltimore & Annapolis Electric Railway, Washington, D. C., quarterly, 1½ per cent, preferred.

West Philadelphia (Pa.) Passenger Railway, $5.

Traffic and Transportation

THE CLAY COUNTY RATE DECISION

Rehearing Will Be Asked in Case of Order for Commutation Fares Applying Only to Short Distances on Two Divisions

As announced briefly in the ELECTRIC RAILWAY JOURNAL of Dec. 12, page 1319, the Public Service Commission of Missouri on Dec. 7 issued an order to the Kansas City, Clay County & St. Joseph Railroad to begin on Jan. 1, 1915, issuing commutation tickets on definite rate schedules established by the commission which figure out at about 1.1 cents a mile. A feature of the order was the commission's valuation of the property of the company.

The Kansas City, Clay County & St. Joseph Railroad was placed in operation on Jan. 21, 1913, charging 2½ cents a mile, or 2¼ cents a mile round trip. Three months later people at Liberty, Mo., and owners of real estate between Liberty and Kansas City began asking for commutation tickets. Shortly after this the steam railroad rates were reduced to 2 cents and the commission ruled that the interurban was a railway and should charge only 2 cents.

The commission asked the company to make a valuation of the property. This was a comparatively simple process because all the records of promotion and organization and of the physical property were available. The company's valuation totaled $5,320,000, as follows: cash, $3,800,000; discount on bonds, $450,000; discount on stock, $310,000; going value, $350,000; working capital, $30,000; promotion fee (figured at 10 per cent of the cash), $380,000. The commission took these figures and made its valuation of $3,900,000. Instead of the company's figure of $380,000 for promotion the commission allowed only $16,000 for this item, although the books and evidence showed that the figure given by the company was the amount of actual cash paid to the promoter. The company's valuation was prepared by Sloan, Huddle, Feustel & Freeman, Madison, Wis. The commission allowed for no discount on the securities of the company issued before the existence of the commission, although when the company issued $135,000 of bonds for a signal system it did allow their sale at a discount of 15 per cent. Included in the section devoted to valuation the order mentioned that the company in its first year showed that it had earned 6.2 per cent on the valuation set by the commission, and the statement was made that this was not as much as the commission would allow the company to earn. There was no statement, however, as to what percentage the company would be allowed to make.

The order requiring commutation rates applies only between Kansas City and Liberty, 14.4 miles, on the Excelsior Springs Division; and to a distance of about 10 miles on the St. Joseph division. As stated, a considerable number of complainants from Liberty and between Liberty and Kansas City had asked the rates, but it is said that only one person on the St. Joseph division in the 10-mile limit had joined the request. There is no order as to commutation rates between St. Joseph and any other points or between Excelsior Springs and any other points. There is no provision for lower rates between intermediate points in the limits named in the order, all the reductions applying to traffic into and out of Kansas City. Explicit prices of commutation tickets, fifty-two rides in a book good for thirty days, the books being non-transferable, are made.

As previously stated, the average rate established by the order is about 1.1 cents a mile. The railway pays the company owning the bridge over the Missouri River, by which entrance is gained to Kansas City, 3½ cents per passenger each way. An instance of the operation of the rate is that the commutation rate from Avondale 4.14 miles from Kansas City is 5.7 cents, which leaves 2.2 cents for the electric line, after paying the bridge company, or about half a cent a mile. The contract with the bridge company was cited in the brief of the electric railway, but there was no reference to it in the commission's order. The Kansas City, Clay County & St. Joseph Railroad is the only electric interurban out of Kansas City wholly or chiefly in Missouri. The Missouri commission, however, took cognizance of the commutation rates of other Kansas City interurbans serving Kansas communities, which rates vary from 1 cent to 1¼ cents a mile.

In its conclusions the commission said that people had bought land along the route of the interurban with the desire and purpose of building homes, but the transportation rate was so high into Kansas City that they could not afford to live there.

J. R. Harrigan, general manager of the company, said that several points presented in the brief and testimony during the hearings warrant a request for a rehearing and continued:

"We showed that the cost of handling passengers, not including taxes or interest charges, was 1 cent a mile. Including the taxes and interest charges the cost of handling passengers was shown to be 1.6 cents a mile. We also showed that we are purely a railway and are not interested in any land along our line; that our revenue is entirely from our street railway traffic."

ORDER IN ALBANY SERVICE CASE

Substantially all of the recommendations regarding service in Albany, N. Y., made by Charles R. Barnes, the electric railway inspector of the Public Service Commission of the Second District of New York, are embodied in an order issued to the United Traction Company on Dec. 12 by the commission. The following improvements are immediately enjoined on the company:

Three modern snow plows to replace the 5½-ton plows now in service and the installation of 50-hp motors instead of 30-hp on the present sweepers. These to be installed by Feb. 1.

Non-rush hour headway of five minutes instead of seven minutes on the Belt Line and rush-hour headway of four minutes between 6:30 a. m. and 9 a. m. and three minutes between 5 p. m. and 6:30 p. m. instead of the present five-minute headway.

Seven-minute headway instead of ten-minute headway during non-rush hours on the Delaware Avenue line.

Transfers to and from the Schenectady cars for passengers to and from points within the city limits on the Schenectady line.

Immediate purchase of twelve new modern cars, seating not less than forty, to be used in place of the present 18-ft. cars of the 100 series.

Immediate increase in the power supply.

Immediate purchase of an automobile wrecking truck, properly equipped, manned and located.

Installation before April 1 of a telephone system along the lines with proper switchboards, etc., for emergency use and for dispatching cars.

Equipment of all single truck cars to remain in service with an auxiliary brake system not later than May 1.

The company is further enjoined to submit a definite program of further improvement to the commission, concerning matters largely of local interest in Albany.

The thirteen clauses in the commission's order of Dec. 12, added to the ten clauses of the order issued on Aug. 10 last, carry out all of the recommendations of Mr. Barnes, or provide for their development at as rapid a rate as possible, with the single exception of the elimination of all the open cars. It was found that this step would have been generally unpopular with the patrons of the road. The orders to the company made last August have been carried out or are under way, the commission finds.

The present decision is in the case into which all of the complaints against the company were consolidated last spring. The recommendations of Mr. Barnes were filed with the commission early in the summer, and hearings were held at which the company objected to many of the recommendations. Those to which there was little objection were immediately made effective and the remainder, the subject of the order of Dec. 12, have been a matter of weekly consideration at the executive sessions of the commission, in order that a way might be found to meet the complaints in an order which would be possible for the company to carry into effect. The order just issued is so arranged as to time that it should not, in the opinion of the commission, impose any undue hardship on the company. The company is instructed to report to the commission the progress which it makes toward carrying out the recommendations.

NEW INDIANA FARES

Statement by Union Traction Company Regarding New Fares Effective on Jan. 1, 1915

The new system of fares which the Union Traction Company of Indiana has been authorized to establish by the Indiana Public Utility Commission will go into effect on Jan. 1, 1915. A statement which has been issued by the company in regard to the new fares reads in part as follows:

"The new system of interurban fares which will be put into effect on the Union Traction lines on Jan. 1, 1915, introduces the copper zone, or 1-cent zone, system in place of the nickel zone, or 5-cent zone, system, which has been in use on the interurban lines as well as on the steam lines in Indiana. Under both systems the rate of fare is 2 cents per mile. By the nickel zone system all fares are computed in multiples of 5 cents, the fare being 'that multiple of five nearest reached by multiplying the rate by the distance.' In determining the distance, the law requires that 'fractions of less than ½ mile shall be disregarded, and all other fractions counted as 1 mile.' As a result of calculating fares in this way the actual rate per mile traveled varies greatly. For instance, the fare for a ride of 3.4 miles is 5 cents, or a little less than 1½ cents per mile. The fare for a ride of 3.8 miles is 10 cents, or almost 3 cents a mile. A ride of any distance, no matter how short, beyond the point where the fares change, adds 5 cents to the fare.

"Under the new copper zone system all fares will be calculated at the former rate of 2 cents per mile, but in ½-mile zones at 1 cent instead of 2½-mile zones at 5 cents each. As a result all passengers will pay at the same rate, as nearly as possible, for the distance actually traveled. The addition of ½ mile to a ride will make a difference of only 1 cent in the fare paid, instead of 5 cents, as was frequently the case under the nickel zone system. Taking the cases already stated, a passenger traveling 3.4 miles will pay 7 cents instead of 5 cents, while a passenger traveling 3.8 miles will pay 8 cents instead of 10 cents. Both passengers will pay at the same rate of 2 cents per mile, instead of one paying almost twice the rate per mile as the other.

"The effect of the changes in fare under the new system will be in some cases to increase and in others to decrease the present fares, while in still other cases no change will be made.

"The new system, it has long been recognized, would do away with discriminations existing under the nickel zone system, but the practical objections to computing fares in odd cents have made interurban officials slow to adopt the copper zone system.

"The officials of the Union Traction Company believe that the new fares will carry out one of the chief objects of the Public Service Commission law—that of eliminating discriminations—and will be generally approved by the public."

The order of the commission in this case was referred to in the ELECTRIC RAILWAY JOURNAL of Nov. 28, page 1221.

"AN 1894 NICKEL"

Under the caption "An 1894 Nickel" the Georgia Railway & Power Company, Atlanta, Ga., carried the following 3½-in. x 4½-in. advertisement in the Atlanta papers recently:

"Got one in your pocket? Look at it. Twenty years of circulation have worn it smooth.

"When that nickel was new it was worth one street car ride in Atlanta.

"Now that it's worn, it still is worth here in Atlanta one street car ride.

"Everything's gone up—except your street car ride.

"That's cheaper—yes, cheaper—than it was when your 1894 nickel was coined. Two decades have brought you better and faster and more comfortable cars, greater transfer privileges, miles and miles of new track lines that didn't exist then. Your 1894 nickel pays your fare in 1914 from College Park to Decatur, or from Decatur to Bolton, or from Bolton to Buckhead, or from Buckhead to East Lake, or from East Lake to Druid Hills, or from Druid Hills to Hapeville, or between any two of a score other extremities of the Atlanta system.

"You couldn't be served adequately to-day by Atlanta's street car equipment of twenty or even ten years ago. You'd laugh at the man who tries to convince you that to-day's equipment will suffice ten years from now.

"We've got to keep growing. That's the foundation of one phase of good service. Growth calls for new investment. That must be assured fair return. That's impossible without your good-will. To win your good-will and keep it, we must give good service. The thing's a cycle.

"Would we be so foolish as to break it?"

JAY WALKER SIGNS IN LOUISVILLE

For two weeks preceding Dec. 13 patrons of the Louisville (Ky.) Railway and the Louisville & Interurban Railroad read and re-read signs placed prominently in every car in the service, on which was this text:

> WHO WHEN WHY
> IS A JAY WALKER?
> Safety First
> Louisville Safety First Association

The public of Louisville has been more or less interested for several months in the efforts of the Louisville Railway to school it in "safety first" practices, and is co-operating with the company to a considerable degree. This particular sign, however, provoked an unusual amount of discussion because its import was not obvious. The card which succeeded it is now answering the question that was driven home to everybody during the last fortnight. This second card reads:

> A JAY WALKER
> WHO? Perhaps you.
> WHEN? You cross the street at any other place than a regular crossing.
> WHY? To save time instead of yourself.
> ARE YOU A J-W?

The graphic character of this series, it is believed, has accomplished much in the way of attracting increased attention to and in getting support for the company "safety first" campaign.

"SAFETY FIRST" AT ALLENTOWN

Extensive Efforts Made to Enlist the Co-operation of the Public in This Campaign

The Lehigh Valley Transit Company on Dec. 11 inaugurated a campaign for "safety first" in Allentown, Pa., with the co-operation of the Allentown School Board, the local council for industrial safety and the Chamber of Commerce. Through the courtesy of the management the Lyric Theater, the largest in the city, was secured, and three public meetings were held. The first was at 2:30 p. m., the second at 4:30 p. m. (a special meeting for the public school children and teachers), and the third, a mass meeting, at 8 p. m. Addresses were made by E. M. Young, vice-president of the transit company; E. C. Spring, manager of the Philadelphia division; Mayor C. W. Rinn, E. J. Tumley, president of the Chamber of Commerce; District Attorney S. H. Rupp, G. T. Fonda, safety engineer of the Bethlehem Steel Company; J. W. Haas, president of Muhlenberg College, and Dr. F. D. Patterson, of the Philadelphia department of accident prevention and of The J. G. Brill Company and Harrison Brothers.

At the 4:30 p. m. children's meeting there were 2000 auditors. The illustrated slides and moving picture reels showed how carelessness results in serious accidents. E. M. Young presided at the evening meeting. In his opening remarks he spoke of the changes in transportation methods in recent years and how greater care was necessary by both the employee and the public. He introduced E. C. Spring, who said that in four years the company had carried 100,000,000 people without the death of one passenger by accident. Mayor Rinn complimented the officials on their efforts. He said that if the 60,000 people of Allentown emulated the employees of the company all accidents would be wiped out. Mr. Tumley said that in one year in the United States 40,000 people were killed and 2,000,000 injured. He said that accident work should be extended to the home. Mr. Fonda stated that the Bethlehem Steel Company had reduced its accidents 60 per cent in the last year by safeguarding employees and educating workmen. Of accidents occurring in industrial plants 80 per cent were due to careless employees and only 20 per cent to non-protected machinery.

Dr. Haas said the safety movement showed a larger human interest, the coming of a better democracy. It was no longer speed first, but care first. Mr. Rupp pointed out that at least five cases had come to his attention in the past year where men were injured or killed through their own carelessness. He showed the economic value of keeping trained employees steadily at their work by giving them the best possible protection. Dr. Patterson proved very adept in driving home the idea of safety first, last and all the time. In the Brill factory the average number of accidents per month had been reduced to thirty. The Pennsylvania Railroad had reduced accidents by 69 per cent. By means of colored slides he illustrated how accidents can easily happen on the street. The moving pictures, "The Workman's Message" and "The Price of Thoughtlessness" were shown on the screen. Another reel showed the difference in damage wrought by an actual head-on collision between two railroad trains made up of antiquated wooden cars and a collision between solid steel trains.

This is the first of a series of meetings which it is proposed to hold in the communities served by the company.

"CAR-FULL" SIGNS AND LIMITED STOP SERVICE IN BOSTON

Limited stop and car-full service has been begun by the Boston (Mass.) Elevated Railway on the Reservoir-Beacon Street and Commonwealth Avenue-Boylston Street subway lines. "Car Full" signs are to be used at the discretion of inspectors during morning rush hours and will be displayed on cars inward bound from Reservoir station upon reaching Coolidge Corner and on inbound Commonwealth Avenue and Brighton cars upon reaching Harvard Avenue, Allston. Such cars will not stop to take passengers until reaching the subway, but will discharge passengers en route. "Limited Stop" signs are to be used during the evening rush hours on outward-bound cars on these lines. Express service will be provided by these cars from the subway incline near Kenmore Street to Harvard Avenue and Corner, respectively, without stops except to receive passengers. In order to accommodate local passengers an additional alternate service will be operated between Park Street subway loop and Coolidge Corner and between Park Street and Oak Square, Brighton, making all regular stops. During both rush-hour periods cars are now scheduled at three-minute intervals between Reservoir station and Park Street in addition to the local line between Coolidge Corner and Park Street, on which a four-minute schedule is maintained. The company has discontinued the use of the term "Express" on passenger car signs, and has substituted the limited-stop sign with destination specified.

Another Elevated Accident in New York.—Seven persons were injured on Dec. 13 in a rear-end collision at 150th Street, New York, between trains of the Manhattan Elevated division, Interborough Rapid Transit Company.

Conductor Convicted of Stealing.—A conductor, charged with petit larceny for pilfering $2.42 from a New York State Railways, Rochester Lines, pay-as-you-enter car, was found guilty in Police Court on Dec. 7. He was ordered to pay a fine of $25, or to serve as many days in the penitentiary. The fine was paid.

Commission to Decide on Augusta-Aiken Fare.—The Railway Commission of South Carolina expected to hold a final hearing on Dec. 16 to decide whether to allow the Augusta & Aiken Railway to increase its passenger rate from 1 cent to 2 cents a mile. If allowed, the order would increase the fare between Augusta and Aiken to 50 cents.

Post-office Appropriation Bill.—It was announced on Dec. 14 that the post-office appropriation bill was virtually completed and ready for submission to the House. The measure includes as a rider the railway mail pay bill, passed by the House and now pending in the Senate, to change the basis of pay from a tonnage to the car space basis used by the mails carried. Approximately $1,000,000 additional compensation would be given the railroads because of the burdens imposed by the parcel post.

City Traffic Committee Proposed.—The transportation committee of the City Council of Toronto, Ont., on Dec. 11 again adopted a report favoring the appointment by the city of a traffic commission and asking that the Board of Control nominate one member for four years, one for three years and one for two years, the commission to investigate the traffic situation of the city and report to Council from time to time the lines of action it deems advisable. The last time the matter was before the Council it was almost unanimously rejected.

Allston Transfer Decision.—The Massachusetts Public Service Commission has issued an order requiring the Boston Elevated Railway to grant free transfers at the intersection of Commonwealth and Harvard Avenues, Allston, to enable passengers to ride inward bound from that point into Brookline Village and thence into Boston, and to transfer from outward-bound Harvard Avenue cars to outward-bound Commonwealth Avenue cars; the privilege not applying to passengers boarding the former cars in the subway on account of the service of the latter on that portion of the system.

Air Reservoir Explosion in New York.—The air reservoir on a Third Avenue Railway car exploded on Dec. 14 without causing any personal injuries and involving only insignificant damage. The reservoir had welded joints throughout, and indications pointed to an initial failure of the longitudinal seam on account of insufficient welded area, the sheet tearing loose from the drumheads over the major part of the joints. The heads remained intact and were not separated completely from the sheet forming the drum so that no metal was thrown by the explosion. Even the pipe connection on one drumhead was left in place.

"Safety First" Zones in Louisville.—Experiments with "safety first" zones at the busy downtown corners in Louisville, Ky., have been so successful that the city police department has established them at all the important corners where streets in the retail section are narrow. The traffic regulations require vehicles of all descriptions to stop at the standards between the tracks and the curb or at the white lines which are painted on the pavement to indicate the limits of the safety zone. The first arrest for disregard of the limits defined by the traffic police was made after the system had been in operation for several months.

Ruling Regarding Trains of Steel and Wooden Cars.—The Long Island Railroad recently petitioned the Public Service Commission for the First District of New York for a modification of the commission's order requiring it, on Dec. 1, 1914, to discontinue the use of wooden cars in trains made up in part of steel cars. The company stated that it had only fifty-three wooden cars in use on the Atlantic Avenue Division, and that these would be retired as soon as new cars could be purchased; but that owing to the financial conditions the company had not yet been able to place its order for the new cars. The commission denied the request for modification.

Ordinance to Free Tracks of Wagons.—At the suggestion of Alderman Capitan the local transportation committee of the Chicago City Council is considering the preparation of an ordinance prohibiting wagons from using the street railway tracks during the Chicago rush-hour periods. In this connection some interesting figures showing delays for the first ten days in December were furnished by J. E. Wilkie, assistant to the president of the Chicago Surface Lines. During this period 100 breakdowns occurred causing an average delay to cars of ten minutes each, and each ten-minute delay meant the holding up an average of ten other cars. Practically all of these delays were accounted for as being due to simple breakdowns in wagons. The territory included in these delay figures was confined only to the Chicago business district.

Employees' Association in Wichita.—An employees' benefit association has recently been organized among the employees of the Wichita Railroad & Light Company, Wichita, Kan. The operation of the association is governed by nine trustees, six selected by the men and three from officers of the company. There are about 150 members. The assessments are 30 cents a month for each member, and the company pays into the treasury an amount similar to that collected among the members. Benefits of $8 a week are paid after the first week of sickness. The maximum sick allowance is fourteen weeks in any one year. The officers act without pay with the exception of the secretary, who receives a salary of $50 a year. Officers and trustees are elected for a year. The trustees meet once a month. General meetings of all of the members are held three times a year.

Fare Changes on Hudson Valley Railway.—The Hudson Valley Railway, Glens Falls, N. Y., has filed with the Public Service Commission of the Second District of New York effective on Jan. 1, 1915, the following changes in fare: Local one-way fares between stations and stops; Through fare between Saratoga Terminal and Ballston Spa, via Hamilton Street (Saratoga), increased from 10 cents to 15 cents, and sub-zones increased from two to three; limited as follows: Saratoga to Geyser's; Geyser's to Gray's Crossing; Gray's Crossing to Ballston Spa; fare between any two points within a sub-zone 5 cents. Through fare between Thomson and Greenwich increased from 10 cents to 15 cents, and sub-zones increased from two to three; limited as follows: Thomson to Trionda Mill Stop; Trionda Mill Stop to Power House No. 2; Power House No. 2 to Greenwich; fare between any two points within a sub-zone 5 cents.

Inquiry Into New York Elevated Accident.—A public inquiry into the fatal accident of Dec. 9 on the elevated railroad in New York was held by the Public Service Commission, First District, on Dec. 16. C. W. Welder, electrical engineer of the commission, stated that there had been thirty-seven collisions on the New York elevated lines since 1908. Two of these resulted in fatalities to passengers. During this time 2,000,000,000 passengers had been carried. He announced that a new speed-control device was under consideration by the commission which would provide safety without limiting the capacity of the lines as would block signals. Frank Hedley, vice-president of the Interborough Rapid Transit Company, testified that steel cars could not be built light enough for use on the elevated lines without rebuilding the structure, the weight of the present wooden motor car being 58,440 lb. He outlined a new device which he had just conceived for short-circuiting the third-rail shoes and the rails in case of accident to insure the blowing of the circuit breakers. This would prevent fires in wooden cars. The accident was caused by failure of the conductor to ride the front platform of the train and signal to the motorman, who was in the fourth car owing to electrical trouble in the front half of the train.

Pennsylvania Commission Rules on Fares.—The Public Service Commission of Pennsylvania, in a decision made public on Dec. 12 in the case of the Pennsylvania, the Philadelphia & Reading and the Baltimore & Ohio Railroads, which a month ago prepared new tariffs effective on Dec. 15, approved certain of the new rates. The commission ordered the continuance of the fifty and 100-trip commutation tickets, but established a fixed rate of not more than 1½ cents a mile as a maximum rate. This allows an advance over the old rate, the old rate on the 100-trip ticket having been approximately 1 cent. The commission also ruled that the sixty-trip monthly ticket and the forty-trip school ticket shall be valid for a period of one month from date of sale, instead of one calendar month, as the railroads proposed, and that the 180-trip commutation ticket shall be valid for three full months from time of issue. In only one particular are the railroads restrained from putting a higher passenger rate into effect, and that is the charge of 2¼ cents a mile on the ten-trip tickets. The commission ruled that the companies shall sell a ten-trip family ticket, on which ten persons can ride at the same time, for a rate no higher than 2 cents a mile. The railroads are permitted to increase the sixty-trip monthly tickets 25 cents each, but must make the ticket good for one full month from the date of sale, instead of only a calendar month. The railroads are allowed also to increase the forty-six-trip school ticket 20 cents each, but they likewise must be good one month from date of sale.

Personal Mention

Mr. Victor S. Curtis has been elected secretary of the Connecticut Company with headquarters at New Haven, Conn.

Mr. W. P. Hendricks, superintendent and master mechanic of the Elgin & Belvidere Electric Company, Marengo, Ill., has resigned to engage in other work.

Mr. H. L. Moss, formerly electrical engineer of the Elgin & Belvidere Electric Company, Marengo, Ill., has been appointed acting superintendent to succeed Mr. W. P. Hendricks, resigned.

Mr. E. C. Clark, the retiring superintendent of the Northampton (Mass.) Street Railway, was tendered a dinner at the Draper Hotel, Northampton, on Dec. 9 and presented with a mahogany clock by the employees as a token of esteem.

Mr. Peter Witt, street railway commissioner at Cleveland, Ohio, has announced his candidacy for the office of Mayor to succeed Mr. Newton D. Baker, who will not seek office again. Mr. Witt served as city clerk for a long period while the late Tom L. Johnson was Mayor.

Mr. J. Stanley Moore, until recently passenger agent of the Empire United Railways, Syracuse, N. Y., has been named by Governor-Elect Whitman as his military secretary with the rank of major. Mr. Moore was born in Syracuse in 1870 and was graduated from Yale in 1893.

Mr. Ivy Ledbetter Lee has resigned as executive assistant of the Pennsylvania Railroad to become a member of the personal staff of Mr. John D. Rockefeller, New York, N. Y., and will take up the duties of Mr. Jerome D. Greene, who in future will devote his entire time to the Rockefeller Foundation.

Mr. John H. Roemer, chairman of the Railroad Commission of Wisconsin, will, on Feb. 1, 1915, join the organization of H. M. Byllesby & Company, Chicago, Ill., in charge of the extensive legal business of that organization and its allied interests. Mr. Roemer has served on the Wisconsin Commission since the time its duties were enlarged to embrace the regulation of utilities other than steam railways in 1907.

Mr. J. J. Scovern, who has been appointed editor of the *H. & M. Review*, which is to be devoted to affairs of the Hudson & Manhattan Railroad, New York, N. Y., began his railroad career in 1902 as chief clerk to the assistant chief engineer of the Erie Railroad. In 1907 he was made chief clerk of the grade commission bureau of the company. From 1909 up to the present time he has been connected with the Hudson & Manhattan Railroad, holding the positions of secretary of the discipline board, secretary of the general safety committee and secretary of the Hudson & Manhattan Railroad Athletic Association.

Mr. E. E. Eysenbach has resigned as general manager of the San Antonio (Tex.) Traction Company and of the San Antonio Gas & Electric Company to devote attention to his own private interests in Oklahoma. Mr. Eysenbach was formerly vice-president and manager of the Consolidated Gas Company of New Jersey, Long Branch, a consolidation of the Long Branch Gas Light Company and the Long Branch Electric Light Company. His duties at San Antonio will be taken over temporarily by Mr. W. B. Tuttle, vice-president of the companies. Before Mr. Eysenbach left San Antonio he was waited on by a committee of the employees, with Mr. Fred Johnston, claim agent of the company, as chairman, and presented with a silver coffee service from the men as a token of their esteem.

Mr. Charles H. Armatage, formerly traffic manager of the United Traction Company, Albany, N. Y., has been appointed first deputy fiscal supervisor of State charities, succeeding Mr. Charles E. Weisz, who resigned on Dec. 1. Mr. Armatage is a prominent Mason and trustee of the Masonic Home at Utica. For six and one-half years he was superintendent of the Albany County almshouse. He has been connected prominently with several interests in Albany other than the United Traction Company. From 1892 to 1894 he was president of the Common Council of Albany. From 1904 to 1906 he was vice-president and general manager of the William E. Drislane Company, grocers. He was affiliated with the United Traction Company for fourteen years. Mr. Armatage's railroad experience also includes terms of service with the West Shore Railroad as assistant superintendent of the Buffalo division and with the New York Central & Hudson River Railroad.

Mr. Horace P. Leiper has been named by officials of the Union Traction Company of Indiana to succeed Mr. L. C. Bewsey as superintendent of the Indianapolis division of the company. Mr. Leiper has lately been a conductor on the Muncie division of the Union Traction Company. He has been connected with the company for thirteen years, serving in the operating department of the Logansport and Muncie divisions. He was born in Franklin, Ind., in 1879. Before entering the service of the Union Traction Company he was employed by the Indianapolis Street Railway, which has been succeeded by the Indianapolis Traction & Terminal Company. The men employed on the Indianapolis division of the Union Traction Company have presented Mr. Bewsey with a diamond ring in appreciation of his courtesy to them while superintendent of the division. As previously announced in the ELECTRIC RAILWAY JOURNAL, Mr. Bewsey has become connected with the Buffalo, Lockport & Rochester Railway as superintendent of transportation.

Mr. D. F. Sherman has resigned as vice-president and as a member of the board of directors of the Rhode Island Company, Providence, R. I. While Mr. Sherman is a member of the bondholders' protective committee of the Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala., now in the hands of a receiver, he has no intention of taking up railroad or other business, but is planning to spend the later winter months in California with Mrs. Sherman and hopes to be out of active business for a time at least. Before being elected vice-president of the Rhode Island Company on July 1, 1911, Mr. Sherman was president of the Providence & Danielson Railroad and the Sea View Railroad, both of which later became a part of the system of the Rhode Island Company. About a year ago, at the time the New York, New Haven & Hartford Railroad, the parent company, was involved in the federal investigation and it became apparent that the electric railways would have to be segregated, Mr. Sherman tendered his resignation as vice-president of the Rhode Island Compay, but it was not accepted. He remained with the company and helped in the reorganization work that followed. This fall when the Rhode Island Company's stock, which was held by the New Haven, was turned over to the trustees to be sold, Mr. Sherman was one of the directors who resigned. Mr. Sherman was born near Indianapolis, Ind. He entered a bank at Kankakee, Ill., as a messenger. A number of years later he became cashier of a bank in Montana and aided in developing the bituminous coal mines in the Rocky Mountains. He next located in Portland, Ore., where he spent fifteen years in the banking business, becoming vice-president of one of the banks there. While in southern California in 1900 Mr. Sherman became interested in the plan for the construction of the Providence & Danielson Railway, assisted in financing the line and later took up residence in Providence.

OBITUARY

Richard Henry Bennett, superintendent of equipment of the Union Street Railway, New Bedford, Mass., died in that city suddenly on Dec. 8. Mr. Bennett was born in New Bedford on Jan. 27, 1873, and was graduated from the New Bedford High School. Shortly after leaving school he entered the employ of the Union Street Railway and was advanced through various positions with the company, finally being appointed superintendent of equipment.

Col. Edward Daniel Meier, past president of the American Society of Mecahnical Engineers, veteran of the Civil War, and one of the most eminent mechanical engineers of the country, died in New York on Dec. 16. Col. Meier was born in St. Louis, Mo., on May 30, 1841. At the close of a scientific course at Washington University, St. Louis, he spent four years in Germany at the Royal Polytechnic College in Hanover. In 1884 he organized the Heine Safety Boiler Company for the development in the United States of the water-tube boiler of that name, and was president and chief engineer of the company from its formation up to the time of his death. He was also responsible for the introduction of the Diesel motor into the United States and until 1908 was an officer of the American Diesel Engine Company.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Ozark Valley Railroad, Cascade, Mo.**—Chartered in Missouri to build a 35-mile interurban railway between Cascade and Williamsville. Capital stock, $350,000. Incorporators: Orah D. Ridgely and J. T. Long, Kansas City; James K. Cochran, Pana, Ill.; James H. Downes, Assumption, Ill., and G. A. Long, Kenner, Mo.

***Cleveland, Canton & Akron Railway, Cleveland, Ohio.**—Incorporated in Ohio to build a four-track subway under Fifty-fifth Street between the lake front and Kingsbury Run in Cleveland. Capital stock, $10,000. Incorporators: W. W. White, Thomas H. Garry, James McSweeney, W. M. Connelly and W. B. Snavely.

***Washington Boulevard Street Railroad, Cleveland Heights, Ohio.**—Charter in Ohio to build an electric railway in Cleveland Heights. Capital stock, $10,000. Incorporators: J. C. Lowe, F. C. Work, V. E. Davis, R. F. Allen and H. W. Downing.

FRANCHISES

Argenta, Ark.—The Argenta Railway has received a franchise from the Council to extend its Washington Avenue line east on Washington Avenue and north on Beech Street to the Rock Island station in Little Rock.

Los Angeles, Cal.—The Pacific Electric Railway has asked the Council for permission to abandon its line on Mountain Avenue, now Avenue Sixty-four, from a point north of the former city limits at Meridian Street in Los Angeles.

Los Angeles, Cal.—The City Council of Los Angeles has voted to advertise for sale the proposed franchise for an electric line for Malabar District, on Boyle Heights, in accordance with the amended route. Bond was fixed at $2,500, and bids will be opened on Dec. 21.

***Los Angeles, Cal.**—The City Council has been asked to offer for sale to the highest bidder a twenty-one-year franchise to build an electric railway along certain portions of Brooklyn Avenue, Wabash Avenue and Evergreen Avenue in Los Angeles.

Pasadena, Cal.—The Pacific Electric Railway has received a thirty-year franchise from the Council for a double-track line on North Lake Avenue between Colorado Street and Washington Street in Pasadena.

***Tarpon Springs, Fla.**—The Pinellas Electric Light & Power Company has asked the Council for a franchise to operate an interurban electric railway in Tarpon Springs.

Chicago, Ill.—The Chicago City Council has been asked to grant a franchise for an extension of the Chicago Avenue line from North Clark Street to the lake shore in Chicago. Alderman Geiger offered the consent of the Lincoln Park Commissioners to have the line pass through park property.

Milwaukie, Ore.—The Portland & Oregon City Railroad has received a twenty-five-year franchise from the Council to build a line through Milwaukie from the south on Elmer Street and use Elmer Street to Washington Street, on Washington Street to Twenty-ninth Street and thence north to the city limits.

Portland, Ore.—The United Railways Company has petitioned the City Council to grant a relinquishment of that portion of its franchise on Stark Street west of Tenth Street and from the terminal yards in North Portland to the city limits. This section of track will be useless to the company in the near future by reason of the revocation of its franchise on the Linnton Road by the Multnomah County Commissioners, which takes effect on Feb. 1, 1915. The proposition may mean readjustment in this city of the entire interurban railway system of the Hill interests, which own both the United Railways and the Oregon Electric Railway. The Council has the proposition under advisement. It is said that an effort may be made to have the company give up its line on Stark Street entirely, as many of the property-owners on that thoroughfare are opposed to an interurban line.

TRACK AND ROADWAY

Florence & Huntsville Interurban Railway, Florence, Ala.—Right-of-way is being secured by this company for its line from Florence to Huntsville. Thurston H. Allen, president. [E. R. J., Nov. 21, '14.]

***Calico Rock, Ark.**—Plans are being considered to build an electric railway between Hoxie and Calico Rock. S. J. Johnson, Calico Rock, and associates are interested.

Little Rock, Pine Bluff & Eastern Traction Company, Little Rock, Ark.—Plans are being considered by this company to purchase its power from the Pine Bluff Company. This is part of a plan to build an electric line to connect Little Rock, Altheimer, Stuttgart, Helena and Pine Bluff. C. C. Kavanaugh, Little Rock, president. [E. R. J., Jan. 31, '14.]

Benicia Land & Terminal Company, Benicia, Cal.—Bids have been received for part of the construction work of the proposed Benicia-Vallejo electric railroad, according to a statement of J. J. Henry, representing the A. D. Bowen Company, of San Francisco. The proposed franchise for the line within the Vallejo city limits is in the hands of City Attorney O'Donnell and will be finally acted on about Dec. 30. The Benicia franchise was granted two months ago and the promoters say everything will soon be in shape to start the construction work. [E. R. J., Oct. 5, '14.]

Glendale & Montrose Railway, Glendale, Cal.—During the next two weeks this company will award contracts to build 2.3 miles of new track between the cities of Glendale and Eagle Rock.

Pacific Electric Railway, Los Angeles, Cal.—Work has been begun by this company lowering the tracks in D Street north from Base Line to Highland Avenue, in the city of San Bernardino.

Sacramento Valley Electric Railway, Sacramento, Cal.—G. W. Pierce, president of this company, announces that the construction of the second unit of this railway, from Dixon to Woodland, will begin as soon as financial and right-of-way arrangements are completed. Surveys are now being made on three proposed routes. The reports regarding three available rights-of-way are expected to be presented to the Supervisors within the next two weeks.

San Francisco (Cal.) Municipal Railway.—M. M. O'Shaughnessy, city engineer, has been directed to prepare plans and specifications for the proposed line of this municipal railway through Golden Gate Park to the Sunset District. The Supervisors have unanimously adopted a resolution to that effect. The line will be routed through the park from the present terminus of the railway at Tenth Avenue and Fulton Street and will extend back of the Museum and around Strawberry Hill. The cars will emerge at Fourteenth Avenue and continue to Kirkham Street.

Middletown & Chester Railway, Middletown, Conn.—Plans are being considered to build this line along the river bank through the towns of Chester, Shailerville, Haddam, Durham, Higganum and Middletown. It will connect at Chester with the Shore Line Electric Railway and in South Farms with the tracks of the Connecticut Company. Richard H. Bunce is interested. [E. R. J., Dec. 12, '14.]

***Torrington (Conn.) Traction Company.**—Preliminary arrangements are being made by this company to apply for a charter in January, 1915, to build an interurban line between Torrington and Thomaston to be operated by electric power or any other power than steam. Among those interested are: Hosea Mann, George B. Goodwin and Howard Guernsey.

Waterbury & Milldale Tramway, Waterbury, Conn.—This company has completed its entire line between Milldale and Waterbury, 8 miles.

***Willimantic & Manchester Street Railway, Willimantic, Conn.**—T. J. Spellacy, Hartford, and associates are reported as stating that they will petition the incoming General Assembly for the incorporation of this railway. The company will ask for a franchise for the construction of an electric railway from Willimantic through Columbia, Andover, Coventry, Bolton and Manchester.

Central of Florida Railway, Daytona, Fla.—Between 5 and 6 miles of new track will be built by this company during 1915.

Caldwell (Idaho) Traction Company.—Plans are being contemplated by this company to electrify about 1 mile of steam railroad between Caldwell and Wilder during 1915.

Lee County Central Electric Railway, Amboy, Ill.—During 1915 this company plans to build a 12-mile line between Middleburg and Rochelle.

Alton & Eastern Electric Railway, Alton, Ill.—Arrangements are being made by this company to build soon the extension of the Alton Street line from Alton to the new hospital east of Alton. T. W. Gregory, East St. Louis, secretary. [E. R. J., Feb. 15, '13.]

Joliet & Eastern Traction Company, Joliet, Ill.—An 18-mile extension between Charles City and the Great Western Railway will be built by this company during 1915.

Erlanger, Ky.—Extension of the Fort Mitchell electric line along the side of the Lexington Pike to Erlanger is a project which the Erlanger Improvement League, the Retail Merchants' Association and the Covington Industrial League have under consideration with the County Commissioners. It is proposed to build a single-track line and efforts are being made by these several organizations to get the right-of-way. David Castlemen, J. P. Rife and Samuel Adams are the local committeemen who are pushing the project.

Kentucky Utilities Company, Somerset, Ky.—Extension of the electric railway line from Somerset to Burnside, also in Pulaski County and about 7 miles due south, is said to be an improvement which it is proposed to make out of the funds realized by this company from the sale of its recently authorized $3,000,000 bond issue.

Orleans-Kenner Electric Railway, New Orleans, La.—The Metairie loop will be built by this company in New Orleans. The route over which the extension will come into the city has not yet been agreed upon. [E. R. J., Oct. 5, '14.]

Boston (Mass.) Elevated Railway.—Three new lines for Brookline are being planned by this company. The plans call for a line from Allston Street down Harvard Street to Dudley Street on a ten-minute headway for normal hours and on shorter time for the rush hours; another line from Cypress Street down Huntington Avenue to Park Street, and another from Cypress Street through Brookline Village down Brookline Avenue and Longwood Avenue to North Station.

Springfield (Mass.) Street Railway.—Rapid progress is being made by this company in the construction of the new line in East Main Street in Springfield.

Worcester (Mass.) Consolidated Street Railway.—Plans are being considered by this company for its branch line to Sandersdale.

***Adrian, Mich.**—Plans are being considered for an electric railway from Adrian to Elkhart.

Detroit (Mich.) United Railway.—This company is asked to consider plans to extend its tracks on the western city limits at Webb Avenue to Palmer Park in Detroit.

Menominee & Marinette Light & Traction Company, Menominee, Mich.—About 1½ miles of new track will be built by this company in Menominee during 1915.

***Trans-Michigan Railway, Muskegon, Mich.**—Right-of-way has been secured, franchises voted and options have been secured for terminal properties by this company for its proposed line between Muskegon and Saginaw.

Fallon (Nev.) Electric Railway.—Plans are being made by this company to push the work on the grade to Sand Springs. About 12 miles of the grade has been completed. The Berney Construction Company has taken the contract to complete the grade to Sand Springs and to build all bridges and culverts.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has placed in operation its Center Street line to the southwest section of Omaha.

***Trenton, N. J.**—Right-of-way is being secured to build an electric railway from Trenton to Washington's Crossing and Lambertville. Among those interested are: Joseph H. Moore, Horace G. Hough, Barton T. Fell and George W. McGuire.

Batavia (N. Y.) Traction Company.—Estimates are being secured and plans made by this company for a 3-mile line from Batavia to Horseshoe Lake. The line will connect with the Batavia Street Railway at its eastern terminus.

Buffalo & Depew Railway, Buffalo, N. Y.—Plans are being considered by this company for an extension east from Depew to Crittenden, 6 miles. A ½-mile extension to Lancaster will be constructed during 1915.

Interborough Rapid Transit Company, New York, N. Y.—The Public Service Commission, First District, has disapproved the contract submitted by the Interborough Rapid Transit Company for the construction of the dual system extensions of the elevated railroads in Manhattan and The Bronx. This contract the company proposed to give without competitive bidding to T. A. Gillespie Company, Snare & Triest and Terry & Tench, the contractors now doing the third-tracking work on the elevated railroads for the company. Instead of a lump sum they were to be paid cost plus 12½ per cent. The commission decided that the company may allow the contractors doing the third-tracking work to build connections with the new lines, but that the main parts of the elevated extensions should be awarded as a separate contract after the company had secured bids thereon from at least six different contractors.

Manhattan & Queens Traction Corporation, New York, N. Y.—This company is asked to consider plans to extend its line now running between Long Island City and Jamaica to St. Albans. It is planned to extend the line along Archer Place in Jamaica, to Washington Street, where the company could connect with the other electric lines extending north and south, east and west in Jamaica.

Shelby (N. C.) Northern Railway.—Preliminary arrangements are being made by this company but no definite plans have been decided upon as to when construction will be begun on its 21-mile line to connect Shelby, Spurlinville, Costners, Beams Mill, Fallston, Boggs, Belwood, Warlicks and Casar. The company will furnish power for lighting purposes. Capital stock, authorized, $400,000. Officers: S. S. Royster, Shelby, president, and Orlando Elam, Shelby, secretary.

Chillicothe Electric Light & Power Company, Chillicothe, Ohio.—This company has been repairing its track on Main Street as far as Brownell Street in Chillicothe. The old track has been taken out and new ties have been placed on a foundation of cement.

Cincinnati (Ohio) Traction Company.—An agreement has been reached between the city of Cincinnati and the Cincinnati Traction Company for extensions of various lengths on the following lines: Vine-Clifton, Warsaw-Elberon (main line now under construction), Sixth Street, Vine Street and Clifton-Elm. The electric railway committee has advised against the construction of tracks on Plum Street between Fourth Street and Eighth Street and Central Avenue between Freeman Avenue and Mohawk Bridge. The construction of the Bond Hill line will go forward as rapidly as possible. Agreements were also reached regarding transfers on certain lines. The extensions are in line with the plan of rerouting made some time ago. A new crosstown line north of the present line on McMillen Street is under consideration.

Cleveland (Ohio) Railway.—Plans are being considered by this company for an extension along Euclid Avenue between East Twenty-second Street and East Fortieth Street in Cleveland. Plans to secure an extension of the Buckeye line from East 116th Street to East 130th Street in Cleveland, are being contemplated.

Cushing (Okla.) Traction Company.—Rapid progress is being made by this company on its line from Cushing in an easterly direction through the oil fields. It is planned to purchase power from the Cushing Electric Light & Power Company. Frank Brown, Independence, president. [E. R. J., Nov. 21, '14.]

***Oklahoma City, Okla.**—H. S. Shelor, president of the Chamber of Commerce, and associates are considering plans to build an electric railway to connect Oklahoma City, Okmulgee and Muskogee. Preliminary surveys have been made.

Peterborough (Ont.) Radial Railway.—Within the next few months this company plans to build 1 mile of new track in Peterborough. All material is now on had.

Sarnia (Ont.) Street Railway, Ltd.—During the next few months this company plans to build about ½ mile of new track in Sarnia.

***Toronto, Ont.**—E. A. Wallberg, 10 Adelaide Street E., owner and engineer, is negotiating with the City Council for permission to build an electric line 4½ miles long, from Leaside to Merton Avenue, North Toronto. The owner will buy all material and will superintend construction. Estimated cost of line $200,000.

Sudbury, Ont.—The Board of Railway Commissioners has authorized the Sudbury-Copper Cliff Suburban Electric Railway to build its tracks across the Canadian Pacific Railway in Sudbury, and across various spur lines and the Canadian Pacific Railway Stobie branch. J. H. Mackey, Sudbury, president. [E. R. J., Nov. 7, '14.]

Rhode Island Company, Providence, R. I.—This company is asked to consider plans to extend its North Main Street tracks to the terminus of this highway at the state line, near St. Paul's Cemetery in Woonsocket.

***Beaumont, Tex.**—Initial steps are being taken to build an electric railway between Houston and Beaumont, via Liberty, Dayton and Crosby. Edward Kennedy and associates are promoting the project.

Brenham, Tex.—At a recent mass meeting in Brenham the plans of L. M. Hewitt, promoter for a 15-mile electric line to connect Brenham, Independence, William Penn and Bryan were accepted. A bonus of $35,000 was asked from the citizens of Brenham, with an additional $50,000 worth of stock in the company. [E. R. J., Nov. 21, '14.]

San Antonio (Tex.) Traction Company.—Work has been begun by this company double-tracking North Flores Street in San Antonio.

SHOPS AND BUILDINGS

Birmingham Railway, Light & Power Company, Birmingham, Ala.—Plans are being made by this company to occupy its new building at First Avenue and Twenty-first Street in Birmingham by Jan. 1.

Glendale & Montrose Railway, Glendale, Cal.—During the next two weeks this company plans to award contracts to build a new carhouse. The structure will be 30 ft. x 120 ft. and will be fully equipped for repairing, etc.

San Francisco (Cal.) Municipal Railway.—The Board of Works has awarded the contract for the construction of the municipal railway carhouse on Seventeenth Street to the Clinton Fireproof Company for $195,900.

Norton & Taunton Street Railway, Norton, Mass.—This company's carhouse at Norton Center was destroyed by fire on Dec. 10. The loss is estimated to be about $50,000.

Mansfield Railway, Light & Power Company, Mansfield, Ohio.—This company is building a new interurban office and waiting station in Mansfield. The cost is estimated to be about $20,000.

Chambersburg, Greencastle & Waynesboro Street Railway, Waynesburg, Pa.—This company is building a new passenger station at Kauffmans.

Columbia (S. C.) Street Railway.—Plans are being made by this company to rebuild its carhouse in Columbia. The cost is estimated to be about $30,000.

Wellsburg, Bethany & Washington Street Railway, Bethany, W. Va.—This company plans to build soon a new carhouse at Bethany.

POWER HOUSES AND SUBSTATIONS

United Traction Company, Albany, N. Y.—Work will be begun at once by this company on the construction of its new transformer station at the corner of Sheridan Avenue and Chapel Street in Albany. The contract for the building has recently been awarded to the Hunkin-Conkey Construction Company, Cleveland, Ohio. The structure will be 60 ft. x 85 ft. and 45 ft. high, except in the center, where the height will be increased to 62 ft. It is estimated that the cost will be about $40,000. In addition to the building the company will spend $55,000 on machinery, copper and underground cable.

Westmoreland County Railway, Pittsburgh, Pa.—This company is scrapping the equipment in its old power house and will buy its power in the future.

Monongahela Valley Traction Company, Fairmont, W. Va.—The new gas-driven power plant of this company at Hutchinson, midway between Fairmont and Clarksburg, W. Va., is nearing completion. Its total cost will be about $350,000. It will be used to supplement the steam plant from which power has been furnished for the line.

Manufactures and Supplies

ROLLING STOCK

Detroit (Mich.) United Railway, according to an unconfirmed report, is expecting to purchase twenty cars shortly.

Glendale & Montrose Railway, Glendale, Cal., expects to purchase one double-truck passenger car, with seating capacity of forty-four to forty-six passengers.

Cushing (Okla.) Traction Company, Cushing, Okla., has just placed an order with the Westinghouse Electric & Mfg. Company for one 50-ton locomotive and two passenger equipments for its new 1500-volt road.

Westmoreland County Railway, Pittsburgh, Pa., has ordered three cars, 42 ft. over all, seating capacity of forty-four, 26-in. wheels, four Westinghouse baby motors from the Cincinnati Car Company.

Los Angeles (Cal.) Railway has ordered from the St. Louis Car Company a car equipment to be placed on exhibition at the Panama-Pacific Exposition which later will go into city service. The equipment is of the low-floor design and is equipped with double Westinghouse No. 306 50-hp motors and light-weight HL pneumatic control.

TRADE NOTES

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has received an order from the Easton (Pa.) Transit Company for one four-motor equipment of No. 306 Westinghouse motors and HL control.

Union Switch & Signal Company, Swissvale, Pa., has appointed H. R. Sheene as sales engineer with headquarters in Room 2039 Railway Exchange Building, St. Louis, Mo., reporting to the resident manager at Chicago.

Mesta Machine Company, Pittsburgh, Pa., has recently acquired the rights from the Stumpf Una-Flow Engine Company, Syracuse, N. Y., to build the Stumpf Una-Flow type of engine in the United States. This company is at present making detailed shop drawings of various sizes of engines for rolling mill purposes. In addition to rolling mill engines, the company will build large units for driving electric generators, air compressors, hoisting engines, etc.

Arthur D. Little, Inc., Boston, Mass., has recently prepared specifications for body, roof and truck paints for electric cars, following studies of the car-painting practice on more than twenty electric railways, which demonstrated the feasibility of reduced painting costs by nearly 50 per cent while cutting time in the shops in half. This company has co-operated with the American Electric Railway Engineering Association in developing specifications for rubber-covered wire and cables and for trolley wire.

Edison Storage Battery Company, Orange, N. J., reports that its storage-battery works, which escaped uninjured by the recent fire which destroyed part of the Edison Phonograph Works on Dec. 9, suffered no interruption whatever to its business. The telephone exchange was in one of the burned buildings, but through the prompt action of the New York Telephone Company a temporary switchboard was working in the battery office before business hours the next morning and the Public Service Electric Company had emergency lines furnishing power about as quickly.

Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" headlights, reports shipments of these headlights during the month of November to the following properties: Sioux City (Ia.) Service Company; Virginia Railway & Power Company; Birmingham (Ala.) Railway, Light & Power Company; St. Louis Car Company for Empire United Railway's new cars; Los Angeles (Cal.) Railway; Strickland-Goodwin Management Association; Western Light & Power Company; Northern Texas Traction Company; Michigan Central Railroad; Cincinnati Car Company, for Ephrata & Lebanon Traction Company's new cars; Topeka (Kan.) Railway; Harrisburg (Pa.) Railways; Indiana Railways & Light Company; Iowa Railway & Light Company; American Car Company, for Bryan & College Interurban Railway's new cars; Southwestern Gas & Electric Company; Omaha & Council Bluffs Street Railway; Wausau (Wis.) Street Railway; Lowell & Fitchburg Street Railway; Scranton (Pa.) Railway; Georgia Railway & Power Company; Jackson Railway & Light Company and Altoona & Logan Valley Electric Railway.

ADVERTISING LITERATURE

Stow Manufacturing Company, Binghamton, N. Y., has issued a catalog describing some of its portable tools, including drills and grinders.

Dielectric Manufacturing Company, St. Louis, Mo., has issued Bulletin No. 9, describing "Dielac Black," its spirit finishing varnish, for painting armatures.

Arnold Company, Chicago, Ill., has issued a postal containing an illustration of a substation just completed by this company for the Chesapeake & Ohio Railway.

Ohmer Fare Register Company, Dayton, Ohio, has published a pamphlet describing its fare box for both cash and tickets. The pamphlet also quotes remarks made by railway men at the last convention covering the use of various types of fare boxes.

Asbestos Protected Metal Company, Beaver Falls, Pa., has issued a catalog describing special uses of Asbestosteel, its asbestos protecting metal, in connection with concrete for the construction of roofs and curtain walls. The catalog contains a number of illustrations of applications of this material to various buildings, among them being a view of the interior of the Philadelphia & Garretsford Railway, which uses this type of construction for the roof of its substation. In developing this process sheet steel is protected from corrosion by being covered on both sides with a uniform coating of asphalt, which in turn is protected from fire and weather exposure by a layer of hardened and waterproof pure asbestos felt laid over and imbedded in the asphalt while still hot and soft. This is done without sacrificing the advantages inherent in corrugated sheets for roof and wall constructions. The catalog is designed and written by Ray D. Lillibridge, Inc., New York.

Archbold-Brady Company, Syracuse, N. Y., has issued a booklet on the subject of its steel transmission structures and catenary bridges. In the booklet are presented views of structures covering a wide range of designs and localities. With the idea of showing actual and varied practice, brief descriptions are given to transmission lines using "A" frame towers and narrow base poles, catenary bridges and also anchor towers and structures required for special purposes. The electric railways represented by the illustrations shown include the Puget Sound Traction, Light & Power Company, East St. Louis & Suburban Railway, Fonda, Johnstown & Gloversville Railroad, Northern Ohio Traction & Light Company, Boston & Maine Railroad (Hoosac Tunnel), Empire United Railways, United Traction Company, Albany, N. Y., and Berkshire Street Railway. The "A" frame towers are designed for both pin and suspension type insulators and for conductors of all sizes and materials. The laced channel poles are particularly adapted for lines in rough country. Since they take up little room at the ground line, the poles save expensive right-of-way where land is valuable and on steep side hills the necessity of erecting "benching in" or extension legs for wide base towers is avoided. They can be set interchangeably with concrete bases or with all steel foundation, as may be most suited to the nature of the ground.

NEW PUBLICATIONS

Proceedings of New York State Association for the Fiscal Year Ending June 30, 1914, published by the secretary, Brooklyn, N. Y. 276 pages.

The annual report of the New York Electric Railway Association always contains a great deal of good material, and this volume is no exception to the rule. The conventions reported are the annual meeting at Bluff Point, June 30 and July 1, and the quarterly meeting at New York on Dec. 9, 1913. The volume is not only attractive because of its contents but because of its exceptionally good typographical execution.

Proceedings of Southwestern Electrical & Gas Association for 1913, published by the secretary, Slaughter Building, Dallas, Tex. 145 pages.

The Southwestern Electrical & Gas Association is to be congratulated upon the excellence of its conventions. A note from the secretary states that the papers in the present volume are not printed in full but in abstract, and that the 1914 proceedings will be published within a short time.

Electric Railway Journal

Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLIV NEW YORK, SATURDAY, DECEMBER 26, 1914 No. 26

SEMI-STEEL AND ALL-STEEL CARS

The difficulty of drawing a sharp distinction between the terms "semi-steel" and "all-steel" is made apparent by several conflicting statements which we have recently received from railway companies in regard to the rolling stock list of our next week's annual statistical issue. In a number of cases the railway described its new cars as "all-steel," whereas the builder of the cars designated them as "semi-steel." This difference in classification may have been due in some cases to the ambition of the general manager to expand the ill-defined but halo-creating term "all-steel" in order to appear more progressive. The confusion, however, more likely arises from the number of small variations in the proportion of steel parts used, ranging between entirely wood and entirely steel construction. The absence of any strict dividing line between composite and all-metal types has rendered impracticable any official cut-and-dried definition. Nevertheless, the slight variations in the proportion of steel in cases do not hinder the effective use of arbitrary and approximate terms for the valuable purpose of noting the progress of modern practice toward adopting steel construction. In presenting our statistics, therefore, we shall endeavor, as closely as our records and variations in design permit, to consider all-steel passenger cars as those which possess not only the steel side sheathing of semi-steel cars, but also steel posts and carlins. We believe that its definition, though arbitrary, should add to the practical value of the statistics.

AN ANOMALOUS SITUATION

The hearing at Washington this week before the Interstate Commerce Commission emphasizes the importance of delimiting in some way the jurisdictions of the federal and state commissions. In saying this we are not criticizing commission regulation in general or the federal commission or individual state commissions in particular. But, as we have said before, commission regulation is so recent it is not surprising that there should be many problems still to be settled, and one of these is the extent of the jurisdiction of each kind of commission. The steam railroads have also suffered from this situation of conflicting authority and in general, we believe, favor the authority of a single federal commission. Certainly President Harrison of the Southern Railway expressed his preference in this way in no uncertain terms at the dinner on Dec. 10 of the Railway Business Association, and his views seemed to receive the approval of those present. On the other hand, state regulation has been favored by electric railway speakers at two recent hearings in Washington, partly because of the better knowledge possessed by the state authorities of local conditions, and partly because the hearings before these commissions are held at state capitals, which are more readily accessible than Washington. We assume that both the federal and state commissioners themselves would be glad to have the present situation clarified, not only as it applies to electric railway problems, but also to steam railroad problems. Indeed, this thought was voiced in a resolution introduced at the last meeting of the National Association of Railway Commissioners by Commissioner Williams of Texas. It certainly seems absurd for the Interstate Commerce Commission to spend its time discussing the best type of fender to be used to prevent accidents in Detroit, for instance, just as it would be to have the rates, schedules and operating conditions of a transcontinental line regulated according to the diverse views of fifteen or twenty state commissions. No serious constructive effort has yet been made to clear up the present anomalous situation, but the matter is so important that we believe it demands prompt attention on the part of our legislators.

A CONSTRUCTIVE RATE DECISION

The Interstate Commerce Commission decision granting to steam railroads in official classification territory a 5 per cent rate increase is probably the greatest single piece of constructive co-operation between the carriers and the public that American finances could receive to-day. We say the public, for we look upon the decision as a notable victory for public opinion rather than a self-inspired action on the part of the commission. For some time the public has realized that the earning power, efficiency and credit of the railroads could be revived only through an increase in revenues, but it has taken the crash of war and widespread financial stringency to bring this fact home to the commission. The statement, however, that the determination of properly remunerative rates must take into consideraton the increasing hire of capital as well as other costs, is really constructive, and we hope that the commission will henceforth be permanent advocates of this modern policy. The exemption of certain rates, it is true, makes the $50,000,000 increase in revenue less than the amount expected by some carriers, but on the whole the decision is a distinct help to the general railroad situation. As great as will be the benefit derived from the increased earnings, more important will be the restored confidence of the investing public as reflected in more active securities. The railroads should be enabled to do the financing that has been denied to them on account of their lessened earning power, and thus replenish their depleted equipment and rolling stock. It must not be expected, however, that an avalanche of orders will now ensue, for liberal buying will depend upon a decided improvement in stock market, general business and foreign trade conditions. Yet in its psychological aspect, as causing managers more hopefully to contemplate added facilities, the present effect of the decision bids fair to be helpful.

INCREASED BAGGAGE CHARGES

In its broad scope the rate decision shows that the relief which the commission had previously thought could be gained from other measures than increased freight charges has been made largely impossible by present depressed conditions. Yet some movements have already been made along the suggested lines, such as the increase of passenger mileage rates, and steam railroad managers are now seriously considering the practicability of adopting uniform rates for the transportation of baggage. In previous issues we have mentioned the first development as being important from the viewpoint of electric railways, but the latter proposal is comparatively no less so.

The proposed new rates for the transportation of baggage would apply only to articles that are now checked free or carried for the payment of a small charge for the excess weight. Some difficulties might be experienced in adopting uniform baggage rates, inasmuch as it would be necessary to change or amend some state laws providing free transportation for baggage weighing under 150 lb. and federal laws requiring the same for emigrants' baggage weighing less than 250 lb. Interstate electric lines, however, are exempt from both of these restrictions, so that they, as well as electric lines in states without baggage laws, might well apply the uniform baggage rate. Such rates would be equitable because there is no reason why a railroad should transport a heavy trunk and a passenger for the same price as that which it charges for a passenger alone. The practice abroad, of course, is to charge for all baggage which is not hand baggage carried by the passenger, and to charge rates for baggage comparable to those charged for passenger transportation. The opposite practice of the American roads has always seemed anomalous to the European manager.

At present some electric interurban roads make an arbitrary charge for all baggage, regardless of its weight, while others handle it free without a charge for excess. Many traveling men with large, heavy sample cases take advantage of the fixed charge regardless of weight, having found that the payment for excess weight on steam railroads is more than the fixed charge on the electric lines and that the latter roads also afford a cheaper passenger rate. We believe that the convenience of frequent electric service to salesmen is so established that the normal increase in their transportation will not be affected if the charge for baggage is made the same as on steam railroads. The detail work in connection with the handling of baggage has become quite a problem, and it is only just that such transportation should be remunerative in proportion to the value of the service rendered.

EFFECTIVE COMMITTEE WORK

The American Electric Railway Association is successful in proportion to the effectiveness of its committee work. Effective committee activity is the barometer which, when indicating a high pressure, predicts fair association weather. At this season, when the committees are pondering their assignments, it may not be inappropriate to consider a few of the elements which observation shows lead to success. In recent issues of this journal the subjects allotted to many committees have been listed as well as the names of the chairmen responsible for the carrying out of the program. A few preliminary committee meetings have also been reported. The committees are expected to have program reports in the hands of the secretary by Jan. 20 for presentation in abstract to the executive committee at the Washington meeting. The committees on subjects of the several associations met early, their reports were laid before the respective executive committees and were promptly acted upon, the schedules were transmitted soon thereafter to the committee chairmen, and now the committees have a good six-month period to do their constructive work. May they go to it, with our best wishes for a fruitful year!

There seem to be at least three elements of success in committee work, namely, the character of the commission given to the committee, the caliber of the committee personnel and the definiteness of the committee's plan of campaign. In the present case the responsibility for the first is upon the committees on subjects, for the second on the officers who appoint the committees, and for the third on the committee chairmen.

A good commission for a committee must be definite, with no ambiguity as to the subjects to be considered. Furthermore, the subject must be timely, even urgent, for railway men, like those in other vocations, have time to do only what must be done. Finally, it must be reasonable in scope, in view of the time and energy available. A few salient topics thoroughly covered are worth more than a vast array of undigested data.

The best of commissions will fall flat unless the committee has the proper personnel, and agreeable personality is not the only qualification for committeemen. Each must have some incentives to do good work and to stimulate and feed his interest. As human nature is constituted self-interest is a dominant characteristic, hence the association will benefit most when the committeemen personally are profiting most, directly or remotely, from their committee activity. There was a time when committee appointments were more or less honorary, but now they are merely opportunities to work, and to work hard.

But with the finest general scheme, the most carefully selected committee will fail to "arrive" without a definite plan and good internal discipline. By virtue of his appointment the chairman is invested with certain responsibility and corresponding authority which are recognized by acceptance of appointment to serve under him. The chairman must command the respect of his colleagues to insure the success of his plans. He must make allowance for "human frailty" by assigning work to sub-committees in definite tasks to be completed within prescribed periods. It has come to be accepted that chairmen are expected to do the work of committees, while the other members play advisory roles. The chairman can only protect himself by handing out reasonable "stints."

Our observation leads us to believe that the railway association committee work is commendable from the standpoint of the above specifications. It is always in order, however, for each committee and each present and prospective member thereof, to apply the same rigid tests of efficiency in this work as are applied in every-day business. The association committee work represents large investments of money and time. The industry has a right to expect results. At this date the burden rests upon the committee chairmen.

"POISONING THE WELLS" AGAIN

In the issue of the ELECTRIC RAILWAY JOURNAL for Dec. 5 an editorial was published under the title "Poisoning the Wells." This was provoked by another editorial in *The New Republic* of Nov. 21, in which the writer rather sarcastically stated that "We are much in need of a far more thorough exposition of the practices and purposes of the public service companies—an *honestly* (our italics) partisan exposition of their side, with no pretence to a monopoly of 'correct principles.' But a deliberate policy of 'influencing public education at its source' is sure to prove worse than futile." Then follows the well-poisoning figure and the statement that colleges now welcome men of affairs to their classrooms to enlighten the student body, but that an organized effort by private interests will defeat this form of co-operation.

Without any desire to make "much ado about nothing," it seems to us that our contemporary has rendered valuable service in bringing out more clearly by way of contrast the underlying facts in this case. Last week we printed a letter from an eminent dean, and two letters from equally competent sources are printed this week. These writers know both sides of the present problem, and they realize keenly how difficult it is to give students a working grasp of the conditions under which they must earn their living after graduation. Occupied as the curriculum necessarily is with fundamental theory, important practical conditions are frequently overlooked. The men who know, from outside, are the only ones who can give the facts. Aside from these men information is largely second-hand. As *The New Republic* allows, they have been welcome visitors in college halls. As *The New Republic* omits to state, these men, while willing enough, have been too busy to spend their time in doing work that the teachers were supposed to be engaged on. They now realize somewhat the importance of lending a hand, and the committee on public relations of the American Electric Railway Association hopes to arrange for more readily meeting the wishes of the educational institutions. To read *The New Republic* editorial one would infer that prominent railway magnates were sitting up nights to devise ways for invading the college field. As a matter of fact, it is only by means of an influential body like the American Electric Railway Association that the educational institutions can get such invaluable assistance, and even then it is far from easy.

CALCULATING STARTING RESISTANCES

Many electric railway problems lend themselves readily to graphical calculation. The graphical representation of data is valuable not only in the solution of problems, but in presenting relationships in easily tangible form. These two statements apply especially to the series motor in which there are the three interdependent variables, speed, torque and current. As these are connected through the magnetic flux in the motor field, which does not vary with the current in any simple relation, it is not practicable to express the relation by formulas. Curves of a very simple nature, however, are easily obtained from experiment and are equally readily applied to operating conditions. Every manufacturer's bulletin describing a modern motor contains a pair of characteristic curves, as a matter of course. In some cases several pairs, for different gear ratios, are given for the user's convenience.

Among the many calculations which can be made with the aid of the characteristic motor curves, that described in this issue by F. Castiglioni is especially interesting and valuable. This article will repay study not only by those who are directly concerned with starting resistances, but by all equipment men who want to be familiar with the simple theory of the subject. It would be productive of energy saving, we have no doubt, if every superintendent of equipment would apply this method to his own equipment just to assure himself that the starting resistance is graduated to suit his requirements. An official of a very large road suspected, some years ago, that all was not right in this direction. Instruments were put upon the cars with astonishing results. By readjusting some resistance grids large power economies were effected. As the method here described indicates, the calculations are simple enough and there is no mystery about them. This must be so, for the data needed for the calculations are so few and so easily obtained.

Mr. Castiglioni's method involves the assumption merely of the upper and lower current limits in starting. These are the limits mechanically set in a control provided with the automatic acceleration feature. By means of sets of curves of certain factors in the elementary formulas calculated for different voltages once for all, and having nothing to do with the motor curves, he is able to save an enormous amount of labor in the actual solution of the problem. As in all such methods the principal labor is performed when these curves are calculated, corresponding to the careful designing and making of dies and jigs in connection with a manufacturing process.

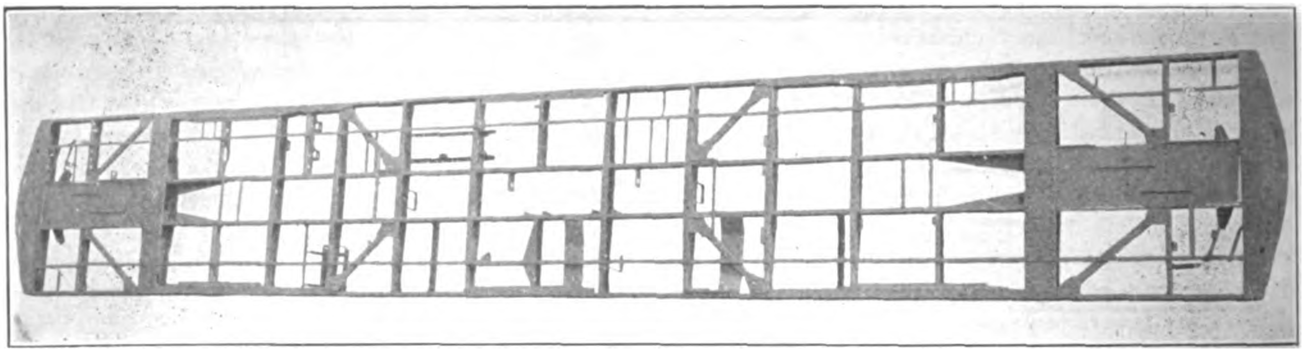
The New York Municipal Car—Trucks, Brake Rigging and Draft Gear

Trucks without Equalizer Bars, Clasp Brakes, Automatic Car Coupler Combined with Air Brake and Control Coupler, and Friction Draft Gear Are Among the Special Features—The Weight of the Truck for a Center-Plate Loading of 45,000 Lb. Is Only 11,280 Lb.

Previous articles* on the New York Municipal Railway Corporation's car for rapid transit service have described the operating conditions that influenced the selection of an extra-wide multi-side door type and the adoption of the principal features of the body. The present article describes in detail the trucks, brake rigging and draft gear, and calls attention to a number of improvements which are incorporated in the details.

TRUCK

The service in which the cars are to be used necessitates that the load per wheel be limited to a definite amount, as explained in the article of June 6. In order that the maximum loaded weight of the car be within the predetermined wheel-load limitations, one motor is placed on each truck and the center line of the truck bolster is 7 in. nearer the center line of the trailer axle than to the motor axle, so that the wheel loads at the rail are equal. Furthermore, the truck design excludes all unnecessary weight, each member, however, being proportioned for its respective duty with an ample factor of safety.



N. Y. M. CAR—UNDERFRAME TILTED AT RIGHT ANGLES TO SHOW ALL MEMBERS

To obtain the desired strength of truck with the least weight of material, the equalizer bars as ordinarily used have been discarded, and the helical springs are placed directly between the top of the journal boxes and the truck frame. The side frame of the truck is in the form of a truss, the top frame member or wheel piece being a pressed channel, developing into an angle form where it meets the transom gussets. The tension member of the truss side frame is a rolled steel angle. The transoms are specially flanged channel forms, fitted with an efficient spring support for the motor nose.

The swing links are supported by the transoms on hardened steel gibs resting on hardened steel gib seats. The lower ends of the links are fitted with the Woodard bolster height adjuster, providing graduations of height of three steps of 3/4 in. each. This arrangement will insure standard height of couplers and car floor during the full wear of the wheels and other parts of the truck.

Safety straps are provided to guard against dropping of the bolster should the swing links break. This safety device includes a special design of lower spring seat. In case a swing link breaks, one end of the spring seat will be caught by the lower member of the side frame and the other end will be caught by the usual form of safety strap.

BOLSTER

On account of close clearances, the bolster is pressed in the form of a U suitably flanged and reinforced with diaphragms and spring seats. The great depth available for the side walls of this type of bolster secures unusual strength with minimum weight. To avoid lost motion in the wearing parts between the car body and the truck, the bolster is fitted with removable, hardened spring-steel chafing plates, located near the ends of the bolster, which engage with similar plates attached to the transom gusset castings.

Provision is made to minimize wear on the wheel flanges, by the use of center plates of cast steel with felt dust guards, phosphor bronze wearing washers and an arrangement for supplying lubricating oil through the floor from the inside of the car body. Self-centering side bearings of the Stucki type are fitted to the trucks. They are provided with shims to permit the adjustment of clearance between car body and truck in steps of 1/16 in.

The pedestals are of cast steel with machined guides for the journal boxes, which are of the McCord type with a suitable seat for the helical spring. The guides are fitted with pressed spring steel liners. Oil wells for supplying lubrication for the guiding surfaces are cast iu the side walls of the box. Recesses are also provided in the sides of the journal boxes to receive the contact shoe beam attachment. Harrison dust guards are used on this truck. The journal brasses are of the semicircular type developed in 1912 by the Interborough Rapid Transit Company, New York, to provide for the heavy pressure of high-speed brake equipment and the driving effort of the motors.

SPRINGS

As clearance limitations will permit only 2 1/2 in. deflection of the elliptic springs due to passenger load of 20,000 lb. per truck, and as it is desired that the

CAR—SIDE AND MOTOR END OF COMPLETED TRUCK, SIDE ELEVATION, HALF PLAN AND MISCELLANEOUS DETAILS springs impart as easy riding qualities to the car when containing but few passengers as when fully loaded, the springs have been arranged with supplementary leaves which come into bearing as the load increases. Easy riding is thus obtained for the extraordinary range of 37,800 lb. passenger load.

About 25 per cent of the springs have been tested by gradually applying sufficient pressure to bring the bands together and readings were taken at each ¼-in. deflection during application and release. The curve on page 1381 shows that the line representing the average between the deflection reading and the release reading taken at each ¼-in. stage, approximates the desired curve. The average of the springs tested did not vary more than 5 per cent from the specified curve.

The helical springs over each journal box are so proportioned that the deflection due to a passenger load of 20,000 lb. on each center plate is not more than ¾ in. nor less than ⅝ in.

WHEELS AND AXLES

The wheels are of Carnegie rolled steel. The driver wheels are 32½ in. in diameter; the trailer wheels, 30 in. in diameter. The rim thickness is suitable for the "one-wear" method of operation, though the design of the truck and brake rigging is such that 34-in. and 31-in. wheels may be used if found desirable at a later date. The decision to use "one-wear" wheels effected a saving of 800 lb. per car. The axles are of open-hearth carbon quenched and tempered steel and have 5-in. x 9-in. collarless type journals.

TRUCK BRAKE RIGGING AND AUTOMATIC SLACK ADJUSTER

As the highest rates of retardation consistent with comfort of passengers are desirable in any rapid transit service, and as the operation of the clasp brake rigging on the New York, Westchester & Boston cars fully demonstrated its success as applied to electric motive power equipment, the New York Municipal Railway trucks have been equipped with clasp brake rigging whereby the shoe pressure is divided between two brakeshoes per wheel with consequent low temperature and high coefficient of friction. This system not only results in economy of brakeshoe wear, but also minimizes the journal wear and eliminates such hot journals as are caused by displacement of the journal and journal brass.

The wear of the brakeshoes will be taken up automatically by the Sauvage shim slack adjuster. The advantage of automatic slack adjustment in nearly doubling the period between brakeshoe inspections has been already exemplified with the surface cars of the Brooklyn Rapid Transit System.

It was originally intended to ream all holes for brake pins in levers, jaws and hangers to a diameter 1/64 in. larger than the pin used and case-harden the metal around the holes to a depth of 1/16 in. In most instances, however, it has been found more practicable to use bushings of seamless cold-drawn case-hardened tubing.

All brake pins are of turned steel, with castle nuts and cotters, and case-hardened to a depth of approximately 1/16-in. Brake levers are of mild open-hearth steel, and all forgings, hangers and tension rods are of refined wrought iron. The brake heads are of manganese cast steel.

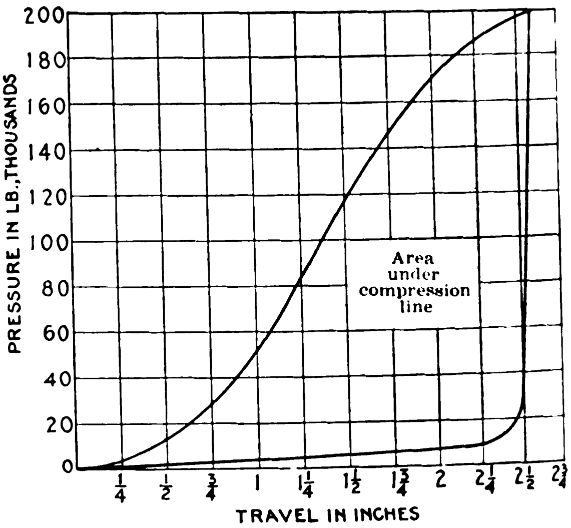
TRUCK DATA

Minimum radius of curve	125 ft.
Distance center to center of truck bolsters	47 ft
Truck wheelbase	6 ft. 8 in.
Distance from center of bolster to center of trailer axle	3 ft. 0⅛ in.
Distance from center of bolster to center of motor axle	3 ft. 7⅛ in.

Wheels—Solid rolled steel 5½-in. tread, M.C.B. 1909 standard contour.
Motor axles—Heat-treated carbon steel, 5-in. x 9-in. collarless journals, 6½-in. motor bearings.
Trailer axles—Heat-treated carbon steel, 5-in. x 9 in. collarless journals.
Height from top rail to bottom of car-body bolster at center plate with car light 2 ft. 9 in.
Frame—Rolled steel and pressed members.
Springs—Full triple elliptic, 40-in. long with scroll ends in bolster, and helical over journal boxes.
Pedestals—Cast steel with pressed hardened steel liners.
Journal boxes—Malleable iron.
Bolster—Pressed steel.
Center plates—Cast steel, self-lubricating and phosphor-bronze washers for wearing surface and felt dust protectors.
Brakes—Clasp type (two shoes per wheel) with helical adjustable release springs, cast manganese steel brake heads.
Transom—Pressed steel channel.
Motors—One per truck inside hung, with flat-leaf spring nose suspension.

WEIGHTS ASSUMED FOR PURPOSE OF CALCULATION

Weight on center plate of each truck due to car body and equipment	25,000 lb.
Weight on center plate of each truck due to maximum passenger load	20,000 lb.
Total weight of center plate of each truck due to car body and full passenger load	45,000 lb.
Weight on each truck center plate for purpose of figuring stresses	55,000 lb.
Load on motor nose support due to weight of motor	2,900 lb.
Torque of motor at motor nose support	3,000 lb.



N. Y. M. CAR—TYPICAL DRAFT GEAR TEST CURVES

As a result of the design described, and in spite of the greater weight of the clasp brake rigging used, the actual scale weight of the first truck delivered by the American Car & Foundry Company to meet a center-plate loading of 45,000 lb. was but 11,280 lb. This weight includes the clasp brakes, the motor gear, the truck side bearings and the truck center plate, but not the car-body center plate.

DETAIL SPECIFICATIONS FOR TRUCK AND BRAKE RIGGING

The specifications for structural steel shapes, plates, bar steel, rivet steel and wrought iron conform to those promulgated by the American Society for Testing Materials under date of June 1, 1912. The open-hearth and crucible steel castings conform to the following specifications: Neither phosphorus nor sulphur to exceed 0.05 per cent; tensile strength per square inch not less than 60,000 lb.; elastic limit per square inch not less than 27,000 lb.; elongation in 2 in. not less than 22 per cent; reduction in area not less than 30 per cent. The specifications for malleable iron and gray iron follow those adopted by the American Society for Testing Materials under date of Nov. 15, 1904, and Sept. 1, 1905, respectively.

All bolts were specified to be open-hearth steel with the following characteristics: Phosphorus not to exceed 0.05 per cent; sulphur not to exceed 0.06 per cent; ultimate tensile strength not less than 55,000 lb. per square inch; elastic limit 0.50 ultimate tensile strength; elongation in 8 in. 1,400,000 divided by the tensile strength; cold bend without fracture for bars ¾ in. in diameter or thickness, 180 deg. flat. CAR—PLAN, ELEVATIONS AND SECTIONS OF DRAFT RIGGING brake pins, the bolts are turned slightly larger in diameter than the size called for, are ground true to size after being case-hardened, are fitted with semi-finished case-hardened castle nuts and provided with spring cotter pins. The threads of the bolts are not case-hardened.

The journal bearing metal is of the following B. R. T. standard composition: Copper, 77 per cent; tin, 8 per cent, and lead, 15 per cent. A variation of 10 per cent was allowed from the specified proportions of tin and lead, but impurities in excess of 1 per cent were not permitted.

The babbitt for journal bearing lining is of the following composition: Tin (New Straits), 91.5 per cent; antimony (Cookson's), 5.7 to 6.3 per cent; copper (refined electrolytic) 1.8 to 2.2 per cent. In this case impurities were not permitted to exceed 0.5 per cent.

DRAFT GEAR

The draft gear specification is of particular interest inasmuch as it includes the first application of the high shock-absorbing qualities of Westinghouse friction draft gear to subway and elevated operation. The gear is figured for a maximum end shock of 185,000 lb. The draft rigging includes automatic car, air and electric coupler heads, radial drawbars and friction draft gear attachment.

The coupler heads are of the tight-locking type, pivoted at the forward end of the drawbar to provide for vertical variations and sway of the car bodies. The drawbars are pivoted on the front end of the draft gear yoke to permit the necessary radial movement required for passing around curves and over crossovers, and they have lugs for centering device atachments.

The automatic couplers are so arranged that all necessary electric control and auxiliary circuit connections are actuated from a valve in either one of the cabs on the adjacent ends of adjoining cars. Also, cars can be uncoupied from either of the two adjacent cabs or cars between which uncoupling is desired. When so uncoupled, all necessary connections on the exposed ends of the cars required for proper operation are automatically obtained. Provision is also made so that cars can be coupled from either side of a train on the ground.

The draft gears were tested for capacity with a static load of 130,000 lb., and with this load the amount of compression measured from the free position of gear did not exceed $1\frac{3}{4}$ in. Tests were also made on about 10 per cent of the total number of gears ordered to determine the absorption capacity of the gear as follows:

"Gear shall be compressed in an approved static test machine and pressure readings recorded for each $\frac{1}{4}$ in. increment of compression from free height until gear is solid. Similar readings shall be taken during the period of the release of pressure at corresponding degrees of compression. These readings when plotted in a manner similar to that illustrated on the appended typical chart, shall show that the area inclosed by the release line, base line drawn through zero pressure line, and a perpendicular erected from the base line to a point where the gear becomes solid, shall not exceed 20 per cent of the area inclosed by the compression line and the other sides of the triangle above described."

The couplers and draft gears were designed for the physical and operating conditions as in Table on page 1381.

The typical chart referred to is reproduced on page 1378. The maximum end shock of couplers due to buffing is assumed as a static load of 185,000 lb., and the maximum load due to pulling is assumed as 100,000 lb., applied horizontally at the center line of the coupler heads. The draft gear has a travel of not less than $2\frac{3}{8}$ in. from its assembled position and a capacity of not less than 130,000 lb. with $1\frac{3}{4}$ in. compression measured

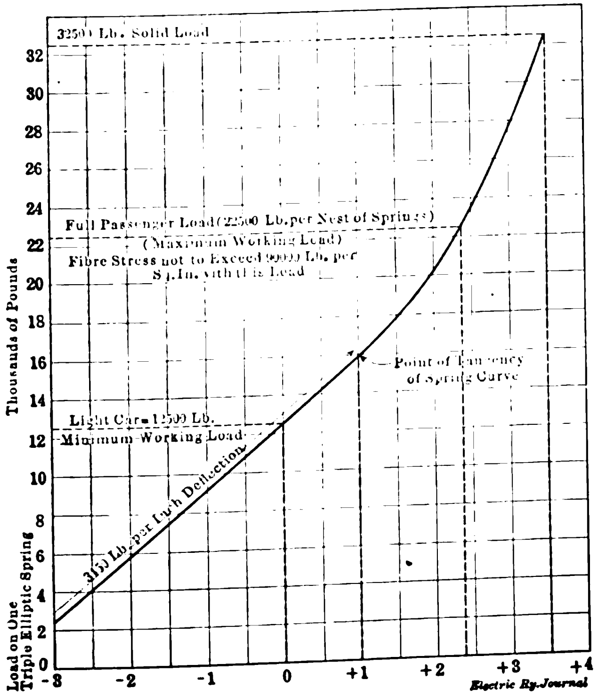
Average distance between local stops	0.48 miles



N. Y. M. CAR—DEFLECTION CURVES OF BOLSTER SPRINGS AT DIFFERENT LOADS

Provisions are made in the couplers for the vertical movement required for the proper operation over track conditions as specified, with a variation of 2 in. in the height of the couplers when the cars are on a level track. Couplers will couple when the vertical distance between the center lines does not exceed 3 in. and they have a horizontal gathering range of 8 in.

TABLE II

Cast steel, other than buffing	12,000 lb.
Cast steel buffing	20,000 lb.
Rivets, shear, other than buffing	10,000 lb.
Rivets, bearing, other than buffing	20,000 lb.
Rivets, shear, buffing	12,000 lb.
Rivets, bearing, buffing	24,000 lb.

Connections are provided in the coupler heads for air brake pipe connections and for such air connections as are required for the automatic coupling and uncoupling of cars; all couple in unison with the coupler. Provision is also made for eighteen train line wires and local circuits, designed for Westinghouse A. B. F. control and other apparatus operated on 32-volt battery circuit.

Progress of Suburban Electrification In Melbourne, Australia

In their annual report the Victorian Railway Commissioners state, in regard to suburban electrification, that despite the large amount of preliminary and detail work inseparable from a scheme of such magnitude, satisfactory progress has been made with the different portions of the work of electrifying the suburban lines. E. P. Grove, as the representative of Merz & McLellan, consulting engineers, arrived in Melbourne in October last and has since, with his staff, been actively engaged in the supervision of the work already in hand at the substations, the Jolimont car repair shed, and the Newport power house. The principal contracts which had been let up to June 30, 1914, were: Condensing plant, circulating water pumps and accessories for the power station, G. Weymouth Proprietary, Ltd. £85,252; equipment for substations, Siemens Brothers Dynamo Works, £201,624; overhead contact lines and power transmission lines, British Insulated & Helsby Cables, Ltd., £278,286; power station buildings and boiler equipment, Babcock & Wilcox, Ltd., £427,720; six 10,000-kw sets of turbo-alternators and transformers, C. A. Parsons & Co., Ltd., £182,046; switch gear for power station and substations, Siemens Brothers Dynamo Works, £140,070; equipment for motor and trailer coaches, General Electric Company, £676,189; provision and laying of 20,000-volt feeder cables, etc., British Insulated & Helsby Cables, Ltd., £259,121; total, £2,250,299. The different contractors have the manufacture of the necessary plant and equipment well in hand, and substantial progress has been made with the erection of the power house, as well as with the excavations for the conduits, pits, etc., and the provision of sidings. It was anticipated that the first section of the car shop at Jolimont would be completed about December, 1914.

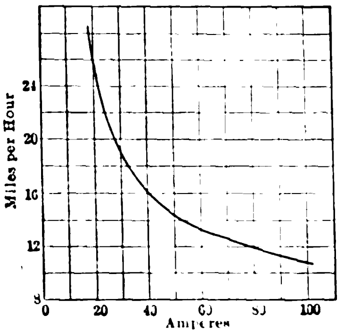
With the eastern Kentucky coal mines shipping to their markets almost past the coal bins of the Kentucky Traction & Terminal Company's power plants, the railroad and utilities company has been able to contract for some 40,000 tons of Tennessee coal at a price which the eastern Kentucky mines could not meet. The explanation is that the coal to be delivered on the contract comes from the Tennessee State mines at Petros on Brushy Mountain, which are worked by convict labor. The convict mine managers can sell at a low price and still make money.

Calculations of Starting Resistances for Railway Motors

An Original Graphical Method for Calculating Starting Resistances for Motors is Described and Illustrated by the Author—This Method Should be Useful in Checking the Gradation of Resistance in Existing Equipment

BY F. CASTIGLIONI, NEW YORK

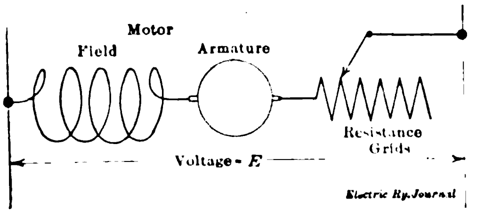
The purpose of this study is to present a simple and accurate graphical method for the calculation of the grid resistances corresponding to the several controller steps. This calculation is very tedious by "cut and try" methods but is extremely interesting and expeditious with a convenient graphical method. In order that the method may be perfectly clear a preliminary statement is given to illustrate how the graphical plan simplifies the calculations.



MOTOR STARTING RESISTANCES—FIG. 1—CURRENT SPEED CURVE OF MOTOR

In the series motor a definite current corresponds to a definite speed. This relation is expressed in the familiar current-speed curve. See Fig. 1.

In bringing a motor up to speed resistance is inserted, as shown diagrammatically in Fig. 2, and is cut out in steps keeping the current between certain limits. If a person were starting a motor with an ammeter in front of him he could throw in the starting switch with sufficient resistance in circuit to keep the current within the upper limit, and would wait before cutting out resistance until it fell to the lower limit, as the rising counter emf reduced it. Then he would cut out sufficient resistance to allow the current to jump to the upper limit, and so on until the motor reached full speed. This operation is sometimes performed by means of automatic relays. To perform it successfully requires that the resistance steps be accurately graduated.



MOTOR STARTING RESISTANCES—FIG. 2—DIAGRAM OF MOTOR CONNECTIONS

Now let us consider the calculation of these resistance steps if we have (*a*) the current-speed curve of our motor as shown in Fig. 1 corresponding to the voltage E (Fig. 2), (*b*) the hot resistance of the motor, and (*c*) the upper and lower current limits which are desirable for the given case.

The natural way in which to start the calculation is to begin with the motor at rest and generating no counter emf. The total resistance can then be calculated from Ohm's law: where

$$R_1 + r = \frac{E}{I''}$$

R_1 = resistance of grids,
r = hot motor resistance, and
I'' = upper current limit.

Assume then that we consider the speed to increase until the current has fallen to the lower limit. Then resistance must be cut out to allow the current to jump to the upper limit again. But how much must go out? In the series motor as the current increases the field strength also increases so that, at a given speed (and we may consider the speed to remain constant during the change of resistance) the current will only increase until a balance is reached so that the new counter emf plus the resistance drop equals the line voltage. This relation is shown by the following familiar formula.

For any value of current I',

$$s_1 = s' \frac{E - I'(R_1 + r)}{E - I' \times r} \qquad \text{(a)}$$

where

s_1 = speed with grid resistance R_1 inserted,
s' = speed (from curve) corresponding to I', and
r = hot motor resistance.

From this formula s_1 can be calculated.

Now sufficient resistance is to be cut out for the next controller notch to bring the current up to the maximum again, that is to I''. We can assume that the speed remains constant during this change, so that we can write,

$$s_1 = s'' \frac{E - I''(R_2 + r)}{E - I'' \times r} \qquad \text{(b)}$$

where s'' = speed (from curve) corresponding to I''.

From this, by inserting the proper value of s'' from the curve and bringing over the value of s' from the previous calculation, R_2 can be calculated.

Again the speed is allowed to increase until the current falls to I' once more, when the speed is,

$$s_2 = s' \frac{E - I'(R_2 + r)}{E - I' \times r} \qquad \text{(c)}$$

and so on until the speed has come up to the value corresponding to I', when all grid resistance is cut out.

The same process is repeated for the two motors in parallel in the case of a car equipment.

This process is somewhat tedious, involving as it does substitutions in formulas and corresponding liability of error. The problem lends itself readily to graphical solution, by means of curves, plotted once for all and applicable to all conditions, showing the relations of current, speed and resistance.

I have found it to be most convenient to rewrite equation (a) in the following manner: Let

$$R + r = \alpha r,$$

when R is any value of grid resistance and α is a factor showing the increased resistance per motor due to the addition of R.

This may also be written

$$R = (\alpha - 1)r.$$

Substituting this value of *R* in formula (a) and writing *I* to represent the current and *s* to represent the corresponding speed, and allowing s_1 to represent here the speed corresponding to the grid resistance *R*,

$$s_1 = s\,\frac{E - I\alpha r}{E - I \times r}.$$

For convenience $I \times r$ may be represented by *a*, whence

$$s_1 = s\,\frac{E - \alpha a}{E - a},$$

or putting the speeds in the form of a ratio,

$$\frac{s_1}{s} = \frac{E - \alpha a}{E - a}. \qquad \text{(c)}$$

The right-hand term is then a *ratio* of the new to the old speed, when, *at a given current*, the resistance is increased to α times the motor resistance by the addition of grid resistance. For convenience let us call this the *speed factor.*

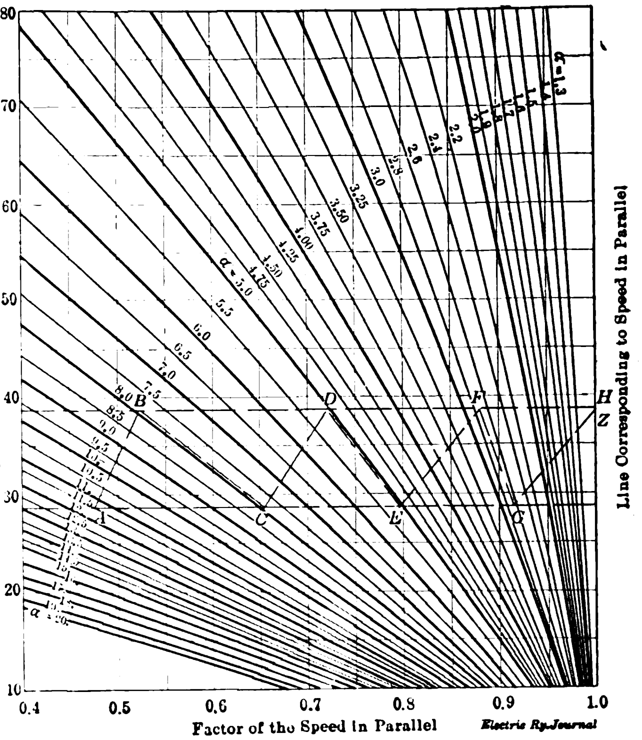
If we consider *E* constant, formula (c) contains three variables s_1/s, α and *a*. Charts showing the relations of these may be plotted and used as illustrated hereinafter. It is most convenient to plot these in the form shown in Figs. 3 and 4.

In calculating the data for these charts values of α were selected within a range shown by experience to be most useful, and then varying *a* and calculating from the formula the corresponding speed factors. The charts illustrated are for 600 volts and 300 volts also. For my own use I have prepared other charts for 575, 550, 525, 500 and 450 voltages with the corresponding half voltages and will be pleased to give railway men access to them for use in making calculations.

It should be noted that these curves are independent of the motor curves which are used as previously explained and as will be illustrated later in this article.

EXAMPLES OF THE USES OF THE CHARTS

Let it be required to determine the resistance steps necessary to start a certain railway equipment comprising two motors, each having a hot resistance of 0.15 ohm, including, say, 20 per cent in leads and car wiring. The starting current at 600 volts is to average 225 amp and the starting "jerks" may have an amplitude 30 per cent as great as the average current; that is, the current may range between $I'' = 258$ amp and $I' = 192$ amp.



MOTOR STARTING RESISTANCES—FIG. 3—SPEED FACTOR CURVES, MOTORS IN PARALLEL

The motor curve, of the variety illustrated in Fig. 1 which is for a smaller motor, shows that the corresponding speeds are $s'' = 15.3$ m.p.h. and $s' = 16.9$ m.p.h. at full voltage.

From the formula,

$$s_1 = s\,\frac{300 - r \times I}{600 - r \times I},$$

we find that the corresponding speeds with motors in series are 7.1 m.p.h. and 8.01 m.p.h.

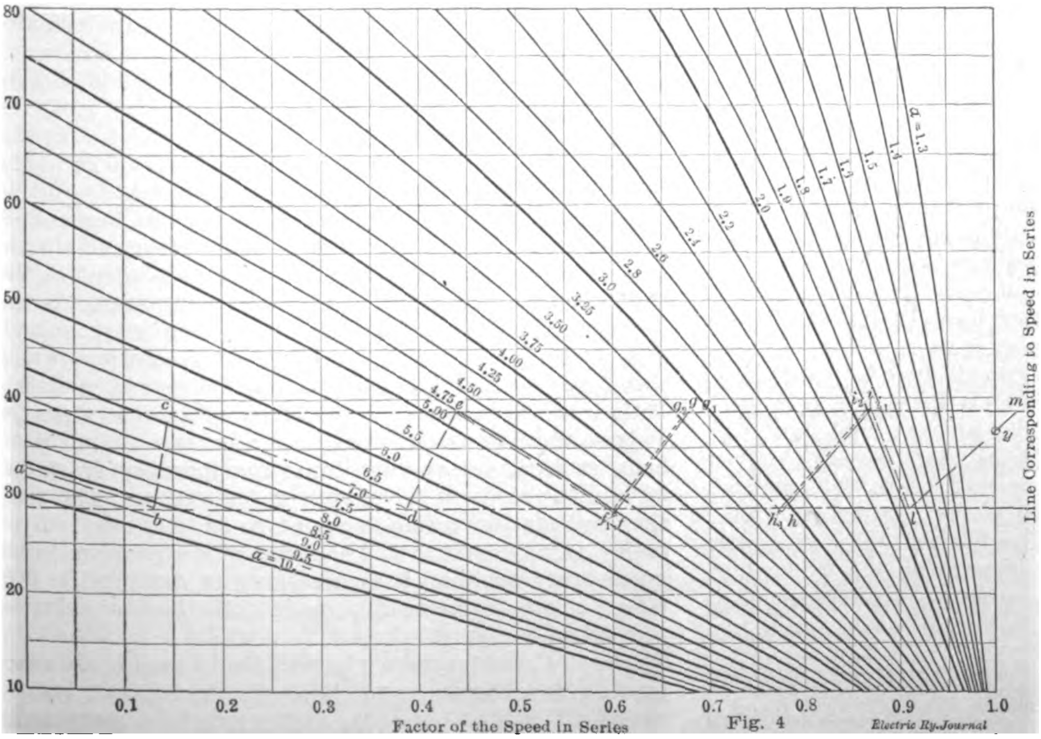


Fig. 4

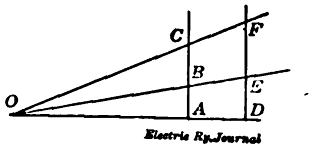

Fig. 5

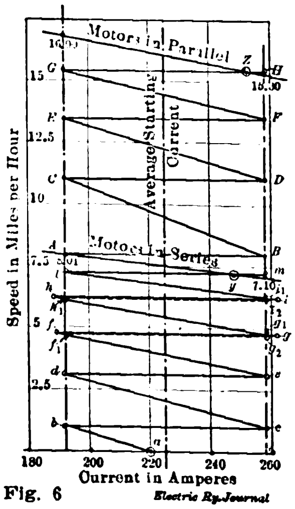

Fig. 6

MOTOR STARTING RESISTANCES—FIG. 4—SPEED FACTOR CURVES, MOTORS IN SERIES. FIG. 5—GEOMETRICAL DIAGRAM. FIG. 6—CURRENT-SPEED CHART

The ratios of limiting speeds are:

In parallel $16.9 \div 15.3 = 1.103$, and
in series $8.01 \div 7.1 = 1.129$.

Also the values of a, or $I \times r$, are:

$$258 \times 0.15 = 38.7, \text{ and}$$
$$192 \times 0.15 = 28.8.$$

It proves to be better to begin at the middle of the calculation, so to speak, at the point of changing over from series to parallel. Also it is not desirable to select in advance a number of resistance steps, for, as was evident from the previous explanation, this is determined by the current limits selected.

Taking up first, then, the "parallel" chart let us plot on it two horizontal lines corresponding to the above values of $I \times r$.

As shown, the full series speed for 192 amp is 8.01 m.p.h. and the full parallel speed for the same current is 16.9 m.p.h. The ratio of these is 0.474, which is therefore the speed factor for the full series position for use on the "parallel" chart. The point is plotted on the chart at "*A*."

The motors are now instantly thrown into parallel with resistance to limit the current to 282 amp per motor, the speed of 8.01 m.p.h. being assumed to remain constant for this instant.

The speed factor for this speed at 192 amp was 0.474. At 258 amp it is $0.474 \times 1.103 = 0.523$.

This point is plotted on the chart at "*B*." "*B*" is located between $\alpha = 7.5$ and $\alpha = 8.0$. Scaling it off shows it to be on the line of $\alpha = 7.9$.

But

$$R_{1p} = (\alpha - 1)r = 6.9 \times 0.15 = 1.04 \text{ ohms}.$$

which is the resistance (per motor) for the first parallel notch.

The motors now accelerate, the resistance (and, therefore, α) remaining the same, so that we may draw a line parallel to $\alpha = 8.0$ for $\alpha = 7.9$ until it intersects the lower "*a*" line at "*C*."

C is 0.654 of 16.9 m.p.h. which is,
$0.654 \times 1.103 = 0.721$ of 15.3 m.p.h. corresponding to 258 amp.

This is plotted at "*D*" which corresponds to $\alpha = 5.06$. From this

$$R_{2p} = 4.06 \times 0.15 = 0.62 \text{ ohm}.$$

Following the same process, "*F*" and "*G*" correspond to $\alpha = 2.72$ and $R_{3p} = 0.26$ ohm, while "*H*" corresponds to $\alpha = 1.02$, or practically 1.

The line "*GH*" cuts the line corresponding to the speed in parallel at point *Z*, which is very near to the assumed limit. Therefore, the whole set of rheostats for the parallel steps of the controller can be considered as provided for, if further considerations connected with the series-operation do not call for some alteration.

It is not asserted that in all cases the point *Z* will be sufficiently near to the upper limit to render changes unnecessary by either increasing or reducing the number of steps by one (which can be done by reducing or increasing the interval between the current limits); but in each case these results are not final until they have satisfied another practical condition which, from the theoretical standpoint, is only there to complicate the problem. This condition is that, in order to minimize the cost of the controller by possibly utilizing the same contacts in series as in parallel, the grid resistances must be arranged to give satisfactory steps in both motor connections.*

We have found the following resistances for parallel operation:

$R_{1p} = 1.04$ ohms, $R_{2p} = 0.62$ ohm, $R_{3p} = 0.26$ ohm, and if we want to utilize them for series operation, as we always call R the grid resistance per motor, we must have for series operation the resistance values R_1 equal to one-half the correspond R_p or to:

0.57 ohm, 0.31 ohm, and 0.13 ohm.

The corresponding α values for these R_1 values are equal to

$$\frac{R+r}{r}, \ 4.8, \ 3.10 \text{ and } 1.87.$$

We may plot these α curves in the chart for motors in series, where previously the horizontal lines for $I \times r = 28.80$ and 38.70 were drawn, and call them ef_1, g_1h_1 and i_1l.

The next step would be to see if these steps, where for operation in series, remain fairly near to the assumed current-limits.

Point f_1 is 0.594 of speed 8.01 m.p.h. in series operation, and it is equal to $0.594 \times$ factor $1.129 = 0.670$ of the speed of 7.10 m.p.h. at the point g_2, which is not precisely coincident with the point g. Without stopping to consider this difference for the moment we may find for $h_1 = 0.772$ the corresponding point $i_2 = 0.772 \times 1.129 = 0.871$, and for $l = 0.909$ the corresponding point $m = 0.909 \times 1.129 = 1.025$.

It is easy to see that the curves ef_1, g_1h, i_1l can be combined to show a satisfactory set of starting resistances by increasing the interval between the current limits at the points f, g, h, i, l and m. In determining these last points, we draw the lines f_1g_2 and h_1i_2 parallel to the corresponding lines fg and hi. It should be remarked that the steepness of these lines varies with the speed factor and that, furthermore, the proportion between the two speeds in series corresponding to the current limits varies with the interval between these limits, but the new lines are so near the old lines that a parallelism is all that is needed for practical purposes.

The point y, where the speed in series is reached, is also satisfactorily near to the limit, and therefore, these steps to be used for both series and parallel positions may be regarded as fixed.

Going backwards we can now determine the remaining steps.

The speed factor at point e is equal to 0.437; therefore that at point d will be

$$0.437 \div 1.129 = 0.388$$

Through d we draw the curve cd for $\alpha = 6.75$. The point $c = 0.145$, and the point $b = 0.25 \div 1.129 = 0.129$.

The first resistance step ab will correspond to $\alpha = 9.05$.

The point a is not at the corresponding maximum limit, but this is rather an advantage on account of the first starting jerk being the most uncomfortable to the passengers. Thus, the problem is completely solved, and if, for some reason or other, this solution is not satisfactory—for instance, because of the uneven distribution of three steps in parallel and of five steps in series—the number of steps in parallel can be increased by narrowing the current-limits for operation in parallel and the steps in series can be reduced by increasing the limits for operation in series, so as to obtain four of each. In any case, as the solution of the problem takes much less time than it is necessary to describe it, different trials can be readily made until the best solution is reached.

The series resistances per motor would be, in this case,

$R_{1s} = 8.25 \times 0.15 = 1.24$ ohms;
$R_{2s} = 5.75 \times 0.15 = 0.862$ ohm.
$R_{3s} = 0.57$ ohm; $R_{4s} = 0.31$ ohm; $R_{5s} = 0.13$ ohm.

It should be remembered that these resistance values are "per motor," and that the real values of the resistance steps are to be figured according to the different combination of motors and resistances, the different grouping of the motors among themselves, etc. The first step of all in the determination will be that of determining what part of the total resistance for a certain combination the resistance per motor really is.

---

*This practical requirement may upset in most cases the former calculations based for instance on that easy rule of the "geometrical progression of the resistance steps" which is found in text-books. Owing to the fact that we are working on the flat part of the motor curve slight changes in the rheostats may produce very marked increases in the current and acceleration "jerks," and a verification of the averaging values that we may assume calls again for the use of the formula (a).

To illustrate this point: The problem above was worked out on the basis of the resistance being in series with the motors. Now when two motors are connected in series with resistance the resistance per motor is one-half the total. If two motors are in parallel and resistance is in series with the pair *the equivalent resistance per motor is four times* the series resistance.

In practice it is possible to make up grid frames of any resistance; and as the heating capacity of the grids is already calculated to stand normal railway service, questions of rheostat design may be ignored.

As a last remark it is proper to point out that all of the lines *bc*, *de*, *fg*, etc., meet at a point on the line, speed factor = 0, as shown in Fig. 5. This fact may be utilized in still further reducing the time needed for this calculation.

The figure shows two lines *CA* and *FD* which represent the lines for $I \times r$ in the charts. *OD* represents the line for zero speed factor. Considering the speed factors in a vertical direction, we have, for instance, $\frac{ED}{BA} = \frac{FD}{CA}$ = constant = ratio of the speed factors at the current limits.

But $\frac{ED}{BA}$ is also equal to $\frac{OD}{OA} = \frac{OA + AD}{OA} = 1 + \frac{AD}{OA}$

We know, for instance, that our factor for operation in series is 1.129; therefore, by scaling the lengths in Fig. 4,

$$1.129 = 1 + \frac{AD}{OA} \text{ and } OA = \frac{AD}{0.129} = \frac{0.5 \text{ in.}}{0.129} = 3.9 \text{ in.}$$

below the lower $I \times r$ line, on the zero line.

For a better understanding of the whole discussion of the method the results have been plotted in the usual manner in Fig. 6.

Power Investigation on the Boston & Middlesex Street Railway

An investigation of the cost of power production as compared with the purchase of Boston Edison service was made by Prof. L. E. Moore, engineer of the Massachusetts Public Service Commission, in the recent Middlesex & Boston Street Railway rate case. It was based upon the possible construction of a new steam station by the company at Waltham, on the Charles River.

The cost of such a plant would be about $250,000 and that of the necessary 13,000-volt transmission system, with substations, $250,000 more. A plant of this kind should produce energy at a manufacturing cost of 0.8 cent per kilowatt-hour, and the total yearly cost per kilowatt-hour at the substation d.c. bus would be 1.57 cents, assuming a transmission efficiency of 80 per cent average and 11 per cent interest and depreciation on the cost of the new plant. The company now purchases 9,614,511 kw-hr. from the Edison company at an average cost of about 1.7 cents.

Professor Moore stated that against the above apparent possible saving should be set the advantages that the railway has no money invested in electric generating apparatus, which easily may be damaged to the extent of $5,000 by a single electrical storm and is freed from the risk of maintaining a 13,000-volt system. Therefore it may be desirable from the standpoint of uninterrupted service and freedom from anxiety to allow the Edison company to take the risk and the corresponding profit.

Recent Practice In Traffic Counts

Various Systems Are Described, Including That Followed by the Research Laboratory of the Massachusetts Institute of Technology

BY D. J. MCGRATH, RESEARCH ASSISTANT MASSACHUSETTS INSTITUTE OF TECHNOLOGY

The first systematic traffic count on any street railway system in this country was probably the one made on the lines of the Chicago City Railway in 1905 by the firm of Ford, Bacon & Davis. Since then a number of counts of various kinds have been made in different cities from time to time, but there is as yet no standard system of traffic tabulation for city street railway systems. In spite of the many advantages of traffic surveys in relation to traffic requirements, very few of the operating companies have made serious efforts to develop any thorough system.

Probably the most recent work on passenger traffic counts is that which has been performed during the past summer by the research laboratory of the Massachusetts Institute of Technology. In connection with the research on the economic limits of the 5-cent fare which is being carried on at the institute the investigators have had occasion to consider in detail the question of the average passenger ride on urban systems. During the latter part of the summer, traffic counts were made on several lines of the Boston Elevated Railway. The results of this work are not available for publication, but it is believed that the experience gained may be of value to transportation officials generally.

Before starting the work the writer had occasion to review the published reports of similar efforts by others, and a brief summary of the various methods and best practice is presented in this article.

Broadly speaking, there are three general methods of making traffic counts determined chiefly by the purpose for which the study is being made.

The first, which we may call the street (or car) tabulation method, consists in recording the load on the cars at a number of previously designated traffic points. It may be done by inspectors stationed at transfer points and reasonably short intervals along the line, or by the conductors on the cars. Street inspectors have been used by the Boston Elevated Railway for several years. During the now famous Milwaukee fare case proceedings, the Milwaukee company made a traffic count by having the conductors record the load at every half-mile point. A similar system as used by the Grosse Berliner Strassenbahn was described in the STREET RAILWAY JOURNAL of May 19, 1906.

From counts of this kind, load curves for the various lines may be plotted, and if the total number of passengers carried is known a fair average value of the passenger ride may be derived. The chief use of this method is for determining car service requirements. It requires quite a few men, if the street inspection scheme is used, and fails to take into account the changes between inspection points.

The second method may be termed the passenger tagging type of count. The only record that has been found of the use of this method is in the case of the city of Philadelphia's investigation of the surface and subway-elevated lines in 1912. The application of this method involves the seeking of information directly from the passengers themselves, or at least from a certain definite proportion of them. Observers are placed on a number of the cars of a line, and as each revenue paying passenger enters the car the first inspector makes out and hands him a card with the name of the street

The ratios of limiting speeds are:

In parallel 16.9 ÷ 15.3 = 1.103, and
in series 8.01 ÷ 7.1 = 1.129.

Also the values of a, or $I \times r$, are:

$$258 \times 0.15 = 38.7, \text{ and}$$
$$192 \times 0.15 = 28.8.$$

It proves to be better to begin at the middle of the calculation, so to speak, at the point of changing over from series to parallel. Also it is not desirable to select in advance a number of resistance steps, for, as was evident from the previous explanation, this is determined by the current limits selected.

Taking up first, then, the "parallel" chart let us plot on it two horizontal lines corresponding to the above values of $I \times r$.

As shown, the full series speed for 192 amp is 8.01 m.p.h. and the full parallel speed for the same current is 16.9 m.p.h. The ratio of these is 0.474, which is therefore the speed factor for the full series position for use on the "parallel" chart. The point is plotted on the chart at "*A*."

The motors are now instantly thrown into parallel with resistance to limit the current to 282 amp per motor, the speed of 8.01 m.p.h. being assumed to remain constant for this instant.

The speed factor for this speed at 192 amp was 0.474. At 258 amp it is $0.474 \times 1.103 = 0.523$.

This point is plotted on the chart at "*B*." "*B*" is located between $\alpha = 7.5$ and $\alpha = 8.0$. Scaling it off shows it to be on the line of $\alpha = 7.9$.

But

$$R_{1p} = (\alpha - 1)r = 6.9 \times 0.15 = 1.04 \text{ ohms}.$$

which is the resistance (per motor) for the first parallel notch.

The motors now accelerate, the resistance (and, therefore, α) remaining the same, so that we may draw a line parallel to $\alpha = 8.0$ for $\alpha = 7.9$ until it intersects the lower "*a*" line at "*C*."

C is 0.654 of 16.9 m.p.h. which is,

$0.654 \times 1.103 = 0.721$ of 15.3 m.p.h. corresponding to 258 amp.

This is plotted at "*D*" which corresponds to $\alpha = 5.06$. From this

$$R_{2p} = 4.06 \times 0.15 = 0.62 \text{ ohm}.$$

Following the same process, "*F*" and "*G*" correspond to $\alpha = 2.72$ and $R_{3p} = 0.26$ ohm, while "*H*" corresponds to $\alpha = 1.02$, or practically 1.

The line "*GH*" cuts the line corresponding to the speed in parallel at point *Z*, which is very near to the assumed limit. Therefore, the whole set of rheostats for the parallel steps of the controller can be considered as provided for, if further considerations connected with the series-operation do not call for some alteration.

It is not asserted that in all cases the point *Z* will be sufficiently near to the upper limit to render changes unnecessary by either increasing or reducing the number of steps by one (which can be done by reducing or increasing the interval between the current limits); but in each case these results are not final until they have satisfied another practical condition which, from the theoretical standpoint, is only there to complicate the problem. This condition is that, in order to minimize the cost of the controller by possibly utilizing the same contacts in series as in parallel, the grid resistances must be arranged to give satisfactory steps in both motor connections.*

We have found the following resistances for parallel operation:

$R_{1p} = 1.04$ ohms, $R_{2p} = 0.62$ ohm, $R_{3p} = 0.26$ ohm, and if we want to utilize them for series operation, as we always call R the grid resistance per motor, we must have for series operation the resistance values R_1 equal to one-half the correspond R_p or to:

0.57 ohm, 0.31 ohm, and 0.13 ohm.

The corresponding α values for these R_1 values are equal to

$$\frac{R + r}{r}, 4.8, 3.10 \text{ and } 1.87.$$

We may plot these α curves in the chart for motors in series, where previously the horizontal lines for $I \times r = 28.80$ and 38.70 were drawn, and call them ef_1, g_1h_1 and i_1l.

The next step would be to see if these steps, where for operation in series, remain fairly near to the assumed current-limits.

Point f_1 is 0.594 of speed 8.01 m.p.h. in series operation, and it is equal to $0.594 \times$ factor $1.129 = 0.670$ of the speed of 7.10 m.p.h. at the point g_2, which is not precisely coincident with the point g. Without stopping to consider this difference for the moment we may find for $h_1 = 0.772$ the corresponding point $i_2 = 0.772 \times 1.129 = 0.871$, and for $l = 0.909$ the corresponding point $m = 0.909 \times 1.129 = 1.025$.

It is easy to see that the curves ef_1, g_1h, i_1l can be combined to show a satisfactory set of starting resistances by increasing the interval between the current limits at the points f, g, h, i, l and m. In determining these last points, we draw the lines f_1g_2 and h_1i_2 parallel to the corresponding lines fg and hi. It should be remarked that the steepness of these lines varies with the speed factor and that, furthermore, the proportion between the two speeds in series corresponding to the current limits varies with the interval between these limits, but the new lines are so near the old lines that a parallelism is all that is needed for practical purposes.

The point y, where the speed in series is reached, is also satisfactorily near to the limit, and therefore, these steps to be used for both series and parallel positions may be regarded as fixed.

Going backwards we can now determine the remaining steps.

The speed factor at point e is equal to 0.437; therefore that at point d will be

$$0.437 \div 1.129 = 0.388$$

Through d we draw the curve cd for $\alpha = 6.75$. The point $c = 0.145$, and the point $b = 0.25 \div 1.129 = 0.129$.

The first resistance step ab will correspond to $\alpha = 9.05$.

The point a is not at the corresponding maximum limit, but this is rather an advantage on account of the first starting jerk being the most uncomfortable to the passengers. Thus, the problem is completely solved, and if, for some reason or other, this solution is not satisfactory—for instance, because of the uneven distribution of three steps in parallel and of five steps in series—the number of steps in parallel can be increased by narrowing the current-limits for operation in parallel and the steps in series can be reduced by increasing the limits for operation in series, so as to obtain four of each. In any case, as the solution of the problem takes much less time than it is necessary to describe it, different trials can be readily made until the best solution is reached.

The series resistances per motor would be, in this case,

$R_{1s} = 8.25 \times 0.15 = 1.24$ ohms;
$R_{2s} = 5.75 \times 0.15 = 0.862$ ohm.
$R_{3s} = 0.57$ ohm; $R_{4s} = 0.31$ ohm; $R_{5s} = 0.13$ ohm.

It should be remembered that these resistance values are "per motor," and that the real values of the resistance steps are to be figured according to the different combination of motors and resistances, the different grouping of the motors among themselves, etc. The first step of all in the determination will be that of determining what part of the total resistance for a certain combination the resistance per motor really is.

---

*This practical requirement may upset in most cases the former calculations based for instance on that easy rule of the "geometrical progression of the resistance steps" which is found in text-books. Owing to the fact that we are working on the flat part of the motor curve slight changes in the rheostats may produce very marked increases in the current and acceleration "jerks," and a verification of the averaging values that we may assume calls again for the use of the formula (a).

To illustrate this point: The problem above was worked out on the basis of the resistance being in series with the motors. Now when two motors are connected in series with resistance the resistance per motor is one-half the total. If two motors are in parallel and resistance is in series with the pair *the equivalent resistance per motor is four times* the series resistance.

In practice it is possible to make up grid frames of any resistance; and as the heating capacity of the grids is already calculated to stand normal railway service, questions of rheostat design may be ignored.

As a last remark it is proper to point out that all of the lines *bc*, *de*, *fg*, etc., meet at a point on the line, speed factor = 0, as shown in Fig. 5. This fact may be utilized in still further reducing the time needed for this calculation.

The figure shows two lines *CA* and *FD* which represent the lines for $I \times r$ in the charts. *OD* represents the line for zero speed factor. Considering the speed factors in a vertical direction, we have, for instance, $\frac{ED}{BA} = \frac{FD}{CA}$ = constant = ratio of the speed factors at the current limits.

But $\frac{ED}{BA}$ is also equal to $\frac{OD}{OA} = \frac{OA + AD}{OA} = 1 + \frac{AD}{OA}$

We know, for instance, that our factor for operation in series is 1.129; therefore, by scaling the lengths in Fig. 4,

$$1.129 = 1 + \frac{AD}{OA} \text{ and } OA = \frac{AD}{0.129} = \frac{0.5 \text{ in.}}{0.129} = 3.9 \text{ in.}$$

below the lower $I \times r$ line, on the zero line.

For a better understanding of the whole discussion of the method the results have been plotted in the usual manner in Fig. 6.

Power Investigation on the Boston & Middlesex Street Railway

An investigation of the cost of power production as compared with the purchase of Boston Edison service was made by Prof. L. E. Moore, engineer of the Massachusetts Public Service Commission, in the recent Middlesex & Boston Street Railway rate case. It was based upon the possible construction of a new steam station by the company at Waltham, on the Charles River.

The cost of such a plant would be about $250,000 and that of the necessary 13,000-volt transmission system, with substations, $250,000 more. A plant of this kind should produce energy at a manufacturing cost of 0.8 cent per kilowatt-hour, and the total yearly cost per kilowatt-hour at the substation d.c. bus would be 1.57 cents, assuming a transmission efficiency of 80 per cent average and 11 per cent interest and depreciation on the cost of the new plant. The company now purchases 9,614,511 kw-hr. from the Edison company at an average cost of about 1.7 cents.

Professor Moore stated that against the above apparent possible saving should be set the advantages that the railway has no money invested in electric generating apparatus, which easily may be damaged to the extent of $5,000 by a single electrical storm and is freed from the risk of maintaining a 13,000-volt system. Therefore it may be desirable from the standpoint of uninterrupted service and freedom from anxiety to allow the Edison company to take the risk and the corresponding profit.

Recent Practice In Traffic Counts

Various Systems Are Described, Including That Followed by the Research Laboratory of the Massachusetts Institute of Technology

BY D. J. McGRATH, RESEARCH ASSISTANT MASSACHUSETTS INSTITUTE OF TECHNOLOGY

The first systematic traffic count on any street railway system in this country was probably the one made on the lines of the Chicago City Railway in 1905 by the firm of Ford, Bacon & Davis. Since then a number of counts of various kinds have been made in different cities from time to time, but there is as yet no standard system of traffic tabulation for city street railway systems. In spite of the many advantages of traffic surveys in relation to traffic requirements, very few of the operating companies have made serious efforts to develop any thorough system.

Probably the most recent work on passenger traffic counts is that which has been performed during the past summer by the research laboratory of the Massachusetts Institute of Technology. In connection with the research on the economic limits of the 5-cent fare which is being carried on at the institute the investigators have had occasion to consider in detail the question of the average passenger ride on urban systems. During the latter part of the summer, traffic counts were made on several lines of the Boston Elevated Railway. The results of this work are not available for publication, but it is believed that the experience gained may be of value to transportation officials generally.

Before starting the work the writer had occasion to review the published reports of similar efforts by others, and a brief summary of the various methods and best practice is presented in this article.

Broadly speaking, there are three general methods of making traffic counts determined chiefly by the purpose for which the study is being made.

The first, which we may call the street (or car) tabulation method, consists in recording the load on the cars at a number of previously designated traffic points. It may be done by inspectors stationed at transfer points and reasonably short intervals along the line, or by the conductors on the cars. Street inspectors have been used by the Boston Elevated Railway for several years. During the now famous Milwaukee fare case proceedings, the Milwaukee company made a traffic count by having the conductors record the load at every half-mile point. A similar system as used by the Grosse Berliner Strassenbahn was described in the STREET RAILWAY JOURNAL of May 19, 1906.

From counts of this kind, load curves for the various lines may be plotted, and if the total number of passengers carried is known a fair average value of the passenger ride may be derived. The chief use of this method is for determining car service requirements. It requires quite a few men, if the street inspection scheme is used, and fails to take into account the changes between inspection points.

The second method may be termed the passenger tagging type of count. The only record that has been found of the use of this method is in the case of the city of Philadelphia's investigation of the surface and subway-elevated lines in 1912. The application of this method involves the seeking of information directly from the passengers themselves, or at least from a certain definite proportion of them. Observers are placed on a number of the cars of a line, and as each revenue paying passenger enters the car the first inspector makes out and hands him a card with the name of the street at which he boards. As soon as the passengers are settled after each stop, the second inspector goes through the car asking of each passenger holding a card his ultimate destination and route, collecting the cards and filling them out with this information. At the end of the trip the cards are enclosed in an envelope marked with all the appropriate data as to the car, trip, route, time, date, etc. Taking one line at a time a whole day's observations are made on a certain prearranged proportion of all the trips, say every fifth car on the line.* A modification of this process was used by Professor Richey in some investigations for the Bay State Street Railway.

For determining the total ride taken by the average paying passenger, the distribution of traffic by lines, routes and localities, and the proportions of passengers taking long, short and average rides, this is no doubt the ideal method of traffic survey. It may be very valuable for the rerouting of lines, but for proportioning service to lines as actually operated it involves much unnecessary work. .It is a rather expensive piece of work, requires the co-operation of the public, which can only be gained by extensive advertising prior to the attempt, and results in many thousands of individual cards which must be assembled, assorted and tabulated. Even with electric tabulating and statistical machinery for compiling the data it is no simple task.

BOSTON ELEVATED RAILWAY—ROUTE 279

Hyde Square—Roxbury Crossing—Subway Inbound, Tuesday, Aug. 11, 1914.

Leave Hyde Square, 7:22 a.m.; arrive Park Street Subway, 7:49 a.m.

Total passenger-miles 116
Total number of passengers.. 61
Average ride per total-passenger = 1.90 miles.

BOSTON ELEVATED TRAFFIC—TABLE SHOWING FORM FOR RECORDING DATA AND CHART PLOTTED FROM THESE DATA

The third, or boarding and leaving tabulation method, is the one which has been used in the recent Boston counts above referred to, and to some extent by operating companies and commissions. It is suggested here as the most suitable method for any street railway company to develop for obtaining data on average passenger ride and service requirements. This method consists in simply counting the passengers as they board and leave the car at each stop, by placing one or more observers on a certain proportion of all the cars as outlined for the other method. From the net additions (or subtractions) at each stop, the load is readily figured and this figure may be at once checked by counting up the load actually on the car after leaving the stop. The officials of the transportation department of the Boston Elevated Railway were sufficiently impressed with the value of this type of count to adopt it for their regular service studies. It is being used by the timetable department of the Public Service Railway of New Jersey and others.

The usual custom has been to place two observers on each car under surveillance, one man to devote his attention to passengers entering the car and the other to count those getting off. On the work done in Boston by the men from the Institute of Technology, it was found that one experienced observer could handle an entire car alone in nearly every case. The Boston Elevated's articulated cars or any others with single entrance and exit are easy, while the prepayment style with entrance at one end and exit at the other are not difficult for one man to take care of if he utilizes the possibility of checking his counts frequently by adding up the total passenger load on the car. Where extreme accuracy is desired, as for instance when the figures must be submitted to a commission, it is better to furnish two men per car. On the recent Boston work, one observer handled a trip carrying a total of 203 passengers with a maximum load at one time of 134, this great overcrowding being due to an unavoidable street blockade.

A pocket-size loose-leaf note book was used. The accompanying table shows the way in which the notes are kept, and the accompanying diagram is the load curve plot corresponding to these notes.

The heavy black lines indicate the interchange of passengers at the various stops, those above the base line representing the number getting on, while those below represent the number getting off. The solid black line represents the load actually on the car at every point and will be found to check at any point with the total number boarding minus the total number leaving up to that point. The broken line simply gives the cumulative totals of all passengers boarding.

A number of these plots should be made up for each line covering all hours of the day. The number and times of trips selected will of course be a matter of judgment for the official in charge of the work and will depend on what specific object he has in view. With such a set of plots, the transportation department will have complete graphical records showing the variation in density of traffic along the line, the adequacy of the service provided and the importance of various stops. From these plots they can quickly determine the points at which it will be advantageous to "turn back" or "short-trip" part of the cars, and the possibilities of inaugurating express service, limited or skip-stop service, or other similar efficiency ideas will be made apparent.

---

*See ELECTRIC RAILWAY JOURNAL for Nov. 2, 1912, page 949.

A few such charts, made up from actual observations on the cars described in this article, will do more to convince a commission and the public of the adequacy of service (if it is adequate), or the advisability of proposed changes, than a week's testimony of opinions and beliefs.

Electric Railway Mail Statistics

The report of the Second Assistant Postmaster General for the year ended June 30, 1914, has just been published. It contains the following statistical table:

ELECTRIC AND CABLE CAR SERVICE	
Number of routes	559
Length of routes, miles	7,932.28
Annual travel, miles	13,151,943.56
Annual rate of expenditure	$762,205.39
Average rate of cost per mile of length	$96.08
Average rate of cost per mile traveled, cents	5.79
Average number of trips per week	15.94
Comparison with the previous year shows:	
	Per cent
Decrease in number of routes	10, or 1.757
Increase in length of routes, miles	291.16, or 3.814
Increase in annual travel, miles	781,974.16, or 6.321
Increase in annual rate of expenditure	$46,010.35, or 6.424
Increase in average rate of cost per mile of length	$2.36, or 2.518
Average rate of cost per mile traveled, cents	No change
Increase in average number of trips per week	0.38, or 2.442

In commenting on this table the report says:

"The appropriation for the fiscal year was $847,400; the amount expended, as reported by the auditor, to Sept. 30, 1914, was $739,458.36, leaving an unexpended balance of $107,941.64, out of which unsettled accounts must be paid. This balance is due to the fact that less new and additional service than was contemplated was authorized and the additional expense on account of the parcel-post system was considerably less than was anticipated.

"The appropriation for the fiscal year 1915 is $784,000.

"The annual rate of expenditure was:

July 1, 1914	$762,283.92
Sept. 30, 1914	775,565.78

"The sum estimated as necessary for the fiscal year ending June 30, 1916, is $845,000, being $61,000, or 7.78 per cent, more than the appropriation for the previous year.

"*Electric car rates.*—The annual rate of expenditure for electric and cable car service authorized at the various rates provided by law was, on June 30, 1914, as follows:

At 3 cents a mile	$194,572.97
At 4 cents a mile	54,391.69
Under special provision	6,007.20
At railroad rates	58,860.91
At schedule rates other than 3 cents and 4 cents a mile	37,400.00
At apartment and independent car regular rates	34,828.80
At apartment and independent car maximum rates	370,579.45
At special agreement rates less than regular rates	5,564.37
Total	$762,205.39

"The estimates for the next fiscal year include the existing special provisions regarding rates that may be paid.

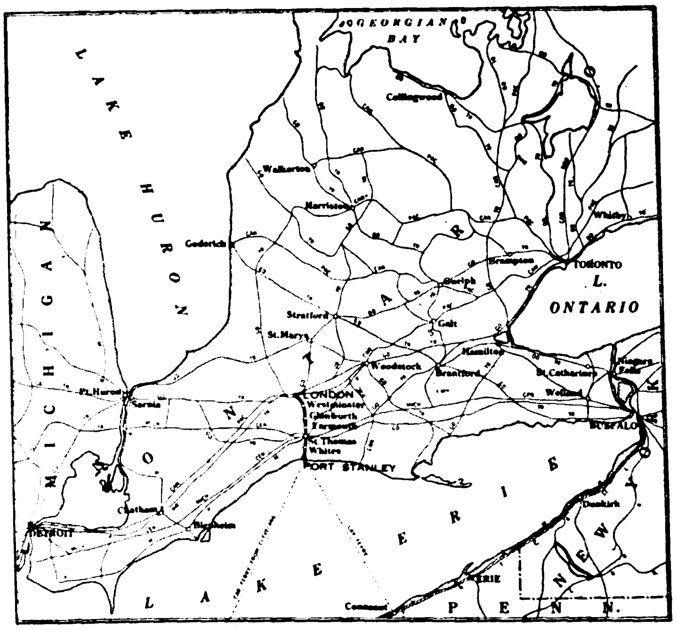
"Many demands were made upon the department during the fiscal year by electric car companies for increased compensation, and increases were allowed where conditions warranted. The Connecticut Company, performing service in the State of Connecticut, refused to accept the compensation fixed by law and abandoned the service on eighteen routes during the year. Substitute service was provided for all offices concerned. At Brooklyn, N. Y., the Brooklyn Heights Railroad Company, having refused to continue the electric car service under the usual conditions imposed by the department and for the rates fixed by law, the electric car service was discontinued and superseded by automobile service."

Electrification of London & Port Stanley Railroad

This Is the First Step in the 1500-Volt, Direct-Current Electrification of the Ontario Municipal Railways

Various municipalities of the province of Ontario, Canada, have for some time been considering an extensive system of inter-connecting electric railways. The general scheme provides for a network of interurban roads supported, as it were, by a backbone of main line electrification handling a relatively heavy freight service. The links connecting the cities and towns will be municipally owned and operated, thus continuing the already extensive municipal ownership feature existing in Canada.

The scheme, in brief, contemplates new roads, or the electrification of existing steam roads, through the central part of that portion of the province lying between Lake Erie and the Georgian Bay. The roads extend from Sarnia on the west to Toronto and Whitby on the east, passing through London, St. Mary's and Guelph. This route follows generally the transmission system of the Hydro-Electric Power Commission from Niagara Falls. Several branches and connections are contemplated, communicating with all the larger cities in that portion of the province, and the proximity of the transmission system affords excellent facilities for substation locations and precludes the necessity of building a distributing transmission line along a large part of the right-of-way.



ONTARIO ELECTRIFICATIONS—MAP SHOWING LONDON-PORT STANLEY LINE, THE FIRST STEP IN THE GENERAL PLAN

The Hydro-Electric Commission of Ontario, of which Sir Adam Beck is chairman and F. A. Gaby is chief engineer, will perform the double function of consulting engineer and contractor for the entire project, installing all equipment ready for operation. The individual sections of the system will then be turned over to the municipalities for operation. The city of London

has taken the first step in this plan and is now proceeding with the electrification of that portion of the main line between Port Stanley on Lake Erie and London, about 24 miles north thereof, mention of the expected costs and operating conditions having been made in the ELECTRIC RAILWAY JOURNAL for Sept. 27, 1913, page 505.

This road has for several years been leased by the city of London to the Pere Marquette Railroad and it forms an important connecting link between the Lake Erie freight ferries and the distributing centers of the province of Ontario. The chief commodity for transportation is coal from Pennsylvania. The single-track line is approximately 23.5 miles long and passes through Whites, St. Thomas, Glenworth and Westminster, connecting with the main lines of the Grand Trunk, Michigan Central and Canadian Pacific Railroads. The profile includes a maximum of 1 per cent grade north of Port Stanley and contains other grades of 0.8 per cent and 0.5 per cent for short distances.

The scheduled service will comprise locomotive freight traffic and multiple-unit passenger car trains between the two termini. Sixty-ton locomotives will take loaded freight cars from the ferry boats at Port Stanley and will haul them in trains of approximately 800 tons to St. Thomas and London, returning with trains of empty cars. In addition there is a local traffic of merchandise between the stations along the line. The passenger service will be performed by limited and local trains consisting, for a large part of the time, of two-car trains providing a half-hourly service in each direction, the limited and local trains alternating. Trail cars will be used with each motor car.

At the inception of the work the Hydro-Electric Commission made a careful investigation of operating results to be expected with high-voltage direct current and also with single-phase alternating current for the trolley, resulting in the final adoption of 1500-volt direct current for propulsion. The energy will be supplied from two substations; one located at London in an extension of the present Hydro-Electric substation, and the other at a distance of 14.2 miles from London, near St. Thomas. The latter will be a new substation. Each will be equipped with synchronous converters and the necessary transformers and switchboards for conversion of the power from the 110,000-volt, twenty-five-cycle form in which it will be supplied by the Hydro-Electric Power Commission's lines.

The overhead structure will be of the familiar single-catenary type supported on side brackets from lattice steel poles placed approximately 180 ft. apart on the tangents. The No. 0000 copper trolley wire will be supplemented by suitable copper feeders.

The materials covered by the first order placed with the General Electric Company includes three 1500-volt, 60-ton locomotives and equipments for five four-motor, 1500-volt passenger cars complete with multiple-unit control and air brakes, and for four trail-cars with controllers and air brakes. Each of the locomotives will be carried on two swivel trucks, bringing all the weight on the drivers, the equipment being housed in a steel, box-type cab extending over practically the entire length of the locomotive. Each will be provided with four GE-251, 750-1500-volt motors designed for 750 volts across each armature and insulated for 1500 volts. The motors will be connected permanently in pairs in series, and the two motor groups thus formed will be capable of connection in series or parallel for speed control. The cab will be divided into three compartments, one at each end for accommodating the operator, and an intervening compartment where the control equipment and accessories will be located. The operating compartments will be provided with 1500-volt electric heaters.

Each of the motors will have an hourly rating of 245 hp with 1500 volts on the trolley, giving a total of 980 hp for the locomotive. At this rating the locomotive will exert a tractive effort of 21,500 lb. Control will be effected by a double-end, type-M, standard equipment, a master controller at each operating position actuating the main 1500-volt contactors by means of a 600-volt circuit supplied from a dynamotor. Provision is made for multiple-unit train operation so that the simultaneous control of three locomotives coupled together can be accomplished from any master controller. The equipment is also designed so that a locomotive may haul a train of eight or ten passenger trail cars and provide lighting energy for them at 600 volts.

The current collectors for the locomotives will consist of pantograph slider trolleys having two contact pans pressing against the trolley conductor. Two of these devices will be furnished on each locomotive. They will be electro-pneumatically controlled from any operating position with one, two or three locomotives hauling a train.

Each motor passenger car will be driven by four GE-225, 750-1500-volt, fully-ventilated, commutating-pole motors connected in groups of two in series. The one-hour rating is 125 hp with 1500 volts on the trolley. Each motor car has sufficient capacity to haul one trail car, and provision is made for the motor and trail cars to be operated in trains up to a total of three motor and three trail cars. All trail cars will be equipped with master controllers at each end, so that multiple-unit train operation is possible from either end of any motor or trail car.

Control energy for the cars will be derived from a 1500-600-volt dynamotor on each motor car. The dynamotor will also supply sufficient energy to light one motor and one trail car. Main and auxiliary train cables will run continuously throughout a train, provision being made for the simultaneous raising and lowering of all pantographs and also for simultaneous sanding (by electro-pneumatic valves) of all cars from any operating position. The pantograph trolleys will be identical with those on the locomotives.

Each car will carry a combined straight and automatic air-brake outfit of the variable release type, with the air supply furnished by 1500-volt compressors. The compressor governors will all be equalized on a special wire running throughout the trains in the auxiliary train cable.

The cars will be built according to the commission's specifications. They will be all-steel, 59 ft. long, and thoroughly modern in every respect. Motor and trail cars will be identical except for the motors. The motor car will weigh approximately 51 tons when fully equipped, while the trailer will have an approximate weight of 32 tons.

"Safety First" Competition in Louisville

In the competition conducted by the Louisville Railway Company to select sentence sermons on safety first to be used on the cards which are being displayed in the company's cars, 642 suggestions were received by the committee which acted as judges. Out of this number the committee, of which Superintendent Samuel Riddle was a member, selected the following for the first award: "Never cross in front of a moving car. There is more room behind." The second award was made for the following sentence: "Here, There, and Everywhere, Safety First."

One of the contestants was given to making rhymes. His suggestions were: "Safety first on cars and trains, saves many travelers aches and pains," and "No matter how great the hurry, 'safety first' saves time and worry."

Hearing Before Interstate Commerce Commission

Argument by John T. Beasley of Terre Haute on Authority of Interstate Commerce Commission to Require Reports of Accidents and Other Statistics from Urban Railways

The hearing of the Interstate Commerce Commission on the subject of urban railway reports was held at the rooms of the commission in Washington on Dec. 18. The full commission was present. There was also quite a gathering of electric railway officials and counsel in attendance. They included John T. Beasley, counsel Terre Haute, Indianapolis & Eastern Traction Company; James F. Jackson, general counsel Bay State Street Railway and formerly chairman Massachusetts Railroad Commission; John C. Donnelly, chief counsel Detroit United Railways, Detroit; B. F. Weadock, counsel of the same company; Horace F. Clark, Washington representative of the American Electric Railway Association; C. Loomis Allen, president American Electric Railway Association and president Newport News & Hampton Railway, Gas & Electric Company; C. L. Henry, first vice-president of the association and president Indianapolis & Cincinnati Traction Company; Arthur W. Brady, chairman of the committee on federal relations and president Indiana Union Traction Company; L. S. Storrs, third vice-president of the association and president Connecticut Company; R. I. Todd, president Terre Haute, Indianapolis & Eastern Traction Company; E. C. Foster, president Manchester (N. H.) Traction, Light & Power Company; J. N. Shannahan, vice-president and general manager Newport News & Hampton Railway, Gas & Electric Company; F. W. Coen, vice-president and general manager Lake Shore Electric Railway; S. K. Colby of Allen & Peck, Inc.; C. C. Peirce, vice-president Providence & Fall River Railway Company and director Boston & Worcester Electric Railway; H. P. Megaree, assistant to the vice-president American Railways Company; H. G. McConnaughy, secretary American Electric Railway Manufacturers' Association; W. F. Ham, vice-president and comptroller Washington Railway & Electric Company; E. B. Burritt, secretary American Electric Railway Association; Henry B. Sawyer, treasurer Stone & Webster Management Association; W. Motley of Gaston, Snow & Saltonstall, counsel for the Boston Elevated Railway; S. S. Perry, legal department New York, New Haven & Hartford Railroad; J. H. Hanna, chief engineer Capital Traction Company, Washington, D. C.; F. W. Hoover, second vice-president Chattanooga Railway & Light Company; I. W. Phelps, claim agent Union Street Railway of New Bedford, and H. W. Blake, ELECTRIC RAILWAY JOURNAL.

The hearing which was to have been held in the morning was postponed until the afternoon so that the commission could listen to the arguments of counsel in a rate case in which the Denver & Rio Grande Railroad was concerned. This case was concluded at 2:45 p. m. and the electric railways then had an opportunity of presenting their case.

The principal argument was made by John T. Beasley, general counsel Terre Haute, Indianapolis & Eastern Traction Company, in the unavoidable absence of J. M. Barrett, president Fort Wayne & Northern Indiana Traction Company. Mr. Beasley explained that he did not have an opportunity, after receiving word that Mr. Barrett would not be able to be present, to prepare his argument in as logical and comprehensive a way as he otherwise would like to have done, but he expressed the hope that he would receive the right to prepare and file a formal brief later. He explained that the hearing did not relate to any concrete case, but it was granted to afford the railways an opportunity to express their views with regard to the statistics, particularly in regard to urban properties, which the railways that had an interstate business were being asked to file with the commission.

Commissioner Harlan asked whether Mr. Beasley would present his argument simply on the filing of accident reports or on the broader question of all statistical reports.

Mr. Beasley said he would proceed along the broader lines. The question, he said, involves a consideration of the Interstate Commerce Commission act itself and turns largely upon the language employed to designate the subjects coming under the act and particularly what the word "railroad" means in the various acts. Mr. Beasley then quoted from the act itself as well as from the safety appliance act to show that the same language was used in both cases, and he said that it is a familiar rule of law that when language has been employed in an act which has been construed by the courts and the same language is used in a later act, the words used in the later act have the same significance as those whose meaning has been defined. For this reason the term "railroad," mentioned in the safety appliance act, and referring to common carriers engaged in interstate commerce, must mean the same kind of carriers described in the previous acts. He added that these several acts have received interpretation by a number of the federal courts, including the United States Supreme Court.

Continuing, he said that in Indiana, with whose conditions he was most familiar, all of the interurban electric railways, so far as he knew, were incorporated under what is known there as the street railway act. This act was the one under which the original horse car lines were incorporated. Gradually these lines were extended into the suburbs, and when electric power became available the railways were extended from one town to another. In most of these cases the electric railway companies operate three classes of service, namely, (1) a local railway system, (2) the interurban system, and (3) the supply of electric current for lighting and power. In Terre Haute, for example, the same power plant supplies all of these services, and he pointed out that it was not possible either legally or practically to separate the units in this power station and to say that one unit was used in interstate business and another in local business. Hence, if the interstate commerce law applied to such companies and to the officers of such companies, it would necessarily apply to all of the officers in all of the services supplied by the company. Again, if the act was construed to apply to accidents which occurred to linemen on a transmission line supplying the interurban railway service, it would have to apply to accidents to linemen on transmission lines which in many cases were far distant from the railroads. He should say, therefore, that the safety appliance act should be narrowed to the particular accidents described in the act, and the act itself to roads having a "roadbed," that is, a private right-of-way.

Commissioner Harlan at this point asked what distinction, if any, Mr. Beasley drew between electric railways operating over streets and steam railroads operating over city streets when passing through a city.

Mr. Beasley thought that there was no difficulty in drawing a clear distinction. He said that so far as the companies with which he was connected were concerned, they did not object to reporting accidents which occurred on their interurban interstate lines but did object to reporting accidents on lines forming a part of their city service. He thought that the Goodrich transportation case did not apply in this instance. In that case the carriers were engaged in maritime commerce but also operated pleasure parks. The United States Supreme Court held that the operation of these parks was incidental only to the interstate business of the company. With an electric railway, on the other hand, there was no connection between the city service and the interurban service. The company operated different cars and different crews in each service and it had no passenger stations in its city service. Usually, also, it had a different superintendent and in its city service collected fares according to the city system, whereas on the interurban lines tickets were sold. It is true the interurban cars pass through the city, but they do not branch out and supply the local city service.

Commissioner Clark asked Mr. Beasley whether he would consider that the Washington, Baltimore & Annapolis Electric Railway was engaged in interstate traffic and should report the accidents in case it had any while operating over the city streets in Washington.

Mr. Beasley replied that the companies with which he was connected had no complaint to make in regard to reporting accidents on their interurban interstate lines.

Commissioner Daniels asked whether he believed that accidents which occurred in a repair shop which was common to an interstate line and to a local line should be reported.

Mr. Beasley replied in the negative. He thought that the accident should apply to something on the line of the railroad and not in the repair shop any more than on the transmission line.

Commissioner Harlan suggested the case of an interstate railroad which had a street car line at each end. He said that Mr. Beasley admitted that such a company should file reports of accidents on the interurban line and asked whether he thought that the company should also file reports of its financial operations.

Mr. Beasley replied that he did not admit that a company should report accidents on its interurban line. Personally, he believed that the commission had no authority to require such a report, but said his clients were not going to bring up this matter at present. Continuing his argument, he said he believed that the Supreme Court had clearly defined the language of the Interstate Commerce Commission act, especially in the case of the Omaha & Council Bluffs Street Railway, a company which supplied local transportation service across a bridge between Omaha, Neb., and Council Bluffs, Ia., as well as local service in each city. Mr. Beasley read extracts from this decision to show that although this road was an interstate road engaged in traffic the Supreme Court had held that it was not the kind of road which the court considered that Congress had in mind in passing the interstate commerce act.

Mr. Beasley referred to the debate on the bill in the Senate and the House and to its course through Congress, as further proof of the fact that Congress had in mind the ordinary railroad and not electric and interurban or street railroads in the passage of the act. He called particular atention to the case of United States v. New York Central Railroad Company, 205 Fed. 428, holding that where a train of cars was hauled by a switch engine over certain tracks and switched from one part of a railroad yard to another, that they might be classified, inspected and assembled, they were not engaged in interstate commerce so as to render the carrier are liable for violation of the safety appliance act, and to the case of Illinois Central Railroad Company v. Behrens, 58 L. Ed. 646, where it was held by the United States Supreme Court as late as March 6, 1914, that a fireman employed by an interstate railway carrier on a switch engine, who was killed while aiding in the work of moving several cars all loaded with intrastate freight between two points in the same city, was not employed in interstate commerce. In this case, he pointed out, the court quotes with approval from the Penderson case as follows:

"There can be no doubt that a right of recovery thereunder (employers' liability act) arises only where the injury is suffered while the carrier is engaged in interstate commerce and while the employee is employed by the carrier in such commerce."

Mr. Beasley's argument, according to the ruling of the commission, was limited to one hour. As he had then occupied fifty-five minutes, the chairman called his attention to this fact, and Mr. Beasley requested permission to file a brief. He received permission to do this if filed within thirty days. This permission was also granted to several other companies whose representatives asked the same privileges.

Recruiting Cars at Hull, England

W. J. McCombe, manager of Hull Corporation tramways, has recently received the sanction of the Lord Mayor to carry out an interesting recruiting scheme in which tramcars will be used as traveling information bureaus. Two electric cars are to be run for eight or nine hours daily on various routes for conveying prospective recruits to the City Hall. The cars will be driven by men in khaki, some of the drivers and conductors in the tramway service being frontiersmen, and the cars will be elaborately decorated with the flags of the Allies and notices bearing an invitation to men to "join now." Officials qualified to give advice on all questions of recruiting, rates of pay, separation allowances, pensions, etc., accompany each car to answer all inquiries. A timetable will be published so that the public will be able to know on which route and at what time the cars will be running.

Trespassers and Railroad Accidents

A bulletin issued by the coroner's office of Cook County, Ill., in which Chicago is situated, states that 70 per cent of all fatal accidents on railroads occur to trespassers, or to children playing on the tracks. It is also noted that a large proportion of these accidents occurred in Illinois, there being more in Cook County than in any other county in the United States, and more in Chicago than in any other city in the United States. On the other hand, the bulletin calls attention to the fact that there was a decrease of 30 per cent below the average for the last ten years and that street railway accidents during that period have been reduced 14 per cent. This marked decrease in the number of accidents to children and trespassers is believed to be due to the work of the public safety commission of Chicago.

United States Consul H. M. Byington reports that the city of Leeds, England, devoted the following surplus profits from its municipally owned public utilities to the relief of taxes for the year ended March 31, 1914: tramways, $340,924; electric lighting, $69,714; waterworks, $60,636; total, $470,936.

COMMUNICATIONS

"Poisoning the Wells" Again

LAFAYETTE COLLEGE
EASTON, PA., Dec. 16, 1914.

To the Editors:

It must be a matter of sincere regret to all interested in electric railway work that the editors of *The New Republic* in the issue of Nov. 21 have seen fit to condemn in such a point-blank way a sincere attempt of the American Electric Railway Association to be of real service in the solution of the electrical problems of today. I refer to the formulation by a very able committee of this association of a "Code of Principles" and the proposal that addresses be given before our student bodies by men of prominence in the electric railway field in order that a more thorough and better understanding between our railways and the public may be brought about.

In this country no man or cause is adjudged guilty until properly proven so after a fair and unbiased hearing of the case. Certainly such has not been given to the cause in question by *The New Republic*. Fortunately an appeal can readily be taken to a court of higher powers, the public. This can be reached through our colleges and through the press.

It is to be hoped that this snap decision against the action and recommendations of this committee may only serve to stir it and the association to even greater activity in pushing this matter. It is too important a question to be let drop merely because some see fit to oppose or condemn it. Certainly no one can deny that there is needed a closer and better understanding between the electric railways and the public they serve. Any movement which makes for this should in every way be helped and not hindered. It is not less but clearer mutual understanding that we need; not less but more and better publicity. I know of no better or more legitimate way of obtaining this than that proposed by the committee.

It is sincerely to be hoped that all interested in electric railway work, as well as the American Electric Railway Association, will stand behind this committee and aid it in its valuable work.

JAMES THERON ROOD,
Professor of Electrical Engineering.

CASE SCHOOL OF APPLIED SCIENCE
CLEVELAND, OHIO, Dec. 16, 1914.

To the Editors:

I have noted with interest your editorial in a recent issue of the ELECTRIC RAILWAY JOURNAL citicising an article in *The New Republic*. I feel very strongly that the opinion expressed in the latter article is based upon a complete misunderstanding of the recommendations of the public relations committee of the American Electric Railway Association. I attended the convention at Atlantic City, and heard not only the report of the public relations committee, various papers bearing on the public relations of the electric railway companies and the discussion on the "Code of Principles," but I had the opportunity to talk personally with many heads of railway companies.

Throughout all the discussions I was impressed with the obvious fairness of the attitude of the men having to do with the shaping of the policy of these public service corporations. It was said, and rightly, that the technical colleges ought to give more attention to the study of railway economics.

There has undoubtedly been but little attention given in the past to this very important subject. As educators we have been rather busily engaged in the engineering phases of our work and because this part of our curriculum has necessarily absorbed a large share of our time, and perhaps because of a lack of thorough understanding ourselves of railroad economics, we have not given sufficient attention to the economic questions involved.

Personally, I interpreted the suggestions of the public relations committee to mean that they wished to afford the technical educators of the country such contact with the railway industry as would permit them to study the economics of the railway business at first hand.

An increasing number of graduates of technical schools are rising to executive positions. There they must meet the many economic and social problems of to-day and, as educators having to do with the technical training of men, we should welcome the opportunity offered by the association to study these problems at first hand and thereby assist our students to a better understanding of them.

I felt throughout the recent convention that the attitude of the railway men toward me as a teacher could be expressed approximately thus: "You are training men we are to use. As railway men, we have many problems which you ought to know about. We don't ask you to accept our views or codes unless you find them to be right and just. But we do want you to know what our problems are, understand our point of view, believe that we are honest and sincere, appreciate that in the long run our interest and the public's interest are one, and then, in so far as you can in your teaching, present the various aspects of the electric railway industry to your students and encourage them to study from all sides, the economic questions involved."

I trust you will be able to read out of this my very sincere appreciation of the spirit of the Atlantic City convention as I found it. HENRY B. DATES,
Professor of Electrical Engineering.

Average Wear of Steel Wheels

In a recent test made by H. H. Buckman, master mechanic of the Louisville & Northern Railway, it was found that the average wear obtained from steel wheels with the American Electric Railway Association contour before the first turning, was 48,000 miles. The contour of these wheels was changed at the first turning to the C. E. R. A. standard, adopted as recommended practice at the November meeting. The mileage obtained from this C. E. R. A. contour between the first and second turning was 54,000, or greater than that obtained before first turning when the American Association contour was used. This increased life secured between the first and second turning is attributed to the additional metal in the C. E. R. A. contour at points where the American Association contour showed excessive wear.

Another Reason for Low Steps

A paper read at a meeting of the Chicago Osteopath Society, held recently, stated that the high steps of street cars were responsible for much lumbago and sciatica. In explaining the reason for this conclusion it was stated that the constant or even occasional reaching for high car steps caused a twisting of the pelvic joint, which produced a pressure upon the nerves, thereby shutting off the regular flow of blood. This resulted in producing severe pain that eventually developed into lumbago or sciatica. As a remedy for this, theuse of lower steps or of more steps where the car platform was high was recommended.

American Association News

Manufacturers' Association Executive Committee Holds Annual Meeting—Equipment Sub-Committee Assignments Are Made—Biographical Sketches of Company Section Officials Are Given Below

MEETING OF THE EXECUTIVE COMMITTEE OF MANUFACTURERS' ASSOCIATION

The executive committee of the American Electric Railway Manufacturers' Association held its annual meeting on Dec. 11 at the offices of the association, 165 Broadway, New York. The meeting was called to close the business of the current year. President Cornell S. Hawley presided and the others in attendance were Safford K. Colby, W. L. Conwell, F. A. Elmquist, Henry C. Evans, Thomas Farmer, Jr., B. A. Hegeman, Jr., Charles C. Peirce, Daniel W. Smith, E. F. Wickwire, George Stanton, W. F. Cutler and Secretary H. G. McConnaughy.

Reports covering the October convention at Atlantic City were received from Vice-President Ellicott, in charge of entertainment, Vice-President Colby in charge of finance, and Vice-President Baker, in charge of exhibits. The treasurer's annual financial statement and other reports from the chairman of various committees were also submitted.

Charles C. Peirce then made a report for the joint dinner committee for the 1915 mid-year meeting, in which he stated that arrangements had been completed to hold the dinner at the New Willard Hotel, Washington, D. C., on the evening of Friday, Jan. 29. Mr. Peirce also outlined a tentative program of that meeting. Letters from both the Railway Association and the Manufacturers' Association containing application blanks for tickets and giving full information regarding the dinner will be sent to the members of each association shortly.

The committee on speakers reported progress and announced that arrangements were under way to secure speakers of national prominence and that the names would be announced later.

Mr. Hawley then retired from the chair, and in the absence of President-elect Baker, Charles C. Peirce was made temporary chairman.

Mr. Peirce asked for a report from the committee on resolutions, and Mr. Colby read the resolutions which the committee had prepared, speaking of the excellence of the work of the retiring president, Mr. Hawley, Chairman W. G. Kaylor of the entertainment committee and Chairman Wylie Brown of the finance committee. The resolutions in regard to Messrs. Kaylor and Brown expressed the thanks of the association for the work accomplished by them and their committees. In the resolution referring to Mr. Hawley, the committee expressed its appreciation of the fact that the splendid advance made by the association and the increased scope of its work was due in a large measure to his executive skill, hard work and close attention to detail and thanked him for his untiring devotion to the interests and aims of the association.

DECEMBER MEETING OF DENVER TRAMWAY SECTION

The twenty-second regular monthly meeting of the Denver Tramway Company Section was held in the Tramway Auditorium on Dec. 17 with an attendance of 100. The presiding officer, C. B. Wells, made an introductory address which was followed by a paper by Walter L. Whitlock, foreman south division, track department. This paper covered the author's observations during a recent trip to St. Louis. Auxiliary papers were read by H. N. Hilling and G. S. LeVine. The papers were followed by a lively discussion.

FOUR LIVE COMPANY SECTION OFFICIALS

These portraits and biographical notes are printed on the "Association News" pages in order to give a personal touch between the readers and company sections.

C. B. Wells, who was recently elected president of the Denver Tramway Company section, began his business career on a cattle range of Wyoming. Later, with his father, he went to Denver, where educational opportunities were better than in the cattle country. He entered the service of the Denver Tramway Company in 1891 as stenographer in the transportation department. Not long after he was appointed to the position of chief clerk and in 1910 was made superintendent of transportation. In June of the present year Mr. Wells became assistant to the general manager of the company and editor and manager of the *Tramway Bulletin*, a monthly magazine published for circulation among the employees of the company.

C. B. WELLS
President Denver Tramway Company Section

H. G. MUNDHENK
Secretary Denver Tramway Company Section

In addition to his electric railway work, he is considerably interested in Denver real estate and has identified himself in the larger welfare of the city. In connection with his work with the company he has taken an active part in the welfare associations organized among the men and has personally participated in the club work, particularly in the bowling league and billiard contests, and has organized a successful glee club. His enjoyment of these activities and his interest in the men of the company have served to keep him in the street car business in spite of a strong leaning on the side of real estate. Mr. Wells' ambition is to be considered the true friend of the "Tramway boys" and he prizes nothing more than the good-will that they constantly show him.

H. G. Mundhenk, who was recently elected to his third term of office as secretary of the Denver Tramway Company Section, was a member of the class of 1908 in the University of Wisconsin. He entered the employ of the Denver Tramway Company in the transportation department as stenographer in 1906 and has served in this department since that year. In addition to being secretary of the company section he is also secretary of the Central Tramway Club, an organization of employees of the company, having a membership of about 300. Immediately after taking up work with the company, Mr. Mundhenk interested himself actively in welfare work among the employees, and his election as secretary of the company section indicates the esteem in which he was held.

George G. Whitney, president of the Washington Railway & Electric Company section, has lived in Washington for just thirty years, having been transferred there at the age of three from his native Republican City, Neb. After a course in the grade and business high schools, in 1899 he entered the employ of the predecessor of his present employer, the then Washington Traction & Electric Company. At that time the Washington roads were in process of electrification. Since 1900 he has been associated with W. F. Ham, comptroller, having been chief clerk of the accounting department since 1909. Mr. Whitney is a member of the American Association committee on company sections and individual membership and of the Accountants' Association committee of education. He was re-elected president of company section No. 4 in October.

GEORGE G. WHITNEY
President Washington Company Section

B. F. HUNTER
Secretary Washington Company Section

B. F. Hunter, who is secretary of the Washington Railway & Electric Company section, was born in Washington in 1891. He attended the public schools in that city and graduated from the business high school in 1909. After filling a preliminary position with a local lumber firm, with which he remained about six months, he was employed in the claim department of the Washington Railway & Electric Company, and is still so employed. While Mr. Hunter is undoubtedly the youngest of the company section secretaries, his recent re-election to his present office is a guarantee that he is doing effective work in it.

COMING COMMITTEE MEETINGS

A meeting of the American Association valuation committee, L. S. Storrs, president the Connecticut Company, chairman, will be held at association headquarters at 2 p. m. on Jan. 7.

The American Association committee on education will meet at the same place at 10 a. m. on Jan. 4. This committee will take up the work on the correspondence course now being inaugurated under the auspices of the association and will lay definite plans for keeping track of the instruction and for stimulating interest.

Sub-committees of the joint committee of the Engineering and Transportation & Traffic Associations on block signals, J. M. Waldron and J. W. Brown, co-chairmen, will meet in New York as follows: Jan. 4, design of standard signal apparatus, J. M. Waldron, chairman; study of costs of maintenance, etc., of signal systems, G. W. Brown, chairman; review of block signal standards and recommendations, C. H. Morrison, chairman; Jan. 5, clearance diagram for semaphore signals; J. Leisenring, chairman; light signals for interurban railways, J. Leisenring, chairman; consideration of A. I. E. E. standardization rules, G. N. Brown, chairman; preparation of a list of items of information needed in connection with block signal contracts, J. M. Waldron and G. N. Brown, co-chairmen.

COMMITTEE ON EQUIPMENT

W. G. Gove, superintendent of equipment Brooklyn Rapid Transit System, chairman of the Engineering Association committee on equipment, has made his assignments of sub-committee work as follows, the name of the chairman being given first in each case: Specifications for heat-treated carbon-steel axles, shafts and similar parts, W. E. Johnson, New York Municipal Railway; R. H. Dalgleish, Capital Traction Company (Washington, D. C.); specifications for gears and pinions, R. H. Dalgleish, J. R. Ayers, New York State Railways (Utica, N. Y.); M. C. B. brass for heavy electric traction, R. N. Hemming, Union Traction Company of Indiana (Anderson, Ind.), L. M. Clark, Indianapolis Traction & Terminal Company; wires and cables for car equipment, W. R. McRae, Toronto (Ont.) Railway Company, F. W. Garrett, Boston Elevated Railway; specification for air-brake hose, W. E. Johnson, W. R. McRae; design of limit-of-wear gage, F. W. Garrett, W. E. Johnson; steel wheel design, J. R. Ayers, F. R. Phillips, Pittsburgh, Railways; to review all existing standards and recommendations originating with the committee on equipment, F. R. Phillips, R. H. Dalgleish; consideration of the A. I. E. E. standardization rules, L. M. Clark, R. N. Hemming.

New England Street Railway Club

At the monthly meeting of the New England Street Railway Club at Boston, Mass., on Dec. 17, H. A. Bullock, staff assistant to the president Brooklyn Rapid Transit Company, gave an illustrated address upon "Employees' Welfare." The work on the Brooklyn system was reviewed as described by the speaker in a paper published in the ELECTRIC RAILWAY JOURNAL of Oct. 16, 1913, with various supplementary remarks. Mr. Bullock described the medical inspection system of the company, which now requires five physicians, and which has reduced the total time lost from sickness by 25 per cent, 10,000 as against 8000 men being employed.

Much good has arisen from an arrangement by which men may apply for recreation time off for one day in ten, except on Saturdays, Sundays and holidays in the summer. A new and greatly improved portable "first aid" case has been designed, the fundamental solutions being kept in Thermos bottles, the smaller bottles being in papier-maché cases to prevent breakage. Individual dressings and bandages in sealed wax paper packages are used to prevent infection. A novel and useful feature in each case is a sealed compartment for doctors' convenience only, containing a hypodermic needle, catgut and other supplies. The cases cost about $18 each, complete, and 114 are now in use or on order. The prone pressure method of resuscitation is taught in first-aid classes and mechanical respiratory apparatus is used to supplement human effort, which tends to become fatigued too early in many cases. The speaker also described the work of the benefit association, the company's safety campaign, the pension system, excursions, recreation rooms and athletic activities, the last including a full-fledged baseball league which has been a great success in creating esprit-de-corps. George H. Vose, assistant superintendent United Shoe Machinery Company, Beverly, Mass., also described the welfare work of his organization.

Replaceable Flange Risers of Tool Steel in Seattle Special Work

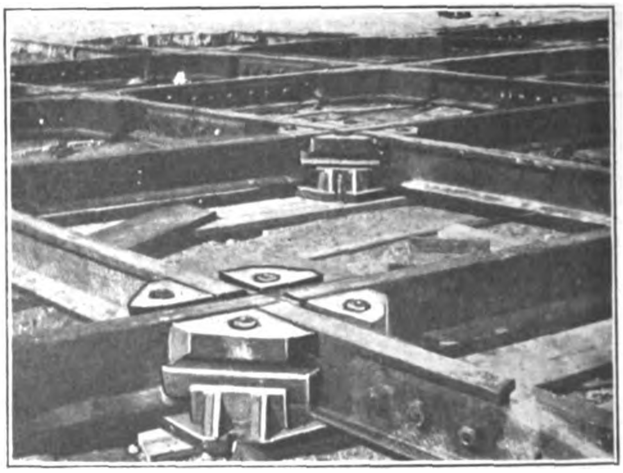
BY JOSEPH PARKIN, RECEIVER SEATTLE, RENTON & SOUTHERN RAILWAY

On the Seattle (Wash.), Renton & Southern Railroad, as elsewhere, loose and broken inserts, loose arms, worn points, etc., gave rise to heavy maintenance charges which, after considerable experience with various types, we had come to look upon as unavoidable.

APPEARANCE ON DEC. 2, 1914, OF CROSSING AT FOURTH AVENUE AND PINE STREET, SEATTLE, PLACED SEPTEMBER, 1913

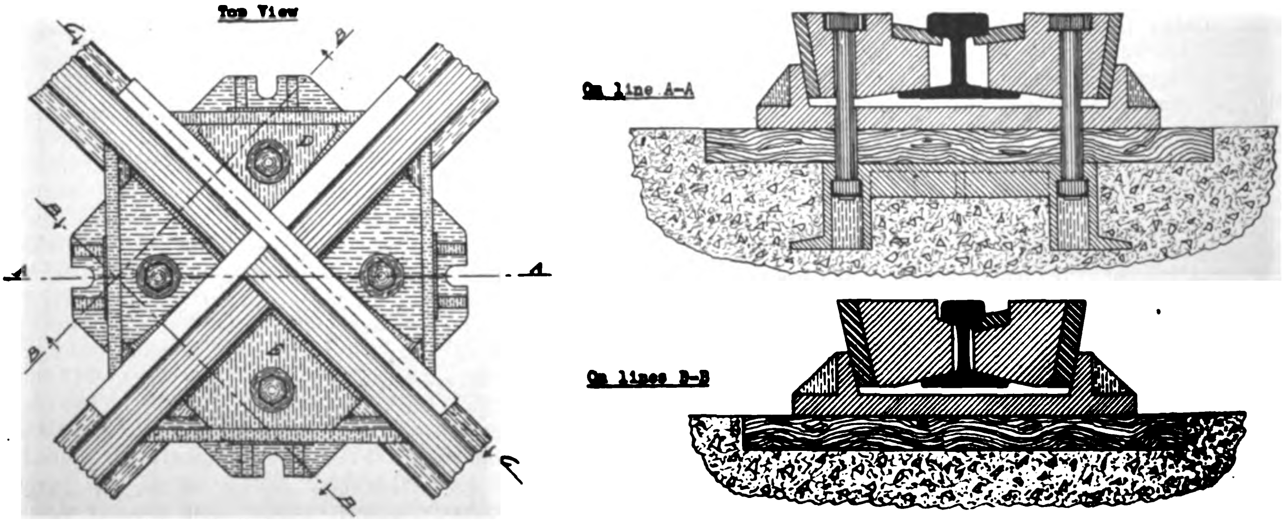
About a year and a half ago, however, there was brought to the writer's attention a new type of crossing which dispensed entirely with the unsatisfactory inserts and was designed, instead, to take the greatest part of the wear on a replaceable flange riser. These risers are made of tool steel, with a taper of about 1 in 40, instead of the abrupt rise found in most types of manganese work, where it is frequently as steep as 1 in 20 or even 1 in 12. The matter of easy approach was also looked after in tapering the throats of the frogs, with the result that the crossing gave very easy riding for the cars.

By avoiding the use of the expensive manganese steel, the designer, Merle J. Wightman, an engineer of Seattle, demonstrated with apparent good reasoning that he could produce a crossing for about one-half the cost of insert work. In view of this large initial saving, the writer was persuaded to install a double-track double diamond at Fourth Avenue and Pine Street, where it was submitted to a seven-minute headway, north and south, and a two-minute headway east and west.



CROSSING AS INSTALLED JUNE, 1913, FOURTEENTH AND JACKSON STREETS, SEATTLE, BEFORE THE ADDITION OF THE PAVING

In view of the easy riding qualities, a longer life was expected than for ordinary built-up work, but it was

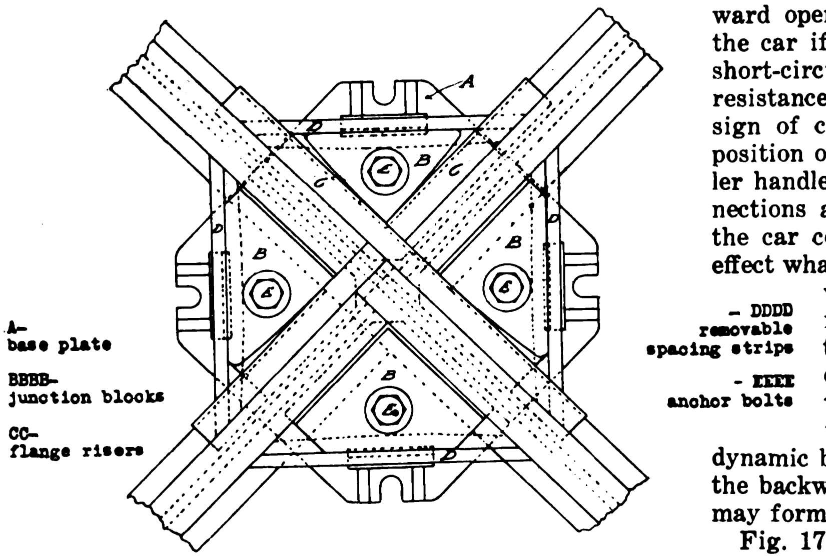


TOP VIEW OF THE ARCH-SUPPORTED CROSSING AND CROSS-SECTIONS SHOWING WOOD CUSHION AND ANCHOR PLATE IMBEDDED IN CONCRETE not supposed that its effective life would approach that of the manganese work. In this the company was agreeably disappointed. After fourteen months of continuous service, without attention, the crossing is in as good condition as at the start. It shows no wear except on the riser, and very little is found even there. Furthermore, a manganese insert diamond, installed about the same time and under similar conditions, has already required attention for loose inserts and shows much greater deterioration throughout than the Wightman type.

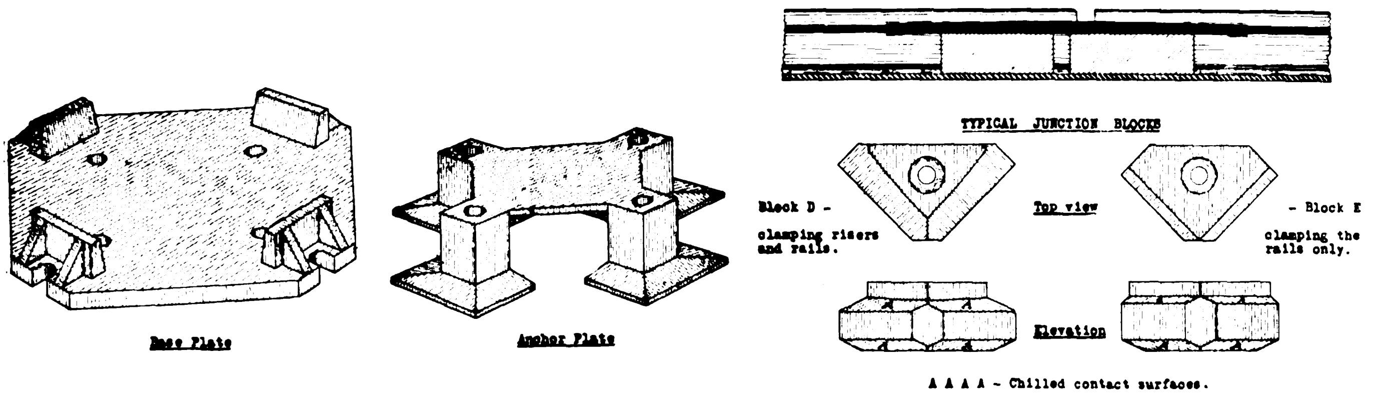
By reason of this excellent showing the Seattle, Renton & Southern Railroad has now adopted this crossing as standard. Two of our manganese diamonds have already been replaced at Jackson and Fourteenth Streets, and plans are now under way for replacing others with the new type at one of our busiest corners.

Although, as indicated, repair work is slight on these crossings, the design enables adjustments to be made both easily and quickly. All parts of the structure are readily produced in any local shop, particularly the flange risers, the only wearing parts, which are made of tool steel instead of manganese. These risers can be set in place by the average track man without disturbing the surrounding pavement.

As a whole, this crossing is so designed that no loosening of any of the component parts is possible. Every piece is automatically self-tightening, and repairs of any nature, even including shimming for the correction of uneven settlement, can be made without breaking the pavement at any point.



PLAN VIEW IN OUTLINE



GENERAL VIEW OF FOUNDATION STRUCTURES—SECTIONAL VIEW ALONG THE THROUGH RAIL ON LINE C-C OF TOP VIEW; ALSO SHOWING JUNCTION BLOCKS, RISERS AND OTHER DETAILS

The itemized cost of building the Fourth and Pine Streets crossing, comprising four diamonds, made in our own shops and the cost of installation, is as follows:

Material Used

Six 80-lb. rails, 32 ft. long—5120 lb. at $2.75 per hundredweight	$140.80
Sixteen base plates, cast iron—2350 lb. at 3 cents per pound	70.50
Sixty-four corner blocks, cast iron—3210 lb. at 3 cents per pound	96.30
Sixty-four 1-in. x 9-in. bolts and nuts	9.15
Thirty-two 1¼ in. x 2 in. tool-steel risers 27 in. long, 800 lb.	36.00
Sixty-four spacing strips, ¾ in. x 2 in. x 10 in.—270 lb. at 3 cents per pound	8.10
Washers, studs, incidentals, etc	11.00
	$371.85
Shop labor and engineering	235.00
Total cost, f.o.b. shops	$606.85

Cost of Installing

300 paving brick	$7.85
25 yd. granite paving blocks, at $2.05 per yard	51.25
19 yd. sand, at $1.70 per yard	32.30
18 bbl. cement at $2.30 per yard	41.40
Team hire, two days	12.00
	$144.80
Labor on foundation	114.00
Labor and superintendence, installing	147.00
Total cost, installation	$405.80
Grand total, for crossing in place	$1,012.65
Estimated cost for renewing risers	$108.00

Equipment Defects—Control Apparatus and Connections—VII

BY C. W. SQUIER, E.E.

Connections for Backward Braking—As already stated, if the motors on a car are connected for forward operation, they will produce a braking effect on the car if it moves in a backward direction simply by short-circuiting the motors on themselves through a resistance. This fact has been made use of in the design of certain controllers with contacts in the "off" position of the controller, so that whenever the controller handle is thrown to this position the necessary connections are made for backward braking. As long as the car continues moving in the forward direction no effect whatever will be produced. Such connections provide automatic means to prevent an excessive rate of backward speed, and afford an additional safeguard against the backward running of a car down grade after it has been brought to rest. It is not necessary for the controller to be arranged with points for electric or dynamic braking in the forward direction in order that the backward braking contacts may be added, but these may form a part of any controller.

Fig. 17 shows a simplified diagram for the Westinghouse type T-1 controller. This controller has the backward braking contacts in the "off" position and is also arranged for either electric or rheostatic braking of the car in the forward direction. This controller has four series, four parallel and seven brake points and is designed for the series-parallel operation of two motors,

Equipment Defects—Control Apparatus and Connections—VII

BY C. W. SQUIER, E.E.

Connections for Backward Braking—As already stated, if the motors on a car are connected for forward operation, they will produce a braking effect on the car if it moves in a backward direction simply by short-circuiting the motors on themselves through a resistance. This fact has been made use of in the design of certain controllers with contacts in the "off" position of the controller, so that whenever the controller handle is thrown to this position the necessary connections are made for backward braking. As long as the car continues moving in the forward direction no effect whatever will be produced. Such connections provide automatic means to prevent an excessive rate of backward speed, and afford an additional safeguard against the backward running of a car down grade after it has been brought to rest. It is not necessary for the controller to be arranged with points for electric or dynamic braking in the forward direction in order that the backward braking contacts may be added, but these may form a part of any controller.

Fig. 17 shows a simplified diagram for the Westinghouse type T-1 controller. This controller has the backward braking contacts in the "off" position and is also arranged for either electric or rheostatic braking of the car in the forward direction. This controller has four series, four parallel and seven brake points and is designed for the series-parallel operation of two motors, using the "short-circuited motor" method of transition from series to parallel.

Connections for Field Control—The regulation of the speed of railway motors by varying the strength of their fields is as old as railway motors themselves. Nearly all of the old double-reduction motors and some of the single-reduction motors were controlled in this manner. This was known as the "loop" system, and the term "loop" is still extensively used to-day by motormen to designate the last or full parallel position of the controller handle. They commonly say that they put the controller "on the loop," meaning that they threw the handle to the last position.

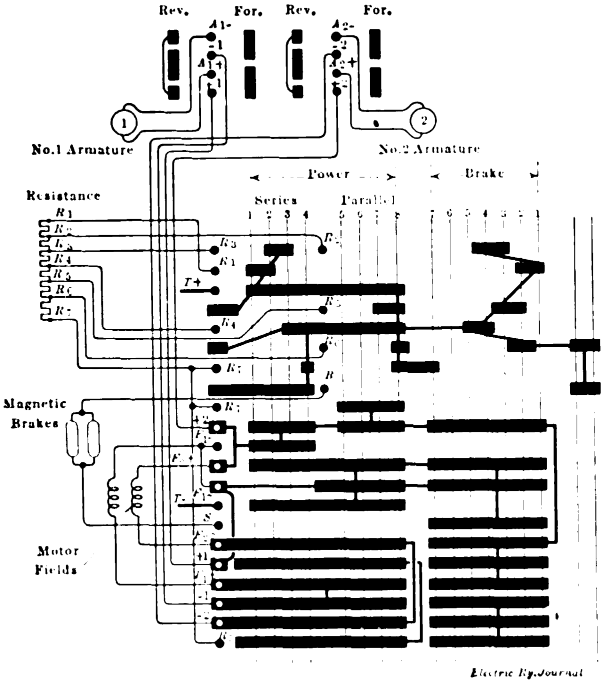

FIG. 17—CONNECTIONS FOR WESTINGHOUSE T-1 CONTROLLER

The first K controller and also the K-2 controller, which was designed twenty years ago, used this form of control. This method then met with poor success due to the difficulties of commutation in the older type motors. With the advent of the commutating-pole or interpole motor, and the use of high-grade carbon brushes with slotted commutators, this form of control has been resurrected in a modified form. Instead of shunting the fields, however, as was done previously, a portion of them is entirely cut out on the last notches for series and parallel. This method avoids having a non-inductive shunt around the motor fields. The shunt would make the magnetism sluggish and would be more liable to produce flashing.

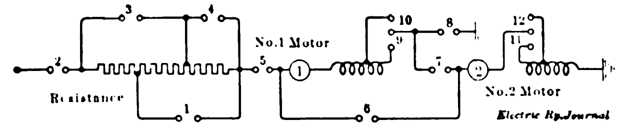

FIG. 18—MOTOR CIRCUIT CONNECTIONS WITH FIELD CONTROL

Fig. 18 shows the motor circuit connections commonly used with field control motors. After the regulating resistance is cut out the first running point is reached with both motors in series and with full field. Contacts 10 and 12 are next closed and 9 and 11 are opened. This first short-circuits and then cuts out a portion of the field in each motor so that we have the first tapped field position with both motors in series, which is the second running point. Before changing the connections to place the motors in parallel, the full field of the motors is again restored, so that we pass through the parallel resistance notches to the third running point with full fields in the motors, when a portion of the fields is again cut out and we have the fourth running point with the motors operating in parallel with tapped or short field. With these connections four different operating speeds are obtained; two in series and two in parallel with full and tapped field respectively.

With some types of control the tapped field speed in series is omitted. This permits the use of a standard controller if a current relay is used to operate switches for changing the field strength, and also simplifies the connections, as no interlocking is necessary to prevent going into parallel with short field. The only advantage gained by having a short field position in series is the small saving in energy that will be obtained. However, as the time that the short field position in series is used is very small, the saving will be correspondingly small, and this does not appear to be worth the added complications in the control. With the connections as shown in Fig. 18, the change from full to tapped field is made without introducing any regulating resistance into the circuit. This produces a high peak in the current as the field is reduced and requires very careful proportioning of the motor characteristics to prevent the peak from becoming objectionable.

The chief advantage of field control lies in its greater flexibility so that the same equipment may be operated efficiently in different classes of service. The saving in the energy consumed during acceleration is another advantage about which much has been written. Most of the work accomplished by the motors in bringing the car up to a speed where they can be operated in parallel across the line is done with resistance in circuit. Field control permits the regulating resistance to be cut out at a lower speed and so reduces the rheostatic losses. A more extended discussion of the saving in energy due to field control will be taken up in discussing motor defects.

Effects of Short-Circuited Field Coils—Ground and Puncture Tests

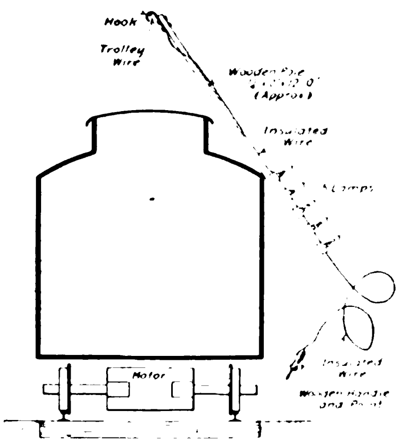
BY F. J. FOOTE, MASTER MECHANIC OHIO ELECTRIC RAILWAY, COLUMBUS, OHIO

The field coils or fields of railway motors often get much less attention from carhouse men than they deserve. The natural reason for this is the fact that the armature is the more active part of the motor and the part through which most of the troubles come to the surface. Thus the armature is nearly always supposed to be the offender when the basic cause may be a defective field. The fields may seem to be all right so far as ordinary inspection goes, but below the perfectly sound tape of the innocent-looking field may lurk the short-circuit that is responsible for the roasting of the armature coils and the blistering of the commutator.

The actual effect of a shorted or partly shorted field is twofold: first, it causes the field flux (or strength) to be less than normal and thus more than the normal current is made to flow through the armature to do the same work; second, the unequal field strength which results from a shorted field distorts the field flux, thereby changing the point of commutation and causing the brushes to flash more or less according to the amount that the field is shorted.

A very marked case of trouble from shorted fields arose recently. In this case, trouble was experienced in keeping the controllers in order on account of excessive burning. After a week of this it was decided to test out the fields of the motors. Several partly shorted fields were found and replaced by good fields, after which the controller trouble disappeared. The explanation is that when the fields were short-circuited the field strength was decreased and the increase in the current required to move the car was abnormal enough to burn the controller contacts.

On our property we find that ample attention to field coils saves a great deal of trouble and expense. On the larger motors, where the fields are of heavy strap copper with asbestos tape between adjacent turns, we have discovered the advantageous fact that a short rarely occurs unless there is also a ground at the same time. The reason is that the ground generally occurs first and is the initial cause of the short, because the arc to ground finally reaches across the turns and short-circuits them. Hence if a field tests free from ground, the chances are about 99 in 100 that there is no short. As the test for a ground is very simple and easily applied, the labor of testing these strap-wound fields is very small. In fact, our rule is to test the fields for ground every time a motor is disconnected from the car cables. A careful test for shorted fields is made in those cases where the large motors have armature trouble that we cannot account for otherwise. However, the ground test generally is considered sufficient for strap-wound fields. This practice does not apply to the wire-wound fields of the smaller motors, for we frequently have such fields that test clear of grounds and yet are badly shorted.



LAMP POLE FOR TESTING

Testing for Grounds

The simplest and most common test for grounds is carried out under the following conditions: At several convenient points we have lamp poles about 12 ft. long, equipped near the lower end with a bank of five incandescent lamps in series; the upper end of this series of lamps is in circuit with an insulated wire which is stapled to the pole and which is connected to a strong iron hook attached to the top of the pole. At the opposite end of the pole the insulated wire from the bank of lamps is stapled down to the extreme end, and is made long enough to leave about 8 ft. to 10 ft. of free wire. The end of this wire is fitted with a wooden handle carrying a point made of about No. 1 solid copper wire. This arrangement is shown in an accompanying drawing, which also illustrates the use of the device.

To operate, the pole is first hooked over the trolley wire. Then the workman takes hold of the insulated wooden handle and touches its copper point to the rail or truck frame which is, of course, grounded. If the lights burn we know that they are in good condition and ready for the test. Usually less than a minute is required to get the pole, hook it over the wire and try it out in this fashion. Next, if the field leads of the motor are disconnected, it is necessary only to touch the copper point to these leads; if the field is grounded, the lamps will burn, but otherwise they will remain dark. This follows from the fact that the motor cases are always grounded to the rail through the axles and wheels. This test can also be used to detect grounds in armatures, brush-holders and, in fact, in almost any other part of the electrical equipment. Under certain conditions the lamp pole is also convenient for use simply as a light, for all that is necessary is to hook the pole on the trolley wire and place the copper point against the rail. It is important that the lamps be tested out each time they are used to make sure that they are in working order.

The lamp pole will indicate any ground that is of low enough resistance to cause immediate trouble, but it will not detect an incipient ground whose resistance is greater than, say, 2500 to 3000 ohms. Such incipient grounds in time may develop into serious grounds, but they are easily detected with a voltmeter, connected in place of the lamp and in similar manner.

Testing for Punctures

While on the subject of grounds, the value of the puncture test should also be mentioned. This test consists of applying alternating current at from 1000 to 2000 volts between conductor and frame (or ground) for a period of one minute. No effect will follow if the insulation is sound, but if it has a weak point the high voltage will puncture it at that point. The advantage of this test is that the weak points can be found and repaired while the motors are on the shop floor instead of waiting for them to break down in service. As a general rule, grounds detected by the puncture test can be accurately located by a little puff of smoke at the instant of puncture. The cost of repairing the weak spot is very small, since the actual burning due to puncture is very slight. On the other hand, if the breakdown of insulation occurs in service the burning is generally serious and expensive to repair. The alternating current voltage to be used for a puncture test in any given case will vary according to the age and condition of the insulation; new insulation should stand at least 2000 volts, even 2500 volts being sometimes used on railway motors. On old insulation it is generally not well to use more than 1200 to 1500 volts, that is to say, double the normal working voltage. Transformers for giving any desired voltage are on the market, but one that will serve for shop purposes can readily be made by rewinding one of the small lighting transformers usually found in the junk pile of any lighting property.

Tests for short-circuited fields will be described by the writer in a second article.

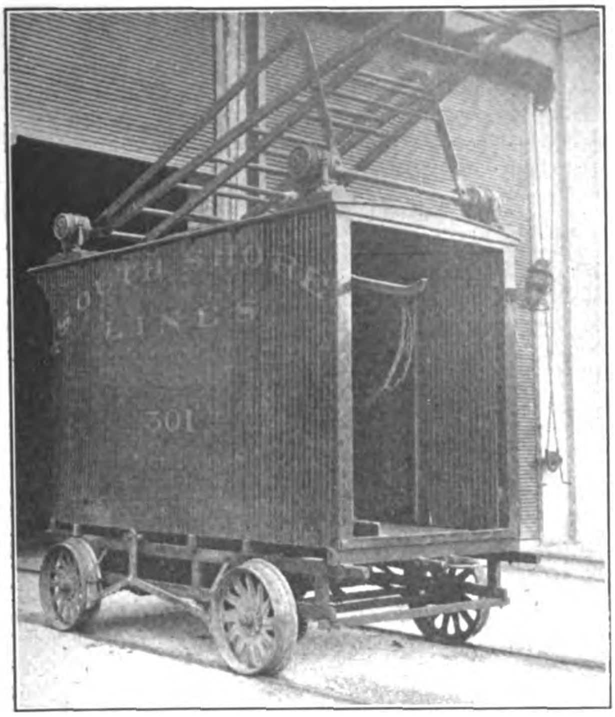
Trolley Buses at Shanghai

Consul General Thomas Sammons, Shanghai, China, reports that seven trolley omnibuses have been purchased in England for use in connection with the electric street car service in the International Settlement at Shanghai. Four of the buses have already arrived, but the remainder are detained on account of the European war. In the meantime it will not be practicable to use the buses already received because of the inability to arrange a satisfactory schedule.

Thus far it has not been possible to introduce the American electric storage-battery buses in China, and it is believed by street car managers in the Orient that the trolley buses may be operated on many of the narrow streets with profitable results. It is estimated that the cost of the trolley wire construction would not exceed the outlay required in purchasing storage-battery trucks. It is assumed that the battery bus is more popular in the United States because of the objection of the municipal authorities to the trolley wire installation in residence districts where there are no car tracks. Moreover, on wide and congested streets it is assumed that trolley omnibuses would not be suitable because of required right-of-way and overhead trolley construction.

A Gasoline Emergency Line Car

To carry linemen to the point of trouble when the power is off the line, the Chicago, Lake Shore & South Bend Railway has a gasoline emergency line car of Buda No. 14 type. A light inclosed top was added of strength sufficient to support two men on the adjustable ladder mounted on its roof. The A-frame ladder has a bracket support for one section which affords two points of attachment, thus giving it an adjustable range of 2 ft. As this road is operated at 6600-volt, single-phase, it was necessary to insulate the ladder thoroughly, and a standard pantograph base was used, as is shown in the accompanying illustration. The weight of the car and equipment permits it to be readily handled by four men. The equipment includes a turntable for removing the car from the track, but when it is on the road with fewer than four men it must take a siding at meeting points. While this causes some delay, the car is never allowed on the road without the dispatcher's order, so that meets with other trains may be readily arranged. The car is supplied, of course, with emergency line repair tools, gasoline and lubricating oil.



GASOLINE EMERGENCY LINE CAR

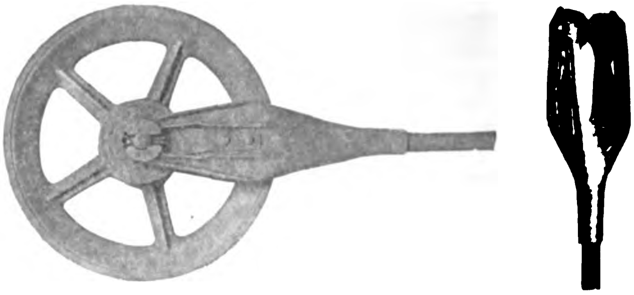
London Car Lamps Dipped in Violet Lacquer Because of War Conditions

Since the edict went forth for the darkening of London at night many experiments have been tried on the London County Council cars to arrive at a satisfactory scheme of lighting, whereby the light would be sufficient to allow passengers to read and conductors to cancel tickets, and at the same time fulfil the requirements as to reduced lighting. At a meeting of the Council in December, G. H. Hume, the chairman of the Highways Committee, announced that the difficulty had now been solved. In the lower saloon of the cars the lamp shades are dipped in a violet lacquer, thereby reducing the lighting by quite 50 per cent. In the upper saloon the shades are similarly dealt with, but the lamps are so arranged as to throw the light obliquely across the car. The dash lights are covered over with yellow paper, and the whole effect is such that, with the reduced public lighting, the cars become invisible at a comparatively short distance.

The lamps used by the London County Council for car lighting are of 22 cp and it was found that this candle-power was too great for the violet lacquer. Consequently the dipping of the lamps was discontinued, and now the lamp shades only are dipped. The effect of the 22-cp lamp on the lacquer was curious. Not only did the violet shade gradually fade away, but it was replaced by a dull reddish-brown hue. Experiments proved that an 8-cp lamp had little or no effect on the lacquer, but a candle-power of greater intensity had a proportionate effect in the manner described.

A 10-In. Trolley Wheel and Light Harp

A trolley wheel with some striking characteristics has just been placed on the market by the R. D. Nuttall Company, Pittsburgh, Pa. This wheel has a diameter of 10 in., a size specially adapted for high-speed service involving single car or train operation on 600-1200 volts, direct current or on single-phase roads. The wheel is said to be especially adapted for gathering heavy currents at high speed, and has an increased life of both the wheel and bushing over other types.



A 10-IN. TROLLEY WHEEL AND HARP

The harps used with these wheels are light in weight and have contact washers which do not turn. The contact spring is riveted to the outside of the harp, as shown in the accompanying illustration.

United States Bureau of Standards Roadbed Resistance Experiments

In connection with its work on stray currents from electric railways the United States bureau of standards is preparing to make experiments upon the electrical resistance of track roadbeds. Sixteen or more sample sections of track, each 12 ft. in length, will be built, and different methods of insulating the track from the ground will be experimented with. Each sample of track will be divided into two sections and resistance measurements will be made over an extended period. It is probable that arrangements will later be made to continue the experiments on a larger scale under traffic conditions. The purpose of the experiments is to determine if it is possible to insulate tracks from the ground reasonably well so as to discourage the flow of stray currents. The experiments are under the general direction of Dr. E. B. Rosa, chief physicist of the bureau.

The Manchester, England, Tramways Committee reports that 370 of its employees have been mobilized with the territorials and reservists. An additional 330 employees have volunteered for active service. At present there are 566 families receiving half-pay allowances from the tramways department.

An All-Steel Express Car and Snow Plow

The development of electric express service on the Albany Southern Railroad recently led that company to order from the Wason Manufacturing Company, Springfield, Mass., the impressive all-steel express car illustrated. The estimated weight of this car and trucks is 37,000 lb., while its capacity is 36,000 lb. The interior of the car has been made unusually light by installing a barred clear-class window between the baggage doors in addition to using clear glass for the upper panels of the doors themselves. The general dimensions follow:

Length over the end sills	44 ft.
Length over the share plows	56 ft. 4 in.
Width of body over sheathing	8 ft.
Width over the bit	8 ft. 4 in.
Height of the share noses	5 ft.
Height from rail over the roof	12 ft. 3⅝ in.
Height from the bottom of sill over the roof	9 ft. 1⅝ in.
Radius of shortest curve on which the car will operate with noses attached	214 ft.

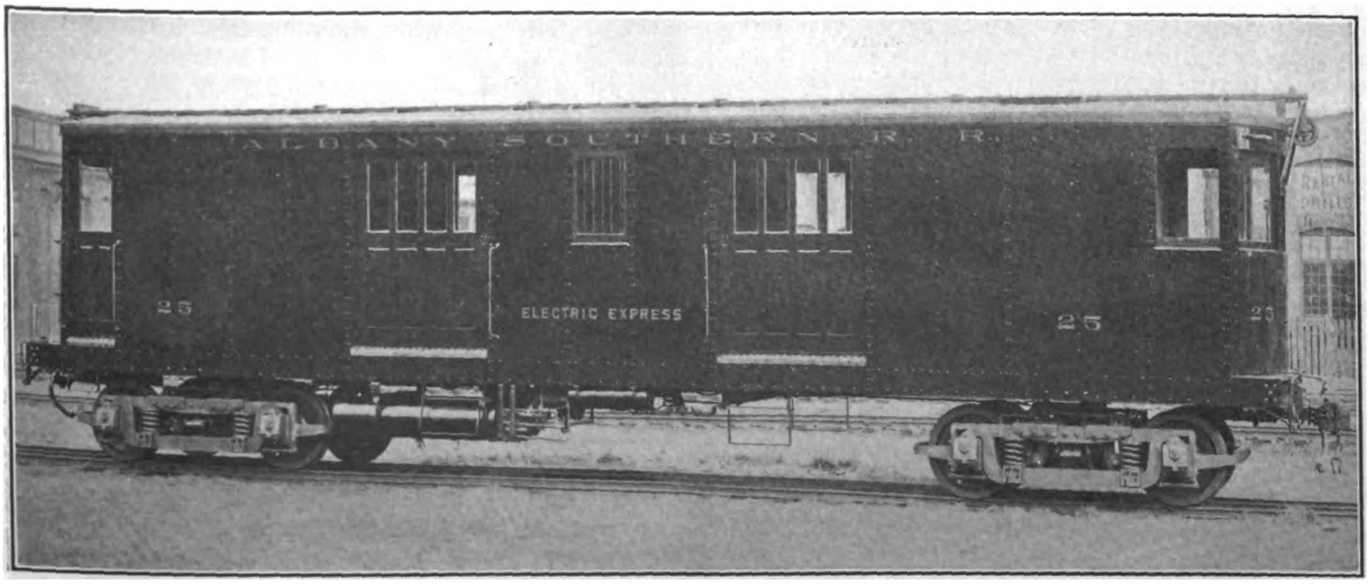
The underframe construction includes two center sills of 10-in. 35-lb. I-beams; side sills of 10-in. 25-lb. channels; two needle beams of 9-in. 21-lb. I's; crossings of 6-in. 8-lb. channels about 3 ft. center to center; end sills of 10-in. 25-lb. channels straight across the car. The bolsters are of the trussed type with 10-in. x 1-in. iron top plates and 10-in. x 1-in. steel bottom plates with cast-iron fillers between.

The side posts, end posts, rafters and side plates are of structural steel, while the outside sheathing to the eaves is of ⅛-in. steel plate. The inside lining is of yellow pine. The roof is of plain arch type with ¾-in. roof boards covered with duck. Ventilation is supplied by means of eight 6-in. Globe ventilators.

The two sliding doors on each side are 5 ft. wide; all other doors, including the sliding door in each partition at the motorman's left-hand side, are 2 ft. wide. The doors are of wood inside the car. The outside of the car is painted standard Pullman green and the inside is painted lead color. The trucks are of Brill No. 27-M.C.B.-3-X of 6-ft. 6-in. wheelbase and with 34-in. rolled-steel wheels. The operating equipment includes GE-214 motors, Westinghouse AMM air brakes and vertical hand brakes.

SNOW EQUIPMENT

The steel flanges are of the Ray V type, located one on the front of each truck. These flanges can clean ice and snow from between rails to a depth of 2½ in. below the top of the rails and outside of the rails equal to the width of the truck. The flanger is operated by air under the control of the motorman. The air-operated share noses are of structural steel and plate built for double track operation to a height of 5 ft., a length of 5 ft. 6 in. and a width of 8 ft. 4 in.

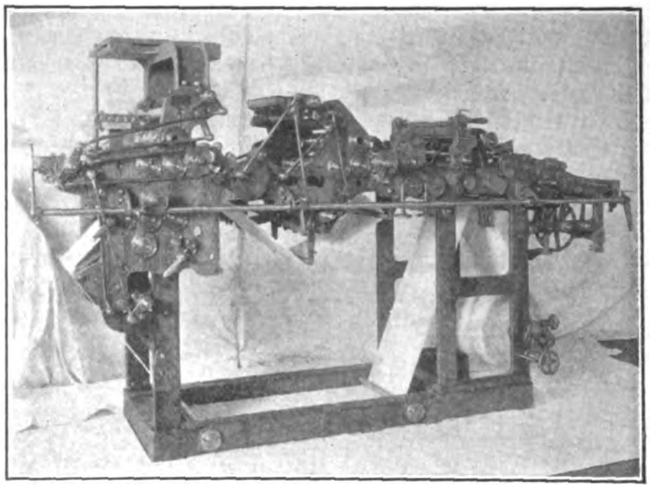


ALL-STEEL EXPRESS CAR OF ALBANY SOUTHERN RAILROAD BEFORE ADDITION OF SNOW FIGHTING EQUIPMENT

Press for Printing Transfers

The remarkable printing press shown in the accompanying halftone was built recently in duplicate for the Third Avenue Railway System, New York. One of these presses will produce 2800 transfers per minute. It is guaranteed to furnish 22,840,000 per month of twenty-six working days with due allowance made for changing the press, numbering, dating and make-ready.

This press has a speed of 200 r.p.m. The transfers are printed from a roll of paper 18 in. wide and are cut in sheets, after being printed, each containing twenty-one transfers. At this high speed and at one operation the transfers are printed in black, dated in red and numbered in red, and are perforated so that they tear easily although the perforations are hardly noticeable. At the same time the paper is trimmed so that the sheets bearing the twenty-one transfers may be easily jogged for binding.



PRESS WHICH PRINTS 2800 TRANSFERS A MINUTE

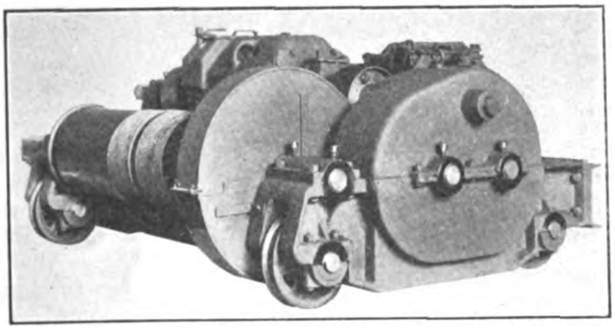
While designed primarily for producing transfers in one operation, this press will print other forms used by electric railway companies, such as order blanks, requisition blanks and other forms. Larger presses with double the capacity are also built by the Meisel

Press Manufacturing Company, Dorchester, Mass., but the smaller ones are usually preferred, because the investment is much greater for the larger presses. They require many more numbering machines, more electrotypes and more time for changing plates and resetting the numbering machines.

A Modern Crane Trolley

The Type E trolley, shown in its general form in the accompanying halftone, has been exploited by the Northern Engineering Works, Detroit, Mich., for some time, but lately several improved details have been added. Primary considerations have been safety, accessibility and rigidity. Durability of gears and other moving parts has been secured by inclosing and protecting them from dust and grit and running them in an oil bath. The construction is such that the covers of the gear cases must be in place or the gearing cannot run, thus insuring against the accidental omission of the gear covers.

Each train of back gears is rigidly mounted in a single frame. The bearings are bored in line and are capped and fitted with through bolts instead of studs, and are lined with bronze. The hoisting gear train from armature to drum gear is in one rigid casting, insuring permanent alignment. The trolley travel gearing is entirely inclosed in a single rigid cast unit gear case of the same general type as that used for the hoist gearing. No overhung gears are used. As the gear covers are castings, the joints of the inclosed gear cases are planned so as to make an absolutely tight construction, thus preventing the leakage and dripping of oil. Any gear with its shaft can be quickly lifted out, without disturbing other parts. Furthermore, very large handholes are provided in each cover, so that it is not necessary to remove the gear covers to inspect or oil the gearing. A point which is emphasized is the much longer life of gearing when running in an internally lubricated design of this kind. Another point is the almost noiseless operation. The trolley differs from others on the market inasmuch as the hoisting gear box is made an integral part of the main trolley frame, thus securing permanent alignment of all gears and their shafts. The advantage of thus making the gear case a part of the rigid trolley casting is especially emphasized as compared with the use of loose gear covers which are liable to be misplaced or bent out of shape and in many cases are not put back into place. A double brake system is used, also an effective limit stop for the hook.



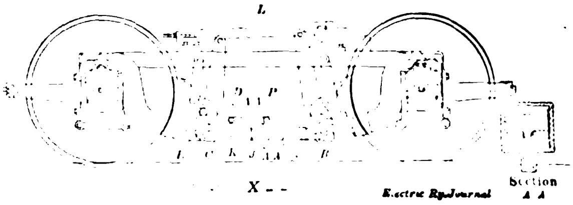
CRANE TROLLEY WITH HOISTING GEAR BOX AN INTEGRAL PART OF TROLLEY FRAME

In addition the trolley is wired in steel conduits. Steel gearing is used and interchangeability and standardization is made possible by the use of standard jigs and templets. This trolley is made in capacities from 2 tons to 125 tons.

Shim Type Slack Adjusters

Operators are beginning to realize in ever larger numbers that the automatic slack adjuster is of remarkable value not only in giving a longer, more uniform and safer wear of brakeshoes but also in multiplying the mileage between inspections. Of these devices for keeping lost motion out of the brake rigging that of the Sauvage-Ward Brake Company, New York, is of particular interest. This adjuster takes care of the wear by means of non-corroding shims which drop automatically into place one by one in the manner hereinafter described.

The accompanying drawing shows the application of a bottom rod shim adjuster to a Brill 27 M. C. B. truck. *A* is the shim box, the shims being shown by straight lines, vertically above the push rod *B*, which extends as far as the back end of the shim box at *K*. The adjusting rods *D* are bolted to the brakeshoe heads. These adjusting rods are made of two pieces, one of which is slotted. The parts are held together by a bolt and washer at *P*, which acts as a guide, and by a bolt, washer and volute spring at *E*. The tension on the volute spring is adjustable for the work. The parts shown at *C* vary in length according to the specific type of truck to which the adjuster is to be applied. The release spring is shown at *L*. The length shown as *X* is such as to allow the first two shims at *J*, which are thicker than those following, to rest on top of the push rod. This length is intended to permit sufficient room for the installation of new shoes, the shims dropping at the first application of the brake.



BOTTOM ROD SHIM ADJUSTER ON BRILL 27 M. C. B. TRUCK

The action of the shim adjuster is as follows: As the shoes wear the adjusting rod *D* is drawn out or extended when the brake is applied, and is held in this position by friction produced by the spring at *E*. When the brake is released the push rod *B* is drawn slightly out of the shim box, thus allowing shims to drop down. In this way the adjuster is lengthened and the wear taken up.

By varying the lengths of certain portions of these two adjusters, and with slight changes in form, it is possible to fit almost any kind of a truck, including brake-beam types, without varying from the principles involved in the design described.

War-Time Traffic in Vienna

In connection with the article on "Vienna Tramways and the War," contributed by Ludwig Spängler, manager of the Vienna Municipal Tramways, to the ELECTRIC RAILWAY JOURNAL of Dec. 5, it is of interest to add that a communication received from the Vienna Municipal Tramways under date of Nov. 16 states that traffic conditions are now excellent. On Nov. 1, for example, the Vienna Tramways actually made a high record both for number of passengers carried and revenue obtained, the figures being respectively 1,100,000 passengers and 220,000 crowns ($44,000). At the time (Nov. 16) the letter was written, the city showed few other signs of war than the presence of the hospital cars, already described in the article of Dec. 5.

News of Electric Railways

INSPECTION OF RAPID TRANSIT MATERIAL

$10,000,000 Worth of Steel Inspected in Year by New York Commission—Inspection Covers 201 Plants in 125 Cities and Towns in Fourteen States

Edward E. McCall, chairman of the Public Service Commission for the First District of New York, and a party of engineers and other officials of the commission were in Pittsburgh on Dec. 14 and 15 inspecting the steel plants from which the commission and the Interborough Rapid Transit Company and New York Municipal Railway Corporation are obtaining much of the structural steel, rails, etc., which go into the construction of the new subway and elevated railroads in Greater New York. The inspection party included, in addition to the chairman, Alfred Craven, chief engineer; Travis H. Whitney, secretary; LeRoy T. Harkness, assistant counsel; Robert Ridgway, engineer of subway construction, and George L. Lucas, engineer in charge of the materials inspection division. On Dec. 14 the party visited the National Tube Company's works at McKeesport, and spent the greater part of Dec. 15 at the Carrie furnaces at the Homestead plant of the Carnegie Steel Company. Taking all classes of materials which are subjected to the inspection of the commission's engineers, the work of inspection covers 201 plants and 125 cities and towns in fourteen states. A large number of these plants are located in Pennsylvania. The other states in which inspections are carried on by the commission's representatives are Connecticut, Delaware, Illinois, New Jersey, New York, Ohio, West Virginia, Michigan, Alabama, Florida, Louisiana, Mississippi and Texas. The materials inspected include in addition to steel and other metals, cement, concrete, waterproofing, lumber, paint and vitrified clay products.

From Mr. Lucas, who guided the party on its tour of inspection, it is learned on Dec. 23 that the commission is now passing upon steel being provided for subway purposes at the rate of 22,000 tons a month. The work of the materials inspection division for the last year has covered sixty general contracts and includes the steel used on the city-owned lines as well as that used by the two companies on privately owned lines of the dual system. Every piece and package is physically tested, and in the case of most materials a chemical test is also made. Accepted materials are branded or otherwise marked by the commission's inspector for identification by its engineers in the field. All materials are inspected at the place of manufacture, and no shipments are allowed without the inspector's approval. This prevents delay in construction by the rejection of material after it has been delivered.

In steel and iron alone the commission has inspected and passed during the last year about 260,000 tons of metal. For the entire dual system it is estimated that from 600,000 to 800,000 tons will be required. It is interesting to note in this connection that the total steel and iron used in the construction of the existing subway (for the tunnel portions only) was 35,000 tons. Expressed in dollars, the total of steel inspected during the last year, namely, 260,000 tons, is worth at prevailing prices, about $10,000,000.

CONNECTICUT COMMISSION REPORT

An Abstract is Presented of the Consolidated Returns of the Twenty-two Companies Reporting

Brief reference was made in the ELECTRIC RAILWAY JOURNAL of Dec. 19, page 1360, to the recommendations contained in the report of the Public Utility Commission of Connecticut presented to the Governor on Dec. 16. An abstract of the references to the electric railways contained in the report follows:

Twenty-two electric railways report to the commission, fourteen of which are operating companies and eight are non-operating. The Bridgeport & Danbury Electric Railway and the Waterbury & Milldale Tramway present reports of their operations this year for the first time. The Bridgeport & Danbury Electric Railway operates a distance of 5 miles in Bridgeport to Long Hill. Its expenditures on account of construction and equipment have been $284,435, representing a cost per mile of road owned of $56,887. The Waterbury & Milldale Tramway operates a line from Waterbury center to Byam road in Waterbury, a distance of 3.466 miles. Its expenditures on account of construction and equipment have been $208,182, which represents a cost per mile of road owned of $61,230. It has a bond issue per mile of road owned of $22,058.

The total amount invested in construction and equipment as reported by the several companies at June 30, 1914, was $90,915,918, to which should be added $14,917,955, the amount of construction and equipment expense paid on account of lines leased. During the year there has been paid on account of construction and equipment by the several companies $1,844,843, and on account of construction and equipment of property leased $1,672,738.

The total amount of capital stock of street railways issued and outstanding at June 30, 1914, was $73,055,900, of which $63,129,200 is common stock and $9,926,700 preferred stock. During the year there was an increase in preferred stock of $28,800 and in common stock $271,500.

The funded debt of all roads decreased $31,500. When the several independent electric railways in Connecticut were acquired by the New York, New Haven & Hartford Railroad and the subsequent organization of the Connecticut Company the several bond issues of the electric railways thus acquired were guaranteed and assumed by the New York, New Haven & Hartford Railroad. Although these bonds were secured by mortgage of the various electric railway properties coming into the ownership of the New York, New Haven & Hartford Railroad they have never been regarded as a liability of the subsequently organized Connecticut Company. The total amount of this bonded indebtedness of the properties now owned and controlled by the Connecticut Company is $7.428,000. During the year the New York, New Haven & Hartford Railroad has paid $850,000 of its original bonded indebtedness.

There was an increase in all of the separate branches of operating revenue except from miscellaneous sources. Freight revenue increased $50,346 and passenger revenue increased $357,270. The total operating revenue was $15,656,593, or $377,323 more than at June 30, 1913. Operating expenses increased $546,831. The total operating expenses of all roads was $10,119,004, resulting in a net operating revenue of $5,537,589. The increase in passenger revenue was practically absorbed by the increase in maintenance charges of $350,907.

On June 30, 1913, the net corporate income of all companies was $157,032. At the close of the year ending June 30, 1914, the net corporate income was $368,092, an increase for the year of $211,060.

The amount paid for taxes, federal, state and municipal, shows an increase for the year of $128,193. The amount paid for interest on funded debt and other indebtedness increased $119,149.

Two operating companies paid dividends and four non-operating companies, the total amount paid being $2,248,304, the average per cent being 4.82. Of the two operating companies paying dividends, the Bristol & Plainville Tramway disbursed $37,500 in dividends and the Connecticut Company $1,500,000. There was an actual decrease in dividends, from the amount paid a year ago, of $573,158.

On June 30, 1914, the surplus of all companies was $1.512,849, an increase of $269,158. If the increase of $346,831 in the surplus of the Rhode Island Company included in these figures be eliminated there was a total decrease in surplus of $77,673 for companies whose operations are for the most part in Connecticut.

The total number of fare passengers carried during the year reported by all roads with the exception of those reported by the Rhode Island Company, with only 1.98 miles of line in Connecticut, was 194,705,102. In addition to this number there were 34,502,789 transfer passengers, making a total of 229,207,891 fare passengers.

The total average fare revenue from each passenger on lines charging a 5-cent fare, not including transfer passengers, was $0.04668. Including such transfer passengers it was $0.04338.

The total mileage operated by the several companies on June 30, 1914, was 1,505.87. The mileage operated in the state of Connecticut was 1,069.68. On June 30, 1914, there had been laid by the several reporting companies in connection with their trackage 799.46 miles of various kinds of roadway construction. Of this total mileage, 73.225 miles was laid and constructed during the year under consideration, and of this total mileage, 60.199 miles was in the state of Connecticut. There are 1,050.41 miles of all kinds of steel rails laid in Connecticut, of which 42,423 were laid during the past year. The entire equipment of all reporting companies consists of 3075 cars with electric equipment and 455 without electric equipment, making a total of 3530 cars of all kinds. Of this total equipment, 2893 are cars used in passenger service.

LONDON MEN ON FIRING LINE

More Than 5000 Men at Front—Bus Drivers in Dangerous Commissariat Service

What the greatest of wars means to one of the big Continental tramway systems was graphically described in Ludwig Spängler's article in the Dec. 5 issue of this paper on "The Vienna Tramways and the War." The following particulars on the London Electric Railway, which operates the greater part of London's train, omnibus and tram (T. O. T.) service, shows how the same problem is dealt with by the biggest British system.

Immediately following the outbreak of hostilities the Admiralty and War Office commandeered, to use a Boer term, a large number of the company's buses. These buses have since become familiar objects in northern France and Belgium, but the story goes that when the natives saw the first ones in all their billboard glory they gave loud cheers for the beverage "Bovril" under the impression that this was the name of a great English general.

Of the company's employees more than 5000 of all ranks are now in the war service. Many of the bus drivers are in the transport service, continually risking their lives in driving right up to the firing line to supply food and ammunition. Their journey from the base is constantly subject to surprise attacks by the enemy who tries to destroy the lines of communication, but the boys have no "speed restrictions" or a "bobby's" orders to turn to the left, so that they rarely fail to get there.

The British government and the London County Council make the regular allowances to all dependents of the railway men at the front, but the London Electric Railway adds certain grants made up equally by the subscriptions of the remaining employees and the company. Under these conditions, the total weekly allotments range from 20 shillings for a wife without children to 36 shillings for a wife with eight children.

T. O. T. Fortnightly News, published for the employees of the company, contains several letters in each issue from the boys at the front. It is a tribute to the flexibility of human nature that in a few weeks these men have been transformed from peaceful drivers, motormen, conductors and gatemen to beings who are as callous to shot and shell as the most hardened veterans. A few extracts will show the spirit which animates the British volunteer.

"My regiment has caught it pretty hot," writes Conductor H. W. Wicks, of the Queen's Own Hussars. "Since we have been here we have lost eleven officers and about fifty men, killed and wounded. The German artillery are, I must admit, simply grand; and without it they would have been beaten by now, but I think the Allies have the whip hand of them. It is much safer down Ringstead Road with a broken brake chain than under fire from German artillery. I shall be very glad to get back to dear old Sutton now that the first excitement has worn off. We have had two days' rest, after being twenty-one days on the firing line, and we go in again for another spasm."

Another conductor, W. E. Brown, who has gone to the Nineteenth Hussars, says: "I am writing this on the butt end of my rifle in a hayloft, while I am seeking shelter from the terrible fusilade of shells; at the same time I am out of the snow. It's awfully cold here, especially when we can't get a rub with the Germans. It's much better to take fares than lives."

The traditional stolidity of the Briton is reflected in a remark by Driver Seymour of the 126th Battery, Twenty-ninth Brigade:

"We have seen plenty of action at Mons and the Aisne. . . . If the Germans don't stop messing us about there will be a war soon."

All of the letters breathe a spirit of utmost cheerfulness, and many express gratitude to Sir Albert H. Stanley and his staff for the care they are giving to the families of those at the front.

DES MOINES FRANCHISE MATTER

Franchise Issue to Be Determined at Election to Be Held on Jan. 16

The State Supreme Court of Iowa rendered a speedy decision in the Des Moines (Ia.) City Railway's franchise case and as a result the citizens of the city will vote on the proposed new franchise on Jan. 16, according to Mayor James R. Hanna, who says he will issue a proclamation for an election on that date. The Supreme Court issued its ruling the day after the oral arguments had been entered in the case. The procedure was merely for the determination of the legal method of conducting franchise elections and was necessary because of apparently conflicting provisions in the Iowa law. The court rules that the election must be held under a section which provides that the City Council may offer amendments at the same election.

Eleven amendments already have been drawn up by Mayor Hanna and they will be submitted to the people when the new franchise is voted upon. The franchise is practically the same as that drawn up by Mayor Hanna several months ago when the City Council and the company were negotiating for a franchise. After it was found that no agreement could be reached the company elected to carry the question to the people. More than half of the voters of the city signed the petition for the election.

Under the Supreme Court ruling the franchise must receive the approval of the City Council as well as that of the people. The question of capitalization is the only issue at stake between Mayor Hanna and the City Council. The capitalization clause is the only one in the Mayor's proposed franchise that is not included in the ordinance submitted by the railway. Mayor Hanna will seek to have this point covered in his amendments.

BAY STATE ARBITRATION HEARINGS BEGUN

Arbitration hearings upon the Bay State Street Railway wages and labor conditions were begun at Faneuil Hall, Boston, Mass., on Dec. 17, before a board consisting of District Attorney Joseph C. Pelletier of Suffolk County, chairman; Henry E. Reynolds, for the company, and James H. Vahey, representing sixteen local branches of the Amalgamated Association of Street & Electric Railway Employees of America. James M. Swift registered as counsel for the company and Joseph B. Eastman and Fred Fay appeared on behalf of the union.

The subject matters before the board are: 1, Determine what scale of wages shall be paid by the company to the members of the association; 2, The amount of extra compensation for regular men for outside time beyond twelve hours; 3, The amount of extra compensation for extra men for outside time beyond fourteen hours; 4, Minimum number of hours to be guaranteed extra men for a day's work; 5, The time allowance for a.m. extras and crews required to report in the morning to cover the list. The arbitration grows out of a series of conferences between officials of the company and of the union extending from Sept. 23, 1914, to Nov. 4, 1914. These conferences were made necessary by the expiration on Oct. 1, 1914, of a joint agreement governing wages and other working conditions, and were held to fix the terms of a new agreement. The stenographic record taken during the conferences has been listed as an exhibit in the arbitration proceedings. The company is the second largest in the world in point of track mileages and operates in ninety-one cities and towns in eastern New England. The union membership totals 3876, including many occupations immediately outside as well as the car service. The company operates 951.3 miles of track.

At the opening hearing Robert S. Goff, vice-president and general manager of the company, described the physical characteristics of the system and the methods of employing men now in vogue. Extra men have no guaranteed wage. The equipment of the road has not changed materially in the past six years, and the company's requirements bearing upon employment are not as severe as on many large city systems. There are 6600 men in the service. First-year men are paid 24 cents an hour, increasing in subsequent years to a maximum of 28 cents. The work of extra men was discussed at length. Mr. Goff said that he did not consider the work of a motorman or conductor as skilled labor, and looked with disfavor upon the Munsterberg methods of determining the qualifications of motormen by psychological laboratory tests. He believed the graduated scale to be an incentive to proficiency and extended duration of service. Many men leave the service each year because a great deal of the work on the system reaches its maximum in the summer. The system as it exists includes about 120 miles of track inherited from its predecessors which should never have been built. The hearing will be resumed on Dec. 28.

THE DETROIT APPRAISALS

Professor Bemis Fixes Physical Value at $16,500,000, Exclusive of Paving Charges and Franchise Values

A physical valuation of $16,500,000, excluding paving charges of $950,000 and franchise values, on the properties of the Detroit (Mich.) United Railway within the one-fare zone was submitted by Prof. E. W. Bemis in his report to the Detroit Street Railway Commission, which engaged him to make an appraisal. Nothing has been made public to indicate what the values of the franchises will be in Professor Bemis' opinion, but it is expected that the total for tangible and intangible values in the Bemis appraisal will not exceed $20,000,000. The company's inventory based upon the reproduction cost basis less depreciation was approximately $32,000,000. No details were given out, the Street Railway Commission contenting itself with the issuance of a statement in which it explained that the appraisal was submitted to the public "without any comments or opinions, subject to analysis and investigation by the board of commissioners."

F. W. Brooks, general manager of the company, issued a statement in which he said the company waited hopefully the outcome of the commission's investigation. He pointed out that in the appraisal of the Cleveland property the physical valuation was several millions lower than the actual value finally placed on the railway, and he intimated that a fair consideration of the subject by the commission would result in a considerable increase over the Bemis appraisal.

Inasmuch as Dean Cooley of the University of Michigan is directing an appraisal of all the properties of the Detroit United Lines for the State Railroad Commission, it is not regarded as probable that anything will be done by the railway or the Street Railway Commission until the Cooley valuation is announced. The Cooley appraisal of the lines within the one-fare zone is not likely to be announced before the latter part of next month.

The Bemis appraisal, in addition to omitting franchise values and paving charges, did not include the new Junction Avenue line, recently built, which has a physical value of $225,000. Professor Bemis included in his total the sum of $950,000 for paving charges, but this item was eliminated by the commission.

WESTINGHOUSE SICK AND ACCIDENT PAYMENT PLAN AND SERVICE PENSIONS ANNOUNCED

The Westinghouse Electric & Manufacturing Company has just issued a preliminary statement of its sickness and accident relief, accident compensation and service pensions, on which its officers have been working for more than a year. The plan includes three separate and distinct features: 1. Extension of the present relief department. 2. An accident and compensation plan. 3. Service pensions. The privileges of the relief department are open to every employee. The company pays the entire expense connected with the operation and maintenance of this department, the dues being reserved wholly for the payment of benefits for sickness and accident arising from causes other than employment. In the event of death the amount paid from the dues will be duplicated by the company, which will also meet any deficit that may arise. Benefits will continue as long as disability lasts, or until the age of seventy years is reached, when pensions will then be granted.

An accident compensation fund is maintained entirely by the company for the benefit of all employees. This plan covers the payment for disability due to accident, or for death resulting from accident, while at work as an employee, and makes provision for both total and partial disability.

Employees of the company are to be retired at the age of seventy years, and those who at the time of such retirement are members of the relief department and have completed at least twenty years of continuous service, are to be granted a pension amounting to 1 per cent of the average monthly wages during the last ten years of employment for every year of continuous service, with a minimum of $20 a month and a maximum of $100 a month. Upon the death of the pensioner, one-half of the pension will be paid to the widow until remarriage, providing marriage occurs at least ten years before the granting of the pension. For the support of each child under sixteen years of age, and for each wholly dependent grandchild under sixteen years of age, one-fourth of the pension will be paid until they reach the age of sixteen years. The president may, at his discretion, retire any employee between the ages of sixty and seventy years who has been in the service the required time, and he may increase any pension for specially meritorious service, by 25 per cent, but not beyond the maximum pension of $100 a month.

CONTRACT FOR SPEED CONTROL AUTOMATIC SIGNAL SYSTEM

The Public Service Commission for the First District of New York has approved the award of the contract by the New York Municipal Railway Corporation to the General Railway Signal Company for the equipment of the dual system lines to be operated by the New York Municipal Company with a speed control automatic signal system to inclube cab signals. This is a new system of automatic train control by which the signals are shown in the motorman's cab, and if the train fails to slow down at an appropriate signal a device in the track engages corresponding machinery in the cars, reducing the speed, independent of the motorman's actions, to an arbitrarily determined point, but allowing the train to continue at the reduced speed. Thus, the time lost by the complete stoppage of a train under the ordinary block signal system is saved. The commission's engineers reported that the new system, if developed as outlined, will be a very great advance over any system of signaling heretofore used. The total bid of the General Railway Signal Company for equipping all the subway and elevated lines to be operated by the New York Municipal Corporation is stated to be about $1,413,000.

BEFORE THE CLEVELAND COUNCIL

At the suggestion of Peter Witt, street railway commissioner, the City Council of Cleveland, Ohio, on the evening of Dec. 21 refused the request of a large number of residents of South Brooklyn to restore the old schedule on West Fourteenth Street. The cars now stop at the Holmden carhouse.

The Townes ordinance, to require interurban cars to stop at regular car stops to take on and discharge passengers, was defeated at this meeting.

Councilman Rolfe introduced legislation to make 5 cents the maximum fare between Nottingham Road and the Public Square. The present fare is 8 cents.

The Cleveland Railway has requested permission to use $35,000 for the construction of special tracks at Miles Avenue and East Ninety-third Street.

Mr. Witt has informed the Council that he will oppose the Dittrick ordinance, the object of which is to render payment of fare uniform on all cars. The measure would require that all cars leaving the Public Square be operated on the pay-as-you-leave plan and all cars going toward the square on the pay-as-you-enter plan.

Appraisal of London Street Railway.—Mayor C. M. R. Graham, of London, Ont., has asked Chief Engineer Gaby, of the Hydro-Electric Power Commission of Ontario, to appraise the London Street Railway.

Short Term Franchise Refused.—Because the term of the franchise recently granted the East Linden Railway by the City Council of Columbus was for only twelve years, it was refused. Request was made for a twenty-five-year grant.

Safety Exposition Prizes Awarded.—At the second annual exposition of safety and sanitation under the auspices of the American Museum of Safety held at the Grand Central Palace, New York, N. Y., during the week ended Dec. 19 grand prizes were awarded to the Brooklyn (N. Y.) Rapid Transit Company and to the New York Edison Company in connection with the exhibits made by these companies at the exposition as referred to in the ELECTRIC RAILWAY JOURNAL of Dec. 19.

Utilities Commission Proposed for Texas.—State Senator A. C. Robbins, Athens, Tex., has drafted a bill for presentation at the coming session of the Legislature in that State for the creation of a commission to be composed of three members which shall have authority to fix the rates of street railways, interurban railways, telephone and telegraph companies, water, light and gas plants, and all oil pipe lines which are common carriers and to have jurisdiction over them in other respects.

Not Under Federal Employers' Liability Act.—District Judge Camp, at Duluth, Minn., in an oral opinion delivered recently held that although the Duluth-Superior Traction Company operates an electric railway from Duluth, Minn., to Superior, Wis., it is not engaged in interstate commerce as contemplated by the federal employers' liability act. Emil Keto, who sought to recover under that act, will be obliged under the decision to accept the amount allowed him under the provisions of the Wisconsin workmen's compensation act.

Mr McMeen on Public Relations.—Samuel G. McMeen, president of the Columbus Railway, Power & Light Company and president of the Ohio State Telephone Company, Columbus, Ohio, addressed the members of the Cleveland Advertising Club at their weekly noon luncheon on Dec. 16. Mr. McMeen said that there was no distinct line of demarcation between public utilities and private business. There was no difference between selling to the few and selling to the many. Public service corporations were not the bogies they have been pictured. Utility men were as anxious as other business men to please the people. The idea that public utilities corporations endeavored to do business only in the dark was a mistake.

The New Jersey Gas Case.—Upon application of counsel representing the cities of Paterson and Passaic, the Court of Errors and Appeals of New Jersey on Dec. 21 decided to retain the record in the 90-cent gas rate case pending a formal move for a rehearing instead of sending the record down to the Supreme Court. Counsel was given until Jan. 7 to file the petition for the rehearing, and Jan. 14 was fixed as the date when the court will hear the arguments on the application. Reference was made in the ELECTRIC RAILWAY JOURNAL of Dec. 12 to the decision rendered on Dec. 9 by the Court of Errors and Appeals of New Jersey, upsetting the order of the Board of Public Utilities Commissioners requiring the Public Service Gas Company to establish a 90-cent rate for gas in the Passaic district. The interest of this decision to electric railways lies in the fact that this rate was placed on a valuation in which the commission made an allowance for "going concern" value, but made no special allowance for the value of franchises.

Detailed Data Desired Regarding Rolling Stock and Equipment Design.—The American Electric Railway Manufacturers' Association sent out under date of Dec. 18 a translation of a letter from Engineer S. F. Narushevitch, in charge of the purchasing department of the Moscow (Russia) City Railways, received through Consul-General John H. Snodgrass at Moscow. Mr. Narushevitch says that he is particularly interested in rolling stock and equipment, and therefore desires detailed data on this subject. He was induced to take recourse to this unusual method of procedure to receive information in which he is interested in anticipation of the closer relations between the technical circles of Russia and America likely to follow after the war. Mr. Snodgrass expresses the opinion that should the Moscow Metropolitan Railway be built after the war American manufacturers will stand a chance of securing some valuable orders. He thinks that American firms should get the contract for building the subway, which, it is estimated, will cost about $40,000,000. Correspondence is preferred in Russian, but may be sent in either French or English.

Hearing on Motor-Bus Applications in New York.—Applications for motor omnibus franchises covering 184 miles of new routes were received on Dec. 18 by the franchise committee of the Board of Estimate of New York City. The Fifth Avenue Coach Company, operating the existing lines, and the three contesting corporations which seek to establish new lines were represented at the hearing. The Fifth Avenue Coach Company applied for nine new routes, covering 7½ miles, as extensions to existing lines; the New York Motor Bus Company asked for twenty-one routes, with a total of 49 miles. The Manhattan Motor-Bus Company asked for three routes, covering 17½ miles, and the People's Five-Cent Bus Corporation applied for twenty routes with 70 miles. The franchise committee had before it the report of the franchise bureau of the Board of Estimate, which eliminated all motor-bus routes south of Fourteenth Street and laid out new lines in Madison and Park Avenues, crosstown lines in Seventy-ninth Street through Central Park, in Ninety-sixth Street and 125th Street, with other connecting spurs. Another hearing will be held on Dec. 29.

Resolution to Sell Seattle Municipal Line Killed.—The city utilities committee of the Council of Seattle, Wash., at a recent meeting voted with only one "no" to kill the resolution of Mr. Dale proposing a conference of Mayor Gill, the members of the Council, representatives of the civic and labor organizations of the city and the officers of the Puget Sound Traction, Light & Power Company, with a view to negotiating for the sale of the municipal railways, the extension of privately owned lines and the purchase of the Seattle, Renton & Southern Railway by the Puget Sound Traction, Light & Power Company. Councilman Dale has, however, reintroduced his resolution, modified in several particulars. He now proposes among other things that a plan be submitted to the voters in March to purchase the Seattle, Renton & Southern Railway at once or abandon all negotiations; that the existing municipal lines, known as Division "A" and Division "C," be offered for sale to the Puget Sound Traction, Light & Power Company, provided the company will also purchase the Seattle, Renton & Southern Railway and make needed improvements in the Rainier Valley; that the practicability of operating motor buses to connect Division "A" and "C" be thoroughly investigated; that the reasons for not proceeding to get common user rights for municipal cars on Fourth Avenue be looked into; that it be determined whether there is any merit in an ordinance authorizing the sale of utility bonds to connect the Lake Burien line, Division "C" with Division "A," without submitting such bond issue to the people.

PROGRAM OF ASSOCIATION MEETING

Second National Foreign Trade Convention

The Second National Trade Convention will be held at St. Louis, Mo., on Jan. 21 and 22, 1915. Three thousand commercial and industrial organizations, corporations, firms and individuals engaged in foreign trade have been invited to send delegates. W. C. Redfield, Secretary of Commerce, will open the convention. John Basset Moore, formerly counselor of the State Department, who is the foremost American authority on international law, will speak on "Problems Arising in War and Commerce." The sessions will be divided between authoritative papers by leaders in the business world and constructive discussions by delegates representing all sections of the country. Ways and means whereby the smaller manufacturer and merchant may engage in foreign trade will have an important place on the program. R. H. Catchin, 64 Stone Street, New York, N. Y., is secretary of the National Foreign Trade Council.

Financial and Corporate

IMPROVED CONDITIONS EXPECTED

The two important events this week in the world of finance and business were the granting of a horizontal 5 per cent rate increase to Eastern railroads and the temporary if not permanent postponement of a complete wage reduction by the United States Steel Corporation. The rate decision, whose importance is emphasized in other columns of this issue, was undoubtedly a factor in the action of the corporation, but the connection is interesting. Railroad purchases have been at a minimum for months, and the rigid purchasing policy of the carriers, combined with the general business depression, was a matter of such serious importance to the steel employers that decreases in the wage scale seemed inevitable. Now, however, a change for the better is expected, so that the corporation is making only minor wage adjustments affecting less than 10 per cent of the men on the payroll.

While an immediate influx of orders from railroads is not looked for, it is believed that the increased orders during the first few months of 1915 will substantially improve the earnings of the manufacturers. Decisions such as reached by the United States Steel Corporation can be based only on real optimism, and indicate what is generally believed will result from the favorable rate decision. It is likely that corporations which have been waiting to follow the lead of the United States Steel Corporation on a downward revision will also be led to look upon the future with brighter eyes and thus help to establish a better tone among the manufacturers and in the general business world.

REPORT FROM ADELAIDE TRAMWAYS

The Adelaide (Australia) Municipal Tramways Trust for the two years from Aug. 1, 1912, to July 31, 1914, showed for the first year total receipts of £310,240; total expenses, £207,319, and a net balance of £102,324. For the second year the figures were: total receipts, £328,810; total expenses, £202,503, and net balance £125,365. The number of passengers carried during the second year was 43,797,227. The receipts averaged 14.63d per mile and the average fare per passenger was 1.78d. The total amount spent on construction work during the two years was £1,359,013, and £36,878 was added to the reserve for renewals, this sum being 2½ per cent of the capital cost of the renewable parts of the lines, plus interest. An agreement has been reached for the purchase of the existing horse tramways in Port Adelaide and its vicinity. Plans for the construction of a system of electric tramways in this section are in preparation and a large amount of materials for construction has been delivered.

ANNUAL REPORTS

Southern Pacific Company

The annual report of the Southern Pacific Company, San Francisco, Cal., for the year ended June 30, 1914, states that the revenues from transportation-rail lines during the year amounted to $126,614,537, an increase of 2.87 per cent, while revenues from outside operations totaled $11,905,721, an increase of 4.15 per cent. Operating expenses-rail lines amounted to $82,800,067, an increase of only 0.81 per cent, but the expenses of outside operations were $10,862,200, an increase of 1.19 per cent, and taxes on rail lines and properties dealt with as outside operations were $7,162,625, an increase of 25.72 per cent. The net operating income was $37,695,367, a decrease of 14.73 per cent. The total fixed charges increased to $31,346,841, or 5.58 per cent, and the surplus decreased to $20,452,216 or 23.88 per cent.

It is stated that the large decrease in passenger earnings is attributable to deferred travel in anticipation of the exposition, the curtailment of travel through enforced economy and the increased competition of interurban electric lines and motor vehicles. Moreover, reduced rates compelled by the influence of federal and State commissions which were in effect during the last fiscal year and not during the previous year resulted in a shrinkage of at least $500,000 in gross revenues. It is conservatively estimated that cumulative reductions of this character during the four years ended June 30, 1914, decreased the gross revenues to the extent of at least $4,000,000.

Along this same line the report adds that while the company has cheerfully made such expenditures as were required by federal or state commissions or by legislation, many unreasonable laws have been enacted, which serve no public good and which add unnecessarily to the cost of operation. There is, moreover, a continuous agitation for the passage of more laws to further burden the railways regardless of necessity or reason. During the last fiscal year the cost of complying with such legislation and with the unreasonable requirements of commissions added $1,099,405 to the operating expenses of the company, viz.: Cost of inspectors required by the safety appliance act and the boiler inspection act, $326,589; increased cost incident to full train crew laws, hours of service laws and the law requiring self-cleaning ashpans for locomotives, $286,580; cost of complying with laws requiring substitution of electric for acetylene headlights, $4,121; cost of unnecessary train service required by railroad commissions, $18,872; cost of physical valuation of property required by state commissions, $37,609, and cost of compiling statistics, printing tariffs and other similar requirements of federal and state commissions, $425,634, or a total of $1,099,405. In addition to the above, the company lost approximately $275,000 during the year through failure to obtain approval of the Arizona Rail-

road Commission for an issue of $30,000,000, par value, of two-year 5 per cent secured gold notes. Although the California Railroad Commission authorized the notes, the Arizona commission held the matter up pending certain unwarranted guarantees until the market changed and one-year notes had to be sold later at a lower price.

Additions and betterments to electric light and power plants of the company during the year cost $2,346. Maintenance of electric power transmission totaled $46,306, a decrease of 15.43 per cent. Electric locomotive repairs were only $77, while repairs of electrical equipment cost $39,790, an increase of 30.28 per cent. The accompanying table shows the total mileage, passenger carriage, equipment and a condensed statement of receipts and disbursements for the various proprietary electric railways of the Southern Pacific Company.

Middle West Utilities Company

The total earnings and expenses of the Middle West Utilities Company, Chicago, Ill., for the year ended April 30, 1914, follows:

Receipts:	
Total income (including securities valued by board of directors at $362,348)	$1,466,760
Expenditures:	
Administration expense	$141,263
Miscellaneous charges including taxes, depreciation of office furniture, etc.	16,699
Depreciation and losses on investments	7,096
Total	$165,058
Gross income	$1,301,702
Interest on three-year 6 per cent gold notes	$146,829
Other interest	80,687
Total	$227,516
Balance	$1,074,186
Appropriated toward writing off discount and expenses	75,000
Available for dividends	$999,186
Dividends on preferred stock paid and accrued	566,925
Balance carried to surplus	$432,261
Middle West Utilities Company's proportion of the aggregate surplus of subsidiary companies	147,416
Combined surplus earnings accruing to company	$579,677

The company is pursuing its policy of keeping the junior securities of its subsidiaries as far as possible in its own treasury. The $3,500,000 of three-year 6-per cent collateral gold notes issued June 1, 1913, and secured by the deposit with a trustee of $4,667,000 par value of subsidiary mortgage bonds, were all sold during the present fiscal year and the proceeds used for corporate purposes.

The combined earnings of subsidiary properties during the company's fiscal year, were as follows:

Gross earnings	$7,345,350
Operating expenses, including taxes	5,036,696
Net earnings from operation	$2,308,654
Fixed charges to outside holders	$908,032
Interest on junior securities, dividends on stock and proportion of undistributed earnings due outside holders	474,817
Total	$1,382,849
Earnings accruing to securities owned by Middle West Utilities Company	$925,805

Of the above-stated earnings, $336,127 has come into the company's treasury as interest on bonds and debentures, and $442,261 as dividends on stocks owned, leaving a balance of $147,416 as the company's proportion of the surplus carried in the aggregate surplus accounts of the subsidiary companies on their own books.

Chicago (Ill.) City Railway.—A quarterly dividend of 1½ per cent has been declared on the $18,000,000 of stock of the Chicago City Railway, payable on Dec. 30 to holders of record on Dec. 26. This compares with a regular rate of 2½ per cent quarterly from March, 1910, to September, 1914, extra payments in various amounts also having been made. The reduction in the dividend is due, according to the management, to a falling off of traffic which aggregates about 1 per cent on all the surface lines of the city for the year, but during the last month the decrease has been between 3 per cent and 4 per cent.

Chicago City & Connecting Railways, Chicago, Ill.—The Chicago City & Connecting Railways has declared a semi-annual dividend of $1.25 per share on the preferred participation shares, payable on Jan. 1 to stock of record of Dec. 26. The company has been paying semi-annual dividends of $2.25 per share for some time. The last dividend at this rate was paid July 1.

East St. Louis & Suburban Company, East St. Louis, Ill.—Smith, Moore & Company, St. Louis, Mo., are offering at par and interest $450,000 of one-year 6 per cent collateral gold notes of the East St. Louis & Suburban Company dated Dec. 15, 1914, and due Dec. 15, 1915, but callable on thirty days' notice at par and interest. The St. Louis Union Trust Company is trustee of the issue. The proceeds will be used to reimburse the company for advances made to the East St. Louis Light & Power Company in connection with the construction of a large power house on the Mississippi River just above Alton, Ill., and a high tension transmission line from that point to East St. Louis. The notes are secured by pledge of $600,000 of East St. Louis Light & Power Company first mortgage 5 per cent gold bonds.

Fresno (Cal.) Interurban Railway.—The Railroad Commission of California has authorized the Fresno Interurban Railway to issue 100 shares of its capital stock of the par value of $100 a share at a price not less than 80. These shares are to be issued in lieu of 100 shares of the company's stock purported to have been issued for the purpose of incorporation at the price of $10 per share. This latter price is to be considered as part payment upon the new issue just authorized by the commission. The proceeds from the sale of this stock are to be used by the company to purchase equipment in the sum of $4,700 and to pay engineering, administration, legal and other contingent fees. The commission has also authorized the Fresno Interurban Railway to issue 2125 shares of common stock of the par value of $100 a share, $350,000 of its first mortgage 6 per cent twenty-six-year bonds and $350,000 of its 6 per cent cumulative preferred stock.

Humbolt Transit Company, Eureka, Cal.—Control of the Humbolt Transit Company, which operates 13 miles of street railway in Eureka, is reported to have been acquired by new owners acting in the interests of the Southern Pacific Company or the Northwestern Pacific Railroad. The Humbolt Transit Company has first mortgage 5 per cent bonds outstanding to the amount of $193,000 and an outstanding stock issue of $500,000.

International Traction Company, Buffalo, N. Y.—A hearing was held at Albany on Dec. 19 before the Public Service Commission of the Second District of New York on the application of the International Railway for authority to issue $3,000,000 of 5 per cent bonds under an existing mortgage to provide funds for the construction of a new line between Buffalo and Niagara Falls. Representatives of both the New York Central & Hudson River Railroad and of the Erie Railroad appeared before the commission at the hearing and reserved the right to object to the plan of the International Railway for the construction of the line should they so desire. The hearing has been adjourned until Jan. 5. The construction of the proposed line between Buffalo and Niagara Falls by the International Railway to supplement its existing line which connects the cities has been the subject of a number of previous items in the ELECTRIC RAILWAY JOURNAL.

Kansas City Railway & Light Company, Kansas City, Mo.—The Kansas City *Times* says that large holders of stock of the Kansas City Railway & Light Company residing in Kansas City have been approached in regard to their willingness to meet an assessment of $16 a share on the stock to provide cash for refinancing the company, second mortgage bonds to be given for the money thus contributed. It is estimated that in this way about $3,500,000 could be raised to pay floating debt and effect an exchange of new long-time bonds for existing bonds which are overdue. Fifty thousand dollars of first mortgage 5 per cent sinking fund gold bonds of the Corrigan Consolidated Street Railway, dated July 1, 1886, have been called for payment at $1,100 per bond on Jan. 1, 1915. The principal will be paid at the office of the Central Trust Company, New York, N. Y., trustee.

Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan.—The Kansas City, Kaw Valley & Western Railway has filed an application with the Kansas Public Utilities Commission for permission to issue $3,312,000 of first and second mortgage bonds. The company also asked permission to reduce its capital stock from $1,500,000 to $1,137,000. The new money which the company is asking permission of the commission to raise by a bond issue is to be used on the second section of the company's Kansas City-Topeka line. This second section is 24 miles from Bonner Springs to Lawrence, connecting with the line already operating to Bonner Springs.

Lake Shore Electric Railway, Cleveland, Ohio.—The Lake Shore Electric Railway has been authorized by the Public Utilities Commission of Ohio to issue and sell its general mortgage 5 per cent gold bonds of the total principal sum of $81,000 for the highest price obtainable, but for not less than 85. In the event of the inability of the company to sell the bonds for 85 or better, it may pledge the same as security for a loan for the largest amount negotiable but for not less than 60 per cent of the par value of the bonds. It is stipulated that the money secured shall be used by the company to reimburse its income account for expenditures for the construction of additions and improvements in the period from Jan. 1, 1914, to Sept. 13, 1914.

Louisville (Ky.) Railway.—James B. Brown, vice-president of the National Bank of Commerce, Louisville, has been elected a director of the Louisville Railway, succeeding Samuel Casseday, deceased.

New York, New Haven & Hartford Railroad, New Haven, Conn.—The Boston *News Bureau* in its issue of Dec. 23 said: "One factor in the New Haven situation which has made some of the inside interests feel decidedly encouraged during the last few weeks has been the decision by Chairman Elliott that the Connecticut Company stock will easily liquidate at a price better than its book value. The New Haven treasury indirectly holds $40,000,000 stock of the Connecticut Company, which is carried at par. This stock forms the largest asset of the New England Navigation Company, which in turn is owned by the New Haven Railroad. Chairman Elliott had until recently been somewhat doubtful about the value of the Connecticut Company investment, but investigation and the company's recent record of earnings have convinced him that the property is worth all or even more than its book valuation."

Stockton Terminal & Eastern Railroad, Stockton, Cal.—The Railroad Commission of California has issued an order extending to April 1, 1915, the time within which the Stockton Terminal & Eastern Railroad may issue $121,000 of its 6 per cent bonds authorized by the commission on March 20, 1913. The commission has also authorized the company to issue two promissory notes for $1,000 each to refund notes now outstanding.

United Railroads, San Francisco, Cal.—First mortgage 6 per cent bonds of the Ferries & Cliff House Railway to the amount of $400,000, have been purchased by E. H. Rollins & Sons and will be offered to investors at 99, yielding about 6½ per cent. The bonds are subject to call any time before maturity at 101½. The Ferries & Cliff House Railway was one of the companies included in the United Railroads when the latter was formed in 1902. The bonds referred to are an extension issue for the remainder of a $650,000 issue, due Mar. 31, 1949, of which a total of $250,000 has been redeemed for cash from the company's earnings. The extended issue is to mature on Dec. 31, 1916.

DIVIDENDS DECLARED

Asheville Power & Light Company, Asheville, N. C., quarterly, 1¾ per cent, preferred.

Aurora, Elgin & Chicago Railroad, Wheaton, Ill., quarterly, 1½ per cent, preferred.

Bangor Railway & Electric Company, Bangor, Maine, quarterly, 1¾ per cent, preferred.

Birmingham Railway, Light & Power Company, Birmingham, Ala., 3 per cent, common and preferred.

Capital Traction Company, Washington, D. C., quarterly, 1¼ per cent.

Cincinnati & Hamilton Traction Company, Cincinnati, Ohio, quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Columbus Railway, Power & Light Company, Columbus, Ohio, quarterly, 1½ per cent, preferred series A.

Consolidated Traction Company of New Jersey, Newark, N. J., 2 per cent.

Germantown (Pa.) Passenger Railway, quarterly, $1.31¼.

Halifax (N. S.) Electric Tramway, Ltd., quarterly, 2 per cent.

Honolulu Rapid Transit & Land Company, Honolulu, Hawaii, quarterly, 2 per cent.

Interstate Railways, Philadelphia, Pa., 3 per cent, preferred.

Lake Shore Electric Railway, Cleveland, Ohio, quarterly, 1½ per cent, first preferred.

Little Rock Railway & Electric Company, Little Rock, Ark., 3 per cent, preferred; 5 per cent, common.

Mohawk Valley Company, New York, N. Y., quarterly, 1½ per cent.

New York State Railways, New York, N. Y., 1¼ per cent, preferred; 1 per cent, common.

Northern Ohio Traction & Light Company, Akron, Ohio, quarterly, 1½ per cent, preferred.

Public Service Corporation of New Jersey, Newark, N. J., quarterly, 1½ per cent.

Reading (Pa.) Traction Company, 75 cents.

Republic Railway & Light Company, New York, N. Y., quarterly, 1½ per cent, preferred.

Ridge Avenue Passenger Railway, Philadelphia, Pa., quarterly, $3.

Springfield & Xenia Traction Company, Springfield, Ohio, 3 per cent, common.

United Electric Company of New Jersey, Newark, N. J., 2½ per cent.

Virginia Railway & Power Company, Richmond, Va., 3 per cent, preferred.

Washington Water Power Company, Spokane, Wash., quarterly, 1½ per cent.

Western Ohio Railway, Lima, Ohio, quarterly, 1¾ per cent, first preferred.

West India Electric Company, Ltd., Kingston, Jamaica, quarterly, 1¼ per cent.

Traffic and Transportation

B. R. T. SAFETY BULLETIN NO. 6

Just before Christmas the instruction branch of the surface lines of the Brooklyn (N. Y.) Rapid Transit Company issued Bulletin No. 6, dated December. The bulletin was very tastefully arranged, being printed in black on red paper with holly at the top and showing the dates 1914 and 1915. On the cover was the following: "Your being careful and courteous will make others enjoy A Merry Christmas and A Happy New Year." The following table contained in the bulletin shows the percentage of decrease in accidents for October and November, 1914, over the same months last year:

	Percentage of Decrease	
Accidents	October, 1914	November, 1914
Car collisions	36.1	59.2
Car and vehicle collisions	26.9	29.2
Cars striking persons	14.8	8.9
Boarding and alighting	8.9	7.4

The bulletin then said:

"This is evidence of some mighty fine work in preventing and avoiding accidents. It is greatly appreciated and we sincerely hope each and every one of you will continue with the good work.

"There were only twelve car collisions on the entire surface system during November, which lowers the record for car collisions in any one month. This is a remarkable showing you have made when it is considered that there are 2000 cars operated daily and that the majority operate through the congested districts of lower Fulton Street, Brooklyn Bridge and Williamsburg Bridge and also in and around the depots. Never relax your constant watchfulness for danger.

"Christmas trees will soon be placed upright on the curb in front of stores located at street corners and, when placed in this manner they obstruct the view to the extent that in many cases it is practically impossible for motormen to see a vehicle approaching from the intersecting street until the car reaches the corner. Be extremely careful during the holidays. When the drivers of vehicles are out late at night they are anxious to get home, therefore, they will very often drive recklessly at a high rate of speed in front of cars. All of the drivers are not reckless, but be on the alert for the reckless driver. Never race up to a car, a vehicle or a street corner and try to stop quickly.

"Several accidents have occurred recently where pedestrians, carrying umbrellas, have either walked into the side or directly in front of a car. During stormy weather, a great many hold an umbrella over their head in such a manner as to make it impossible for them to see where they are going. Children wearing rubber hoods over their head during stormy weather have their view obstructed to a certain extent and they should be watched as closely as those carrying umbrellas. Also, men carrying large bundles upon their shoulder have their view obstructed, causing them, in many cases, to walk directly in front of the car. Not only look out for the reckless driver but also look out for the thoughtless pedestrian.

"We wish you all A Merry Christmas and A Happy New Year."

The bulletin was issued by E. C. Clarke, supervisor of instruction of the company, with the approval of William Siebert, superintendent of surface lines.

FIVE PER CENT RATE INCREASE GRANTED

The Interstate Commerce Commission on Dec. 16 decided that steam railroads in official classification territory should be allowed to make a horizontal rate increase of 5 per cent. It is estimated that this will result in increased earnings of about $50,000,000. The decision covers all rates in the territory with the exception of rail and lake, bituminous coal and coke, and anthracite coal and iron ore rates, all of which have been previously adjusted or are now under separate review. Rates on cement, starch, brick, tile, clay and plaster, which were denied in the preceding grant for the central territory, may now be increased. In handing down its decision, the commission states that the financial problems of the carriers have undoubtedly been made much more acute by the war and that if rates are to be set to afford reasonable remuneration of the carriers, consideration must be given to the increased hire of capital as well as to other increased costs. The commission expects the constructive work presented in its original report for the purpose of increasing net revenue will be carried on without interruption. There were two dissenting opinions to the decision. Commissioner Harlan agreed that the railroads need increased revenues, but he dissented from the course approved in the belief that the decision unlawfully shifts the burden of the carriers' troubles upon the interstate shipper. Commissioner Clements objected to the entire decision on the ground that no prior case before the commission or any court decision has held that the need of a carrier for money is in itself proof of the reasonableness of rates increased to meet such need.

ALL FOR FIVE CENTS

Gerald Stanley Lee, author of "Crowds," headed his talk in the New York Sunday *World* of Dec. 20 "A Street Car Christmas." In the course of his remarks Mr. Lee said:

"When I got home and was sitting by the fire in my slippers I fell to thinking again of the street car. It came over me gradually how much that street car meant —what a deep, wise and rather wonderful street car it was. I felt a little rebuked when I thought about it. The street car had apparently—all when I wasn't knowing—held me up quietly, good naturedly, made me stand perfectly still and put over on me an Idea! I recalled all the faces and the attitudes of those people I had been with in the car, and all the while that gay, mocking little fare recorder up there above their heads singing to them of the seats they were paying for that they hadn't got. All jammed full of kindness and hope! A kind of small, neatly packed-up, rolling America. The money singing away up over their heads, and people standing and joining in the chorus. Inconvenience and joy! Anybody coming over to this country and wishing to see America and see it soon, should be shown at once into such a street car. So as I sat by my fire I felt rebuked. I thought what a wonderful street car it was I had stood up and found fault in. It was a deep and wise street car. Elijah's chariot looping the loop and making a great idle, useless, glorious, lonely flourish in the heavens, was nothing—not as a sign of the times or a prophecy of the world—to that street car bowling jovially up the hill. Elijah's being grabbed decorously and caught away in the heavens all alone was not so essentially religious as what had happened to me that afternoon —and all for 5 cents."

Freight Rights Granted.—The Worcester (Mass.) Consolidated Street Railway and affiliated companies have been granted the right to carry freight and baggage in Oxford, Mass., by the Public Service Commission.

Approval of Folding Steps at Boston.—The Massachusetts Public Service Commission has approved the application of the Bay State Street Railway for the right to use double folding running boards on open cars of the Wason type and single-folding running boards on cars of the Bay State make.

"Safety First" Suggestions.—A department of *Trolley Topics*, the journal of the Louisville (Ky.) Railway, is given over to "safety first" suggestions from employees. The current issue of the publication, which is distributed among the men and sent to the newspaper offices, contains many suggestions.

Ice Interrupts Traffic.—Needle ice at the Decew Falls generating plant of the Dominion Power & Transmission Company choked the flumes during the night of Dec. 15 and power had to be shut off. The local railways in Hamilton, Ont., and several interurban lines were at a standstill for about five hours.

"Jitney" Bus a Menace in Everett.—Attorney J. A. Coleman, Superintendent George Newell and K. K. Carrick, representing the Everett Railway, Light & Water Company, Everett, Wash., appeared before the City Council recently to ask the city to bring action looking to the regulation of the auto-bus business.

Semi-Annual Safety Banquet.—The semi-annual banquet of the "safety first" committeemen of the Union Traction Company of Indiana was held at the Doxey Hotel, Anderson, Ind., on Dec. 1. H. A. Nicholl, general manager of the company, acted as toastmaster. Seven prize essays written by employees of the company were read.

Hearing on Fare Increase Petition.—The public hearing on the petition of the Charleston-Isle of Palms Traction Company to the Railroad Commission of South Carolina to increase the round-trip fare between Charleston, S. C., and the Isle of Palms from 30 cents to 40 cents was held recently. The hearing will be continued.

Fire in the New York Subway.—Fire in a subway train of the Interborough Rapid Transit Company, New York, N. Y., at the peak of the morning load on Dec. 21 started a rush of passengers on the platform of the Seventy-second Street express station. A man was cut by glass from a broken window and several women fainted. Traffic was delayed for twenty minutes.

Wage Question at Wilkes-Barre.—Thomas A. Wright, general manager of the Wilkes-Barre (Pa.) Railway, has offered an increase in wages to the trainmen in the employ of the company amounting to 1 cent an hour for the first year and an additional cent an hour for the next two years of a three-year contract. The agreement between the company and the men expires on Dec. 31.

Service Action Contemplated.—Counsel for the Public Service Commission of the First District of New York has been instructed to begin legal proceedings against the Interborough Rapid Transit Company to force it to live up to the orders of the commission concerning traffic during the non-rush hours. This means that the commission either will institute mandamus proceedings or will start a penalty action.

Health Crusade in Kansas City.—The sanitation inspectors of the board of health of Kansas City, Mo., Dec. 1 began on a campaign to stop the practice of spitting in street cars. The Metropolitan Street Railway is assisting to the extent of granting badges to the inspectors permitting them to ride free on the cars. The inspectors also will urge upon the conductors the necessity of proper ventilation in the cars.

Claim Agent Prepares Safety Hints.—The United Railroads, San Francisco, Cal., has included as a supplement to its magazine for December a series of safety hints by the claim agent, arranged in placard form for conspicuous display. The hints are addressed to motormen and conductors. They are concluded with the statement that any suggestions relative to the prevention of accidents will be welcomed by the claims department.

"Near Side" Stop Record in New York.—First reports of the operation of the near-side car-stop regulation during September, October and November indicate that it has materially promoted street safety. On the lines of the Third Avenue Railway during this period the number of crossing accidents fell to 1061 from a total of 1306 for the corresponding period last year. These figures include all car and knock-down accidents which occurred at street intersections only.

Safety Zones Recommended for Columbus.—After a trip to Detroit where they studied the safety zone system, Director of Public Safety Barger and Chief of Police Carter of Columbus, Ohio, have decided to recommend to the Council committee on streets the adoption of the plan for use in that city at such street intersections in the congested business district as have become especially dangerous for pedestrians. Director Barger has also inspected the traffic signal system installed some time ago at 105th Street, Cleveland.

Install Speed-Control Signals.—As a result of the investigation conducted by the Public Service Commission of the First District of New York into the accident and fire in the Lenox Avenue branch of the subway at 142nd Street on Sept. 29, the Interborough Rapid Transit Company has notified the commission that, in accordance with the recommendation of the commission's engineers, it will install speed-control signals on both south-bound tracks approaching the junction at this point. This will prevent a repetition of the collision which caused the fire.

Christmas Cards to Employees.—The public relations department of the Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, of which R. P. Stevens is president, enclosed with its Dec. 20 pay checks to all employees the following notice: "At this time of the year when all mankind seeks to bring joy and happiness into the hearts and lives of those dear to him, let us not forget to take courtesy, kindliness and thoughtfulness for others into our work that we may handle the Christmastide rush in a spirit that is worthy of the gladsome season. May your Christmas be a merry one and may the New Year dawn in prosperity for you individually and for us in our common interest.—Mahoning & Shenango Railway & Light Company."

Gold Pieces Distributed in New York.—The Interborough Rapid Transit Company and the New York Railways gave a $5 gold piece as a Christmas present to each of their employees who receive $115 per month or less in salary. The subway and elevated employees received $43,500 and the surface railway employees more than $26,000. Frank Hedley, vice-president of the companies, in announcing the gift stated in a general order to the employees that it is being made in appreciation of their efforts in maintaining at all times the highest degree of comfort and convenience to the company's patrons. This is the third year that the gold pieces have been given to the Interborough Rapid Transit Company employees and the second year that the New York Railways' men have received them. The gift applies only to those employed prior to Jan. 1, 1914.

New Transfers in Portland.—On Jan. 1, the Portland Railway, Light & Power Company, Portland, Ore., will put into use a new system of transfers to apply on all the urban lines. Supplanting the present system, which provides one general form of transfer slip, punched to indicate originating line and secondary line of fare, the new system will have two forms for each line, one for each direction. A new feature is a stub for intermediate travel, to be used in cases where two transfers are to be made. The first conductor issues the slip and the second conductor tears off the stub, leaving theremainder of the slip for the third conductor. Another stub is printed "P. M.," but this is torn off by the issuing conductor if the slip is issued in the morning. The hours from one to twelve are printed in black type in a row, with a space marked off into quarters adjoining each.

Front-End Collection System Working Well.—*Electric Railway Service*, published in the interest of the Detroit (Mich.) United Railway, contains in its issue of Dec. 11, the following appeal to its patrons for their co-operation in connection with the trial of the front-end collector system: "The experiment of admitting passengers through the front doors of Woodward and Hamilton cars between 4 p. m. and 6 p. m. at the Pontchartrain, State and Grand River crossings is working out very nicely. There can be a great improvement if intending passengers will have the exact fare—cash, ticket or transfer—ready. For tickets, transfers and change it is necessary to board the car in the rear. The purpose of the experiment is to find some way of getting the cars through the congested district in shorter time. To accomplish this it is absolutely necessary for the passengers to be prompt."

Recent Accident Record in Louisville.—Comparison of records of the Louisville Railway Company for the months of November, 1913, and November, 1914, show a marked decrease in the ratio of accidents to mileage, one of the benefits attributed to the "safety first" campaign which has been conducted by the company. In November, 1914, there was one accident to every 2219 miles negotiated by the company's cars. Last November the ratio was one accident to every 2323 miles. Averages follow for the past four months on seven of the company's lines: Oak Street line, 4410 miles to each accident report; Twelfth and Fifteenth Street line, 3179; Second Street, 2814; Portland and Shelby Streets line, 2802; Market Street line, 2776; Fourth Avenue line, 2531, and Broadway line, 2490. Three motormen have not been involved in a vehicle collision in nearly four years.

Another Safety Campaign.—The Westchester Street Railroad, White Plains, N. Y., has inaugurated a "safety first" campaign among its employees. On Dec. 17 lectures on accident prevention were delivered to both the day and the night shifts by a representative of the Independence Inspection Bureau, Philadelphia. Slides were shown made by the bureau from pictures taken on various electric railroads and by a score or more of the Brooklyn Rapid Transit System's series on accidents to children and by collision with vehicles. J. H. Calhoun, superintendent of the company, prefaced the lectures with a plea to the men that they exercise the greatest care at all times. The company has required all its platform men to undergo an examination by a local optician. Those whose sight is found to be defective are required to provide themselves with glasses fitted according to the optician's prescription.

Package Service in Memphis.—The Memphis (Tenn.) Street Railway has put its first package car in operation, one car serving for the trips from Memphis to Raleigh, Memphis to Normal and Memphis to Lake View, with a second trip each day to Raleigh. The service is primarily for the benefit of the suburbanites. Service will not be rendered in the central portion of the city. A general classification of 15 cents for first-class, 12 cents for second-class and 10 cents for third-class express has been announced. Foodstuffs and canned goods are carried for 10 and 12 cents a hundred, and there will be special rates for green groceries, vegetables, etc. A minimum charge of 15 cents will be made from point to point on the same line, and from a point on one line to a point on another a charge of 1½ cents, with a maximum charge of 25 cents, will be collected. Schedules of the service and rates are being prepared and will be supplied to the public in printed form.

New Stop System in Salt Lake.—The Utah Light & Traction Company, Salt Lake City, Utah, has announced a new system of stops to be followed in operating its cars. At intersections in the paved districts, for stops on the near side, the front end will be stopped even with the cross walks. Far side stops will be made so that the rear of the car will be clear of the crosswalk. In the business district cars will pull up a full car length from the crosswalk on the far side before stopping. On unpaved streets when cars are bound toward the business district, they will be stopped with the rear platform at the crosswalk for passengers. When cars are outbound, from the business district, they will be stopped with the front platform at the crosswalk on the unpaved streets, except that during muddy weather they will be stopped with the rear platform at the crosswalk. Passengers desiring to alight will be requested by the trainmen to leave by the rear door. At the junction of paved and unpaved streets the car will be stopped so that passengers may board or leave them on the pavement.

Electric Railway Furthers Farming.—The following announcement has been made by the Cumberland County Power & Light Company, Portland, Maine, operating the Portland Railroad and the Lewiston, Augusta & Waterville Street Railway: "All of the freight business of the Atlantic Express Company, which includes freight carloads and parts of freight carloads, will be taken over by the Cumberland County Power & Light Company on Jan. 1, and F. E. Woods, late of the Springfield (Mass.) Street Railway, has been appointed general freight agent of this company with headquarters at Portland. The Atlantic Express Company will continue to handle the express business, but will not handle freight. The rates which we will put into effect will be considerably lower than former express rates and will be designed to develop the farming interests along the 270 miles of system which we operate. We will have close working arrangements with the Maine Central Railroad at all points where we connect, and hope to make our business a developer of more extensive farming along the entire line by placing the farmers in close touch with the markets at rates which will be attractive. At every point on our road where we can take care of the needs of shippers we will arrange to do so." The appointment of Mr. Woods to the company was announced in the ELECTRIC RAILWAY JOURNAL of Dec. 12.

Personal Mention

Mr. J. S. Pevear has resigned as president of the New Orleans Railway & Light Company, New Orleans, La.

Mr. E. J. Bean, formerly attorney for the Public Service Commission of Missouri, has succeeded Mr. William F. Woerner as a member of the commission.

Mr. J. J. Cogan has been appointed general superintendent of the Florence & Cripple Creek Railroad, Colorado Springs, Col., and leased lines, effective on Jan. 1. Mr. Cogan has also been appointed general superintendent of the Midland Terminal Railway.

Mr. James E. Allison, at one time chief engineer of the St. Louis Public Service Commission, has been appointed lecturer in economics in Washington University, St. Louis, Mo. His lectures will deal with the economic principles underlying the regulation of public utilities and the new course will replace in part the second semester's work in general economics for seniors in the school of engineering. Mr. Allison has established a fund for the purpose of awarding cash prizes or in other ways promoting the study of public utility economics.

Mr. W. L. Locke, superintendent of construction of the Stone & Webster Engineering Corporation, has taken up his activities as head of the construction department at Seattle, Wash. Mr. Locke was in Seattle prior to his assuming charge of the transmission line from the Big Creek development project, in California, to Los Angeles, where he was established in charge of the Los Angeles office, under Mr. Shuffleton. Before going to the Big Creek project Mr. Locke had charge of local construction in Seattle for the engineering corporation, which at that time did all of the construction work for the Seattle Electric Company.

Mr. P. C. Dugan has resigned as counsel for the United Traction Company, Albany, N. Y., to become associated in the general practice of law with Mr. S. W. Rosendale, Mr. Albert Hessberg and Mr. Edgar M. Haines, under the firm name of Rosendale, Hessberg, Dugan & Haines. Mr. Dugan was born at Wright, N. Y., on March 10, 1867. In 1889 he was admitted to the bar and immediately began the practice of law in Schoharie County. He moved to Albany in 1892 and in 1901 he became connected with the law department of the United Traction Company. In 1907 and 1908 he served as deputy under Governor Martin H. Glynn of New York, who then was Comptroller of the State.

Mr. Samuel Riddle, superintendent of transportation of the Louisville (Ky.) Railway and the Louisville & Interurban Railway, owned by the same interests, is featured by the Louisville *Times*, in the "Pousse Café" section, which is the joint work of the cartoonist on that paper and the staff humorist. It mostly has fun with the prominent people of the city, but one department is given over to a good likeness of some well-known man with a humorous appreciation of him and of his work. The text in connection with the cartoon, with pleasant references to Mr. Riddle's small daughter, says that since coming to Louisville Mr. Riddle has put into effect many reforms in operation of the local railways, such as to place the Louisville system in the front rank.

Mr. Byron T. Burt has resigned as general manager of the Chattanooga & Tennessee River Power Company, effective on Jan. 1. He will be succeeded by Mr. George S. Baker, who has been auditor of the company since it opened offices in Chattanooga. Mr. Burt will go to Buenos Aires early in the year as manager of the South American Trading Company, and will open the main office of that concern for the sale of American manufactures in Argentina. He has been conspicuous in Chattanooga business circles for several years, having been manager of the old Chattanooga Electric Company until its consolidation with the Chattanooga Railway & Light Company. When the Chattanooga & Tennessee River Power Company was organized to construct the Brady power plant at Hale's Bar on the Tennessee River he was made general manager.

Mr. A. N. Connett, who is chief engineer and a joint managing director of J. G. White & Company, Ltd., London, has accepted the position of a vice-chairman of the Belgian Relief Commission and will take charge of administering in Belgium the distribution of the food and other means of relief being sent to that country from America. This appointment will require Mr. Connett to make his headquarters in Brussels for the next few months, but his executive ability and long experience in the direction of large business affairs in America and in different European countries eminently fit him for the efficient organization and direction of this important philanthropical work. Mr. Connett is an American, and before taking up residence abroad some eighteen years ago, built the underground conduit electric railway lines in Washington, D. C. He is now in this country but expects to leave for London on Dec. 30, there to receive instructions before going to Brussels.

H. B. CAVANAUGH

Mr. H. B. Cavanaugh, elected president of the Central Electric Railway Accountants' Association at the meeting in Dayton, Ohio, on Dec. 11 and 12, was reared on a farm in northern Ohio and remained there until he was twenty-two years of age. Having completed a course in stenography, he entered the office of what is now the Cleveland, Southwestern & Columbus Railway as stenographer about sixteen years ago. The company was then operating 39 miles of track, connecting Cleveland and Berea and Cleveland and Elyria. After serving about a year and a half as stenographer Mr. Cavanaugh was appointed bookkeeper. Two years later he was made auditor. Mr. Cavanaugh has served continuously in the department of accounts. The company now operates 215 miles of road. He was one of the charter members of the Central Electric Railway Accountants' Association and served during the past year as first vice-president of the association.

Mr. D. D. Curran, now president of the New Orleans & Northeastern Railroad, has been elected president of the New Orleans Railway & Light Company, New Orleans, La., to succeed Mr. J. S. Pevear, resigned. Mr. Curran was born in Ireland. He entered railway service in 1873 as a brakeman on the Pennsylvania Railroad, which position he held for five years. He was then successively freight conductor of the Mobile & Montgomery Railroad, passenger conductor of the same road, yard master of the Louisville & Nashville Railroad at Montgomery and train master of the same road at Birmingham, Ala. From 1887 to 1893 Mr. Curran was connected with the Central of Georgia Railroad successively as superintendent of the South Carolina division, superintendent of the Southwestern division, superintendent of the Columbus & Western division and superintendent of the Savannah and Western division. He was appointed to the last mentioned position in 1892. From February, 1893, to August, 1907, he was superintendent of the New Orleans & Northeastern Railroad. In August, 1907, he was elected president of that company. Mr. Curran will assume his new duties in February. Commenting editorially on the election of Mr. Curran, the New Orleans *Times-Picayune* said recently: "Mr. Curran enjoys respect and confidence in this community. He has been in charge of the Queen and Crescent line for twenty years, and has had an opportunity to prove his ability in that position, to show that he understands the railroad business, and that he knows local conditions and desires. The fact that Mr. Curran is a local man will, without any narrow prejudice in the matter, better qualify him for the position."

OBITUARY

Elmer E. Spofford, chairman of the Maine Railroad Commission until the creation of the Public Utilities Commission, died in Deer Isle on Dec. 12, aged fifty-two years.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

Willimantic & Manchester Street Railway, Willimantic, Conn.—Chartered in Connecticut to build an electric line to connect Willimantic, Hop River, Andover, Bolton and Manchester, 18 miles. T. J. Spellacy, Hartford, and associates are interested. [E. R. J., Dec. 19, '14.]

***Carolina, Greenville & Northern Railroad, Greenville, Tenn.**—Chartered in Tennessee to build a 30-mile electric railway from Kingsport to Newport, Tenn. Capital stock, authorized, $1,500,000. Common stock, $1,000,000. Preferred stock, $500,000. Much of the right-of-way has been secured. The line will connect at Kingsport with the Clinchfield Railway and at Newport with the Southern Railway. Officers: H. S. Reed, Los Angeles, president; James L. Callahan and Kirby Thomas, New York, vice-presidents.

FRANCHISES

Los Angeles, Cal.—The Public Utilities Committee of the City Council is considering the proposed notice of sale for the franchise for an incline railway in Griffith Park, applied for by Colonel Lewis Ginger. Arrangements have been made to begin work on this line as soon as the franchise is granted. This proposed line will be built on the northeastern side of the park and will extend 1850 ft. to the top of Mt. Hollywood to the site for placing an observatory. [E. R. J., Oct. 31, '14.]

Pasadena, Cal.—The Pacific Electric Railway has officially accepted the thirty-year franchise for its double-track line on North Lake Avenue in Pasadena.

Bristol, Conn.—The Bristol & Plainville Tramway Company has asked the Council for an extension of time on its franchise in which to build several extensions of its lines in Bristol and also for permission to change its tracks from Park Street to Divinity Street in Bristol.

***Sanford, Fla.**—I. Michael Sholtz and associates will ask the Seminole County Commissioners for permission to construct a bridge across the St. Johns River at the Monroe Ferry in Sanford. This is a part of a plan to build an electric railway from Daytona to Sanford, via DeLand.

Saratoga Springs, N. Y.—The Hudson Valley Railway has asked the Council for a franchise across Broadway at Congress Street and thus connect its Troy-Saratoga and Saratoga-Warrensburgh lines in Saratoga Springs.

Ironton, Ohio.—The only bid for the twenty-five-year franchise to be awarded by the City Council, opened on Dec. 15, was filed by the Ohio Valley Electric Railway, Huntington, W. Va., which has been operating the local road for some time past. The company proposes to carry passengers at a fare of 5 cents, but it is said that Council will probably insist on six tickets for 25 cents.

Portland, Ore.—The Portland & Oregon City Electric Railway has filed its acceptance of its Tacoma Avenue franchise at the same time filing a bond of $5,000 as required by the city. The franchise is for the use of streets from the southeast section of Portland to and through the downtown business section. Connection is to be made with an interurban line now being built between Portland and Oregon City.

TRACK AND ROADWAY

Birmingham Railway, Light & Power Company, Birmingham, Ala.—About 2.53 miles of new track will be built by this company in Birmingham during 1915.

Phoenix (Ariz.) Railway.—Plans are being contemplated by this company to build a 1½-mile extension in Phoenix from the terminus of the present South First Avenue line to the city limits and ½-mile from the city limits to Riverside Park.

Fresno (Cal.) Interurban Railway.—The 3-mile section of this railway between Fresno and Barton has been placed in operation. The company has asked the commission for authority to issue securities to provide for the extension of the line easterly to the Centerville citrus belt, and also for a branch line to what is known as "Gould Colony," north of Fresno. If the commission authorizes this issuance, work will be begun at once on the construction of the extensions of 26 miles. Power is purchased by this company from the San Joaquin Light & Power Corporation. J. B. Rogers, 625 Market Street, San Francisco, president.

Los Angeles, Cal.—A new survey is to be made by the City Engineer's department of the route of the proposed franchise for the electric line to extend northerly from North Pritchard Street and North Broadway, to reach Glen Alta, Schuetzen Park and the Hermon districts to the boundary limits of South Pasadena. [E. R. J., Nov. 14, '14.]

Pacific Electric Company, Los Angeles, Cal.—Work has been begun by this company laying track on the extension of its line between Harrison Street, Arlington and Corona.

Ukiah, Cal.—Preliminary arrangements are being made to build an electric railway to connect Ukiah, Cold Creek, Upperlake and Potter Valley. Among those interested are E. L. Cunningham, P. Connolly and T. J. Weldon. [E. R. J., Oct. 5, '14.]

Connecticut Company, New Haven, Conn.—This company is asked to consider plans to extend its lines through East Street from Water Street to State Street in New Haven.

Washington Railway & Electric Company, Washington, D. C.—Double tracks will be constructed by this company on Fourteenth Street from F Street to Pennsylvania Avenue; also from Water Street eastward from Fourteenth Street in Washington.

***Safety Harbor, Fla.**—Plans are being considered to build an electric railway in Safety Harbor.

Savannah (Ga.) Electric Company.—The tracks of this company on the Habersham Street line, which have heretofore ended at the intersection with the Atlantic Coast Line Railway right-of-way at Thirty-seventh Street, are now being extended to Forty-fourth Street in Chatham Crescent in Savannah.

Peoria, Ill.—Preliminary arrangements are being made by the citizens of Chillicothe to organize a company, with a capitalization of $5,000, to build an electric railway between Peoria, Ill., and Chillicothe, Ohio. Among those interested are: E. F. Hunter, E. A. Mitchell, E. V. Mattice, John F. Lynch and R. H. Truitt.

Sterling, Dixon & Eastern Electric Railway, Dixon, Ill.—This company plans to build 2 miles of new track in Dixon during 1915.

Freeport Railway & Light Company, Freeport, Ill.—About 1 mile of new track will be built by this company during 1915.

Chicago, Peoria & Quincy, Peoria, Ill.—Woolf Teitel, president of Woolf Teitel & Company, of Utah and California, has arrived in Peoria and is directing the disposition of stock in the proposed railway between Peoria and Quincy. It is expected to begin the construction of this line in the spring. [E. R. J., Oct. 5, '14.]

Bangor Railway & Electric Company, Bangor, Me.—This company has ordered the necessary equipment to build the Harlow Street and Central Street loop in Bangor. The sum of $40,000 will be expended in this work.

Boston, Mass.—A contract was awarded on Dec. 15 by the Boston Transit Commission (B. Leighton Beal, secretary), Boston, for the construction of Section E, Dorchester tunnel, under Ft. Point Channel, a distance of about 3200 ft., to P. McGovern at $1,955,375.

***Monticello & Middletown Railroad, Monticello, N. Y.**—Preliminary arrangements are being made for the organization of this company with a capitalization of $500,000 to build a railway between Monticello and Middletown, via Wurtsboro, Bridgeville and Bloomingburgh. Ultimately this line will be extended west of Monticello into White Lake, Bethel and Jeffersonville. Blake A. Mapledoram, Monticello, engineer, is interested.

Brooklyn, N. Y.—The construction work on the West End elevated line, which is part of the Broadway-Fourth Avenue route of the dual subway system, has been begun. That is the announcement which the Public Service Commission received from Post & McCord, the contractors. The work started on Tenth Avenue, between Thirty-eighth and Fortieth Streets. The steel for this elevated line has all been cast and is lying in the yards of the Public Service Commission, at Greenville, N. J. It will be shipped to Brooklyn as it is needed.

International Railway, Buffalo, N. Y.—This company has asked the Public Service Commission of the Second District for permission to build an extension from Buffalo to Niagara Falls and for permission to issue $3,000,000 of 5 per cent bonds under an existing mortgage to pay for such extension.

***Ilion, N. Y.**—Plans are being made for the preliminary surveys for an electric railway in Ilion. The Business Men's Association and the Board of Trade are furthering the preliminaries in the hope that the project may be taken up and the road constructed.

Richmond Light & Railroad Company, New York, N. Y.—During 1915 this company plans to build about 1½ miles of new track.

Stark Electric Railway, Alliance, Ohio.—Plans have been made by this company to extend one of the Alliance city lines to Marlborough, a distance of 7 miles. It has not yet been decided just when construction will be begun.

Cincinnati (Ohio) Traction Company.—The proposition of establishing an electric line to Fairview Heights was explained by Walter A. Draper, vice-president of this company, to a meeting of residents of that suburb, held under the auspices of the Fairview Heights Civic League. Mr. Draper said that the traction company was willing to establish the route if a "Y" were located near the incline.

Cleveland, Alliance & Mahoning Valley Railway, Cleveland, Ohio.—The 7-mile section of this line between Newton Falls and Leavittsburg is being completed. The grade has all been made and most of the track has been laid. The poles have all been set, but the overhead work is yet to be put up. This railway may be extended on to Warren within the next year.

Cleveland (Ohio) Railway.—A double-track into Garfield Park is being built by this company in Cleveland and it has placed in operation its new line down Warner Road to Bancroft Avenue.

Cleveland, Youngstown & Eastern Railway Company, Cleveland, Ohio.—R. D. Beatty, general manager of this company, was appointed receiver of that portion of the company's property between Chagrin Falls and Garretsville on Dec. 16. The application was filed by the Citizens' Savings & Trust Company, Cleveland, which asked that a mortgage for $52,000 held against that portion of the line be foreclosed. Attorneys stated that that portion of the property has not been on a paying basis since its construction.

Columbus Railway, Power & Light Company, Columbus, Ohio.—Citizens of the North Side are urging that what is known as the stub line on Eleventh Avenue be connected with the Chittenden Avenue line in order to furnish better service for that section of the city. It is possible that this may interfere with the proposed crosstown line on Fifth Avenue, but consideration will be given this point before action is taken.

Dayton, Middletown, Reading & Cincinnati Company, Middletown, Ohio.—Surveys have been completed by this company on its line between Middletown and Cincinnati, 30 miles, and surveys are now under way on the line between Middletown and Dayton, 20 miles. This 50-mile line will connect Middletown, Monroe, West Chester, Sharonville and Reading. James G. Miller, West Chester, president. [E. R. J., Oct. 12, '14.]

Galion, Mt. Gilead & Delaware Electric Railway, Mt. Gilead, Ohio.—Right-of-way has been secured, but on account of being unable to secure financial backing no further progress has been made on this proposed 39-mile electric railway to connect Galion, Westpoint, Mt. Gilead, Cardington, Ashley and Delaware. S. P. Gage, Marengo, president; A. H. Breese, Mt. Gilead, secretary, and T. E. Buck, Mt. Gilead, chief engineer.

Portsmouth Street Railroad & Light Company, Portsmouth, Ohio.—During 1915 this company expects to build a 22½-mile line from Sciotsville to Ironton, Ohio.

Springfield (Ohio) Electric Railway.—This company has placed in operation its Lowry Avenue extension in Springfield.

Ontario West Shore Railway, Goodrich, Ont.—The Ontario Hydro-Electric Commission is surveying the route of this railway between Kincardine and Goodrich. [E. R. J., Nov. 14, '14.]

Wentworth Street Incline Railway, Hamilton, Ont.—The Board of Control had a conference with G. F. Webb, with reference to the extension of this railway. Mr. Webb explained plans which had been prepared, showing tracks passing under the Toronto, Hamilton & Buffalo Railway, and across the Grand Trunk Railway on the level, and extending north from the present terminus, sufficiently far to reduce the existing gradient, and stated that he would undertake to carry out these plans if the city would construct a permanent roadway on Wentworth Street. The members expressed a general approval, and asked that complete details be submitted, so that a definite decision might be reached and a recommendation made to the City Council at an early date.

Toronto, Ont.—Ratepayers in the northwest section of Toronto are agitating for a civic car line on Lansdowne Avenue, south from the St. Clair Avenue line. Extension of the Gerrard Street civic line is being discussed by the ratepayers. The line does not at present extend to the eastern city limits.

Toronto, Ont.—Estimates have been given out covering the projected Hydro-electric railway in Elgin and Middlesex counties. Five possible routes are being considered, but only one of these is estimated to yield a surplus. This is a railway running between London and Tillsonburg, Ont., via Aylmer. This line would connect with the London & Port Stanley Railway at Westminster, and extend through Belmont, Lyons, Aylmer, Springfield, Brownsville and Tillsonburg. The estimated capital cost is $892,000.

Hagerstown, Greencastle & Mercersburg Railway, Middleburg, Pa.—C. S. Johann, consulting engineer, 50 Broad Street, New York, and associates have secured the control of this railway, whose main office is in Greencastle, Pa. The affairs of the company will be managed by Mr. Johann; plans and specifications for the completion of the work will be completed at an early date. At a recent meeting the following officers were elected: C. S. Johann, New York, president and general manager; E. J. Hutter, New York, treasurer, and F. S. Simons, New York, secretary. [E. R. J., Jan. 18, '14.]

***Marietta, Pa.**—The citizens of Maytown and Marietta are considering plans to build an electric railway between Maytown and Marietta. Several surveys have been made for the proposed line, and it is expected that work will be begun in the spring.

Titusville (Pa.) Electric Traction Company.—A 12½-mile line between Tryonville and Cambridge Springs will be constructed by this company during 1915.

Denison & Sherman Railway, Dallas, Tex.—Plans are being made by this company to build a loop line in South Denison.

Puget Sound Traction, Light & Power Company, Seattle, Wash.—This company has announced its intentions of expending not less than $100,000 in making necessary repairs on the right-of-way of the Seattle-Tacoma Interurban, between Seattle and Tacoma and in constructing two bridges, one over White River, 1 mile south of Kent, and the other over Black River, at Duwamish. Both structures will be of steel and the company is in the market for this material.

Charleston, Parkersburg & Northern Railroad, Parkersburg, W. Va.—The proposed line of this railway is 56 miles long from Charleston to Palestine, W. Va. It will connect at Palestine with the Little Kanawha River branch of the Baltimore & Ohio Railroad extending from Palestine to Parkersburg, 30 miles. The route chosen for the new line is via Sissonsville, Cicerone and Pocotalico River. The first grade will not exceed 1 per cent and the second not over 1½ per cent. Few bridges will be necessary, but where they are needed short spans of the through plate girder type will be used. Bids for construction will be opened about Jan. 1. [E. R. J., Oct. 5, '14.]

Appalachian Power Company, Bluefield, W. Va.—During 1915 this company plans to extend its city lines about 1 mile.

Badger Railway & Light Company, Milwaukee, Wis.—During 1915 this company plans to continue its line to Elkhorn and Lake Geneva and from Whitewater to Jefferson, a distance of 25 miles.

SHOPS AND BUILDINGS

Pacific Electric Railway, Los Angeles, Cal.—This company has opened its new station at the corner of Sherman Way and West F Street in Van Nuys.

Benicia Land & Terminal Company, Benicia, Cal.—This company has opened offices at 310 Georgia Street in Vallejo. [E. R. J., Oct. 5, '14.]

Jacksonville (Fla.) Traction Company.—Plans are being prepared by this company to build large modern storage track yards on its property to the north of the carhouse on Riverside Avenue in Jacksonville. It is moving its sub-offices from the old two-story building to the structure across the street and in the grounds surrounding the power house.

Metropolitan Street Railway, Kansas City, Kan.—Plans are being considered by this company to build a new union interurban station in Kansas City.

Boston (Mass.) Elevated Railway.—This company is asked to consider plans to build a new subway station at Arlington Street in Boston. Five hundred dollars has been raised by residents of Back Bay and Boylston Street for the purpose of obtaining legislation favoring the establishment of this new station.

Worcester (Mass.) Consolidated Street Railway.—This company has opened a new waiting station at 10 Monument Square in Worcester.

United Railways of St. Louis, St. Louis, Mo.—A plan for the erection of a passenger station at Main and North Market Streets in St. Louis, as a stop for all trains, and the building of a new United Railways line, with the station as an initial point, and the west city limits as a terminus, is being considered.

Hornell (N. Y.) Traction Company.—Plans are being made by this company for the erection of an addition to its carhouses on Adsit Street in Hornell. The addition will be 109 ft. long and will join the present structure on the Adsit Street side. The contract will be awarded at once so that the building can be completed early in the spring. It will be used as the machine shop, and the present machine shop will be used as a paint shop.

Ogden, Logan & Idaho Electric Railway, Ogden, Utah.—A new brick depot, a new freight house and new carhouses will soon be constructed by this company in Preston.

Rutland Railway, Light & Power Company, Rutland, Vt.—The new freight and express station on Strongs Avenue in Rutland has been completed and will be opened at once by this company.

POWER HOUSES AND SUBSTATIONS

Connecticut Company, New Haven, Conn.—Work has been begun by the Sperry Engineering Company for the Connecticut Company on an extensive addition to the buildings formerly used as a carhouse and power house in Ferry Street, near Quinnipiac River, in New Haven. It is stated that the enlargement of this plant, which has been used for storage purposes for some time past, will cost about $16,000. It is also planned to erect interior partitions of fireproof construction and a bulkhead will also be erected on the river front. When completed the building will be used as the storage house of the company in this city, and practically all of the supplies used in repair of equipment and in other work will be quartered here.

Stark Electric Railway, Alliance, Ohio.—An addition is being constructed to the power house near Alliance by this company.

Cushing (Okla.) Traction Company.—This company has ordered from the Westinghouse Electric & Manufacturing Company one 500-kw geared generator and turbine for its new 1500-volt line. This new line extends from Cushing to Drumwright, Okla., and will be primarily a freight road, drawing most of its traffic from the oil fields.

Manufactures and Supplies

Boston (Mass.) Elevated Railway, noted in the ELECTRIC RAILWAY JOURNAL of Nov. 14 as expecting to purchase 100 trailers, has ordered this equipment, including car bodies and trucks, from The J. G. Brill Company.

Norton & Taunton Street Railway, Norton, Mass., will probably purchase during 1915 ten or twelve new cars, equipped, to replace the fifteen or sixteen open and closed cars which were destroyed on Dec. 10 in the Norton Center carhouse fire.

TRADE NOTES

Simmen Automatic Railway Signal Company, Buffalo, N. Y., has appointed C. E. Chatfield as sales engineer.

Perry Ventilator Company, New Bedford, Mass., has received an order to equip with ventilators the fifty new cars recently ordered by the Pittsburgh (Pa.) Railways from the Pressed Steel Car Company.

Prof. Dugald C. Jackson of D. C. & W. B. Jackson, consulting engineers, Chicago and Boston, authorizes the statement that he has not been engaged by the Merchants' Association of New York City to investigate certain matters relting to the New York Edison Company. A statement to this effect has appeared in one or two technical papers.

Western Electric Company, New York, N. Y., reports that two days, December 7 and 8 of sleet, rain, cold, high winds and falling trees resulted in 25,000 miles of fallen wire and 1200 poles down on the toll and local lines of the Southern New England Telephone Company. By prompt and effective emergency shipments of material for making temporary repairs from this company's warehouse at West Haven, Conn., it was possible to re-establish toll lines to every exchange in the State by the evening of Dec. 10.

Canadian General Electric Company, Peterborough, Ont., has undertaken to construct buildings and install machinery in its Peterborough plant at an estimated cost of $150,000, in return for which the city agrees to take care of the rental of about three miles of the unused Chemong section of the Grand Trunk Railway, which the Canadian General Electric Company will use for testing purposes for the electric locomotives it proposes to manufacture. The expenditure incurred by the city will be approximately $115 a year.

General Electric Company, Schenectady, N. Y., has received the following orders for electric railway equipment: New Orleans (La.) Railway & Light Company, fifty GE-201, 60-hp, two-motor car equipments with K-36 controllers; Interurban Railway, Des Moines, Ia., four GE-210, 70-hp railway motors; Morgantown & Wheeling Railway, four GE-205, 80-hp railway motors; Auburn & Syracuse Electric Railway, twelve GE-200, 40-hp, two-motor equipments and twelve straight air-brake equipments; Arkansas Valley Railway & Light Company has ordered thirty-two GE-203, 50-hp railway motors and twelve K-35 controllers; Pacific Electric Railway, two GE-222, 140-hp, four-motor car equipments.

ADVERTISING LITERATURE

Shuman Advertising Company, Chicago, Ill., has issued a bulletin in regard to its advertising service for trade and technical journals.

Stone & Webster Engineering Corporation, Boston, Mass., constructing engineers, have issued a catalog describing and illustrating the Dundee Falls hydroelectric development of S. D. Warren & Company and the Falls Village development of the Connecticut Power Company, both recently constructed by this engineering company.

Harrison Dust Guard Company, Toledo, Ohio, has issued a folder describing its journal dust guards, which will be installed on the new cars of the New York Municipal Railway. The guards are designed to obviate cut journals and brasses and prevent delays to trains by hot boxes. These guards are constructed of hard wood, well oiled, and lined with heavy belting leather. The two sections are held yieldingly together by means of two special rods, with two twenty-coil brass springs, housed within the lower section, and secured by two hexagon jamb nuts on each rod.

NEW PUBLICATION

Die electrischen Stadtschnellbahnen der Vereinigten Staaten von Nordamerika (City Rapid Transit Systems of the United States—Construction and Operation) by F. Musil, Consulting Engineer, Vienna. Published by C. W. Kreidel, Wiesbaden, 1913. Two parts, 9½ x 12 in. paper, total, 84 pages exclusive of map inserts.

A Frenchman, Taine, wrote the most famous review of English literature. In the same way it seems we must look for the most comprehensive studies of American rapid transit practice to the publications of foreign engineers who have visited our largest cities to see what could be adopted for or adapted to their own cities. Mr. Musil's two pamphlets are among the latest and best of this kind. They are in the form of reports to the Vienna Rapid Transit Commission Commission für Verkehorsanlagen) which has charge of the present Stadtbahn. This is a steam-driven belt line with many tunnels, and therefore a fit object for electrification. The commission's plans also contemplate the extension of the system by means of three new electric subways each about 4 miles long. Preliminary work on these projects was well under way, but has now been interrupted by the war. As consulting engineer for the Vienna Rapid Transit Commission Mr. Musil was charged to visit the United States twice, in 1911 and 1913. Each time he spent two months studying transit conditions in New York, Boston, Philadelphia, Chicago, Pittsburgh and other cities, enjoying many courtesies from the officials and other experts named in his reports. Mr. Musil's reports are accompanied by numerous maps and drawings in addition to a large number of photographs, chiefly of construction methods and unusual traffic conditions.

RECENT BRITISH DEVELOPMENTS

Liverpool is preparing to point out to the Board of Trade the danger of allowing contracts with German companies, whether registered in England or not, to remain in operation and permitting payments to be made thereon during time of war.

The Brighouse and the Huddersfield Corporations have reached an agreement whereby the Huddersfield Corporation tram system will be extended to Brighouse. The Huddersfield Corporation intends to seek power to construct a tramway from its present line at Ashbrow to a point near the terminus of the Halifax trams. The Halifax Corporation has announced its intention of promoting a bill in Parliament for tramway extensions, to include a line from Brighouse to Rastrick. In this connection it sought the support of the Brighouse Corporation, which replied that as it was already negotiating with Huddersfield, it was unable to deal with Halifax.

The London County Council contemplates increasing its tramcar service. Before additional cars can be run it will be necessary to obtain a temporary supply of power from an outside source. The committee has been in communication on the matter with the London Electric Supply Corporation, which has agreed to provide an additional supply of power up to about 1500 kw at a price of £3 a kilowatt a year and 0.4d. a unit. This compares with the price paid for a supply of power previously obtained from the company of £3 a kilowatt a year and 0.35d. a unit. The increase of 0.05d. a unit is due to the increased cost of coal owing to war insurance risks. The power will be provided at the Lewisham substation, and will be sufficient to enable between fifty and sixty additional cars to be run. The Council's elaborate scheme for the consolidation of its tramways, which would have involved an expenditure of about £800.000 to £900,000, much of it being in the nature of linking-up and doing away with "dead" ends, has been abandoned for the present. It has been decided, however, to proceed to Parliament with the scheme for dealing with electricity in Greater London by means of a system of municipal control with company management. This will involve no immediate capital expenditure.

As there is still considerable opposition to the purchase of the Bristol tramways by the Bristol Corporation, A. Dickinson has prepared a report giving his views as to the financial aspect of the purchase. Mr. Dickinson estimates that the corporation may be called upon to pay about £1,215,000 as the purchase price of the undertaking.
